The Department of Commerce is the state's leading economic-development agency, working with local, regional, national and international companies. The Department's mission is to improve the economic well-being and quality of life for all North Carolinians. The mission is carried out by serving existing business and industry, including providing international trade assistance; recruiting new jobs and domestic and foreign investment; encouraging entrepreneurship and innovation; marketing North Carolina and its brand; supporting workforce development; strengthening communities; and promoting tourism, film and sports development. The Department also provides data, statistics, information and reports for state government and agencies, which regulate commerce in the state. As such, the Department of Commerce is a natural fit to house the State Broadband Initiative for North Carolina, with broadband infrastructure being key to reaching North Carolina's business and workforce goals, and with broadband infrastructure being a critical component to allow all NC businesses and communities to participate in the global economy.

Fall 2012 Broadband Data Collection and Mapping Process

Data Collection

The official data request letter from the NC Department of Commerce was sent to all identified providers of broadband service on July 17, via e-mail. Hardcopy mailed letters were not distributed this round. The grant transfer to DOC was explained in the letter. Providers were given a link to the relevant Webpage which housed: Data Instructions, the Excel Data Template, the NC Department of Commerce Designation Letter, the Guidance Letter from NTIA from June 2011, and a file to download the 2010 Census Block GIS layer from NC OneMap. Providers were also reminded that they may choose to submit availability data by census block and street segment, considered public data under the grant program, or address-level data, and were asked to contact DOC with questions about confidentiality of data. Providers were asked to reply to the data request on or before August 10, 2012.

During this data collection, as providers inquired about data confidentiality, they were provided with a letter from the NC Department of Commerce explaining the protections provided under North Carolina's Public Records Act. Working through the NC Telecommunications Industry Association at their request, DOC provided letters to sixteen telco providers explaining these protections. Working through the North Carolina Cable Telecommunications Association at their request, DOC provided three additional letters. Letters were provided directly to four additional providers (three of these being mobile providers). Non-Disclosure Agreements were secured with four of DOC's contractors with potential access to the data. The DOC did not enter into NDAs with any providers. There were no unresolved confidentiality issues brought forward by providers.

As mentioned above, Excel and geodatabase templates were shared with providers, along with PDF format instructions summarizing all NTIA requirements and information relevant to each type of provider (fixed wireless, mobile wireless, and wireline). Technical assistance was provided to any organization who requested it.

A secure server hosted by MCNC is configured with an open source, browser-based direct file upload system called eGroupware. Providers were sent a log-in name and password for this upload system once they contacted either Angie Bailey or Stephanie Jane Edwards to communicate that their data was ready for submission. A confirmation e-mail went to Stephanie Jane once data had been uploaded.

Individual reminder e-mails were sent, or phone calls made, to targeted providers. NC Broadband did use some previously-submitted datasets for providers that were unresponsive, or who asked that previous data be used for this round. NC Broadband plans to make a more concerted effort at full participation in the Spring 2013 data round. The number of known broadband service providers operating in North Carolina is still at 105, with one new addition and one provider removed due to acquisition.

Out of these 105 known providers, 75 now have broadband data in this statewide geodatabase. Several additional providers are in communications with NC Broadband, in an effort to produce usable data for upcoming data collections.

Notable changes in the provider list include the acquisition of Sky Catcher Communications by Skyrunner, and the name change from WildBlue Communications to ViaSat Communications.

Integration of Provider Data into NTIA Statewide Geodatabase

For ease of data integration, a front-end Excel format template was offered to all providers, containing notes defining required fields, explanations of which data is required in which formats by which types of providers, and hyperlinks connecting fields to additional tables listing the corresponding NTIA-specified values and codes (for speed tiers, technology types, connection point facility types and capacities, county codes, end user types). A brief description of how census block FIPS codes work was also taken from an internet source and distributed as needed to providers who had questions about how to report this information.

BB Service by Census Block

As requested by the NTIA mapping and planning team, all census block data is included with 2010 census block geometry. Technical assistance was often needed by providers to correctly report served areas by either the 15-digit FIPS codes or in some way by which NC Broadband staff could derive the appropriate FIPS codes.

BB Service Road Segment

The reporting and mapping of data by street segment presented significant challenges to accurate interpretation of where broadband availability is and is not. This is mainly attributed to the difficulty of standardization among the many data structures by which providers report street segments. Quality of data has improved since some providers have switched to submitting data in shapefile format, and others have been able to start including a Tigerline ID (TLID) field for reference in mapping tabular information. Use of this unique identifier has reduced ambiguity in some tabular datasets and improved data quality upon mapping.

BB Service Address

A few address-level datasets were submitted to NC Broadband with the latitude/longitude coordinates already determined in a spatial format, but most needed to be geocoded. This was done using the NC Master Address file as the primary reference file, significantly increasing the accuracy of matching records. Secondary sources for address records that did not find a match this way included street segment interpolation, ESRI data utilizing the 4-digit ZIP extension, and manual placement/digitizing based on a combination of reference data and online browser maps. Upon completion of geocoding for each provider submitting address data, the address point features were overlain with a 2010 census block layer to add the census block FIPS code attribute, then all address feature points were loaded into the geodatabase feature class. The geocoded shapefiles for each provider are kept with geocode match score and match reference type for every matched address, so the thoroughness of this data type could be tracked and/or improved with more time.

BB Service Wireless

Approximately nine small, fixed wireless providers have been able to share technical information about their transmitting towers, antennae, and frequencies, so that NC Broadband can produce for them a service coverage shapefile using the contracted services of the University of NC at Greensboro Center for Geographical Information Science (http://cgis.uncg.edu) . An Excel template was developed with all the relevant information that can be filled in by providers with technical assistance in some cases, and the propagation model is field-calibrated to reflect actual ground conditions.

BB Service Overview

Records for overview containing subscriber-weighted nominal speeds of a given provider were generally joined to a template layer of county features, using the option to keep matching records only. Then these matching features and their new attributes were exported as a new shapefile before being loaded into the collective overview feature class. For providers with multiple technology types serving a given county in at least one instance, this information was single-field geocoded using the 5-digit county FIPS code, and then geocoded point features were spatially joined to the county polygon using "within" criteria.

Some detail formatting performed as needed:

- Add state FIPS code and any needed leading zeros onto county code for the new State+County FIPS code. Most providers list just the county code because this was the original NOFA request.
- Change state abbreviation values from "37" to "NC".
- Change weighted speeds to appropriate units (kbps) and remove unit text.
- Translate to county from weighted speeds reported by RSA/MSA.

BB Service - Critical Anchor Institutions

Only anchor Institutions that could be geolocated were included. Only 17 CAIs were identified that could not be geocoded to a point feature. CAIs were collected by contacting administrative offices of some CAI category types and receiving databases of information, as well as collecting from individual CAI locations for other types using survey emails and follow up phone calls as necessary. There are 5,857 CAI's identified, located, and included in the geodatabase to date. There were no changes to the CAI feature class since the previous data collection round in fall 2011.

Census Block data (tabular)

- Fields standardized and transferred into Excel template
- Geocoded to centroids of census blocks using 2010 Census Block layer in WGS1984 projection as reference file for "Address Locator".
- Spatial join of geocoded census block data points to polygon features

Street Data

Some datasets were submitted to NC Broadband by providers already in shapefile format, and others were reported in various tabular formats (text, Excel, CSV, etc.). Of the tabular datasets, some included a Tigerline ID ("TLID") field along with some or all other fields such as city, state, zip, and census block FIPS.

- For datasets submitted tabular with TLID:

- Max and Min address ranges were calculated from the FromRight, ToRight, FromLeft, ToLeft format used by most standard street segment reference files and incoming datasets
  - All data formatted into back-end Excel format, including converted speeds if reported at some other granularity.
  - Table geocoded to Tigerline 2010 street segment file using single-field and "TLID" values, with zero offset.
  - Geocoded point features converted to street segment geometry via spatial join using "contains" criteria, keeping matched records only.
- For datasets submitted tabular without TLID:
  - Max and Min address ranges were calculated from the FromRight, ToRight, FromLeft, ToLeft format used by most standard street segment reference files and incoming datasets
  - All data formatted into back-end Excel format, including converted speeds if reported at some other granularity.
  - Table geocoded to Tigerline 2010 street segment file using false midpoint address and either ZIP5 or census block FIPS (whichever available) as address locator zone.
  - Geocoded point features converted to street segment geometry via spatial join using "contains" criteria, keeping matched records only.
- For datasets submitted as shapefiles: VB If/Then statements used to calculate "Max" and "Min" address range attributes required by the NTIA/FCC, converted from the FromRight, ToRight, FromLeft, ToLeft format used by most standard street segment reference files and incoming datasets:
  - **To calculate "Min":**

```
Dim fromRight
Dim toRight
Dim fromLeft
Dim toLeft

fromRight = [FROMRIGHT]
toRight = [TORIGHT]
fromLeft = [FROMLEFT]
toLeft = [TOLEFT]

Dim minright
If fromRight = 0 And toRight = 0 Then
   minright = 0
ElseIf fromRight = 0 Then
  minright = toRight
ElseIf toRight = 0 Then
  minright = fromRight
Else
  If fromRight < toRight Then
    minright = fromRight
```

```
  Else
    minright = toRight
  End If
End If

Dim minleft
If fromLeft = 0 And toLeft = 0 Then
   minleft = 0
ElseIf fromLeft = 0 Then
  minleft = toLeft
ElseIf toLeft = 0 Then
  minleft = fromLeft
Else
  If fromLeft < toLeft Then
    minleft = fromLeft
  Else
    minleft = toLeft
  End If
End If
```

- **To calculate "Max":**

```
Dim fromRight
Dim toRight
Dim fromLeft
Dim toLeft

fromRight = [FROMRIGHT]
toRight = [TORIGHT]
fromLeft = [FROMLEFT]
toLeft = [TOLEFT]

Dim maxright
If fromRight > toRight Then
  maxright = fromRight
Else
  maxright = toRight
End If

Dim maxleft
If fromLeft > toLeft Then
  maxleft = fromLeft
Else
  maxleft = toLeft
End If

Dim max
If maxleft > maxright Then
```

```
  max = CStr(maxleft)
Else
  max = CStr(maxright)
End If
```

Creating last mile and middle mile features

- Formatted numeric fields in Excel as text since the short integer format in the data model for these fields will not accept values from the Excel import's default general format.
- ArcToolbox > Data Management Tools > Layers and Table Views > Create XY Event Layer
- Zoom to Layer, verifying that all points are located inside NC boundaries

Provider-specific notes, functions and corrections performed by NC Broadband as needed

Access/On Multimedia Inc.

- This is a middle mile only provider
- Provider confirmed no changes since last round so fall data was used

Cape Lookout Internet Services F12

- Duplicated Centurylink footprint (CB and street), to represent their reseller status.

AT&T F12

- Converted subscriber weighted nom speed data from CBSA to county
- Calculated conversion of Left and Right To/From addresses for street segment data to NTIA's required Max/Min values (using "min" and "max" formulas in Excel)
- Checked data by CB for duplicates, none found.
- Geocoded street-level data using 2010 TLID field.
- Selected counties from mapped subscriber weighted nominal speed data that actually contain broadband availability data by census block or street segment. Exported selection as Overview file.
- Linked geocoded points representing street segment data to polyline street segments via one-to-many spatial join, using intersect criteria with a 2 foot search radius. Eliminated extraneous joins by selecting out records in the results where target and joined TLID fields did not match.
- Many exact duplicates. After eliminating exact duplicates, many streets were reported with multiple speeds. Consolidated and took the highest speed available.

AT&T Mobility F12

- Merged shapefile features into a single multipart polygon to remove arbitrary grid boundaries.
- Validation: Ran "Eliminate Polygon Part" tool to remove any parts or donut holes less than 0.125 square miles in area.
- Removed extraneous vertices using a max offset of 150 feet.
- Added attributes supplied in Excel spreadsheet.

ATMC F12

- Merged shapefiles of address level data from two counties served, renaming and consolidating attribute fields.

- Added Address field populated with a concatenation formula of component address information.
- Added EndUserCat field and populated with code 5
- Overlay of address points w/CB layer to get FIPS code field
- Created new fields and used Calculate Geometry function in ArcMap to generate Lat and Long attributes

ATMC Wireless F12

- Ran repair geometry to resolve an error due to nonsimple features.
- Clipped shapefile to Tiger 2010 state boundary
- Eliminated polygon parts less than 0.125 square miles
- Ran simplify polygon to remove extraneous points, set to 20 feet max offset.
- Added spectrum attribute

CenturyLink F12

- Reprojected CB and street shapefiles and changed format of some fields for loading (created new fields of compatible type for TransTech, EndUserCat, and Provider_Type fields)
- Used If/Then scripts to calculate min and max address fields from left and right max/min ranges in ArcMap field calculator
- Noted partial CB geometry delineated (ie boundaries indicating where only parts of some CB's are served around the served area perimeter), but with correct 2010 census block FIPS codes, as confirmed by a test geocode.
- Created a template copy of the CB-based polygons and removed duplicates by conducting a one-to-one inner spatial join, using "identical to" criteria, with speed fields set to short integer field type and maximum merge rule.

Charter

- Re-projected and formatted attribute fields. Added EndUserCat field with value 5 for "Other/Unknown"
- Streets submitted and mapped in 2010 Tigerline, with no address range information. No unique identifier in common with reference Tigerline file, so no resulting address range info.
- Checked for duplicates in CB shapefile using Delete Identical, none found.
- exclusion of a small area of street segments and census blocks along the southern border of Cleveland County which was found to be bleedover from availability data in SC. Recalculation of subscriber weighted nominal speeds by county, consolidating two speed tiers calculated separately in previous data collections (values still reflect data as of spring 2011, need update next round).

Comporium F12

- For parent company Springboard: Tidied up text submission of address data and removed duplicates of equal or lesser max speeds. Ran address sorter script, all addresses found a match with previous data and were transferred new GDB (with the newer tech and speed attributes).
- For parent company Citizens Telephone Company: worked with provider to change granularity from census block to street segment level based on a specified radius from DSLAM coordinates sent from their engineering department.

Comcast F12

- Mapped CB's submitted this round
- Calculated min/max address ranges for street segment data in Excel
- Manually cleaned up street data text.
- Geocoded hypothetical midpoint of tabular street segments by address range, using composite street geolocator with zero offset.
- Spatially joined the above geocoding results to TIGER 2010 street segment features (using Intersect criteria with search range of 150 feet). Ran Delete Identical tool on the resulting street segments based on unique shape, TLID, and TransTech.
- Mapped Overview data as submitted in Fall 2010
- Clipped all mapped data to Caswell county, as directed by Comcast point of contact
- Created ArcGIS Explorer map for provider to review and feedback on data quality issues

Cricket S12

- Eliminated polygon parts smaller than 0.125 square mile, and removed extraneous points using a max 20-foot offset.
- Merged and duplicated polygons based on spectrum used
- Formatted attribute fields

Country Cablevision and Carolina Mountain Cablevision F12

- Formatted fields of new address data
- Removed 314 duplicates existing due to exclusion of unit/apt numbers
- Geocoded addresses and designated those in Haywood County as those served by Carolina Mountain Cablevision
- Created overview table based on information sent from provider in a follow up email.

Electronics Service Co of Hamlet

- Customized propagation model for unique antenna setup high up in trees
- Clipped output to state boundary

Frontier F12

- Began new with data submitted in this round, as per the provider this dataset includes/supercedes data previously combined from updates and formerly-Verizon's network.
- Applied speed codes based on email follow-up with provider
- Added fields for EndUserCat and ProviderType, populated all records with 5 and 1, respectively.
- Created XY Event layer for last mile/DSLAM points submitted.
- Applied a 15,000 foot service circle to last mile points for availability (no dissolve).
- Created subset of 2010 road segments that intersect the 15,000 ft radius buffers, via spatial join using intersect criteria.

Greenlight (City of Wilson) F12

- Re-projected shapefiles into WGS84.
- Added FRN2 field with leading zeroes, Lat, Long, EndUserCat (populated with code 5), and Provider type field (populated with code 1) to address attributes, and re-concatenated "Address" field.
- Spatial join of address points to obtain census block FIPS codes

- Removed duplicate addresses using Delete Identical tool in ArcToolbox, checking in Address, TransTech, MaxAdDown and MaxAdUp fields.
- Populated missing Typical speed fields with Maximum Advertised fields.
- Added/populated FRN w/leading zeroes, lat and long fields for middle and last mile
- Attribute join to county template feature class for Overview

Interstar F12

- Mapped subscriber addresses supplied by the provider.
- Saw that previous service area polygons still represent the best approximation of coverage over this new set of addresses plus previously submitted addresses, so transferred previous polygon created in the following way:
  - identified clusters of these address points, then used subsets of the point locations to derive Minimum Bounding Polygons (Convex Hulls) representing available wireless coverage.
- One-to-one spatial join associating provider attributes and speeds with minimum bounding polygons.
- Added spectrum field and populated with code 6.

Inteliport F12

- Provider is working on but has not yet been able to compile equipment specs that would allow us to run a propagation model, so in the meantime, polygons were created from census block locations.
- Follow up from provider in March 2012 clarified the max advertised speed values, based on service tiers and throttling used to keep streaming media from overloading the bandwidth when many users are subscribing to a given microcell. These were reduced from the maximum bandwidth capacity values included previously.
- Census block shapes used in the wireless feature class were merged into a single, multipart polygon based on their identical attributes.

MCNC F12

- Transferred the existing points from spring 2012 data. Corrected provider type value to 3 for "Other". Updated all the EndUserCat codes to 2, since MCNC serves middle mile directly to institutional end users only.
- Confirmed no duplicates between previously reported and new incoming end user address points.
- Geocoded entire set of newly reported/added end user addresses, though some lat/longs were reported (provider staff expressed some doubts about accuracy). Used provided lat/longs for 3 points that did not find a geocode match to the NC Master Address File.
- Mapped new set of the same middle mile information but with some coordinate corrections, per the provider.

Mediacast F12

- Max Advertised speed values duplicated to populate typical speed fields.
- Use of previous wireless propagation data, minimum signal strength threshold of -80 dBm, after confirmation with the provider that 2 towers recently hit by lightning had been restored.

Mediacom F12

Used Spring 2012 data which was processed in the following way:

- Confirmed with provider that address data includes both current and potential customers, and that the list of serviceable addresses had not changed since the fall. Provider did submit new file with typical speeds. These values were the same as populated in fall by duplicating the max advertised speeds.
- Transferred formatted and mapped data from Fall 2011 database. (112,075 points as these do not include duplicates or those we could not geocode).

MI-Connection F12
Used Spring 2012 data, which was processed in this way:

- Deleted 5,989 duplicate records (using address, transtech, and EndUserCat fields)
- Ran script to sort out new address records from previously submitted addresses.
- Populated unmatched/ungeocoded addresses with placeholder values (-9999)
- Concatenated Address field for cleaner, consistent contents

Morris F12

- Use of same address list as Spring 2012, having confirmed that these include both current and potential broadband customer locations. Data contained previous correction for fiber records that had originally been reported by Mbps and converted these to NTIA codes to match other records.
- Spatial join with 2010 census blocks for FIPS field.

NC Wireless F12
Spring 2012 data used, which was processed in the following way:

- Wireless propagation of data, this time using a higher minimum signal strength threshold of -80 dBm.
- Follow up helped correct the max advertised and typical speeds of one tower footprint within more practical values based on channel availability.

North State F12

- Corrections for missing FIPS digit and inserted leading zeros for tracts.
- Speeds were reported as Typical Up/Down only. Substituted these values into Max Ad Up/Down as well.
- Worked with provider to change granularity from census block only to address level across the service area.
- Middle Mile, Last Mile: Added negative sign to longitude values

Pineville Telephone Company F12

- Removed FRN in census block feature class, to prevent conflict with “speed tier” duplicates check in NTIA script. This is a workaround because script is not set up to handle multiple DBA names used by the same parent company with the same FRN.

Randolph TMC and Randolph Telephone Company F12
Used Spring 2012 data, which was processed in this way:

- Formatted text information and consolidated into one Excel file
- Generated hypothetical street addresses based on the min, max, and integer midpoint of each address range provided. Geocoded these addresses to Tigerline 2010 reference file, with zero

offset (3 potential points for every address range record sent by Randolph). Each original record assigned a unique ID which was duplicated with each set. Set field created as well to distinguish.

- Geocoded addresses spatially joined to corresponding street segments
- Merged any duplicates based on TLID, FRN, and temporary ID.

Sprint Nextel F12

- Validation: Ran "Eliminate Polygon Part" tool to remove any parts or donut holes less than 0.125 square miles in area.
- Ran "Simplify Polygon" tool to eliminate unnecessary vertices with a max offset of 20 feet.
- Added Spectrum and new TransTech field with short integer data type.
- Removed hyphens from FRN

Star Telephone Membership Corporation F12

- Identified a formatting issue with zeroes in the tract number section and corrected this. Followed up a second time about
- Identified a remaining 51 census block records that did not find a match, and were found to be vintage 2000 census block FIPS codes. Converted these records to year 2010 geometry, and combined with blocks reported as 2010 geometry, then removed some resulting duplicates.
- Corrected one last mile connection point with a formatting issue on lat/long that was creating an inconsistent extent when mapped.
- Used field calculator to make the contents of Provider Name and DBAName fields consistent and spelled out in every feature class rather than sometimes abbreviating Corporation to Corp.
- Corrected FRN to have sufficient number of digits/leading zeroes.
- Added lat/long coordinates to middle mile point reported, based on communication that Star TMC, Starvision, and Interstar all share this connection point.

Starvision F12

- Parsed street information in address data
- Mapped using lat/longs supplied by provider.
- Corrected latitude coordinates that seem to have been typos in the original file (one degree +/- the location described by the address)

Skybest and Skyline F12

- Created missing .prj file for shapefile exports from provider, based on follow up determining an NAD 83 North Carolina FIPS 3200 ft projection.
- Converted polylines to polygon for each DSL and fiber-to-the-home technology layers.
- Created fields and attributed manually from contents of provider-supplied .mdb files.
- Spatial join with Tigerline 2010 streets WGS84 by location inside newly created polygons (using streets was found to be more accurate, with less overstatement, than an overlay with census blocks).
- Manual touch up, deletion of streets that only touch the boundary of served polygons.
- Used VB script in Field Calculator to derive max/min address range information

Sky Catcher F12

- Using data as previously mapped, this footprint was added to the footprint of Skyrunner following their acquisition of Sky Catcher.

SkyeNet Wireless Communications F12

- Provider does not participate in data collection. Information was gleaned from the provider's website in previous data collections, by selecting and merging the relevant census blocks corresponding to served areas indicated on the provider's online map. This footprint was checked for currency using the company website on 9/26/2012.
- Unlicensed spectrum is assumed and no match could be found on the FCC FRN system.
- Maximum speeds were obtained from the FAQ page of the same website. Typical speeds were inferred by information also on the FAQ page, with speed codes most closely matching the ranges described. Speeds were updated after checking the website again on 9/26/2012.

Skyrunner F12

- Corrected footprint using most current wireless equipement specs and -80 dbm (previous signal threshold change had been done on older data by mistake).
- Added Sky Catcher data to the footprint to reflect the recent acquisition of their network.
- Last Mile: assumed Ownership by Skyrunner in the Ownership field, wireless type for backhaul, and capacity codes equivalent to max advertised speed of the surrounding wireless footprint.

Star TMC F12

- Corrected zero misplacement in tract numbers and 15-digit CB FIPS codes (double zeros should be at the end, rather than beginning of tract numbers)
- 51 CB's found to be reported in year 2000 vintage. Converted those to year 2010 using methods similar to those described in Fall 2011:
    - Select all records in Spring 2011 provider dataset
    - Relate FIPS 2000 field in provider data to FIPS 2000 field in statewide crosswalk table
    - Relate FIPS 2010 field in statewide crosswalk table to GEOID field in 2010 census block layer.
    - Export related/selected 2010 CB records as new layer, and related/selected crosswalk records as a provider-specific dBase table.
    - Join Field on exported Crosswalk subset with Spring 2011 provider data layer based on year 2000 CB number.
    - Join Field on new 2010 CB layer with the joined crosswalk DBF (which should now have the relevant provider data) based on 2010 FIPS field.

Suddenlink F12

- Removed records without speed codes, as per the provider these indicate blocks and street segments without Suddenlink broadband service.
- 553 duplicates removed from address data.
- Mapped new fall data as reported (census blocks and geocoded addresses), despite unexplained reduction in total records (attempting to follow up with provider to find out if they have made corrections, reduced service, or are reporting current subscribers only).
- Changed 45 census blocks and 50 address records from tech code 40 to 41 to reflect lower max advertised speed.

Surry TMC and Piedmont Communications F12

- Added zeroes to FRN for 10-digit format.
- Duplicates removed from streets

- Created hypothetical addresses in increments of 100 from within the address ranges supplied in Excel format: one street number being the integer midpoint, one being the min value plus 50, the next being 100 higher than that, etc. up to the max value minus 50.
- Spatially joined the geocoded points to polyline street segments using intersect criteria and a search radius of 2 feet.
- Used original address ranges for the min and max address ranges in street attribution. Dissolve on resulting street shapefile, to merge Tigerline segments applying to the same address range reported by Surry.
- Removed CBs where streets were given (they were double reported)

TDS Telecom F12

- Data submitted as geodatabase feature classes, availability at address level. Addresses and mid-mile points spatially joined with 2010 census blocks to derive complete/correct FIPS codes.
- Removed 36 addresses that were unmatched by geocode in data received.
- Duplicated max advertised speed codes in typical speed fields

Time Warner Cable F12

- CB and Streets:
  - Reprojected into WGS 1984
  - Added Provider Type field and coded as a “1”
  - Added EndUserCat field and coded as “5”
  - Input Max Advertised speeds as Typical Speeds as well, since they were not included.
- Streets: no min or max address ranges of any kind were included in the data, so this was left null in the transfer geodatabase.
- Mapped middle mile data, which contained nationwide connection facilities TWC chose to include as middle mile, and none of these fall within North Carolina’s boundaries, so none was added to the transfer geodatabase.

T-Mobile F12

- Reprojected shapefiles into WGS 1984.
- Added field to categorize by technology type/T-mobile service tier (3G, 4G).
- Attributed manually from information sent in a text file from T-Mobile.
- Executed Symmetrical Difference on UTMS and HSPA21 layers with layer of next fastest speeds, to extract footprints where only these speeds are available and not the higher speed. Appended both resulting features into shapefile for HSPA42.
- Eliminate Polygon part tool to remove features <0.125 square mile.

Tri-County F12

Spring 2012 data was used, which was processed in the following way:

- Concatenated address information into single Address field in BackEnd template spreadsheet.
- Fall data used for wireless.
- Addresses geocoded for DSL availability, then aggregated to corresponding census blocks and street segments
- For Tech Type 10: Selected and exported resulting aggregated CB data for CB’s <2 mi. These were loaded into the geodatabase with associated broadband data.

Verizon Wireless F12

- Merged “evdo” and “lte” transmission type files into one with field distinguishing the two.
- Simplify wireless polygon to remove extraneous vertices, max offset 150 ft.
- Eliminate polygon parts less than 0.125 square miles
- Applied attributes according to accompanying word document from provider.

Yadtel F12

- Worked with provider staff to improve granularity of data from census block to street (for DSL) and address level (for FTTH). Applied attributes from census block level for each technology type (using within criteria, non-Clementini), as well as EndUserCat codes from a field provided in new address-level data.
- MidMile: changed capacity code from 8 to 3 (most closely matching mid-mile code to what seems to be a value reported in terms of last-mile codes)

Providers for which typical speed information was not supplied to NC Broadband:

- Barnardsville Telephone Company (FRN: 0003766714)
- Clearwire (FRN: 0017775628)
- Comcast
- Frontier Communications of the Carolinas, Inc. (FRN: 0018802660)
- Greenlight/City of Wilson (FRN: 0015950934)
- Lexcom (FRN unknown)
- Saluda Mountain Telephone Company (FRN: 0003767662)
- Service Telephone Company (FRN: 0003767712)
- Time Warner Cable (FRN: 0013430244)
- ViaSat Communications (FRN: 0007843766)
- Windstream Concord Telephone (FRN: 0003762010)
- Winstream North Carolina (FRN: 0004967634)

For these providers listed, the coded values for maximum advertised speeds were duplicated in the typical speed fields, since the placeholder code “ZZ” to indicate missing information is no longer accepted in the data model. When typical speed information is not supplied by the provider, a comprehensive and accurate substitute is not available, particularly since speed test data does not necessarily reflect the throughputs of the highest speed tier available.

Post-processing Functions for Final Integration

Census Block

After Census Block data was loaded into the transfer geodatabase feature class, FIPS code fields were calculated using commands in the Field Calculator and contents of the FullFIPSID field. The following calculation formulas were used:

STATE FIPS = Left ([FULLFIPSID],2)
COUNTYFIPS = Mid([FULLFIPSID],3,3)
TRACT = Mid([FULLFIPSID],6,6)
BLOCKID = Right ([FULLFIPSID],4)

- Duplicate records were identified using the ArcToolbox Frequency tool and various field combinations.
- Format problem with Wilkes Telecom/Wilkes Telecommunications were repaired by reloading their data with an alternate FullFIPS ID field and recalculating individual FIPS components. Records no longer flagged as duplicates due to this correction.
- Duplicate records (with same value for Provider Name, DBA Name, FRN, TransTech, and FullFIPS ID) were removed using a one-to-one spatial join on the original provider dataset for CenturyLink with a template of its own partial-CB geometry (with Delete Identical run on it's FullFIPSID field) and those records were reloaded into the transfer geodatabase. The results of this process were applied to the @ Communications provider footprint, as a licensed reseller of CenturyLink service.
- Warnings on speed values were identified and either edited or explained after follow up with the provider and/or further investigation.
- Ran repair geometry tool 2x and confirmed that no features were deleted.

Road Segment Data

- Warnings on speed values were identified and either edited or explained after follow up with the provider and/or further investigation.
- Ran repair geometry tool and confirmed that no features were deleted.

Address Data

- Populated FIPS code field for 3 address points that did not have a value after their dataset's spatial join (because of location on the state border).
- Verified that all FRN's were either 9999 or 10 digits with leading zeroes.
- 2129 records removed and reloaded after parsing for missing information in building number or street name field, in addition to a join with original data from Suddenlink to populate missing City data. Concatenation of full address field for Suddenlink and North State records.
- Warnings on speed values were identified and either edited or explained after follow up with the provider and/or further investigation.
- Ran Repair Geometry tool and confirmed that no features were deleted.

Wireless

- Duplication of multipart coverage polygons to reflect multiple spectrum ranges used, per NTIA/FCC instruction.
- Separated and performed Erase on provider coverage polygons that overlapped with those of the same provider and spectrum but with higher max speeds available.
- Warnings on speed values were identified and either edited or explained after follow up with the provider and/or further investigation.
- Ran Repair Geometry tool 2x and confirmed that no features were deleted.

Overview

- Field Calculated "Geographic Unit Type" field to CO, and "StateAbbr" field to NC.
- Field Calculated missing Maximum Advertised Up and Down speed fields to "ZZ" "default" values.
- Deleted records of information for wireless technology types.
- Verified that all FRN's were either 9999 or 10 digits with leading zeroes.
- Ran Repair Geometry tool 2x and confirmed that no features were deleted.

Last Mile

- Field Calculated "Ownership" field to -9999 for records null in this field. Calculated "StateAbbr" field to NC.
- Ran Repair Geometry tool and confirmed that no features were deleted.

Middle Mile

- Spatial join with census block layer to derive the 15-digit FIPS code, then reload features into middle mile feature class including the new values for populating the "FullFIPSID" field.
- Replaced Null Elevation values with -9999 "default" value using Field Calculator.
- Populated State Abbreviation column with "NC".

CAI

- Parsed address information for address fields
- Excluded 526 records for which survey respondents report that they do subscribe to broadband but did not give speed information accepted by the NTIA's script.
- Added fire department, health, public health, and police CAI's from recent data gathering efforts.

Verification Implemented Prior to Spring Data Submission

Data verification methods implemented by NC Broadband in time for submission at the federal level followed generally along the lines of quality control. Methods most often used are outlined below. Time constraints on existing staff did not allow for the execution of some more complex verification approaches that are in the planning/setup stages, but more substantial verification involving multiple data sources continue to develop.

Standardizing

The files from datasets received from each provider, except for those few submitted in shapefile format, were manually transferred to a back end Excel-format template with field headers, to create a single-file, standardized field structure for each provider's data that could be used for quick reference and map feature creation. This step also helped staff to ensure that all required components were either present or requested in follow up to the provider, and that the components were reported in the correct format.

Lat/long coordinates

Some information was submitted to NC Broadband with lat/long coordinates included for the location of point features. This location information was checked during the mapping process, and values were corrected if the provider had made mistakes such as reversing the latitude with the longitude, or forgetting to include the negative sign for the longitude value. In addition, NC Broadband followed up with providers on point features that showed up in the map outside the state and/or outside the provider's reasonably expected service area. Point features that mapped outside the state after follow up with providers, including those that mapped to zero degrees latitude and longitude due to an unknown location, were deleted from the geodatabase for submission at the federal level. For fixed wireless data generated by propagation model from antenna specs, the latitude/longitude coordinates of the antenna locations reported by the provider to NC Broadband were verified by NC Broadband's university GIS research contractor using high-resolution orthoimagery.

Multiple FRNs

In several instances, providers reported multiple FRN's that increased in numerical increments of one for each record of data, and this was found to be a simple error when the providers were trying to paste their organization information down the rows applying to a list of broadband data records. This was checked for and corrected after confirming that the lowest/first reported FRN was the correct one.

Correct technology type codes

Knowledge from our technical staff and online research was sometimes used to supplement data that NC Broadband had relevant to a provider that was unresponsive or otherwise did not supply this specific piece of the information. For example, a provider may have gaps in their transmission technology field and these were filled in when technical staff could confirm that the provider operates with only a single technology type. Or the staff may know which technology type is used by a provider who left this field blank on all records.

Subscriber-weighted nominal speeds

Weighted nominal speed values were checked, and staff followed up with the provider if all values were the same for multiple counties, as this could result from either a single speed tier for a given transmission technology across counties, or in some cases providers were not following the formula provided and had manually entered the same value regardless of differences in subscriber numbers. When these cases were discovered, technical assistance was offered and a new subscriber-weighted nominal speed dataset created to reflect variation between counties.

Wireless model fieldwork

For fixed wireless provider data that was generated as coverage area output from models based on technology and environmental factors, the data was verified by "ground-truthing" with measurements of signal strengths at sample locations within a provider's service area, observation of the influential ground conditions in each location, and comparison to the expected signal strengths at the same locations in the model. Some calibration of the model was then performed so that the resulting polygons could more accurately reflect what would be found in real life.

Check Geometry

After compiling all datasets into the geodatabase feature classes, the check geometry process in Arc Toolbox's Data Management section was used on each feature class to identify and repair any geometry errors in the features.

Comparisons with Citizen-Sourced Data

NC Broadband has recently begun mapping layers of input from citizens who report having no access to broadband at their location from any broadband provider (or possibly just mobile or satellite options that don't meet the users needs or budget from their perspective). A compiled layer is collected from local citizen advocates, citizen input on NC Broadband's website feedback form, and locally conducted surveys. Comparison of provider-sourced data with this source of information has allowed for targeted follow up with providers in order to promote access to broadband for these citizens, as well as to begin refinement of our statewide broadband data. FCC deadzone and speed test data has also been retrieved and is being processed for inclusion and comparison. Further data collection from citizen input and comparative analysis approaches will be described in the near future.

North Dakota Broadband Mapping Methodology Report

Executive Summary

The following report describes methods and issues related to the October 1, 2012 deliverables to NTIA for Broadband Mapping in North Dakota. This data submission is compliant with all guidance and specifications provided by NTIA. As per NTIA guidance we are using current versions of the Broadband data model and the validation script.

North Dakota has developed a robust operational data model, components of which are described in this report, to support our broadband mapping efforts. We feel our operational model can support any reasonable modifications to NTIA requirements. Since this deliverable format is derived from our operational data model, we anticipate some modifications will be required. We are able to take best practices recommendations from the NTIA and incorporate those into the final deliverable without major modifications of our work flow and operating rules.

Our mapping process started with infrastructure points (central offices, remote terminals, wireless towers and antenna locations, middle mile and backhaul), cable franchise areas, and anchor institution addresses. Those served an important role, especially with providers who have not actively participated in coverage mapping and those supplying broadband coverage for large generalized areas and larger geographic census units such as census tracts. When providers have not supplied detailed information of their service areas that can be mapped at the census block level, coverage models were derived dynamically from this infrastructure based on geoprocessing techniques specific to each broadband technology. Examples of geoprocessing techniques include using infrastructure points in conjunction with the road network to predict the area served for DSL coverage. For all providers of wired broadband services, those have all been completed and remain static unless a provider chooses to participate with more detailed coverage mapping at a level of geography at or smaller than a census block.

We developed a system to quantify “validated” data for the purpose of determining what was suitable for delivery to NTIA. The operational data model maintained reliability and validity codes. As more data is obtained from providers in maintenance updates, the validity and reliability of infrastructure points has diminished, though they remain the only basis we have for non-participating broadband providers.

Provider Summary

Through extensive research we identified a master list of 173 potential providers in North Dakota with 52 companies identified as actual broadband providers. The North Dakota

Broadband map includes 50 broadband providers. The full list of the potential providers researched but subsequently identified as not providing broadband service is included in Appendix A.

Data Sources

In the first rounds of broadband mapping, provider presence maps were developed for central office locations and incumbent local exchange carrier locations for all assumed providers in the state. These were identified through a commercial spatial database purchased from GeoTel Inc., and supplemented by other public data sources such as the State's Public Service Commission and DSLReports.com. These were intended to be "talking maps" and general intelligence on where providers have infrastructure for subsequent phone and written communications with providers. These maps were compared to counties served by provider in the state's telecommunications association directory.

Web site research, review of materials submitted to the state by providers, and public websites, such as the FCC were researched for each provider.

New providers are contacted to request data when a significant number of speed tests are recorded, or when we learn of their presence through ancillary sources. Providers that contact us directly and submit data are also included.

Broadband Coverage

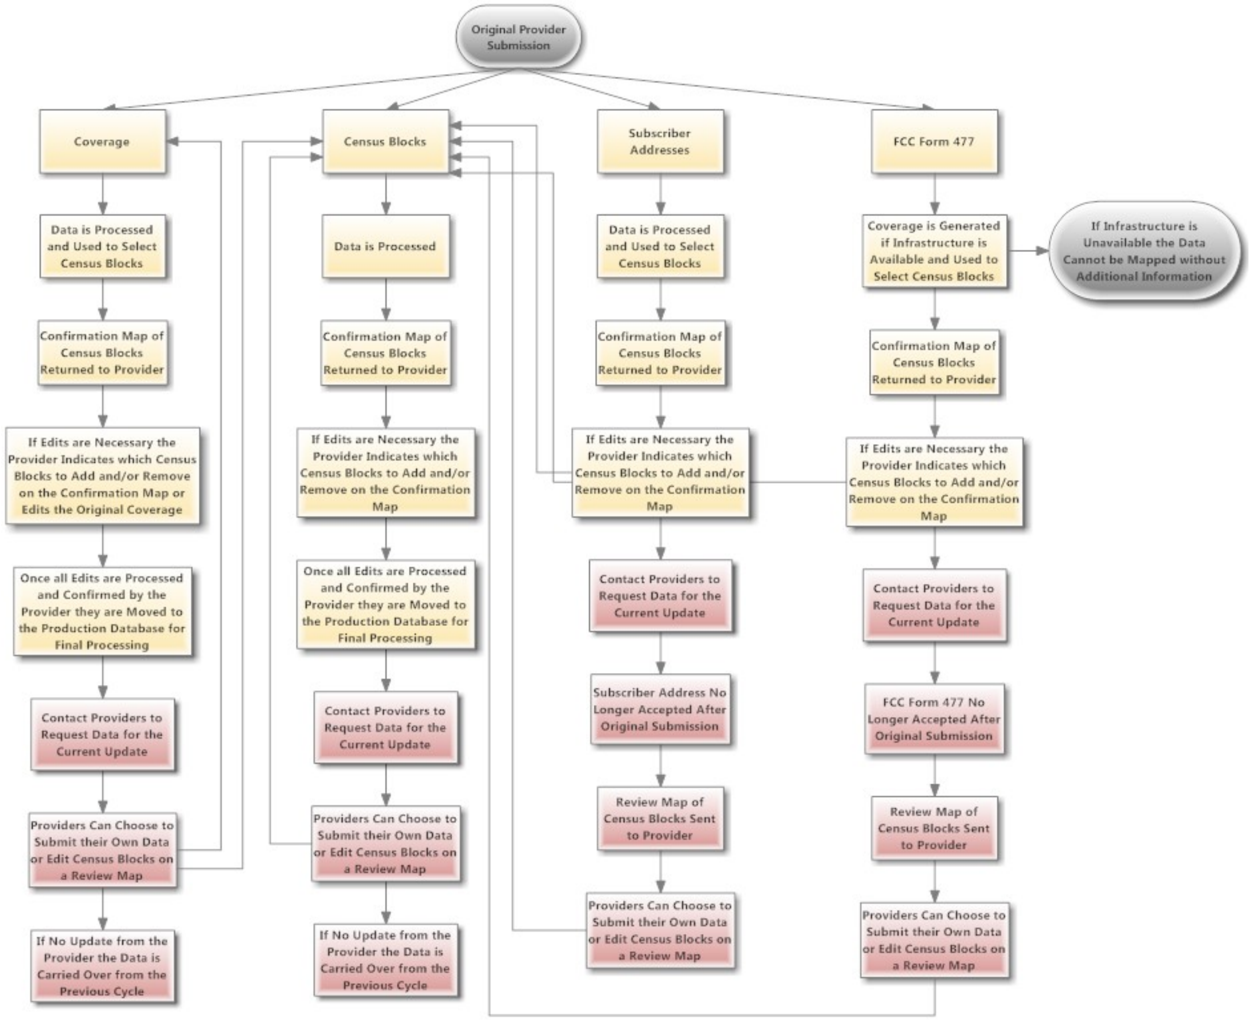
Data submitted by broadband providers was accepted as is and was mapped in complete form when provided as a broadband coverage at the same scale or larger scale than the census block level. Provider coverage submitted at a coarser geographic scale (e.g., census tracts, counties, zipcodes) was supplemented with public data, independent measurements and GIS modeling techniques. When provider submitted data appeared to be exaggerated or providers did not participate in the broadband mapping process, independent measurements and other data sources (e.g., state GIS framework structure locations, speed tests, survey results, website data and infrastructure) were used to override or supplement the provider data.

Broadband providers that chose to submit data did so in a wide variety of formats, levels of completeness, and at varying geographic scales including: narrative descriptions, analog and digital coverage maps, CAD files, GIS shapefiles and geodatabases, KMZ and KML files, FCC 477 reports, and data spreadsheets. All data formats were accommodated and processed whenever possible.

If data was submitted by a provider in a format that did not allow mapping at the census block level of geography, providers were sent standardized maps that included census blocks and a data spreadsheet in an attempt to standardize the inputs and increase the geographic granularity of the provider data submission.

Although each provider had individual characteristics and nuances in their data submissions, several data patterns can be described generalizing the provider submissions.

Figure 1 Provider Submission Types and Workflow



Providers Submitting FCC Form 477 Reports or Similar Format

Broadband providers are required to submit FCC Form 477 reports twice a year to the FCC; recently 477 submissions have been done using a structured web site maintained by the FCC. The 477 reports require broadband providers to submit a list of census tracts with the number of subscribers based on maximum advertised downstream and upstream speed tiers. Several providers submitted their actual FCC 477 report or a modified version in analog or digital format.

Census Tract Detail - Technologies except Terrestrial Mobile Wireless

If you reported broadband connections in Part I.A in a technology category other than Terrestrial Mobile Wireless, you must specify the technology category, identify the Census Tracts in this state in which you had connections in service using that technology, and, for each Census Tract, report the number of connections and the percentage residential in each relevant download/upload information transfer rate combination.

You can use the Federal Financial Institutions Examination Council Geocoding System to look up Census Tract numbers for street addresses.

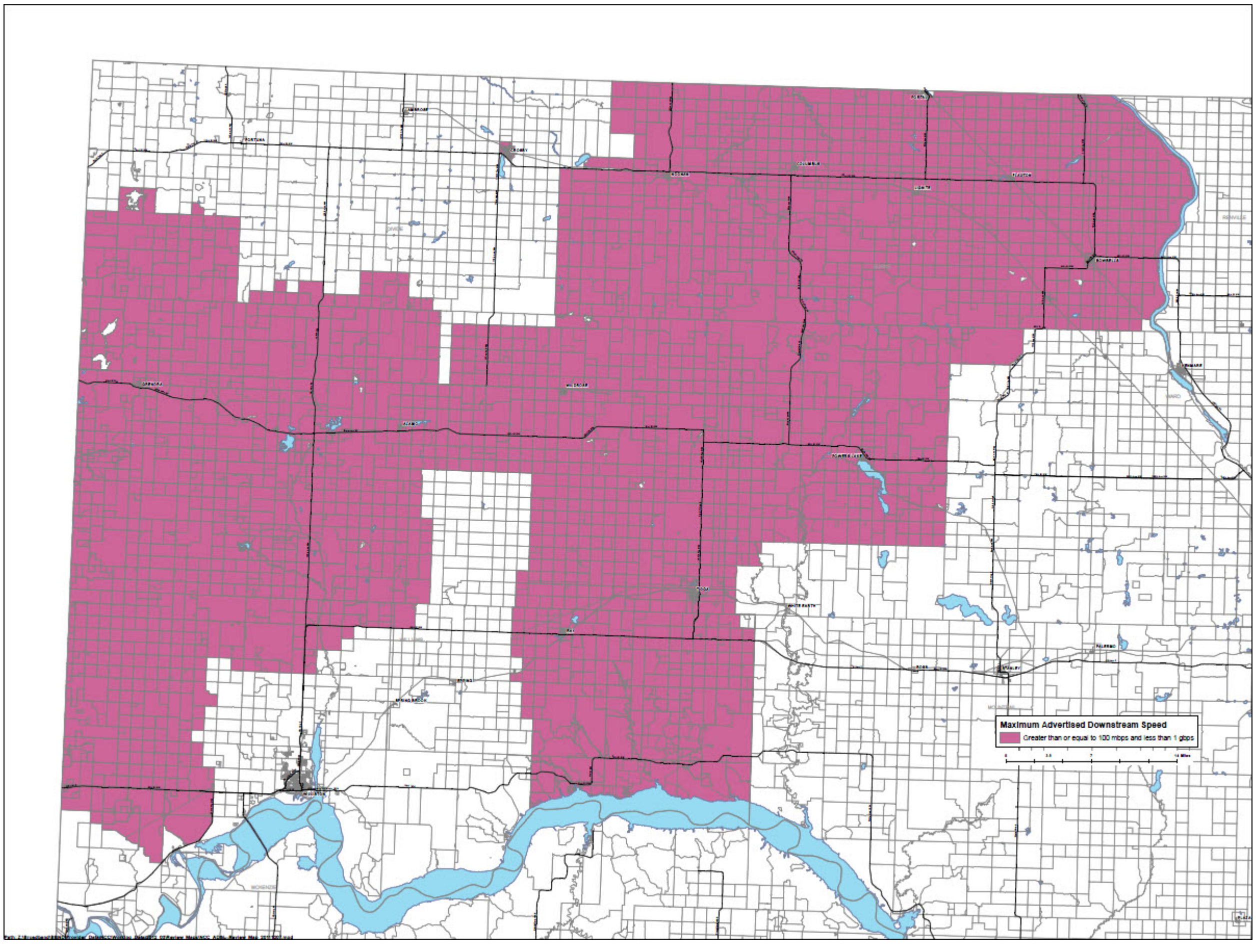
How They Were Handled

FCC Form 477 reports were entered into a standardized format that included the census tract ID code, maximum advertised downstream and upstream speed tier code, and number of subscribers (when available). Since the FCC 477 reports requires providers to submit data for all speed tiers within a census tract, only the highest maximum advertised speed for any given census tract was entered into the standardized spreadsheet in order to be compliant with the definition of broadband service.

The spreadsheets were then joined to a census tract feature class template that included the attribute fields from the NTIA schema. The resulting feature class was a geographical representation of the FCC 477 report including the technology of transmission and speed information. This feature class was used in conjunction with validated infrastructure data (i.e., central offices and/or remote terminals) to run the DSL or Cable geoprocessing models respectively.

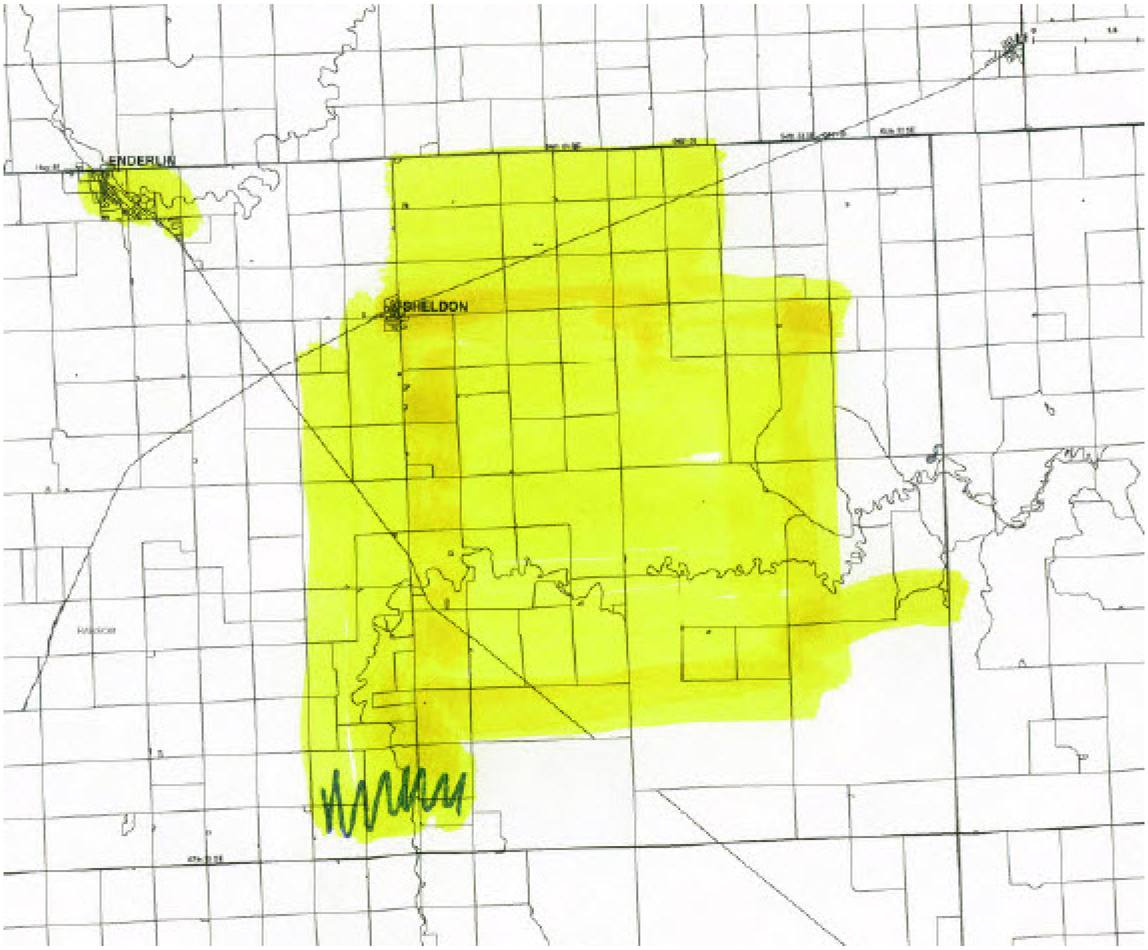
The resulting census block selection from the DSL or Cable model was displayed on a standardized review map and returned to the provider for confirmation.

Figure 3 Review Map Example



If additional edits were required the provider "marked-up" the review map(s) to indicate which census blocks should be added and/or removed. The provider submission was handled as a census block update (describe in the section below) from that point forward. In future updates from those providers FCC Form 477 data was not accepted and providers who originally submitted data in this format were asked to make edits to the review maps.

Figure 4 Provider's "Marked-Up" Map Example

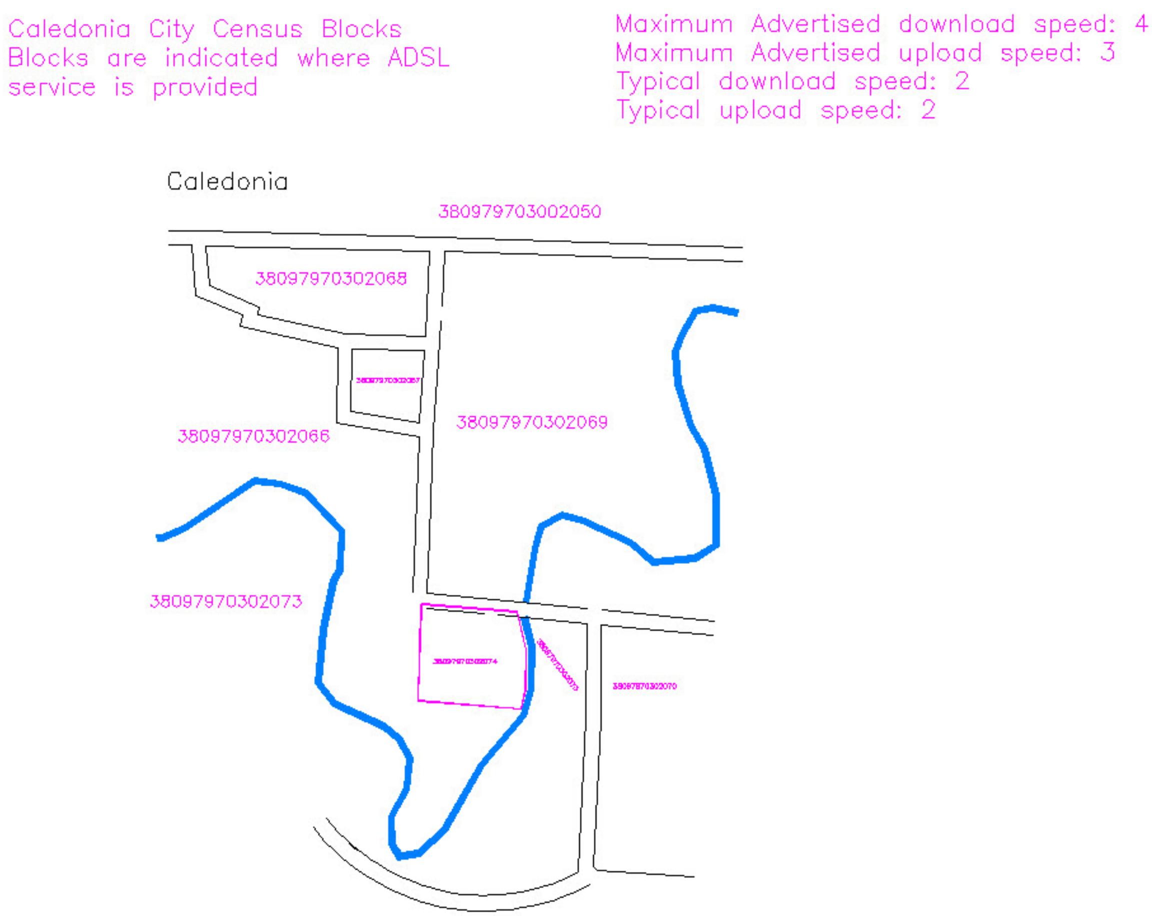


Several providers did not respond to the original confirmation maps and their final submission represented the best modeled estimate of their coverage at the census block level for DSL and/or Cable technologies. Providers that submitted FCC 477 data for fiber to the end user or fixed wireless could not be mapped and were not included in the final broadband map unless they provided additional data at the census block level or equivalent coverage at a similar scale.

Providers Submitting Census Block Coverage

Census blocks submitted by providers representing their broadband coverage area come in a wide range of formats including: analog and digital maps, CAD files, GIS shapefiles and geodatabases, tabular lists, and spreadsheets.

Figure 5 Census Block Submission Example

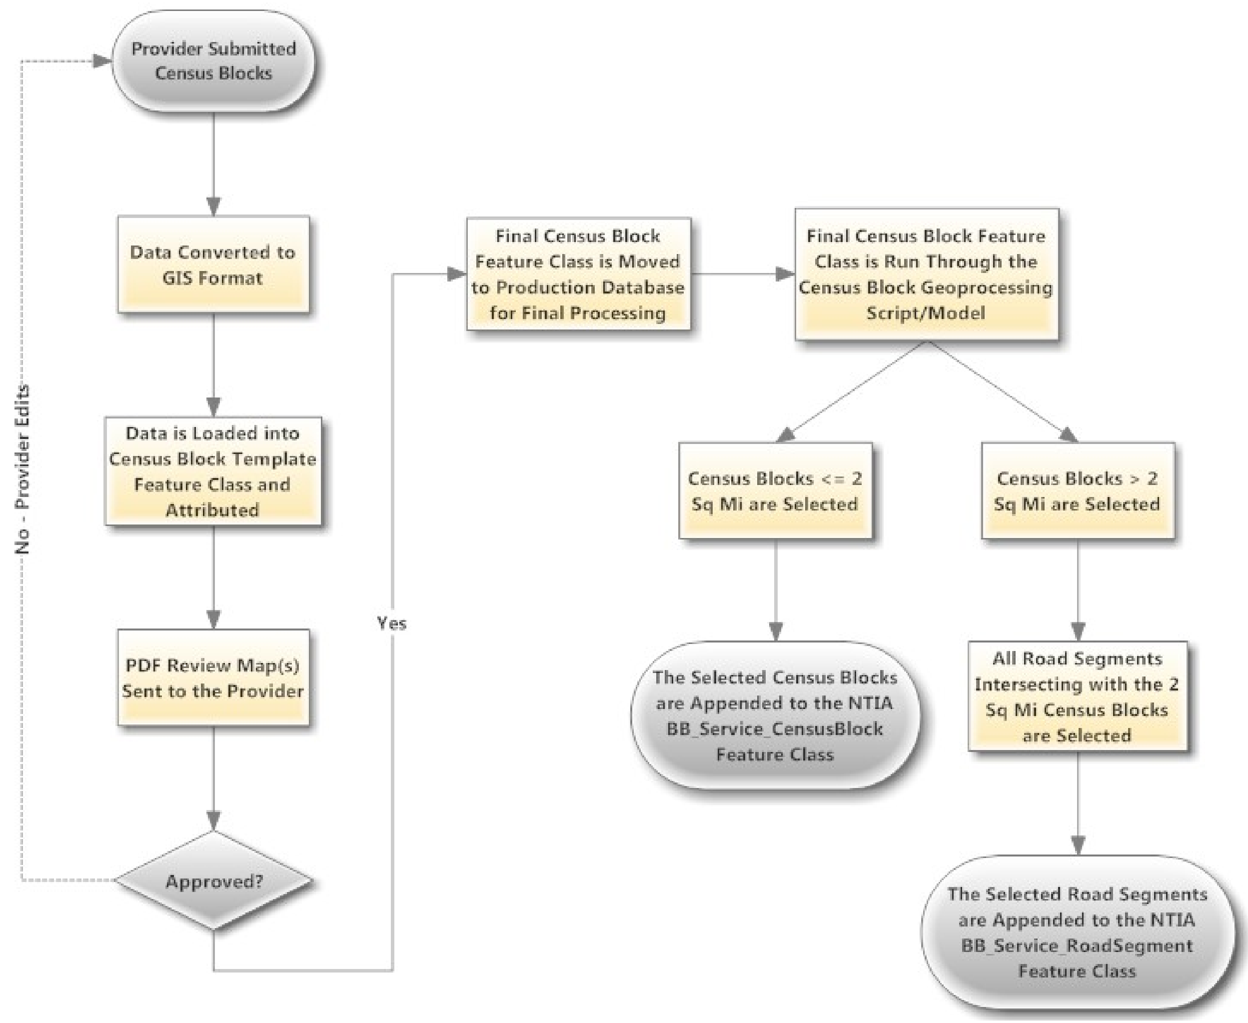


How They Were Handled

All census block submittals were loaded into a census block feature class template that included all of the attribute fields from the current NTIA schema. Census 2010 geography was used as required by NTIA. Domain codes were entered in the appropriate attribute field for technology of transmission, maximum advertised downstream speed, and maximum advertised upstream speed. If a provider did not identify the technology of transmission for a given census block or blocks, they were contacted by phone or email in order to obtain this information. In instances where speed information was not included in the data submission providers were contacted and asked to supply this data; in cases where the provider refused to supply either the downstream, upstream, or both speeds, and their advertised speeds were not available on their web site, the lowest domain code was entered in the applicable attribute field.

Standardized confirmation maps were created for each provider by type of technology and sent to the provider for review. Once processing was completed for a provider's census block submission, the census block feature class was run through an Esri geoprocessing model that performed several quality control-quality assurance tests and selected census blocks less than or equal to two square miles and road segments that intersected census blocks greater than two square miles and were appended to the appropriate NTIA transfer data model feature classes.

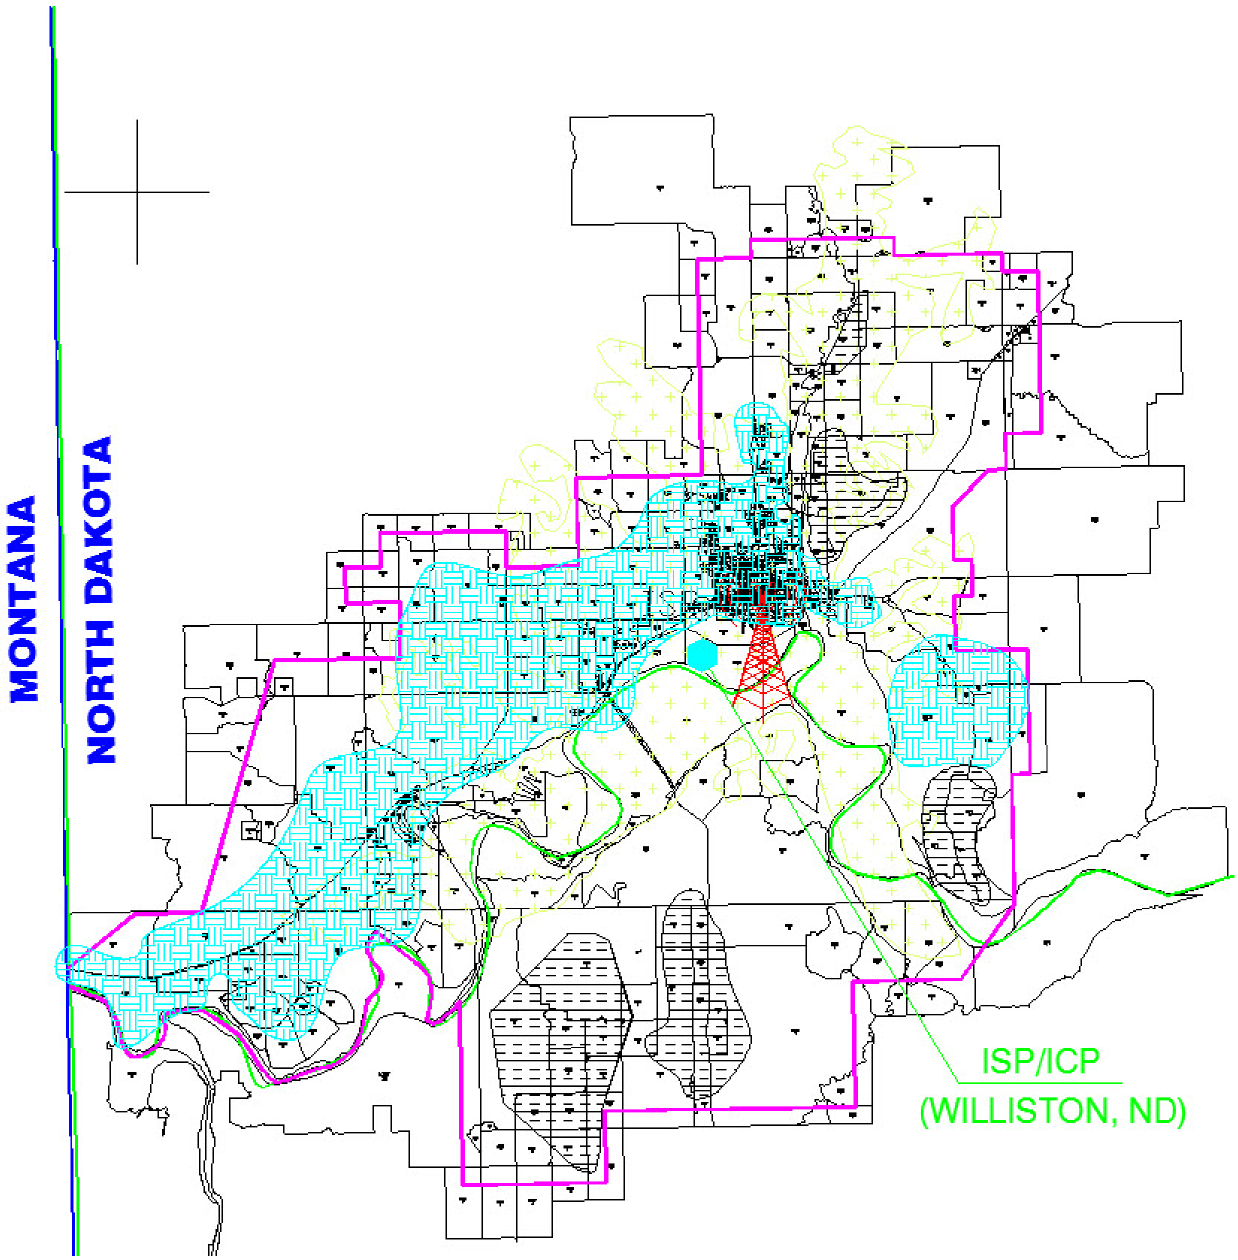
Figure 6 Census Block Geoprocessing Model



Providers Submitting Coverage Data

Provider submitted coverage data were differentiated from the other types of geographic data submissions coarser than a census block since they represented the full and explicit range of broadband coverage. Similar to the other types of data submissions, coverage data was also provided in a wide range for formats including: analog and digital maps, CAD files, GIS shapefiles and geodatabases. Coverage data was submitted by several providers or was available on several providers' websites.

Figure 7 Coverage Data Example



How They Were Handled

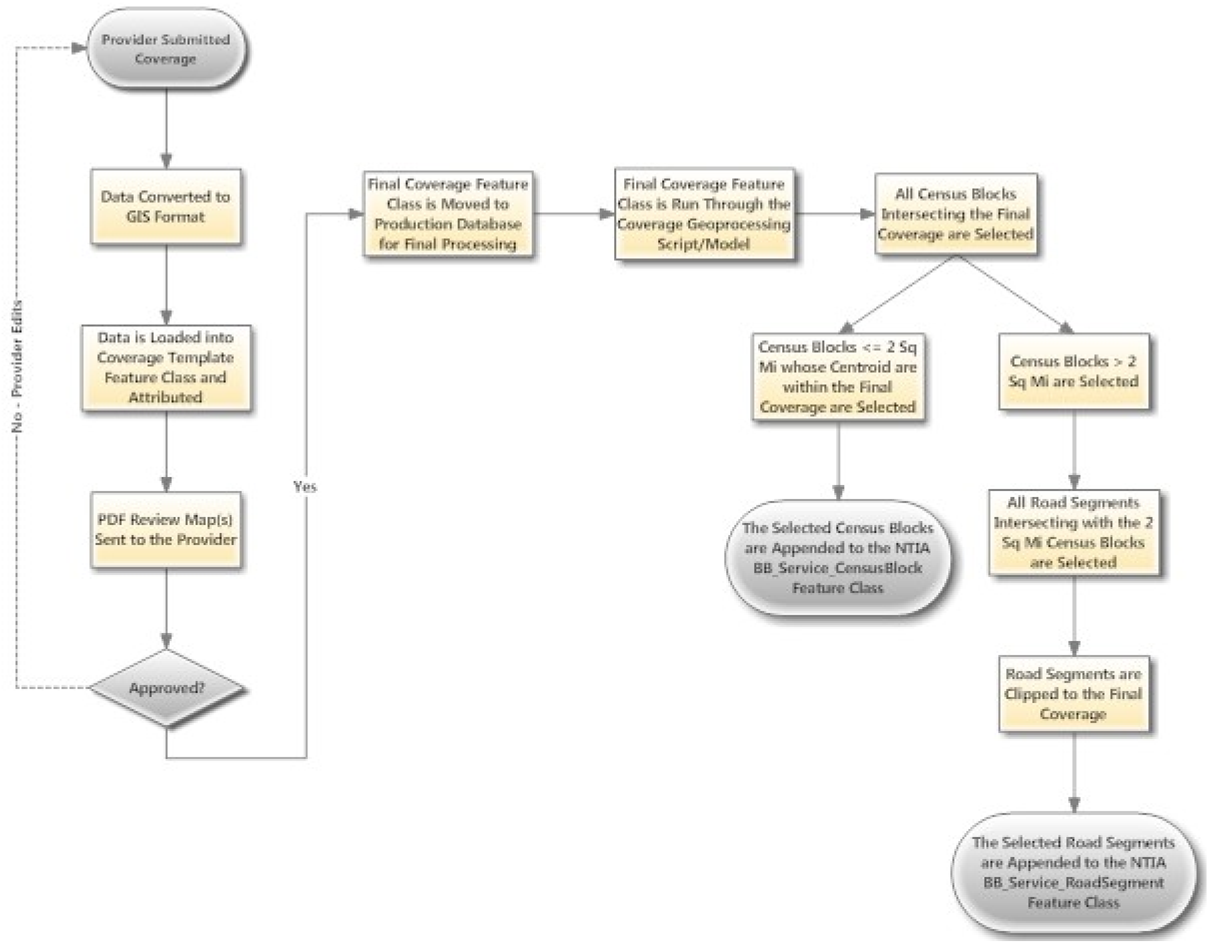
All coverage data was loaded into a coverage template feature class schema that included all of the attribute fields from the NTIA schema. The method of data loading was driven by the format in which it was received. Providers who supplied GIS shapefiles or feature classes could generally be loaded into the coverage template feature class schema using the simple data loader while CAD data had to be exported to GIS format prior to being loaded into the coverage template.

Coverage data supplied as digital or analog maps required georectification and digitizing prior to loading into the coverage template feature class. Domain codes were entered in the appropriate attribute field for technology of transmission, maximum advertised downstream speed, maximum advertised upstream speed, and spectrum. If a provider did not identify the technology of transmission for a given coverage area, they were contacted by phone or email in order to obtain this information.

When speed information was not included in the data submission, providers were contacted and asked to supply this data; in cases where the provider refused to supply either the downstream, upstream, or both speeds, the lowest domain code was entered in the applicable attribute field. If a provider did not specify the type and spectrum used for fixed wireless the default values for unlicensed were used.

Standardized confirmation maps were created for each provider by type of technology and sent to the provider for review. Once processing was completed for a provider’s coverage submission, the data was run through an Esri geoprocessing model that performed several quality control-quality assurance tests and selected census blocks less than or equal to two square miles when the centroid of the census block was within the coverage area. Road segments that intersected with census blocks greater than two square miles were selected and then clipped to the coverage area in order to provide the most accurate representation based on the provided coverage. The selected census blocks and road segments were appended to the appropriate feature class in the NTIA data transfer model.

Figure 8 Coverage Geoprocessing Model

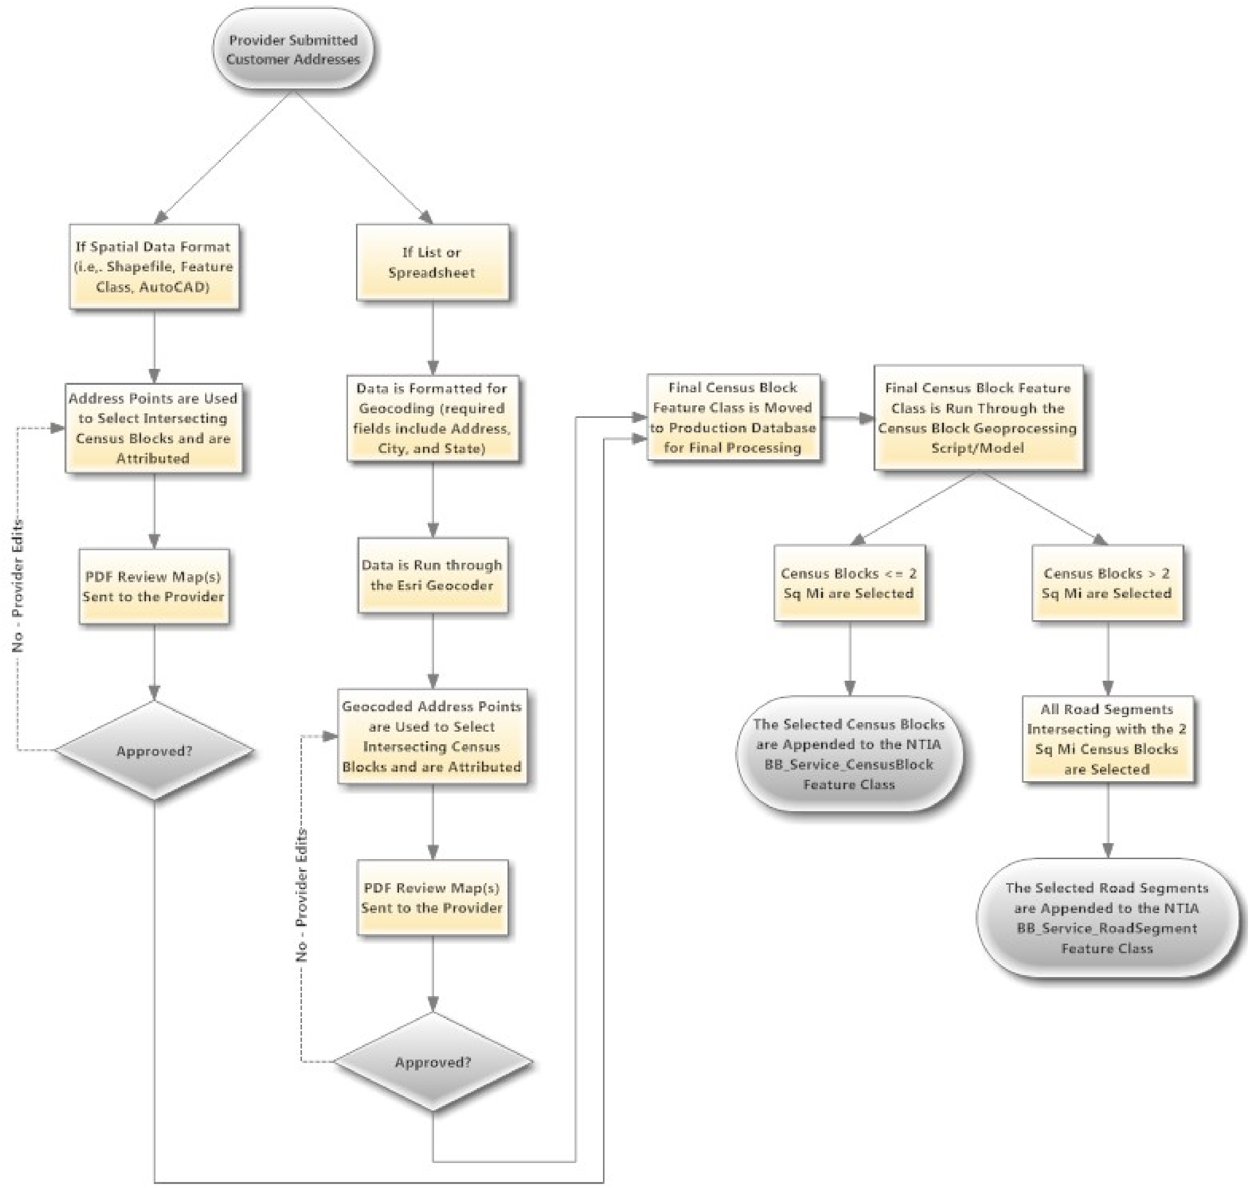


Providers Submitting Customer Locations

Providers that submitted customer locations typically fell into one of four categories. Several providers submitted customer locations in AutoCAD files, the points were exported to a shapefile and used to select all intersecting census blocks. Other providers submitted analog or digital maps that included customer locations, these images were georectified and census blocks were selected by an operator viewing the customer point images underlying the census blocks. Lists of customer addresses were also submitted. The data was loaded into a spreadsheet and geocoded using ESRI Business Analyst USA Geocoding engine. The geocoded points were treated identically to customer locations submitted in GIS or CAD format and used to select intersecting census blocks.

The resulting census blocks were added to confirmation maps and returned to the provider. If edits were necessary the provider indicated on the map which census blocks needed to be added and/or removed. The provider submission was handled as a census block update (described in the section above) moving forward. In subsequent updates subscriber address data was discouraged and providers who originally submitted data in this format were asked to make edits to the review maps.

Figure 9 Customer Addresses Geoprocessing Model



Providers Submitting Other Levels of Coarse Geographic Submission

This category had a wide range of submissions. The most common were telephone exchange areas or equivalent, wire centers, zip codes, counties or general references to towns or cities. These coarse geographic submissions were problematic because these areas were typically very large and lacked the detail of a defined coverage area resulting in over-exaggerated broadband coverage.

How They Were Handled

Operational rules established early in the project heavily scrutinized provider data that appeared to significantly over-represent broadband coverage and often resulted in a rejection of the submitted data. Providers who submitted coarse geographic levels of coverage data and infrastructure for DSL or cable modem service were initially that also were represented in the last point of aggregation infrastructure point file were sent estimated census block coverage maps and spreadsheets, and provided a second submission with finer level geography.

Providers submitting town locations for DSL or Cable were handled differently, and used as validation for central offices from the last point of aggregation table, and subsequently to run the DSL modeling routine or validate a cable or cable plus areas.

Cable Modem Geoprocessing Model

An ESRI geoprocessing model was created to generate coverage areas for Cable providers who did not submit census block or coverage data (i.e., census tract providers).

The most authoritative GIS layer available from the state with incorporated areas and city boundaries was used as a surrogate to model cable broadband coverage. Some towns that were not incorporated were also added. Municipalities and towns were sporadic in their digital update of these maps, since annexations and other boundary modifications were ongoing and difficult to maintain in real time updates. To compensate, likely areas contiguous to these city boundaries were added, labeled "Cable-Plus" in the operational data model. These additional polygons were determined using operator interpretation, road density, structures points from Info USA in Esri Business Analyst, speed test results, and in some instances NAIP imagery. In general areas were added that were immediately contiguous to existing city or town boundaries that represented likely areas where cable service existed. We were conservative in this approach and did not include populated areas near the cable plus boundaries unless they were directly contiguous to existing boundary areas.

Cable broadband providers primarily work under the structure of franchise agreements with municipalities. In the early rounds of broadband mapping updates, phone calls were made to the largest cities in the state in order to obtain that respective city's cable franchise agreement. They were all either unknown or a text agreement without maps.

The full set of potential cable areas were then passed through validation sources to determine if cable was provided. This included public sources, such as the Warren Communications Cable Fact book (http://www.warren-news.com/factbook.htm).

The second and most authoritative form of validation was data received from cable providers at the census tract, block, or coverage level of geography. A spatial join geoprocessing operation was performed on these datasets with the full set of potential cable coverage areas in order to further validate areas with cable coverage.

The third source of validation came from the public speed test site maintained throughout the project. Whenever user submitted speed tests identified cable modem broadband service near or adjacent to existing estimated cable areas, the cable-plus boundaries were expanded using the same method of digitizing outlined above.

It was not possible to differentiate between technology of transmission codes 40 and 41 using this indirect mapping method. The only authoritative way to determine this information was from data submitted by a provider. In all cases where the provider did not indicate the type of cable modem technology being used, the code for Cable Modem-Other (41) was assumed.

DSL Geoprocessing Model

An ESRI geoprocessing model was created to generate coverage areas for DSL providers who did not submit census block or coverage data (i.e., census tract providers). This model is based on typical DSL technology which can provide service up to 18,000 feet from a central office or remote terminal, unless otherwise specified by a provider.

Since DSL lines are typically buried alongside roadways, underneath roadbeds, or strung on aerial telephone lines which tend to run alongside a road, a GIS dataset of a state's road network were used as a surrogate to model DSL areas. In the initial rounds of broadband maintenance we purchased commercial (GeoTel) and publicly available data sources representing last points of aggregation (LPA) for DSL, including central offices and remote terminals. Each LPA was validated based on publicly available data, provider data, and independent measurements. LPAs were used in a DSL model only if they were supplied directly from a provider or could be verified by two or more sources. The actual geoprocessing model used the validated central office and remote terminal locations to generate a raster cost surface based on all of the available roads radiating out 18,000 feet from each active LPA point. The raster coverage was converted to a polygon feature class and a small back-buffer was applied to achieve the final DSL coverage polygon representing a provider's maximum possible DSL coverage area. The DSL coverage areas were then used to select intersecting census blocks and road segments.

Remote terminals were provided or publicly available for only a small number of providers, therefore this method may tend to underestimate the full DSL coverage for a provider.

It was not possible to differentiate between ADSL or SDSL based on the LPA data; the only authoritative way to determine this was from data submitted by a provider. In all cases where the provider did not indicate which type of DSL service was being provided, the technology code was assigned to 10 "Asymmetric xDSL".

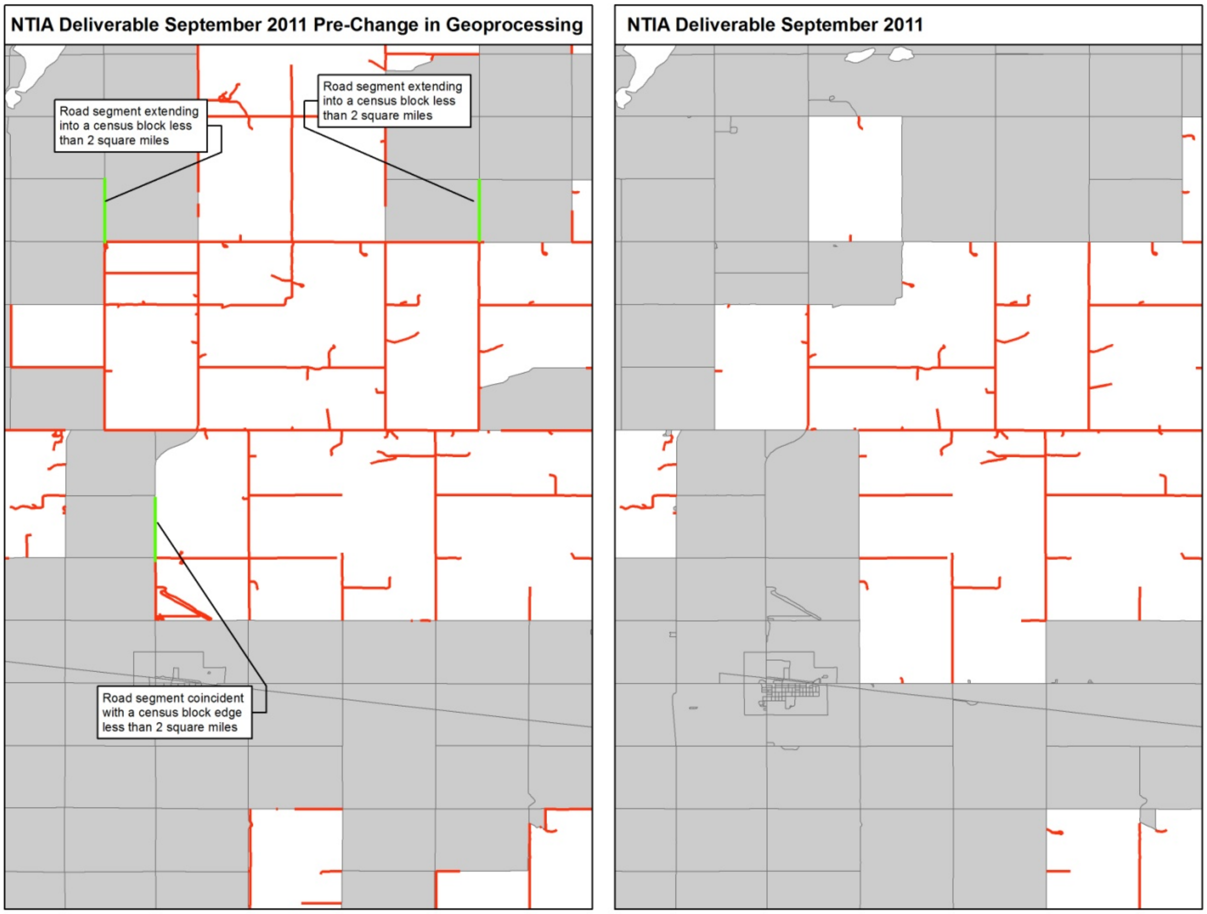
2000 T0 2010 Census Block Conversion

The September 2011 deliverable to NTIA required the transition from 2000 census data to 2010 census data, but the conversion process was dependent upon the type of data submitted by a provider. These providers fell into two categories, block providers or coverage providers. The conversion to 2010 census geography was a straightforward process for the coverage providers; the reference to the census block data in the geoprocessing model used to select census blocks and road segments was simply changed from the 2000 data to the 2010 data and each provider's data was re-run. The conversion from 2000 census to 2010 census data for block providers required several geoprocessing steps due to the inability to simply match census block IDs across vintages. The census blocks for each provider were dissolved by type of technology to form a quasi-coverage area. The dissolved blocks were then used to select any 2010 census block whose centroid fell within the "coverage area."

Road Segment Geoprocessing Change

Prior to the September 2011 NTIA data submission, road segments in census blocks greater than 2 square miles were selected with a straight intersect. This resulted in road segments being selected that were coincident with census block edges in blocks less than or equal to 2 square miles. Using this same geoprocessing methodology combined with the new 2010 census blocks and TIGER roads, road segments were selected that were coincident with census block edges and that extended into census block less than or equal to 2 square miles. We believe this "error" occurred due to the improvements in the spatial accuracy of both the 2010 census blocks and road segments for 2010 where features were now coincident. For the September 2011 submittal a small negative buffer (-0.5 feet) was applied to the intersect to avoid selecting roads that were coincident with census block edges and/or those that extended into census blocks less than 2 square miles. This resulted in a significant decrease in the number of road segments reported but overall we believe this method more accurately portrays each provider's coverage area.

Figure 10 Road Segment Geoprocessing Change Example



Wireless Coverage

Three forms of wireless coverage were provided in this table, fixed point to point wireless, mobile wireless and satellite. No public data was located on fixed wireless infrastructure points, except notification of availability on provider's web pages, and in some instances, specific towns, recreation or commercial locations where wireless service was provided. No modeling was attempted on fixed wireless coverage. All coverage came directly from providers or was mapped from locations provided on a provider web page. We did not attempt any propagation modeling on fixed wireless, since that can be influenced by local structures and vegetation in the vicinity. A few providers did provide coverage that appeared to be derived from propagation modeling.

Most of the public data research focused on mobile wireless providers using cellular service spectrums. The Federal Communications Commission (FCC) Universal Licensing System (ULS) is the consolidated database and application filing system for most Wireless Radio Services. ULS supports electronic filing and provides public access to licensing information, weekly Public Notices, FCC rulemakings, processing utilities, a telecommunications glossary, and much more." The FCC ULS Advanced Licensing Search was queried for all FCC licenses filed in the state; a relational database was built from the results. Information from the database was extracted in order to perform the cellular tower propagation modeling for wireless broadband.

The FCC ALS and ULS reporting systems were the source for most of the tower locations. Towers were required to be licensed when they meet specific published criteria. These included some variables that could be modeled with GIS statewide, such as varying proximity to airports and heliports, combined with specific local level criteria not easily obtained or modeled statewide such as the grade construction within proximity of these, and any structure over 200 ft in height. A number of cell towers providing broadband were likely not located in the FCC database. None of the mobile wireless providers were willing to provide infrastructure such as tower locations and parameters, and the coverage provided were very generalized.

Any fixed or mobile wireless antenna or tower location submitted by a provider, or obtained from the FCC that was used in the final processing for wireless broadband coverage was maintained in the operational database for last point of aggregation, and subsequently transferred to Table 3 backhaul and middle mile points.

Providers submitted coverage data in a wide variety of formats, levels of completeness, and at varying geographic scales. All types of data was accommodated and processed whenever possible. An open structure process for submittals was allowed, accepting any data, and attempting to work with the provider when questions arose. If data was submitted by a provider in a format that did not allow a direct coverage to be mapped, such as a coarse level of geography such as a census tract, or county, feedback was provided to the providers in the form of standardized spreadsheets in an attempt to standardize the inputs, and increase the geographic granularity of the provider data submission. Although each provider had individual characteristics and nuances in their data submissions, some data patterns can be described generalizing the typical types of submissions. In general, for fixed wireless to be mapped it was necessary to receive data from a provider, since there were no public sources available on point to point wireless tower locations in public form, except as depicted on providers web pages in a few instances.

Providers Submitting FCC Form 477 Report or Similar Format

Geographically, these were lists of census tracts of coverage, accompanied by additional documentation on technology of transmission, speed tiers, and number of customers. Providers submit these twice a year to the FCC and recent submissions have been done using a structured web site maintained by the FCC. A few providers submitted printouts that appeared to be from this web format and were typically complete and standardized. More providers submitted spreadsheets roughly in the F477 format, but with modified and generalized data.

How They Were Processed
If the providers identified specific coverage areas as census blocks, or direct coverage area, or as infrastructure tower locations, they were processed and mapped. Providers identifying census blocks were processed by dissolving the census blocks into single coverage polygons by speed tier. Providers identifying a direct coverage area were converted directly to GIS polygon files and attributed. Providers submitting tower locations were mapped as circular polygons centered on the tower with a radius averaging 10 miles measured as Euclidian (straight line) distance from the tower. Providers that specified variable radius were mapped as circles at the radius they submitted.

Providers Submitting Census Block Coverage

A few providers submitted coverage as census blocks, either through a tabular listing of census blocks or spreadsheet, or in map format. It was common that a provider where public data indicated multiple technologies of transmission only submitted some of the technologies of transmission.

How They Were Processed
These were loaded directly into the master Census 2000 block coverage by provider and attributed with available data submitted by the provider. In instances where some data attributes were missing, such as advertised or typical speed tiers, or subscriber data, the data attributes were left blank or null. Providers identifying census blocks were processed by

dissolving the census blocks into single coverage polygons by speed tier. A visual inspection of independent speed test data overlaying the provider submitted block coverage was completed, but no action was taken to override a provider's submittal.

Providers Submitting Actual Coverage Maps

Coverage maps were submitted by several providers, or coverages were derived from public sources or from other indirect indicators of coverage such as customer point maps or tabular lists in text or spreadsheet format. These were differentiated from the other types of geographic submission coarser than a census block since they represented the full and explicit range of coverage.

How They Were Processed
Coverage maps were treated as explicit coverage and all census blocks intersecting any portion of a coverage were selected and attributed with the provider coverage by technology of transmission, and all related attributes were transferred to the census block representation. The method of creating the coverage varied by source. Providers who supplied broadband coverage as a GIS polygon or CAD feature were converted to polygons. Some providers, including non-responsive providers who did not submit anything to the project, had published coverage maps of various forms on their web sites or submitted an image in jpg, tiff, pdf or other graphic format. These were georectified to base map layers, typically roads, but sometimes other features such as state or county boundaries or towns, and subsequently converted to polygon features. Then they were intersected and transferred to census block feature classes like the digital GIS submissions. Providers who submitted customer locations typically fell into four categories. Some were submitted as AutoCAD files where the points could be transferred to the GIS, then spatially joined to the census blocks they were located within. Others submitted maps in image format that were georectified in the same manner as other images, then census blocks were selected by an operator viewing the customer point images underlying the census blocks. When customer lists were submitted, they were loaded in a database and geocoded using ESRI Business Analyst USA Geocoding engine based on TeleAtlas road features. The geocoded points were subsequently treated identically to customer locations submitted in GIS or CAD format, and spatially joined to the census block template file. A visual inspection of independent speed test data overlaying the provider submitted block coverage was completed, but no action was taken to override a provider's submittal.

Providers Submitting Other Levels of Coarse Geographic Submission

This category had a wide range of submissions. The most common was as telephone exchange areas or equivalent, wire centers, zip codes, counties or general references to towns or cities. The problem with these submissions was that often a given polygon overlapped a census block or multiple blocks, and in most cases, they were much larger geographic entities than a census block.

How They Were Processed
Our operating rules established early in the project did not allow final provider coverage to significantly over represent provider coverage. Those providers that submitted coverage area by coarse geographic features and did not specifically identify coverage as a coverage layer or census blocks were not able to be processed. No interpolated data was used to calculate these data, if the data was not provided by a provider in a format capable of processing; the data was not calculated for that provider.

Satellite

Satellite coverage for the entire state was included for the three satellite providers: HNS License Sub, LLC, StarBand Communications Inc., and WildBlue Communications, Inc.

Community Anchor Institutions

Lists were obtained from the state and affiliated processional organizations for anchor institutions to be included in the broadband mapping in each of the community anchor institution community code categories. These were sorted and cross referenced and an initial round of elimination of duplication was accomplished.

All institutions on the initial draft spreadsheets used for the first two submittals were geocoded using ESRI Business Analyst Desktop with the USA Geocoding engine using TeleAtlas premium road features. This was judged to be the best available geocoding source for batch processing of addresses. No commercial source is 100% accurate in a primarily rural state such as this with low population numbers compared to other states and no large cities or metropolitan statistical areas. In subsequent rounds of updates since the first two submittals, we have used the same geocoding engine from Esri Business Analyst, but the geocoding locator switched to NavTech geocode locator. In every round of geocoding we used conservative matching criteria, and maintained and stored the type of match (building match, address match, or zip code match), along with a record of those not matching and not able to geocode.

All geocoding is dependent on accurate road locations and complete and accurate street segment attribution. The GIS road layers available from the state were not judged as complete as the premium commercial sources. The Tiger 2009 road files, while spatially comparable to the commercial sources, have a large percentage of null values in the database attribution and street segment address ranges necessary for accurate geocoding. As in most parts of the country, geocoding is more accurate in urban settings than in rural routes. Complicating the process in a rural state for anchor institutions are the situation where some anchor institutions, such as public safety anchors are often staffed by volunteer staff and a post office box is the only valid address, and the physical address is wherever the public safety equipment is parked or stored at any given point in time.

Category codes were assigned based on the original source list and from keywords in the name of the institution and independent research. Technology of transmission and advertised speeds were obtained when possible, which initially was entirely based on the anchor institutions maintained by the state for consortiums providing state service contracts. Two iterations were accomplished with these state maintained lists, and all available attributes were obtained with assistance of the state analysts.

After initial data collection, analysts worked on researching, calling and improving the addresses for those below an 80% match criteria. Many on the 70 percent matching range were fairly accurately located. The difference between a 70% and 80% match typically occurred when an address lacked a prefix or suffix cardinal direction on a street that had two cardinal directions (example 101 1st Street, on a street segment with 101 N. 1st Street and 101 S. 1st Street). Analysts were also able to obtain physical addresses for some lists supplied by the state with only a P.O. Box.

The lists with updated and corrected addresses were re-geocoded for the final mapping effort, and any anchor with any level of geocoding was included on the final map. The operational database identifies the type of match, so future maintenance cycles can be prioritized and targeted to those matching only zip codes or with address changes.

From the results of the previous step some attribution of database attributes for attributes with null values was accomplished. This step was rule based. The attribute of whether an anchor institution subscribes to broadband service could only authoritatively be answered yes, if the information was provided by the state, or a confirmation from an anchor speed test could be matched. Those anchors that were located within an area covered by a DSL, cable, other copper or fixed wireless were also assumed to have the ability to subscribe to broadband coverage and were also estimated to be subscribers. Assigning the technology of transmission and the advertised speeds (which required identifying a provider for the anchor institution) was only possible on a subset of all coverage in those areas where only one provider/technology of transmission was present. This allowed a few hundred more anchors to be identified, but typically only occurred in rural settings. Most urban settings had multiple providers. In addition many providers submitted multiple technology options, so identifying one provider/technology of transmission combination was not possible even if there was only one provider possible for the anchor institution.

It is likely that in some instances in the rural settings and small towns an anchor institution may rely on mobile wireless broadband. This is common in public safety mobile equipment such as vehicles, but likely less common in anchor facilities. For the purpose of assigning attribution to anchor institutions with remaining null attributes, we took a conservative approach and did not overlay anchor institutions on mobile wireless coverages to assign attributes.

Maximum advertised downstream and upstream speeds were not available or collected for any of the CAIsA new domain value of “U” for Unknown was added to the data model for the current submission, and all values formerly coded as 0, were changed to “U”.

A new optional attribute was requested by NTIA requesting knowledge about the presence or absence of WIFI at the CAI location. This was not researched and attributed by the state in the current submission. All records were set to “Unknown” for the attribute, Public Wi-Fi.

In the first two submission processes for geocoding we used conservative matching criteria, and maintained and stored the type of match (building match, address match, or zip code match), along with a record of those not matching and not able to geocode.

A new optional attribute was requested by NTIA after the initial maintenance updates requesting a CAI unique identification number for K-12 schools, libraries and colleges and universities. The following steps were completed for this request: Added CAIID for the Library category using the NCESID from http://nces.ed.gov/surveys/libraries/librarysearch/ ; Added CAIID for the University, college, other post-secondary category using the IPEDS ID from http://nces.ed.gov/collegenavigator/ ; Added CAIID for the School – K through 12 category for public schools using the NCES ID from http://nces.ed.gov/ccd/schoolsearch/ ; Added CAIID for the School – K through 12 category for private schools using the PSS_SCHOOL_ID from http://nces.ed.gov/surveys/pss/privateschoolsearch/

A new optional attribute for the URL for each anchor institution was requested by NTIA. Assigned URLs to CAI records: for the University, college, other post-secondary category assigned the URL from http://nces.ed.gov/collegenavigator/; for the Library category added the URL from http://nces.ed.gov/surveys/libraries/librarysearch/

Middle Mile

Middle mile and backhaul points were included for all public data and provider submitted infrastructure judged to be reliable and valid. A systematic reliability (geographic scale and authority of the source) rating and a validity rating (cross referencing between multiple sources) were developed and used throughout the project, both on a scale of 1-10, along with feature level metadata to maintain the last point of aggregation. A persistent unique identifier was used to track each point and each instance of a point as they moved through the system and improved in quality. Old points were retired but were not deleted from the operational database. Only active records were used in the final processing.

A feature class labeled "Last point of aggregation" (LPA) in the operational database was created to hold point locations of broadband infrastructure (examples include central offices, remote terminals, head ends, etc.). Addresses purchased or obtained at any level of geography were geocoded to a street address (using ESRI Business Analyst and TeleAtlas data) or located more generally to the center of a town (snapped to the USGS Geographic Names Information System location) when no address information was available. and All mobile wireless locations obtained from public sources or commercial sources that were not already validated were confirmed using NAIP aerial imagery and Google Street View (when available). All FCC tower locations included a latitude and longitude, however all towers were validated and moved to the NAIP aerial imagery location.

A reliability code indicating the source and geographic scale represented as an integer from 1 (low) to 10 (high) was assigned. Validity codes were assigned cross-referencing public and provider data submissions; it was also rated on a scale of 1-10. A point with a validity code of 7 that fell within a provider's coverage for DSL, mobile or fixed wireless, or was used in a final modeled coverage was included in this table. In addition, backhaul points identified by the state, by providers and consortiums providing services to the state and anchor institutions, were included in the table. Providers were typically reluctant or unwilling to provide infrastructure data, and often unwilling to confirm data obtained through public sources. The methods used in the state allowed a significant level of identification and mapping of infrastructure locations and feature level metadata on reliability and validity of point locations, but data on owned or leased characteristics, serving facility codes, and for elevation of infrastructure was confirmed by few providers who responded directly in a spreadsheet provided to them to list infrastructure.

Speed Test Data Processing

A public facing website was created in the spring of 2010 asking internet users in the state to complete a brief survey regarding their internet connection and run a speed test on their connection using the Ookla speed test. The speed test site asked that a user enter their location as an address on a Google map interface. If the address did not geocode to their satisfaction, the user could choose to move the place mark to their desired location. Next, users were asked to select their technology of transmission from a list, enter their provider in a free form text field, complete an optional questionnaire, and run a standard speed test on their connection. The date and time, and IP address of the user were captured during the speed test.

All speed tests were geocoded, and the IP address was looked up in batch mode in the WHOIS database returning one or two providers registered with WHOIS. All speed tests were cleaned and analyzed against provider submissions and models. For the first two submissions a final provider assignment was assigned by examining the WHOIS fields, and the provider submitted by users. Consistent rules were not always possible, but generally when two WHOIS records were returned, the second more specific WHOIS provider was selected. In some instances, where the WHOIS providers were backhaul or other and were not providers meeting the NOFA criteria, the user submitted provider designation was cleaned and standardized and assigned as the final provider

There was considerable variation between the user reported technology of transmission (TOT) and the known technologies for any given provider. Records were divided on unique provider/ TOT combinations for the first and second submissions, which limited the record count in many instances. For the current submission the records were divided only by provider, not taking TOT into consideration.

For the first two submissions, the speed test records were used in two ways for the final processing.

1) As an independent measurement to validate the presence/absence of a provider coverage for DSL and/or Cable technologies.

In the first submission a few providers were identified as DSL broadband providers based primarily on speed tests. In these instances, DSL models were executed for both providers based on verified central office locations. Some speed tests with an identified technology of transmission of Cable Modem were used to expand “likely” cable areas which were typically adjacent to incorporated and urban areas. These “cable-plus” areas were created to supplement submissions from Cable Modem providers who did not provide detailed coverage or census blocks. No new DSL providers or Cable providers were identified using speed tests in the current submission.

2) As an independent measurement for typical upload and download speeds.

Once data were cleaned and final provider and technology of transmission assigned, these fields were concatenated. In the first two submissions, if the remaining records exceeded 10 for the combination of provider and technology, and the speed test was successfully completed (values > 0) the average value and standard deviation of the download speed were calculated. Any values exceeding 1 standard deviation were removed as outliers, and the mean of the remaining records within 1 standard deviation was calculated for the download and upload speed. This value was reported for each provider/technology of transmission record as the typical speeds for that provider. In some instances the typical speed was lower than that required to meet the definition of broadband by NTIA, but that did not preclude the records from being included in the broadband map in the first two submissions as it did in the current submission.

For the current submission, these procedures were modified and all records were re-run. The steps of the current processing are provided below. The primary procedural change was to drop the validation of the presence/absence of provider coverage for DSL and/or Cable technologies, since providers had been validated in the first two submissions and potential new providers identified through additional speed tests were determined to not meet the NOFA criteria for being considered a broadband provider. The use of the speed test data for determining typical speeds was implemented with similar rules as the first two submissions with the exception of the use of the technology of transfer, and raising the minimum number of speed tests to 15, after removing outliers, to be used in typical speed calculations. Procedurally, the process was also automated with a Python script to improve processing performance and minimize quality control/quality assurance testing.

Typical upload and download speeds for all providers with less than 15 processed speed test records were coded as null values. In addition, based on telephone communication with NTIA on March 9, 2011, all typical speeds less than minimum NOFA upload of download speed criteria were also ignored and reported as null. Based on a related request in the same communication, the typical speeds greater than the advertised speeds were ignored and reported as null. Processing steps for the current submission are provided below:

1. Speed test records were imported into a SQL Server data file, adding fields Final Provider and IPGroup to the initial records.

2. IPGroup attribute was set by extracting the left three nodes of the IP Address of the speed test (e.g. 161.7.1.236 had 161.7.1) moved to the IPGroup attribute.

3. An IPGroup to Final Provider cross reference table was created to determine the final provider from the unique three part IPGroup.

4. Each IPGroup was reviewed with the data in the WHOIS 1 provider, WHOIS 2 provider and then the user specified provider to determine the most authoritative final provider from the official list of providers. None of the WHOIS or user submitted fields were absolutely authoritative in all instances, so expert opinion by technicians knowledgable of the providers was used in some instances to assign the IPGroups, and subsequently the Final Provider attribute.

5. Run a python script to remove outliers and calculate summary statistics for each Final Provider assignment. The rationale for removing outliers was to mitigate the many variables that effect a typical speeed test, such as the time of day, others on the network, etc. The script implemented the following work flow rules:

   a. Use all records for each unique FinalProv attribute value with D_kbps greater than 0 or U_kbps greater than 0 , then:

   b. Calculate a mean for the unique provider group for each D_kbps and U_kbps.

   c. Calculate a standard deviation for the unique provider group for each D_kbps and U_kbps. Each speed attribute was calculated independently of the other.

   d. Subtract the outliers (if any) higher or lower than one standard deviation from the mean.

   e. Calculate the median value of the remaining non-outliers for each provider D_kbps and U_kbps respectively.

   f. Create a summary table with the final calculated assignment of FinalProv, D_kbps and U_kbps.

6. Post process the summary table in the following sub steps:

   a. Join the summary tables by provider for the upload and download speeds into one summary file including the number of records or frequencies for up and down speeds for each provider after removing the outliers, and the mean up and down speeds in kilobits per second for each provider.

   b. Select "FreqDown" < 15 AND "FreqUp" < 15 then delete the resulting selection set from the joined table. The FreqDown/Up fields counted the number of speed test records for a provider after the outliers more or less than one standard deviation from the mean value were removed from consideration.

   c. Select "D2_kbps" <= 768 kbps AND "U2_kbps" <= 200 kbps. then delete the resulting selection set from the joined table.

7. Import the remaining valid mean values for each provider into the appropriate broadband coverage feature classes.

8. Select any typical speeds greater than advertised speeds either up or down, and make the resulting records null in the final broadband coverage feature classes (as per NTIA request 3/9/2011).

Reliability, Validity and Completeness

Reliability codes apply to the source data points and polygons and assess the authority of the source we obtained the data from and the level or coarseness of the geography (address or town). Validity codes are determined from cross checks of data sources and the number of independent sources of verification. These are as simple as comparing speed test locations against DSL modeled polygons, or as complex as geospatial analysis operations such as a kernel density function cluster analysis. Completeness is determined by public sources, independent measurements or provider submittals and checks on the domain classes required for the final NTIA deliverables such as Technology of Transmission domains, Speed Test domains and serving facility and wireless spectrum facility types and categories. The categories for these, and the subsequent records in our operational geodatabase tables have the ability to grow and change as new data is obtained. New data for wired We are maintaining these as feature level metadata tied to points and polygons maintained by analysts and technicians in a wiki table and coding them to the geodatabase. In this way the unique situations that arise can be cataloged and maintained with some level of flexibility while contributing to the final indices in a controlled fashion.

Reliability Codes

Throughout the course of the broadband project the State of North Dakota has employed several validation and verification techniques to help quantify the accuracy of the broadband map. The techniques used are listed below:

- Reliability Codes Assigned to Infrastructure Points
- State Run Speed Test Portal
- State Wide Broadband Survey

The two factors incorporated in reliability codes include the level of geography that was used as a source or provided as a clarification of location and the authority of the source for the information. We are also considering clusters of point information from independent measurements and sources to be higher in reliability than individual point information.

Generally, the coarser the source geography the lower the resultant score. Everything besides an address or street intersection, latitude/longitude location, or location provided in a georeferenced digital source is assigned a reliability score less than 5. This applies to source data coming (e.g. a central office located in a city instead of an address) and review comments on a previously mapped location (e.g. “That location is wrong, I know it is on the south side of town”).

We have incorporated the reliability code into our last point of aggregation (LPA) and provider coverage geodatabase files, and into some of the publicly available data (PAD) geodatabases.

We are also carrying a short text field (50 characters) with a descriptive rationale for the score. This will allow us to focus more on the lower scores that need to be confirmed, and ignore the high confidence data scored as 9 and 10.

Reliability Codes		
Code	**Description**	**Detailed Description**
0	Not assigned	• Not yet assigned
1	Level 1	• Checked but unverified
2	Level 2	• County • Presence by other coarse geography (e.g. administrative region)
3	Level 3	• City • Census tracts • Cable Plus (area likely to have been annexed into an incorporated town or CDP)
4	Level 4	• Cable - incorporated • Zipcodes • Census blocks
5	Level 5	• GeoTel unverified • Confirmed by provider or anchor institution key advisor but to geography coarser than address or intersection
6	Level 6	• Qwest/Midcontinent or other web site random testing check • Speed test from individual average residential
7	Level 7	• From anchor institution key advisor Webex • GeoTel verified address only with no 3rd party confirmation from public sources o Building unverified • Speed test from anchor institution
8	Level 8	• From provider • FCC ULS or ARS • Geotel verified address and possibly verified by 3rd party source (Google Streetview) o Another provider's sign is on building (usually Qwest) • Geotel possibly verified by 3rd party source (NAIP, Google Streetview) • From state authoritative public data source (e.g. DCN or SummitNet) o Address or building unverified • Speed test from cluster of average residential
9	Level 9	• From provider as coverage with authoritative confirmation • Geotel verified address and verified by 3rd party source (NAIP, Google Streetview) o Provider sign on building o Tower or dish visible • From provider or anchor institution check of our data * Root Wireless
10	Level 10	• From 2+ authoritative confirmations

Validity Codes

We included validity codes in the last point of aggregation infrastructure data which drives creation of the DSL models. We also included validity codes in each of the final technology of transmission deliverables for polygons and point feature classes. The scales of validity vary by each major type and function.

Infrastructure Validity Codes

The purpose of this validity code is twofold:

1. To determine which infrastructure points are turned into DSL model coverages
2. To use as a reference in other coverage validity checks

Infrastructure Validity Codes		
Code	**Description**	**Detailed Description**
0	Level 0	• Not yet assigned
1	Level 1	• Not yet assigned
2	Level 2	• Not yet assigned
3	Level 3	• Checked against ND PSC Report or DSLReports at the town level • Checked against DCN anchor institution data
4	Level 4	• Checked against two or more independent public sources at the town level • Checked against provider public data (e.g. Qwest ICONN) at the town level
5	Level 5	• Not yet assigned
6	Level 6	• Confirmation of DSL or cable from authoritative public data to broader geography than address not confirmed by provider
7	Level 7	• Authoritative public data at address level (e.g. Geotel) not confirmed by provider
8	Level 8	• Provider submission at the census tract level • Provider website independent address checks (Qwest, Verizon)
9	Level 9	• Provider submission at the census block level or address level
10	Level 10	• Provider submission at the coverage level at census block scale or blocks less than 2 square mile and larger scale then census block for blocks larger than 2 square miles

Final Technology of Transmission Validity Codes

The purpose of this validity code is twofold:

1. To determine which elements are loaded in the spreadsheet provider submission packages in their review

2. To determine which provider coverages are chosen for submittal with one of the NTIA deliverables

Final Technology of Transmission Validity Codes		
Code	**Description**	**Detailed Description**
0	Not assigned	• Not yet assigned
1	Level 1	• Unassigned at this time
2	Level 2	• Unassigned at this time
3	Level 3	• Checked against ND PSC Report or DSLReports at the town level • Checked against DCN anchor institution data
4	Level 4	• Checked against two or more independent public sources at the town level • Checked against provider public data (e.g. Qwest ICONN) at the town level
5	Level 5	• Confirmation of DSL or cable from authoritative public data
6	Level 6	• Provider website independent address checks (Qwest, Verizon) • Provider submission at the census tract level
7	Level 7	• Provider submission at the census block level • Provider submission at the census block level confirmed by Speed test cluster OR other independent measurement
8	Level 8	• Provider submission at the address level
9	Level 9	• Provider submission at the address level confirmed by Speed test cluster OR other independent measurement
10	Level 10	• Provider submission at the address level confirmed by Speed test cluster OR other independent measurement

Quality Assurance Testing

A separate analyst checked each provider submission. Due to the variety of provider submissions, the analyst originally doing the work and the analyst checking discussed the interpretations when the criteria were subject to interpretation.

Coverage, technology of transmission, and speed tier were checked completely for each provider.

Many of the models and block, tract and coverage level processes were completed with ESRI Modelbuilder and Python scripts, and these methods were tested for quality assurance in the preliminary mapping stages and in the initial sample data submissions to NTIA.

All providers who submitted geographic coverage coarser than a census block were provided a data checking package to assess for accuracy and completeness. Any comments received from providers were processed.

1. QA/QC Checks prior to Individual Data Processing (i.e., block or coverage geoprocessing model). [Automated Modelbuilder tools and follow-up by an analyst]
    a. Check for inconsistencies within the Provider Name, DBA Name, FRN
    b. Check for duplicate census blocks or coverage areas
    c. Check the Provider Name, DBA Name, FRN against the "Official Provider Table"

2. For each provider after initial data processing is completed [Review by an analyst that did not process the original data]
    a. Review correspondence log
        i. Review recent correspondence, since previous NTIA submission
        ii. Note changes/additions/comments on coverage area, technologies, speeds, infrastructure, subscriber weighted nominal speeds (SWNS)
    b. Review wiki data processing page (current metadata)
        i. Note changes/additions/comments on coverage area, technologies, speeds, infrastructure, SWNS
    c. Review individual Provider Wiki page (historic metadata)
        i. Note changes/additions/comments on coverage area, technologies, speeds, infrastructure, SWNS
    d. Check Provider Data Folder
        i. Review recent data submissions, since previous NTIA submission
    e. Check Working Data Folder
        i. Review current update feature class geography
        ii. Review coverage with provider's submissions
        iii. Review technology of transmissions (TOTs) with provider's submissions
        iv. Review Max Adv Speeds: Down/Up with provider's submissions

3. For each provider after final data processing is completed [Review by an analyst that did not process the original data]
    a. Check PROVCOV_Master geodatabase:Provider Blocks feature class and/or Provider Coverage feature class
        i. Review geography
        ii. Review TOTS
        iii. Review Max Adv Speeds: Down/Up

4. Check Infrastructure feature class [Review by an analyst that did not process the original data]
    a. Review recent submissions, since previous NTIA submission

5. Check SWNS feature class [Review by an analyst that did not process the original data]

   a. Determine if provider submission is valid

6. For each provider after speed tests are processed [Review by an analyst that did not process the original data]
   a. Check PROVCOV_Master geodatabase for Typical Speeds: Down/Up

7. QA/QC Checks and Reports on the Final NTIA Deliverable [Automated Modelbuilder tools and follow-up by an analyst]
   a. Check the Provider Name, DBA Name, FRN against the "Official Provider Table" for each NTIA feature class (i.e., BB_Service_CensusBlock, BB_Service_RoadSegment, BB_Service_Wireless, etc.). NTIA_Provider_Name_DBA_FRN_Errors_Sample.xls, looks at each NTIA feature class (i.e., census blocks, road segments, wireless, etc…) and checks to see if there is an identical match in the "Official Provider Table." If an identical match does not exist for that Provider Name, DBA Name, FRN concatenation it is written to a geodatabase table along with the NTIA feature class where the "error" occurred. When an "error" does occur it then has to be checked by an analyst and corrected if necessary.
   b. Change Detection Report – This geoprocessing model compares and reports any changes in the Census Block, Road Segment, and Wireless feature classes for the current and previous versions of the NTIA SBDD Transfer database. The user needs to supply the feature classes for each NTIA version as well as the name of the final change detection table. NTIA_Change_Detection_Example.xls, compares and reports any changes (limited to Provider Name, DBA Name, FRN, TOT combinations) in the Census Block, Road Segment, and Wireless feature classes for the current and previous versions of the NTIA SBDD Transfer database. If the final change detection table has no records, then no changes were detected between the two databases. If a Provider Name, DBA Name, FRN, TOT combination does not have a "pair" in either direction (the current or previous NTIA database) then it is written to a geodatabase table along with the NTIA feature class and version where the "error" occurred. This report does not change any data in either database but rather acts as a flag, requiring an analyst to check if the "error" is valid.
   c. Check for duplicate census blocks or road segments or wireless coverage areas.
   d. Check for duplicate anchor institution points.

8. Review Final NTIA deliverables [Review by an analyst that did not process the original data]
   a. Review BB_ConnectionPoint_MiddleMile
   b. Review BB_Service_CAInstitutions
   c. Review BB_Service_Census Block
   d. Review BB_Service_Overview

e. Review BB_Service_RoadSegment
f. Review BB_Service_Wireless

9. Run the NTIA Check submission tool and python tool to confirm that all possible records passed the NTIA data checks. The only items that failed in the checking process were those where inconsistencies in the final NTIA NSGIC data model did not agree with the final documentation and rules established by NTIA and FCC in the final webinar and documentation presented March 17, 2011. These exceptions were documented along with the submission.

Appendix A

Potential providers researched but subsequently identified as not providing broadband service.

Nebraska Broadband Mapping Project: Product Release White Paper

Contact Name Manager:	Mike Hybl
Contact Phone Number:	402-471-0211
Contact E-mail:	**mike.hybl@nebraska.gov**
Submitted By:	Shana Knutson
Contact Phone Number:	402-471-0232
Contact E-mail:	**shana.knutson@nebraska.gov**
Technical Lead:	Don Gray
Contact Phone Number:	402-471-0242
Contact E-mail:	**don.gray@nebraska.gov**

Product Specification:	Fall 2012 NTIA Data Model
Product/Process:	NTIA—October 1, 2012 Data Deliverable
Dataset Submission QC:	NTIA—SBDD_CheckSubmission.py

Table of Contents

OVERVIEW

This white paper highlights the **Submission Summary** for this deliverable, as well as describes the **Data Gathering**, **Data Integration**, **Data Validation and Verification** and **Quality Control** processes used to create the Broadband Mapping Project's October 1st, 2012 data submission. To support varying levels of technical and program knowledge, both a **high-level summary** and a **detailed process review** are supplied.

SUBMISSION SUMMARY

PROVIDER DETAILS

PROVIDER PARTICIPATION

- Provider Participation Statistics Summary

Summary	Count
Total Providers Researched/Contacted	168
Total Participating Broadband Providers	86
Providers in Research Phase	8
Non-Responsive Providers	1
Non-Cooperative Providers	1
Number of Providers - Supplied Updates for this Submission	64
Number of Providers - Confirmed No Updates	6

- New Providers Since Last Data Submission
  - Future Technologies (TT-70)
  - Geneva Broadband, LLC (TT-10)
  - Geneva Broadband, LLC (TT-50)
  - Omni-Tech Inc. (TT-70)
  - Sandhills Wireless (TT-70)
  - Skywave Wireless, Inc. (TT-70)

- Non-Responsive/Non-Cooperative Providers
  - Peetz Communications, Llc
  - Wire Free Nebraska, Inc./Community Internet Systems, Inc.
    - Members of the Commission met with Wire Free Nebraska, Inc. at their offices on August 28, 2012 to discuss their future participation in the SBI Mapping effort.

- Providers that Supplied Coverage Updates

AIS	Glenwood Telephone	Rural Telephone Service Company, Inc.
Allo Communications	Golden West Telecommunications Cooperative, Inc.	Sandhills Wireless
Arapahoe Telephone Company	Great Plains Communications, Inc.	Skycasters
AT&T Corp.	Hamilton Telephone Company/Nedelco	Skywave Wireless, Inc.
Blue Valley Telecommunications, Inc.	Hartelco	Southeast Nebraska Communications
BroadBand Wireless Internet	Hartman Telephone Exchanges, Inc.	Speedconnect/Gryphon Wireless, L.L.C.
BWTelcom	Hershey Cooperative Telephone Company	Sprint Nextel Corporation
C and R Electronics / Action Communications	Huntel, Inc.	Stanton Telecom, Inc.
Century Link	K & M Telephone Company, Inc.	Ste Wireless, Inc.
Charter Communications	Key Art Comm., Inc	Superior Inet
Connecting Point	Mainstay Communications	Telebeep Wireless
Consolidated Telco, Inc.	Mobius Communications Company	Three River Telco
Cox Communications	Nebraska Central Telephone Co. (NCTC)	Time Warner Cable
Cozad Telephone Company	Nebraska Link	Usa Communications, L.L.C.
Cricket Communications, Inc.	Northeast Nebraska Telephone Company	Verizon Wireless
Dalton Telephone Company, Inc.	Omni-Tech	Vistabeam
Diode Communications/Diller	Orbitcom, Inc.	Wauneta Telephone Company
Fibercomm L.C.	PC Telcom	Westel Systems/Hooper
Fort Randall Cable Systems, Inc	Pierce Telephone Co Inc	WildBlue Communications Inc. (ViaStat)
Frontier Communications Of Nebraska	Pinpoint Communications Inc.	Wireless Inter
Future Technologies	Plainview Tel Co.	Zayo Bandwidth Northwest Inc
Geneva Broadband, Llc		

- Existing Providers – No Updates
  - Cable One, Inc.
  - StarBand Communications Inc.
  - Swiftel Communications
  - Unite Private Networks, LLC
  - US Cellular
  - Windstream

- Providers researched and identified as non-broadband providers can be viewed within the table at the end of this document.

COVERAGE AREA CHANGES

- Coverage Footprint Reductions/Map Refinement –
    - CenturyLink (TT-10)
    - Charter Communications (TT-40)
    - Charter Communications (TT-41)
    - Cox Communications (TT-40)
    - Diode Communications (Middle Mile)
    - Fort Randall Cable Systems, Inc (Middle Mile)
    - Frontier Communications Of Nebraska (Middle Mile)
    - Golden West Telecommunications Cooperative, Inc. (TT-10)
    - Golden West Telecommunications Cooperative, Inc. (TT-50)
    - Great Plains Communications, Inc. (TT-50)
    - Hamilton.net, Inc. (Middle Mile)
    - Key Art Comm., Inc (Middle Mile)
    - Mobius Communications Company (Middle Mile)
    - Three River Digital (Middle Mile)

- Coverage Footprint Expansion –
    - Action Communications (TT-70)
    - Allo Communications (TT-50)
    - AT&T Mobility LLC (TT-80 / Added a Spectrum and Speed Change)
    - Atcjet.net LLC (Middle Mile Rename)
    - Citizens Telecommunications Company of Nebraska (Middle Mile)
    - Clarks Telecom (TT-50)
    - Connecting Point (TT-70)
    - Consolidated Companies, Inc. (Middle Mile)
    - Dalton Telecommunications Inc. (Middle Mile)
    - Frontier Communications Of Nebraska (TT-10)
    - Great Plains Broadband, Inc. (TT-41)
    - Great Plains Broadband, Inc. (TT-41)
    - Great Plains Communications, Inc. (TT-10)
    - Great Plains Communications, Inc. (TT-41)
    - Hanson Communications, Inc. (Middle Mile)
    - Hooper Telephone Company (Middle Mile)
    - Huntel Communications (TT-50 / New TT for this round)
    - Mobius Communications Company (TT-50)
    - Nebraska Central Telephone Co. (TT-10)
    - Nebraska Central Telephone Co. (TT-20)
    - Nebraska Central Telephone Co. (TT-50)
    - Nyecom Teleservices (TT-71)
    - Orbitcom, Inc. (TT-10)
    - Pinpoint Communications Inc. (TT-10)
    - ViaSat (TT-60 / Was WildBlue)
    - Zayo Group LLC (TT-50)

- Provider Attribute/Name/TT Changes –
  - New Edge Networks, Inc. (TT-10/TT-20/TT-30/TT-41 Removed / Non-Coop)
  - WildBlue Communications, Inc. (TT-60, Changed Name ViaSat)
  - Northeast Nebraska Telephone Company (TT-71 / Removed the wireless from business)

DATA CORRECTIONS

There were no provider data corrections required for this data submission.

COMMUNITY ANCHOR INSTITUTION (CAI) DETAILS

OVERALL STATISTICS

Community Anchor Institution - Categories	Overall Count	CAIID Counts	Broadband Subscriber (Yes)	Trans Tech	Advertised Speed Down	Advertised Speed Up
Category 1 - School K through 12	1497	1192	1119	1119	1120	1117
Category 2 - Library	94	65	93	93	93	93
Category 3 - Medical/Healthcare	162	0	155	155	155	155
Category 4 - Public Safety	129	0	129	129	129	129
Category 5 - Universities/Colleges	162	3	136	131	136	136
Category 6 - Other: Government	349	0	348	348	348	348
Category 7 - Other: Non-Government	134	0	134	134	134	134
Total	**2,527**	**1,260**	**2,114**	**2,109**	**2,115**	**2,112**

CAI CHANGES

- The amount of CAI's and broadband information increased since the last data submission based on information supplied directly from providers stating they specifically supply service to that individual CAI.

- There were 1,260 CAI's within the following categories, that were reviewed against the below-mentioned databases to identify if any CAIID's need to be updated or added.

  - For K-12 institutions (CAI type 1) please add the NCES ID CCD ID value found here: **http://nces.ed.gov/ccd/bat/**

  - For Higher Education (CAI type 5) please add the NCES IPEDS ID value found here: **http://nces.ed.gov/ipeds/datacenter/**

  - For Libraries (CAI type 2) please. Combine (do not add) "FSCSKey" and "FSCs_SEQ" from the "puout08av2000" file and place them here: **http://harvester.census.gov/imls/data/pls/index.asp** (FYI the LIBID is your state's unique ID for libraries)

SUBMISSION RECEIPT

SUBMISSION RECEIPT RESULTS

- Attached are the results from the NTIA data submission receipt quality script.

SD_2012_9_25.txt

- Error Report
  - The main items flagged within the submission receipt were the technology and speed matches, which were validated by the provider and/or are within the ranges communicated in the NTIA data model.

  - All items are included within the accompanying ReadMe file.

HIGH-LEVEL SUMMARY

DATA GATHERING

BROADBAND SERVICE AREAS, MIDDLE MILE AGGREGATION POINTS AND BROADBAND SERVICE OVERVIEW

The collection of Broadband Service Areas, Middle Mile Aggregation Points and Broadband Service Overview information is handled through the following Provider Outreach Process:

- Build and maintain an inventory of Broadband providers through currently known providers and research.
- The inventory and everyday interaction with providers is tracked using the Provider Catalog (PCat). Below are some examples of the web application, which has a shared access between our team and mapping partner (BroadMap).

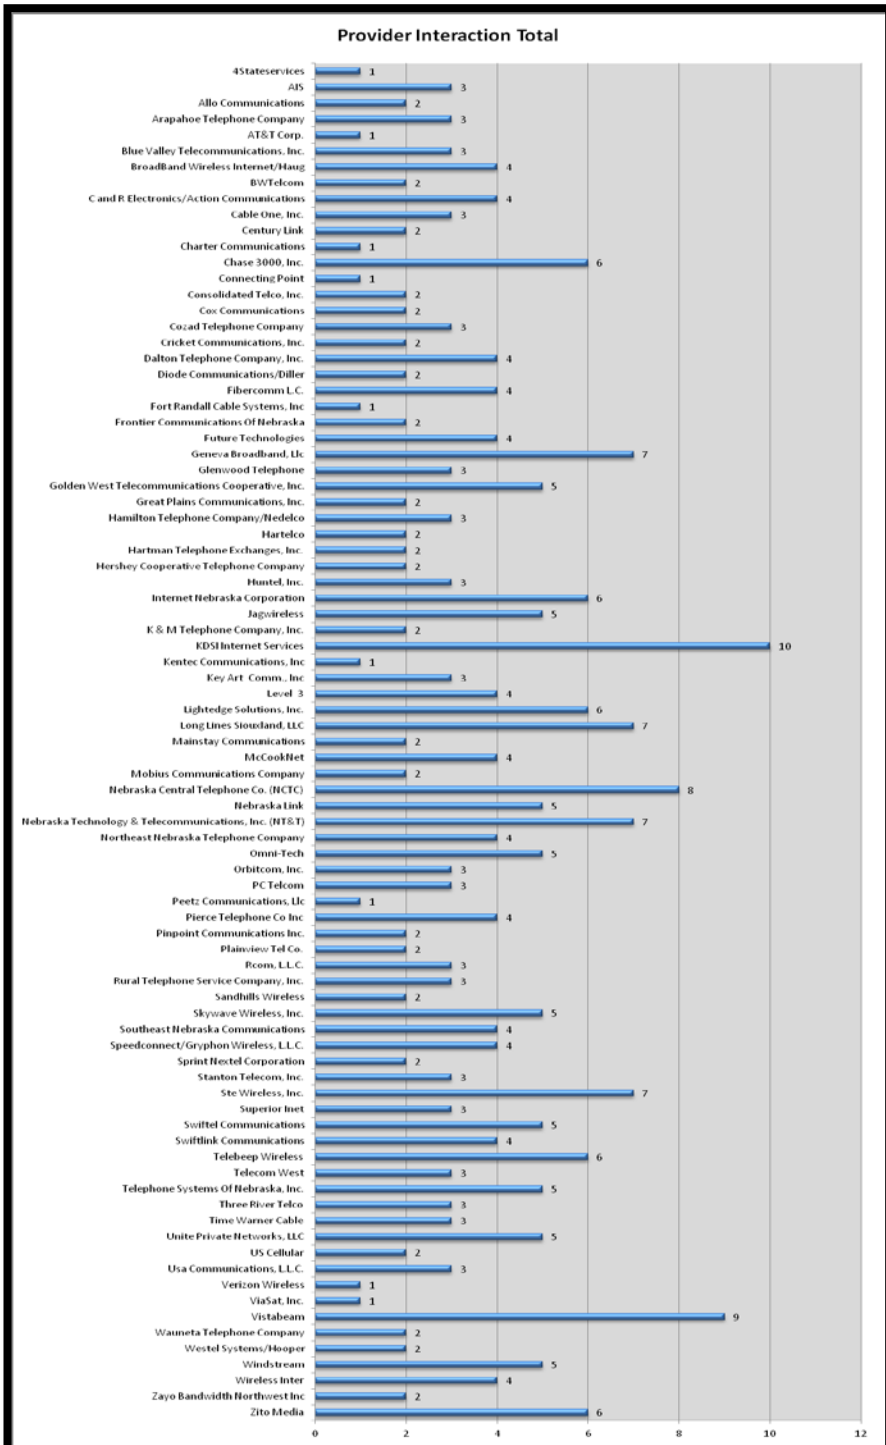
- To encourage participation throughout the life of the program, we feel it's important to foster relationships with providers and encourage a collaborative team effort between all parties for each data submission. The following table represents the number of times each provider was contact via e-mail or phone for this data submission.



- Update provider material that describes the data requirements and logistics for data transfer.
- Update Non-Disclosure Agreement (NDA) for use in the project, where applicable.
- Maintain multiple protocols for the provider to submit data, including Secure File Transfer Protocol (SFTP) technology when desired.
- Conduct one-on-one informational discussions with each provider to communicate the following:
    - Requirements of this project;
    - Broadband data required to support the product data model;
    - Submission protocols available;
    - Capability to validate how the supplied data is aggregated.
- Download/receive provider data.
- Establish a repeatable process with provider. Maintain provider communication, transaction and data handling records throughout the project (dates contacted, data received, etc.).

COMMUNITY ANCHOR INSTITUTION (CAI)

The collection of CAI information is handled through the following CAI Collection Process:

- Collect and maintain inventory of CAIs through currently known CAIs, data mining, and research.
- Maintain web-based CAI portal for institutions to add or confirm attribution, location and enter broadband-specific information.
- Upload web-based data to Core Database for standardization.
- Perform internal cleansing, such as removing duplicate records, identifying gaps in broadband attribution and verifying category.
- Geocode CAI locations.
- Translate Core Database data to deliverable-ready format.
- Continue engagement with non-responsive institutions.
- In the upcoming months, one of the statewide semi-monthly webinars produced by the Planning team is scheduled and will focus on CAI engagement, education on the program, and use of the CAI Portal. The broadband planning and mapping teams are working together to present material on the overall broadband program, benefits, and importance on CAI involvement.

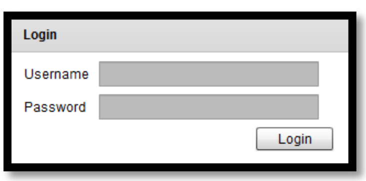
DATA INTEGRATION PROCESS

The data integration and processing mechanisms currently used allows for multiple types of inputs and result in a standardized output that meets the NTIA deliverable requirements. This flexible process supports data model changes and project-requested enhancements.

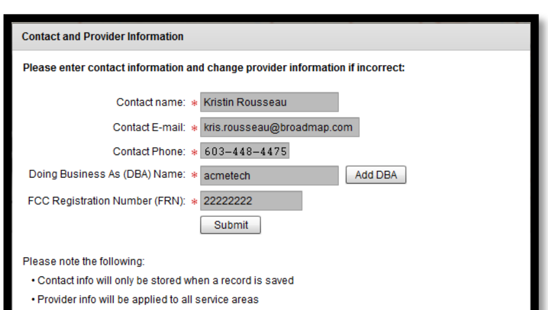
- Receive inputs from providers via submission protocols; upload into Sourcing Database and catalog with provider information.
- Review provider-supplied data for completeness and for potential discrepancies that require resolution prior to processing and flag as necessary.
- Categorize input into data-type category (addresses, block lists, paper maps, etc.).
- Standardize input based on data type within Staging Database.
- Create Compact Polygons (CP)—(internal methodology for generating area-based feature for coverage in Staging Database).
- Apply broadband attribution to CP; apply metadata to CP.
- Perform quality analysis of the CP against the source supplied to identify any completeness or accuracy issues.
- Request additional information from the provider if elements of coverage are missing or contain discrepancies. This is a second manual quality check to ensure data is complete.
- Process coverage area to build the required NTIA data model layers.

With the deployment of the Provider Portal this round, the data collection and later validation process was streamlined allowing both activities to occur within a secure web application. The majority of the providers used this methodology as it supplies them with more visibility into how their data is being represented and gives them knowledge and ownership of their coverage representation. Below are some bullet points and supporting screen shots on how the portal is used.

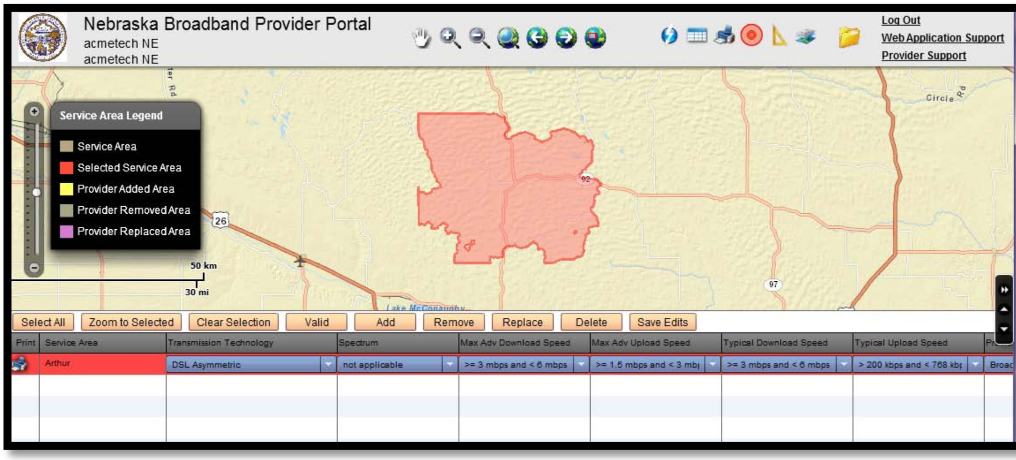
- Each provider is assigned credentials with a strong password to ensure security measures are taken into consideration



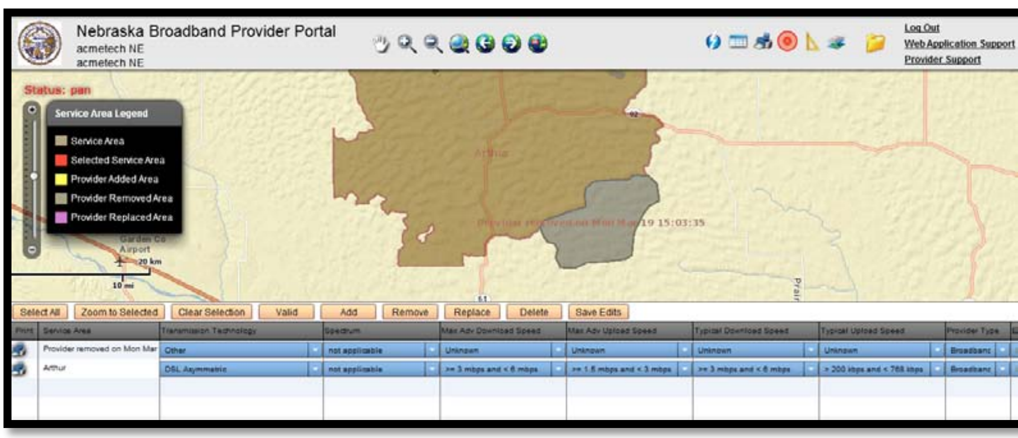
- Collection and confirmation our contact, as well as the company's DBA Name and FRN accuracy



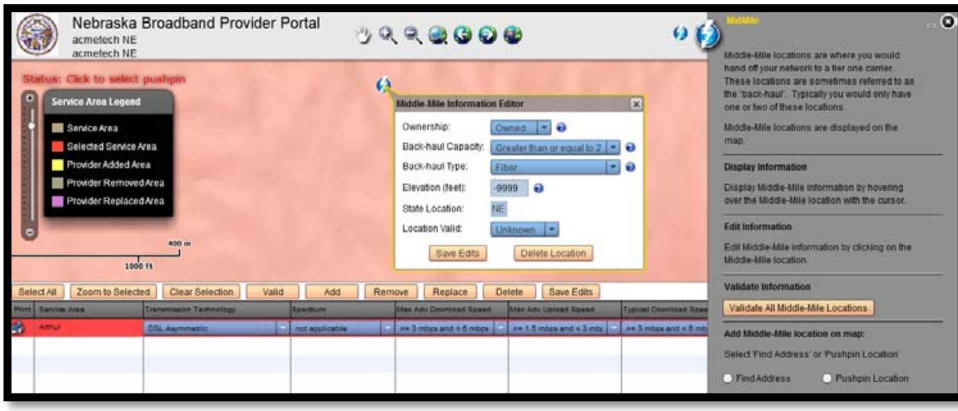
- Capability to review and request changes to the coverage footprint

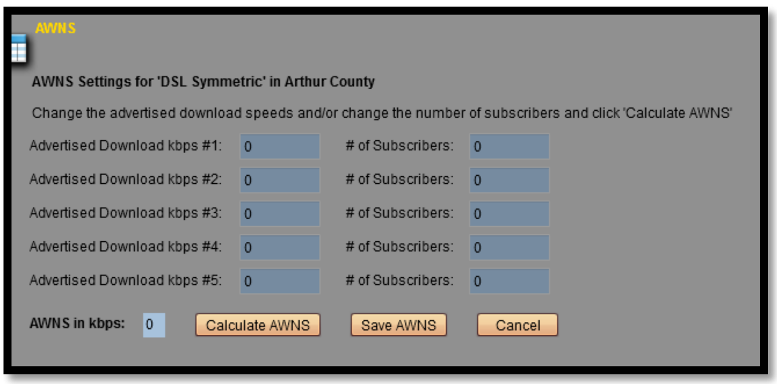


- The provider can Add/Remove portions, or all, of the footprint requesting that their footprint be increased or refined.

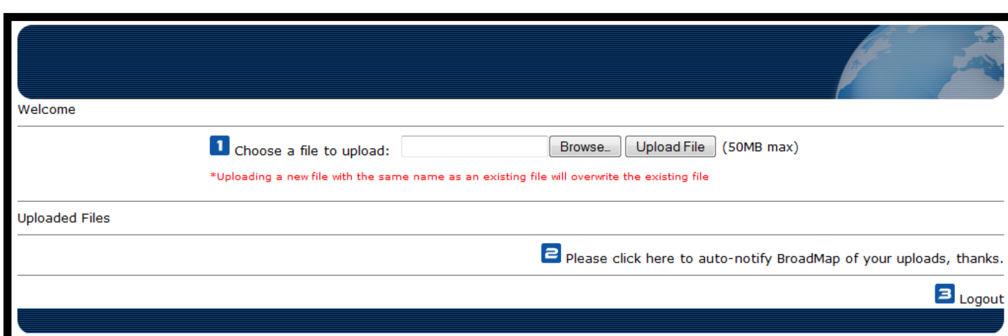


- Middle Mile and Average Weight Nominal Speed (AWNS) collection and validation





- File upload functionality to support providers that would prefer a shapefile, spreadsheet, PDF, KMZ/KML file be used to reflect changes for the data round



- Once the provider has reviewed the completed changes to their coverage, middle mile and AWNS, they can then validate them all by signing off that everything is accurate.

DATA VALIDATION AND VERIFICATION

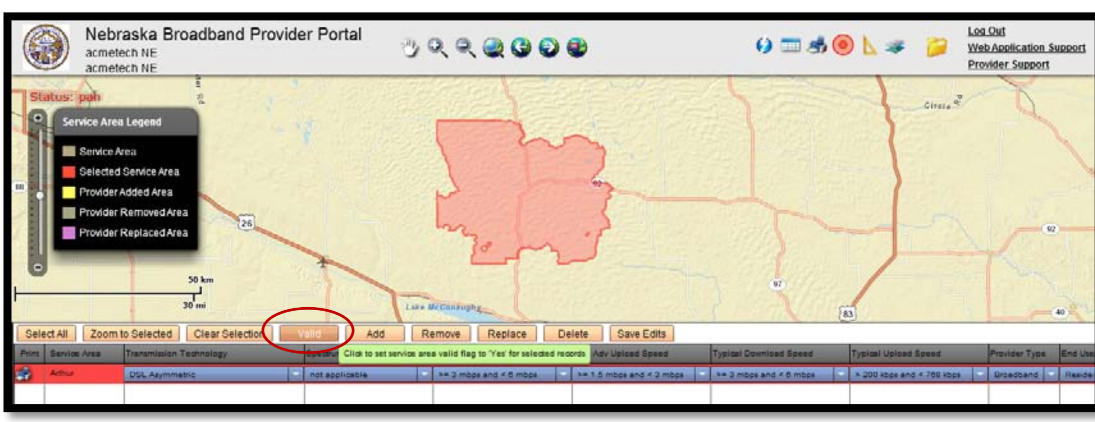
Following the creation of the product, process steps within Data Validation and Verification occur. To ensure the data collected and processed is as accurate and comprehensive as possible, provider validation and internal verification activities are employed. After the initial mapping of providers' coverage areas and serviceability claims, additional reviews are performed using the methods described in the subsections below in order of action (**Broadband Provider Validation**, **Third-Party Data Verification**, **Public Verification, and Confidence Values**).

BROADBAND PROVIDER VALIDATION—PROVIDER PORTAL APPLICATION

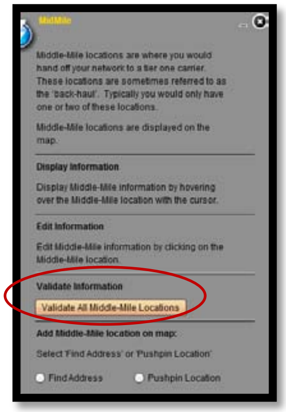
Providers are trained on and requested to use a secure interactive web application to review their current coverage area(s) and supporting broadband attribution and validate their data or submit change requests to update their data. All provider change requests go through the **Data Integration Process** and are reviewed with the provider to complete validation.

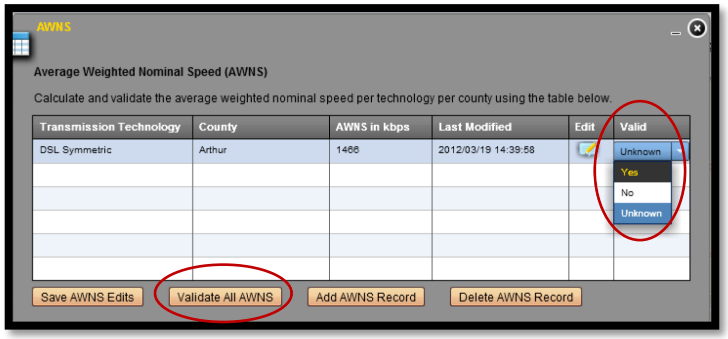
With the latest released of the Provider Portal, validation on the coverage area, middle mile and average could be completed individually. Validation examples are as follows:

- Coverage validation can be done on one record/footprint at a time or by selecting footprints and selecting the 'Valid' button. The provider could also print off or download their coverage for their own tracking purposes.



- Middle Mile & AWNS Validation





All validation results are tracked internally through our Validation Table, which also improves the overall **Confidence Value** as mentioned below.

SME VERIFICATION – PROVIDER PORTAL ADMIN

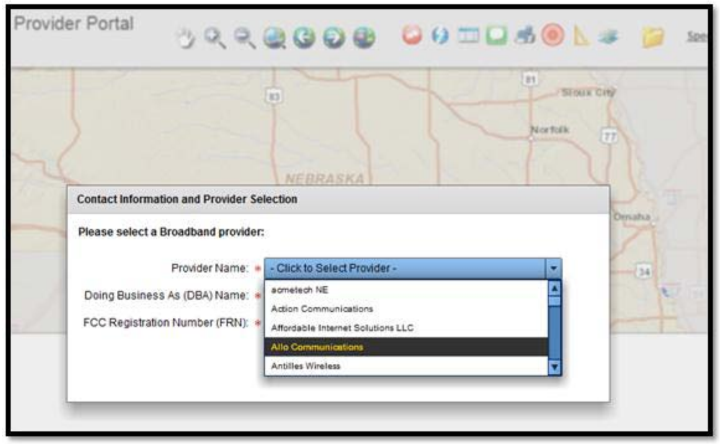
For this dataset submission, Nebraska has introduced new verification enhancements to the Provider Portal that supports administrative functionality for Subject Matter Experts (SMEs) to review the provider coverage areas and supply feedback/commentary on the accuracy and completeness. These enhancements allow them to:

- Review the coverage submitted by the carriers online
- Use subject matter expertise to evaluate the accuracy of the data against local knowledge, online advertising, personal meetings, etc.
- Document a dialogue with its providers for verification purposes. We were able to review many of the provider submissions manually and submit questions to the providers if speeds, coverage areas, technology types, or other items appeared.
- Report verification comments and any responses from the providers to NTIA in the dataset.

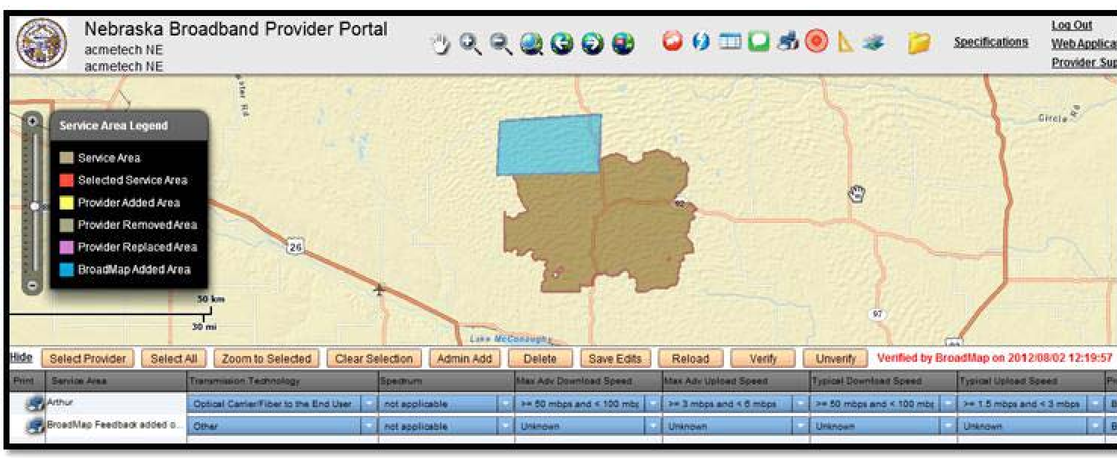
NOTE: This has just recently been released and will be utilized fully for the next data submission

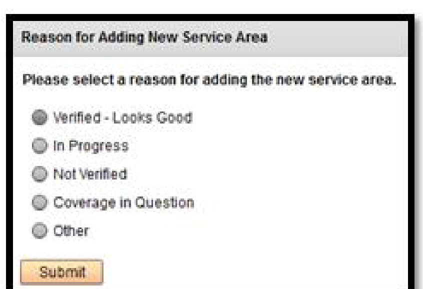
Below are some screen shots illustrating the administrative capability of the Provider Portal.

As shown below, the SME can login through the secure web application and choose the provider to be reviewed.



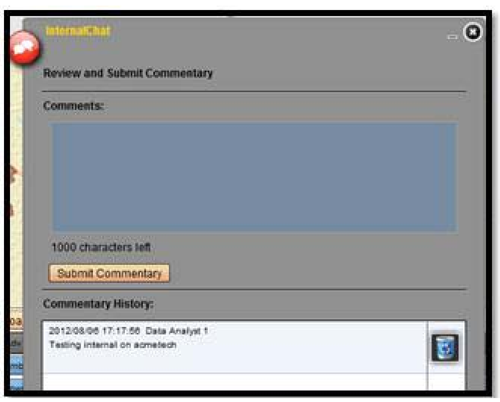
The portal supports two ways of verification at a coverage footprint level. The SME can draw areas of concern or approval on the map and supply a categorized comment that can easily be extracted at anytime.

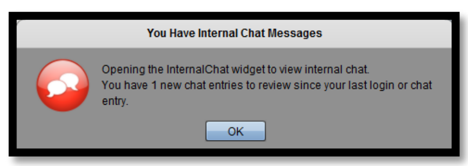




Additionally, the SME can leave commentary that will then be automatically e-mailed to the provider for their review and displayed as a pop-up when the first login to the Provider Portal. This includes historical tracking so you can see all commentary between the SME and provider, as well as the date/time stamp for each comment.

The administrative Provider Portal also allows for commentary between team members, which will only be viewable by the internal admin team members. The team members are notified automatically via e-mail when a comment is submitted, as well as when they login.





Similar to how the providers update and validate their coverage within the Provider Portal, the administrative version walks the SME through the verification assignments to ensure everything is reviewed and documented with a status and date/time stamp. Once everything is signed off on, the SME can select Verify to signify that the provider is signed off for the submission.

Through the testing and initial release of the portal, the providers have been very responsive to the commentary and supplying updates where needed. As we progress with this tool, the commentary and verification status will be included in future submission documentation. Some is already included within this submission's data package.

THIRD-PARTY DATA VERIFICATION

For this submission, the NTIA 3rd Party Data summary was reviewed again to ensure any corrections required were represented in the final product and the supporting documentation. This includes additional feedback received directly from NTIA, prior to this data submission.
We are currently in the process of reviewing 3rd party data to extend our verification efforts.

This submission was also compared to the previous data submission, spring 2012, as a quality check to identify and resolve any potential erroneous discrepancies or data degradation.

PUBLIC VERIFICATION – CROWD SOURCING

The broadband interactive map has been released to the public, which includes functionality to collect feedback on the provider's coverage areas, as well as running a speed test. The feedback and speed results continue to be collected and reviewed with the providers prior to the next data submission to identify if any map refinement is required.

The public website can be viewed at the following hyperlink:

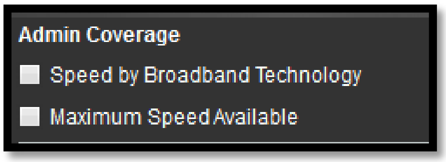
http://broadbandmap.nebraska.gov

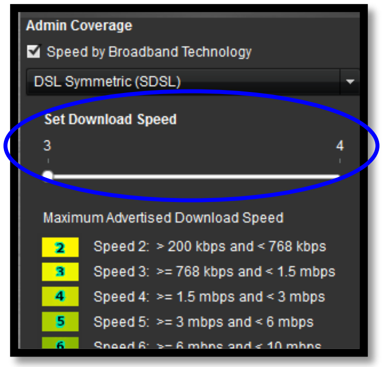
In the past quarter, we've had over 830 visits to the websites, with over 140 speed test and feedback results collected. We will also be promoting this website and the importance of public feedback at the upcoming 2012 Broadband Connecting Nebraska Conference on October 2nd in Lincoln, NE.

During this quarter, we have also updated the public site to have a Planning component, or administrative login capability. This way they can review other layers that may not be appropriate for view to everyone, or review existing layers differently. Some examples are as follows:

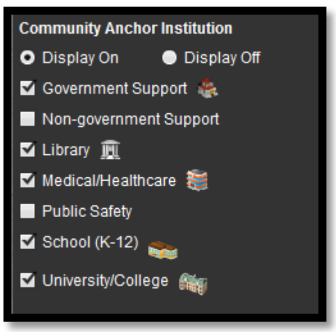
Administrative Login:

Administrative Data Layers and Functionality:
We're still adding more layers to the admin functionality, but below is an example of two that were added. As a layer is selected, additional functionality is provided. In the case below, the speeds can be changed by using the slider.

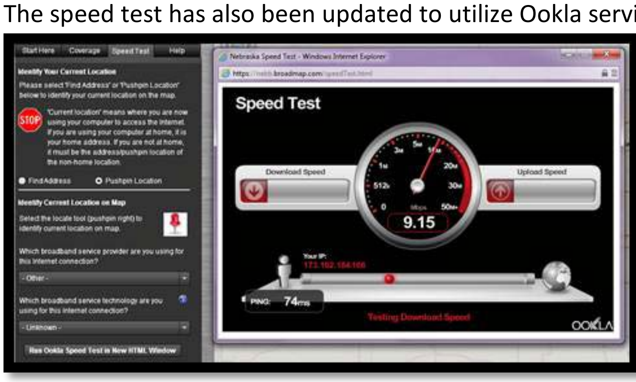




Community Anchor Institutions can also be turned on/off individually to compare against the broadband services available.



The speed test has also been updated to utilize Ookla services.



CONFIDENCE VALUES

All verification, validation and manual quality review results are tracked by provider/technology type and stored and maintained within a **Validation table**. A confidence value is assigned, based on internal assessments of the collected information, to highlight the provider coverage areas and/or attributions that would benefit from further investigation and/or enhancements.

With the continued efforts on provider validation, 3rd party verification and the release of the public interactive map with feedback collection functionality, the confidence values will be utilized further to identify specific areas in need of attention.

QUALITY CONTROL

Following collection, processing and analysis of the provider and CAI data, the product is checked manually and algorithmically against the NTIA data model. Some of the items included within these checks are:

- Format correctness;
- Table and field structure;
- Valid values, including default values, where applicable;
- Geographic extent and topology errors.

Prior to data submission, another quality control script supplied by NTIA is run. This script, SBDD_CheckSubmission.py, creates an output in text form that is required to be submitted along with the final deliverable. All errors must come up clean, unless otherwise specified by NTIA.

DETAILED PROCESS REVIEW

To review the detailed process, please review the attached object:

BMap_ProcessDetails_2012_10_01.docx

PROVIDERS RESEARCHED

Below is a list of providers we are still in the process of researching or closing NDA and data collection efforts:

- Chase 3000, Inc.
- KDSI Internet Services
- Kentec Communications, Inc
- Lightedge Solutions, Inc.
- Swiftlink Communications – Recently purchased by 4Stateservices
- Telephone Systems of Nebraska, Inc.
- Zito Media

Below is a list of providers that were researched and contacted, but identified as non-broadband providers and didn't require inclusion within the data submission. Some may be due to different naming conventions or inaccurate FRN/DBA names and were therefore considered a closed source.

ACN Communication Services, Inc.	Mcleodusa Telecommunications Services, Inc.
ACN Digital Phone Service Llc	Mettel

New Hampshire Broadband Mapping and Planning Program
University of New Hampshire
October 2012 Data Submission

I. Data Description

In accordance with the effective NTIA guidance for Round 6 data submissions, the New Hampshire Broadband Mapping and Planning Program (NHBMPP) submitted the data set described below and associated documents to NTIA in October of 2012.

NH_SBDD_2012_10_01.gdb – file geodatabase containing feature classes for:

Feature Class	Number of Records
BB_ConnectionPoint_LastMile	0
BB_ConnectionPoint_MiddleMile	117
BB_Service_Address	0
BB_Service_CAInstitutions	3,899
BB_Service_CensusBlock	101,296
BB_Service_Overview	0
BB_Service_RoadSegment	44,005
BB_Service_Wireless	41
State_Boundary	1

In total, over 145,450 individual data records on broadband availability were submitted by New Hampshire. This includes an increase in middle mile records due to the addition of one provider that was previously not included in the NHBMPP. Collectively, these records describe availability as reported by 39 broadband providers in the state. In addition, the NHBMPP submitted data on 3,899 community anchor institutions, a reduction of 15 records from the prior submission due to institution closures.

To achieve this level of reporting, the NHBMPP relied on a number of sources to identify potential providers in the state. The following table details the disposition of the initial set of providers:

Description	Number of Records
Potential providers identified in NH	93
Providers confirmed as delivering service in NH	60
Providers represented in the NHBMPP submission	39

II. Provider Participation

The NHBMPP has identified 60 broadband providers in the state. As noted above, 39 of these providers actively participated in the program for the Fall 2012 cycle. This number represents an increase of two providers from our prior submission – one national satellite provider was just identified and the second new provider was previously non-responsive.

The current participating providers include:

Provider Name	Technology
1. Argent Communications, LLC	Cable, Fixed Wireless
2. AT&T Mobility LLC	Mobile Wireless
3. Charter Communications Inc.	Cable
4. Comcast Cable Communications, LLC.	Cable
5. Covad Communications Company	DSL, Other Copper Wireline, Middle Mile
6. Cyberpine Cooperative, Inc.	Fixed Wireless
7. DSCI Corporation	Middle Mile
8. Dunbarton Telephone Company, Inc.*	DSL
9. FairPoint Communications, Inc.	DSL
10. Freedom Ring Communications, LLC. (dba BayRing Communications)**	Middle Mile
11. G4 Communications**	DSL, Middle Mile
12. Granite State Communications (aka Granite State Telephone)*	DSL, Fiber
13. Great Auk Wireless (dba GAW High-Speed Internet Inc.)	Fixed Wireless
14. GWI (aka Biddeford Internet Corporation)	DSL, Other Copper Wireline
15. HughesNet**	Satellite
16. IAMNOW.net*	Fixed Wireless
17. Lakes Region Wireless**	Fixed Wireless
18. Level 3 Communications**	Fiber, Middle Mile
19. Lightower Fiber Networks*	Middle Mile
20. MetroCast**	Cable
21. OTT Communications	DSL, Middle Mile
22. Oxford Networks*	Middle Mile
23. Sidera Networks, LLC	Middle Mile
24. Skycasters	Satellite
25. Sovernet Communications*	DSL
26. Spectra Access*	Fixed Wireless
27. Sprint	Mobile Wireless
28. StarBand Communications, Inc.**	Satellite
29. Tamworth Wireless Cooperative	Fixed Wireless
30. TDS Telecom	DSL, Fiber, Middle Mile
31. Time Warner Cable	Cable
32. T-Mobile	Mobile Wireless
33. Topsham Communications	Fiber
34. U.S. Cellular*	Mobile Wireless
35. Verizon Wireless	Mobile Wireless
36. Wave Comm, LLC	Fixed Wireless
37. WildBlue Communications, Inc.**	Satellite
38. Wireless LINC of NH and VT (f/k/a NCIC)*	Fixed Wireless
39. WiValley*	Fixed Wireless

* Provider confirmed that coverage has not changed and did not submit revised data for this round. Data reported for the March, 2012 submission was confirmed as still being effective.

** Provider did not confirm or submit revised data for Fall 2012 submission. Data submitted was from previous data submission rounds and is being resubmitted.

The following 21 providers have remained unresponsive to multiple and ongoing requests to participate in the NHBMPP, or have dropped out of the program after initially providing data.

Provider Name	
1. Boston Telephone	2. CityVoice
3. Cogent Communications	4. DESTEK
5. EarthLink Business (aka One Communications)	6. Fibercast Cable Communications
7. The Granite Connection	8. Grolen Communications
9. ITLLC (f/k/a Russet Communications)	10. Met Tel
11. MV Communications	12. NCIA
13. NHvt	14. Qwest Communications
15. RadiusNorth	16. segTel, Inc.
17. SkyWire Wifi (f/k/a Akers Pond)	18. TelJet
19. Turnpike Technologies	20. USAi.net
21. WindStream	

The following 2 providers have been identified as providing internet service, but the maximum download and upload speeds they currently offer do not meet the broadband definition.

Provider Name	
1. Bretton Woods Telephone	2. Dixville Telephone

The 8 providers listed below were identified from analysis of the FCC Form 477 data (filings through February, 2011). The NHBMPP has contacted these providers, but to this date they have either been unresponsive or data has not been received so we cannot confirm their status in NH.

Provider Name	
1. Airespring, Inc.	2. Broadview Networks
3. BurgNet	4. Global Crossing North America, Inc.
5. Hickory Tech	6. NewEdge Network, Inc.
7. NextWave Wireless, Inc.	8. Telovations, Inc.

Finally, the NHBMPP identified a number of providers during previous rounds that we no longer maintain on the active list because they have either ceased providing service, have merged with other providers, or were never an active provider in NH.

Provider Name	
1. Access Communications	2. All Media, Inc.
3. Alterracom Networks	4. BIT-NET

5. CheshireNet	6. Cooperative Resources
7. Equal Access Networks	8. FCG Networks
9. Finowen	10. First Bridge
11. GreenNet	12. Green Wave Wireless
13. JLC	14. Level One Communications
15. Mainstream EIS	16. Mason Coop
17. Megapath	18. RNK Communications
19. TTLC.net	20. Vermont Telephone
21. WaveGuide	22. Wireless Horizon
23. Worldpath	

The initial master list of providers was extracted from the "New Hampshire Broadband Action Plan", 2008, NH Telecommunications Advisory Board (TAB) and NH Department of Resources and Economic Development (DRED). This listing was cross-referenced against a statewide cell tower inventory maintained by the NH Office of Energy and Planning. NHBMPP staff maintains an ongoing effort to identify additional active service providers in the state based on continuing interactions with TAB and DRED, review of speed test results, updated FCC data when published, and other sources as available.

III. Data Collection and Integration

A. Primary Data Collection

Data Acquisition

Primary data was collected directly from the service providers. The NHBMPP first developed a set of guidance documents based on NTIA specifications, and distributed those to the individual providers. Once the guidance was disseminated, NHBMPP staff followed up with providers via phone/email to encourage participation and address questions, as required. Typically, multiple communications were required to ensure a complete data submission was received.

Data Pre-Processing

To support the data mapping and integration efforts, the following base data sets were acquired and/or retrieved from the NH GRANIT state GIS clearinghouse archives:

- State and town boundaries (based on 1:24,000 USGS DLG files);
- 2001 Land Cover data set (derived from Landsat TM imagery);
- 2010 TIGER Census Blocks;
- 2010 Census MAF/TIGER Road Segments; and
- 2009 USGS National Elevation Data set (NED).

All required NTIA fields were added to the census block and road segment data sets. In addition, the road segments were processed against the census blocks to populate two fields used internally – the left block ID and the right block ID associated with each road segment.

Data Processing and Integration

The broadband availability data was processed and integrated using a suite of GIS tools and procedures, depending upon the format and content of the data submitted by the individual providers. Generally, the processing involved executing one or more of the following steps:

- Scanning and georeferencing paper maps and using the results as a visual reference to select out corresponding features from the project base data sets.
- Geocoding addresses using both an internal locator based on the TIGER road segments, and where required, the ESRI TA_BatchAddress_US subscription service; where NDAs were in place, geocoded points were then used to identify the host census block (if <= 2 sq. mi.), or the TIGER road segment in closest proximity but within 500' (if the host census block was > 2 sq. mi.). Related note(s):
    - In some cases, the selection of the TIGER road segment in closest proximity to the geocoded point yielded a pattern of disconnected road segments with broadband service.
- Using ArcGIS Network Analyst to select road segments within a cumulative distance of 3,000 and/or 18,000 lineal feet from central office locations, depending upon data submitted by the provider. The selected segments were subsequently used to identify adjacent census blocks <= 2 sq. mi. or used as features to quantify coverage along census blocks > 2 sq. mi. Note that in previous rounds, adjacent census blocks were flagged based on road segments intersecting those blocks. In this round, we refined our approach to define adjacency as blocks sharing a boundary with the road segment. This more conservative approach resulted in some blocks dropping out of provider coverage footprints.
- Processing KMZ image files, using the bounding rectangle to establish interior georeferencing, and then converting the georeferenced image to polygons.
- Utilizing Cellular Expert ArcGIS extension to generate a signal prediction surface for wireless providers submitting antenna locations (and associated data). Related note(s):
    - The statewide cell tower inventory provided the starting point for the signal propagation modeling efforts.
    - Subsequently, working with UNC-Raleigh and a NH-based fixed-wireless provider, the data processing models were refined to take into consideration visibility parameters (in addition to vegetation and topography).
    - During the current processing round, program staff participated in additional Cellular Expert training sessions to further enhance the signal propagation models. As a result, some provider coverage footprints have been reduced from previous submissions.
    - A -90 DB threshhold was used to define service areas of fixed-wireless providers.
    - In processing the fixed-wireless polygon data, exterior polygons, e.g. those outside of the main coverage footprint, that were < .125 sq. mi. were eliminated. Interior non-coverage polygons were not eliminated.
- Processing satellite coverage footprints to incorporate the Utah shadow analysis (as posted on PBWorks).

The NHBMPP maintains a record of all specific processing steps applied to each provider's data submission in each round. We review that methodology with each provider as part of the verification process to ensure appropriate processing steps are followed.

Data Processing Issues
The NHBMPP encountered a number of issues in processing the broadband data for the state. These include:

- Most providers submitted data only on areas that are currently served, and not on areas that could be served following the NTIA guidance. This contributed to the pattern of occasional disconnected rural road segments with broadband service.
- Reliance on the TIGER road segments likely yielded overstated broadband coverage in rural areas. A single rural customer address, when geocoded, could result in a long street segment being selected as part of a provider's coverage area.
- Most providers did not submit typical speed data. As the volume of our speed test data set grows, we will explore using this information to estimate typical speeds.
- Fixed wireless providers frequently did not deliver the full set of antenna parameters required for the signal propagation software, and required multiple requests for data followed by requests for clarification of those data submitted. While the submissions this round were more complete than in previous rounds, this remains an issue.
- Providers who are knowledgeable and experienced with the original 2009 NTIA NOFA and corresponding clarification documentation provided information appropriate to that data schema / model, and modifications to these in June 2011 resulted in additional follow-up required to achieve a complete data submission.
- As a result of reprocessing data to incorporate enhanced methodologies, there are some instances of reduced provider footprints being reported.
- For providers who submitted address records, the first process was to geocode those addresses to the 2010 TIGER road segments. For any ungeocoded addresses, the program next utilized ESRI's online geocoding services. Any remaining, ungeocoded records were geocoded manually using Bing. In some instances, records continued to remain uncoded after this three-phase approach. We have identified a number of issues with some of the resulting geocoded data:
    - In reviewing addresses geocoded against ESRI services, we discovered a small number of records that did not appear to be correctly positioned. The incorrect positioning was confirmed by viewing the geocoded points relative to both TIGER road data and by referencing Bing. In some instances, the geocoded points were positioned a significant distance away from any mapped road segment. A proximity analysis with a 500' distance constraint was used to identify the closest road in these instances.
    - Finally, some geocoded results were mapped in a town other than the town identified by the provider in their address records. In most instances the geocoded result was to a neighboring town and was within .1 miles of the recorded town. The NHBMPP retained the geocoded locations and notified the provider of these discrepancies.
- For speeds reported by providers in ranges, e.g. 4G LTE, the speed tier reported was selected to include the upper end of the range.

- Some fixed wireless providers continue to report minimum download speeds < 768 kbps, e.g. outside of the NTIA domain, but maximum download speeds within NTIA speed tier domain values. In these instances, the NHBMPP reported the data based on the maximum speed reported.

B. Community Anchor Institutions

Data was submitted for 3,899 Community Anchor Institutions (CAIs) in the state covering the full range of categories established by NTIA, as follows:

Category	Number of CAIs	Percent of Total
1. School – K through 12	762	19.5%
2. Library	766	19.6%
3. Medical/health care	808	20.7%
4. Public safety	564	14.5%
5. University, college, other post-secondary	64	1.6%
6. Other community support – government	736	18.9%
7. Other community support – non governmental	199	5.1%
TOTAL	3,899	100.0%

In this data collection and maintenance round, the collection was largely accomplished by the nine regional planning commissions in New Hampshire, with the Upper Valley Lake Sunapee Regional Planning Commission (UVLSRPC) & NHBMPP staff at the University responsible for developing guidance, for overseeing collection, and for compiling the resulting regional data sets into a standardized statewide layer. The primary steps in the process included:

- Develop a master list of CAIs by category that were not inventoried in previous rounds through review of updated statewide lists (schools, libraries, health care facilities), existing GIS data sets (largely from local hazard mitigation plans), and local knowledge;
- Develop a list of previously identified CAIs with incomplete broadband information;
- Contact those entities to collect their broadband details using an email outreach methodology, as well as phone surveys;
- Map the location of each unmapped CAI, using existing GIS data sets, reference to aerial imagery, property boundaries, web research, and field data collection where necessary;
- Verify data (see verification section below).

IV. Validation

A. Primary Data Collection

The NHBMPP utilized multiple processes to verify the broadband provider data collected during the current round. These processes, each of which is described further below, included:

- Internal verification
- Provider verification
- Ground infrastructure checks
- Use of orthophotography
- Use of parcel data
- Use of FCC filing data
- Crowdsourced data – including speed tests and surveys
- Satellite dish inventory

First, the NHBMPP continued to use local knowledge to conduct an internal analysis of the reasonableness and consistency of our mapping results. Significant overstatements or understatements of service areas resulting from internal processing issues were readily identified and addressed. The NHBMPP also verified the "reasonableness" of data by comparing current coverage footprints to those reported during the prior round. This allowed us to identify areas where service areas changed substantively, and to communicate these findings to the provider for verification.

Secondly, the Fall, 2012 feedback loop with providers was more robust than prior rounds, largely due to increased effort on the part of program staff to solicit comment and the strong relationship now established between the providers and program staff. This round's efforts engaged all providers, including those who did not submit new data but whose prior data was reprocessed according to newer guidelines (described above). The NHBMPP returned maps (.pdf files) to each provider for review and correction. Where providers delivered addresses or road segments, the product returned was a geographically referenced version of the data that was submitted. For wireless providers who delivered antenna locations and specifications, the program provided maps that displayed the modeled coverage area generated from the Cellular Expert signal propagation modeling software. Some providers requested the data verification information be provided in shapefile and/or Google Earth (.kmz) format. The provider verifications yielded a number of requests for modifications, all of which are represented in the data submission.

Orthophotography was utilized to support a number of mapping activities. Among other applications, it assisted in verifying tower locations and mapping results for the wireless signal propagation modeling, was used as an important reference layer in the verification maps delivered to providers, and contributed extensively to the mapping and verification of Community Anchor Institutions.

Community Anchor Institution mapping was supported by two other substantive data sets – parcel data and "community destination" data. The parcel data was used to map and/or verify locations. (Note that it also was used to assist in verifying the positional accuracy of address data submitted by providers.) The statewide community destinations inventory served as a starting point for compiling and mapping municipal facilities.

The NHBMPP utilized FCC Form 477 filings (through February, 2011) to support the verification of provider coverage areas. Analysis of tracts reported as being served by each provider against those developed from the provider's submission allowed for verification and validation of service areas. There were some instances where a provider's FCC report indicated a greater footprint than indicated by their data submission, and this information was relayed back to the provider during the data review period.

Other verification measures included:

- Speed test – The NHBMPP program has posted a customized speed test on the project web site (iwantbroadbandnh.org). To date, over 5,200 have been submitted. We have processed those data to generate speed result summaries and the locations from which the tests were conducted. Through further analysis of the speed tests focusing on reported providers, the program will compare the service identified to the provider's reported coverage area to ensure there are not areas unreported, and/or areas where speed test results represent a significant deviation from the reported speed tier.

- Broadband survey – The NHBMPP website also hosts an online broadband survey, encouraging users to report their broadband access (or lack thereof) at the address level. The address submitted is then geocoded, which delivers a means of verifying provider coverage data at specific locations. (The survey is also linked to the speed test, so that users completing the form are asked to take the speed test as well.) To date, 501 surveys have been completed.

- Satellite dish survey – The NHBMPP has completed a drive-by inventory of satellite dishes in selected rural areas of the state, under the premise that a cluster of buildings with satellite broadband dishes signifies an area with no other broadband options available. This information has been utilized as part of the internal data review cycle.

- Cellular Drive Testing – The NHBMPP has recently completed a mobile wireless drive test to identify the areas of New Hampshire that are lacking mobile wireless data coverage. The 5 mobile wireless providers (AT&T, Sprint, T-Mobile, US Cellular, and Verizon Wireless) have provided the NHBMPP with polygon shapefiles of their coverage in an aggregate for the state. It is recognized through personal experience, community emails, and online surveys that these data overstate the actual service coverage. The drive test results will be used to review, verify and enhance the coverage information submitted by the providers in subsequent data submission rounds.

B. Community Anchor Institutions

The CAI data has been subjected to several rounds of verification during this and previous data submission cycles. An initial round of verification was completed in May, 2010 by re-interviewing a randomly selected subset of CAI contacts (20% of the entities within each of the 7 data categories). Subsequent verification rounds, including one conducted during July/August of 2011, were accomplished by generating a broadband profile sheet for each CAI, emailing that to each CAI contact for review, and modifying the CAI record based on any updates returned.

As of March, 2012, we created an interface for CAI contacts to review and modify their individual records via the NHBMPP website and we continued to leverage the use of these web technologies during the current reporting period. Additionally, the NH Department of Education's Director of Technology and the NH State Librarian were solicited to outreach and engage the schools and libraries in updating their broadband information. We continue to receive contact from these institutions.

Overall, the completeness of the data set improved over the previous submission in two specific areas:

- The percent of libraries with associated CAIIDs increased from 19% to 30%; and
- The data on public WiFi access improved, with the number of complete records increasing from 25% to 34%

Data Processing: Collection, Reception, Loading, Validation

This document describes the process used by the New Jersey Office of Information Technology (OIT) and Applied Communication Sciences to collect, receive, load, validate and verify broadband availability and usage data submitted to us by wireless and wireline service providers, CAIs, and other sources and organizations for the State of New Jersey. Individual provider data reports attached hereto provide details on the processing of each provider's submission and explain how the policies presented in this document were applied to the data. The CAI summary report, also attached, provides details on the CAI data processing. This report also describes some of the complexities and challenges we have encountered to date in this project.

1 Structure of this Report

This methodology report consists of the following

- Section 2 summarizes our outreach efforts to collect data
  - This section also describes some of the challenges in determining what service providers are in and out of scope for this work and our approach to service provider categorization, in addition to summarizing our efforts to engage CAI constituencies
- Section 3 provides an overview of our process for Service Provider Data Reception
- Section 4 provides an overview of our process for Service Provider Data Loading
- Section 5 provides an overview of our process for Data Validation
  - This section includes a table of business rules and how they were implemented.
- Section 6 describes our handling of special cases, including verification procedure, validation warnings and handling of fixed wireless providers
- Appendix A: NJ Provider Data Reports
  - This appendix concatenates 32 files, one file for each provider whose data were included in the submission. Each report provides a narrative describing the steps involved in collecting, verifying, loading, and validating the provider data, including a log of the interactions with the provider.
- Appendix B: CAI Processing Report
  - This is a summary of the details of the CAI processing for this submission.
- Appendix C: Third Party Comparisons
  - This summarizes analysis of feedback received from NTIA/Michael Baker based on their comparison of NJ data submissions with third-party data, and responses from them to questions raised by our analysis.

2 Data Outreach

2.1 Provider Data Outreach

Applied Communication Sciences and OIT have conducted further outreach to identify additional potential providers not previously participating. We re-attempted to contact every company with an FRN active in the state of New Jersey. We conducted Internet searches and used information provided by wireless information service provider associations and neighboring states to try and identify potential new providers. When contacting these providers, we described the potential benefits of participation and included instructions on data requirements, including how to submit via our custom-designed Web site found at http://connectingnj.state.nj.us/.

Most providers who had participated in the past were willing to participate again, although some small providers, e.g., Advanza, expressed concerns about the burdens of the data collection process. Several, listed below, opted not to provide data updates in this round. One provider, New Edge/Earthlink opted out because of data accuracy concerns about their map data. The large national providers clearly have processes in place to collect and submit data, while the small local providers require greater assistance. Applied Communication Sciences offers assistance where possible, allowing providers to submit whatever data they have available in any convenient format. This increases the complexity of the data collection and processing operations, but enables greater coverage of providers. As examples, some smaller wireline providers simply submitted a list of addresses where they offer service and some small cable operators submitted the names of the municipalities they cover.

- In this round, we are submitting data from 34 providers. Of these, two (Tata Communications and Skycasters) are new providers. Also note that AT&T and Cablevision each provided data for two FRN's.
- We contacted more than 70 organizations that were potential service providers, via email, postings to their Web site and/or telephone calls, broken down as follows:
  - 29 facilities based providers who had contributed data previously;
  - 22 other organizations with FRNs associated with the state of New Jersey and hence potential service providers;
  - 6 service providers reported to offer wireless data services in NJ, including one (Jersey Shore Wireless/Duxpond Communications) that submitted data in the last round;
  - 18 additional potential providers we identified through our own market research and Internet searches.
  - Note that Sprint generously provided their data before we sent out requests and information about two other providers, Broadstar and Convergence Technologies, was gleaned from web searches.
- Of the 31 providers who contributed data in the previous round, we are submitting data from 30 of them:
  - We had 20 providers submit revised data for this round.
  - Six providers instructed us to use previously submitted data.
  - Four providers failed to respond to repeated contact attempts via email and phone, but had submitted data during the last round. We elected to submit the spring data for the following providers again:
    - Jersey Shore Wireless/Duxpond Communications
    - Level3
    - Netcarrier Telecommunications
    - Service Electric of Sparta
  - One provider indicated that they no longer wished to submit data:
    - New Edge/OneCommunications/EarthLink sent an email saying they did not believe the data they had was complete or accurate enough for submission;
- We contacted many other organizations who have FRNs associated with New Jersey to try and determine if they are providing service in the state. We contacted these organizations via several emails, telephone and/or through postings on their Web sites. In addition, we reached out through our regional sharing group consisting of local states (PA, VA, MD, WV, DE, etc.) and through PBWORKS to obtain contacts at organizations that other nearby states are using. Of these, we had direct interactions with only four, listed below.
  - Reallinx, Inc.: Provides consulting to potential commercial broadband customers
  - Sidera: Has no broadband customers in New Jersey.
  - World Discount Telecommunications: Uses Megapath or Covad to provision their broadband services in New Jersey.
  - Tata Communications and Skycasters: Provided data for this submission.
  - The following did not reply to any of our requests: Abry Partners, Broadcore, eVolve/Cinncinati Bell, Hickory Tech Corporation/Enventis Telecom, Hotwire Communication, Interglobe, Lightower, SmartChoice, Stage 2 Networks, T2 Technologies, Towerstream, Transbeam, Vocal IP Networks, VoicePulse, Windstream/Cavalier Telephone/Paetec, and Zayo.
  - Email was returned (or not successfully delivered) to the following: Line Systems/Magellen Hill, Reliance Global Communications/YIPES Holdings, and Telefonica Data Corporation.
  - We determined from web searches that Broadstar, a twenty-third organizaiton with an FRN, did not yet offer service in New Jersey.
- We contacted 8 companies identified as wireless information service providers in New Jersey.

    - Hughes Network Systems, ViaSat and Skycasters provided data.
    - StarBand instructed us to resubmit their data from the last round.
    - Jersey Shore Wireless/Duxpond Communications did not respond to our request, so we have resubmitted their data from the last round.
    - We received no response from three other providers: Natural Wireless, Reynwood Communications, and Yellowspeed.
    - In addition to those providers indentified in our last submission as either out of business or no longer in the wireless business we are adding Wave2Wave.
- We attempted to contact 18 additional organizations, not already identified in our April-12 methodology, that we subsequently discovered through our own ongoing market research and in Web searches as **potentially** offering broadband service in New Jersey, e.g., those who provided broadband services in neighboring states:
    - Frontier Communications replied that they do not offer BB services in New Jersey
    - Airespring, Bandwave Systems, BCN Telecom, Cooperative Communications, Copper.net, CTI Networks, Everest Broadband Networks, Link Technologies, Savvis, Tele-Data Solutions, TouchTone Communications, and VoicePulse did not respond to our requests.
    - The following were either unreachable or email was returned from their published addresses: 1800HIGHSPEED.com, Data Network Solutions, EmbraceCORTEL Technologies, and MetroPCS Wireless.
    - We determined from their website that Convergence Technologies does not deliver broadband service in New Jersey.
- We have previously identified the following organizations that do not serve New Jersey:
    - Five companies that are not in business at this time: FARIOUS.NET, Near You Networks, SeaWaves Technology, SuperNet WISP, and WEBNJ.net.
    - Four companies that are not service providers: American Telephone Company (sells equipment), MeTel Metropolitan Telecommunications (reseller), Reallinx (consulting group), and World Discount Telecommunications (reseller).
    - Four companies not providing service in New Jersey: Broadstar, Metrocast/Harron Communications, and Sidera (formerly RCN).
    - Three companies that provide service in New Jersey but cannot meet a 7-10 day service window: Atlantech Online, Azirband Communications Holdings, and Global Crossing North America.

2.2 Service Provider Classification

We have classified Service Providers into the four categories as follows:

Type 1 = Broadband
These are broadband providers that meet the NOFA definition of a facilities-based provider with a 7-10 service provision time frame.

Type 2 = Reseller
These are broadband providers who do not meet the NOFA definition of a facilities-based provider because they resell facilities that belong to another service provider.

Type 3= Other
These are broadband providers who are known not to be of Type 1 or Type 2. Typically this is either because they cannot meet the 7-10 day service provision time frame or because their service architecture is complex and is neither facilities-based nor a reseller.

Type 4 = N/A
We used this classification for providers who did not respond to our requests, because we did not have sufficient information to assign them to another class.

Since it is only Type 1 providers who are squarely in scope for this program, these are the only ones for whom we have ensured that the NDA, provider_ind and submit_ind columns in the service_provider_info spreadsheet are completed. Our rationale for this is the following -- we would not want to categorize a non-Type-1 organization as "will not provide data" or "non-responsive" under provider_ind, as this may appear pejorative.

In our ongoing efforts to reach out to the full set of broadband service providers in New Jersey, we work to identify potential providers and screen them to determine if they are providing or reselling broadband services in the state. We maintain a commented list of those organizations that we have determined not to be New Jersey broadband providers or resellers and of those organizations that remain under investigation. Some of these organizations are no longer active business concerns; some are no longer independent organizations, but have been acquired by other entities; some offer or resell broadband service in other locations but not in New Jersey; some are companies that provide engineering or consulting support around broadband, but do not provide or resell service; and some are firms for which further interaction is needed to definitely determine their situation. Service Providers

2.3 CAI Data Outreach

Applied Communication Sciences and OIT used a variety of means to collect Community Anchor institution data. We collected reference data with lists of CAIs of various types in the state and we collected broadband data from individual institutions via our website and from aggregated sources. For healthcare institutions we used as the reference list an enhanced list of hospitals, pharmacies and clinical laboratories that the NJ OIT obtained. For public K-12 schools, we obtained the results of the survey conducted by the New Jersey Department of Education to collect Internet access information from public K-12 schools. This survey had a high degree of participation from the schools and has resulted in significantly higher records in the category of public schools.

CAI Category	Reference Records	Broadband Records	Total Records Identified	Complete Records Created
School K-12 (Public) School K-12 (Private)	2686 (DOE) 1156 (NCES)	2428 (DOE) 796 (Web)	3762	2465
Libraries	461 (IMLS)	89	460	43
Medical/Healthcare	9265	5	8604	5
Public Safety	343 (NJ 911 Comm.)	120	337	76
University	160 (NCES IPEDS)	39 (NJEdge)	159	34
Other – State and Local Government		2007	1694	1694
Other – Non Government		8	8	8

For each CAI category, the following table provides the number of records we obtained from the reference source, the number of broadband access records we obtained, the total number of records we submitted to the NTIA and the number of complete records, with verified address information and broadband access information.

Abbreviations and Acronyms

911 Comm	New Jersey 9-1-1 Commission
IMLS	Institute of Museum and Library Services
IPEDS	Integrated Postsecondary Education Data System
NCES	National Center for Education Statistics
NJHA	New Jersey Hospital Association
NJ-DHHS	New Jersey Department of Health and Human Services

New Jersey has a strong tradition of home rule and, like many eastern states, a plethora of small governance entities – towns, townships, boroughs, cities, and other local municipalities. Among the major challenges we face in collecting broadband CAI data in the state are the dearth of strong, state-level organizations that might compel members to provide data (as opposed to comparatively weaker coordinating bodies) and the lack of existing broadband data sources. NJEdge's data on the higher education institutions to which they provide service is one of the very few such resources in the state.

NJ OIT executives worked through state-level contacts in public safety, education and libraries, etc., to encourage their constituencies to participate and submit data through the website. While some groups were more responsive than others, many have expressed concerns about placing additional burdens in a time of shrinking budgets and cutbacks. We did not receive any additional data from the website in this round.

We encountered a few issues with collection, interpretation and processing of CAI data:

- Some institutions provide information on multiple connections to the internet, each with its own technology of transmission and maximum speeds. These may represent separate redundant connections for a large institution that provides critical services or separate facilities for different classes of users (e.g., staff and clients). Our policy thus far has been to submit a single entry for each institution, but this policy may be a candidate for refinement.
- Satellite institutions such as branch libraries or campus outreach centers can complicate the CAI picture. Our policy is to attempt to collect data for each separate geographic location as a separate CAI.
- Sometimes multiple government offices are co-located in one geographic location; e.g., a large building or complex that may include county government offices, court, jail, and/or other government offices. Here the challenge is avoid incorrectly overstating broadband capability or understating the need for broadband services.
- It remains challenging to convince busy employees at CAIs to take the time to provide this data.
- The CAI transfer model requires a street number and for some CAIs this is not readily available as institutions may use a cross street for directions, a PO box for paper mail, etc.

3 Service Provider Data Reception

Applied Communication Sciences defined a process for handling provider data upon receipt. The following steps describe that process:

These steps must be performed upon receipt of provider data. These steps set up the file system and database for later processing, including both the initial assessment and load, and protect the confidentiality of the information.

1. Update the provider interaction log spreadsheet with the date of receipt and other metadata.

2. Copy the email or decrypt the uploaded files to individual directory on dedicated and secure server.
3. Test that the files can be opened, read, etc. This may require using ESRI ArcCatalog to check a shapefile or file geodatabase.
4. Send an acknowledgement to the provider of receipt of readable submission, or request re-send as needed.
5. Create empty provider data report into the new folder, using the appropriate wireless or wireline template**.**
6. Connect to the PostgreSQL database and instantiate a schema for the provider
7. Perform an evaluation on the submitted data, evaluating the completeness of the submission and the validity and reasonableness of the included values. In addition, run the NTIA validations against the submitted data to determine if there are any errors or warnings. Interact with provider to address any questions or issues.

4 Service Provider Data Loading

The provider data submissions vary in form, format and content and in the ease versus complexity of the processing and loading tasks.

In general, the most straightforward data to process are shape files submitted by wireless providers. Wireline providers who submit census block data are a step up in terms of complexity. Some cable providers simply list the municipalities which they serve. A number of smaller providers submit a list of addresses corresponding to locations where they provide service. These are much more challenging to process as we must first manipulate the address information and then geo-code the locations; these operations can be time consuming and subject to inaccuracies.

The service provider reports attached in Appendix A give the full details per provider on all steps taken to extract, transform, and load the contents of the provider tables into the NTIA tables. Note that every NTIA table has a "shape" column where a geographic feature such as a point, line (e.g., road segment) or area (e.g., census block) must be submitted.

Here is a summary of some of our key policies and challenges:

- All non-disclosure agreements executed with providers prohibit us from disclosing customer addresses. Although some providers have not executed NDAs, we have chosen to treat all providers similarly. We have chosen to obfuscate the address data by transforming it to census blocks or street segments. This carries a slight risk of overstating coverage, but that seems more appropriate than simply dropping the data because it is sensitive. In addition we had one provider who sent us proprietary subscriber-weighted nominal speed data. Given the proprietary restrictions associated with these data, we did not include them in the submission.
- Speeds associated with address data from some providers represent the price plan chosen by the customer; they are definitely neither the max advertised speed nor the typical speed. Our decision was to keep the maximum speeds encountered in the census block and report them in the maximum advertised fields and to report typical as null.
- Maximum advertised speed, combined with the 7-10 day availability requirement, results in vagaries in interpretation. In particular, the concept of advertised speed is well suited for providers who offer services to extended areas, such as large telephone and cable television companies. Its application is less clear for providers who offer service to defined set of specific addresses. They deliver services to those specific addresses, and could offer the same service to a new tenant within the time limit. In some cases, they could increase the speed within that time period as well. They could not easily deliver service to any neighboring location with a two-week period. We have operationalized the notion of maximum advertised speed by determining the maximum speed a provider could offer on the facilities they have in place at customer locations, then reporting that speed for census blocks or street segments.
- After initial poor results in geo-coding the customer address lists provided by some cable providers who had no geo-spatial capabilities, we identified an alternate approach that leveraged the franchise-nature of

cable television service in the state. We asked those cable TV providers to send us the list of municipalities that they are licensed to serve. We build the submission by locating the municipality shapes and using those shapes to find all census blocks contained within them. For large census blocks, we report all the TigerLine street segments that are contained within those blocks.

- For middle mile data, the exact definition of a connection point remains open to interpretation and requires further development. We are not completely sure that all providers interpret middle mile in the same fashion and do not have a clear enough picture ourselves to provide appropriate guidance or validation. Despite this, we have submitted the middle mile information that we received.
- All but one provider submitted 2010 Census Blocks (CBs). On satellite provider submitted data using 2000 CBs. Given that we had to convert this to a single shape, rather than map to Y2010 census blocks, this was not an issue.

5 Validation and Verification Operations

5.1 Custom Data Verification and Validation

Incoming data was subjected to a number of validation checks. When incoming data failed a validation check, we first investigated our process to ensure that we were not inadvertently creating an issue. If the problem was determined to be with the submitted data, we notified the provider concerned and recorded the interaction in the provider data report as provided in Appendix A.

We have observed a few issues that arose when processing the current submission:

- New Jersey placenames can be difficult. We validate against data from the following sources: State of New Jersey geographic information (https://njgin.state.nj.us/NJ_NJGINExplorer/DataDownloads.jsp), the Federal Government placename information (http://geonames.usgs.gov/domestic/download_data.htm), and the US Postal Service data (available for a fee).
- A survey of 3100 New Jersey households was conducted in November and December by Rutgers University as Applied Communication Sciences's subcontractor under this program. Householders who responded that they were broadband users were asked who their service provider was and this was compared against service provider serving areas. 95% of the responses aligned with service provider information. In the remaining 63 cases, the survey respondents reported being served by a provider whose coverage area did not appear to cover that location. Through these cases we have identified an area for additional investigation which may lead to improvements in service provider coverage. The technique, based on geo-spatial analysis of neighboring CBs is briefly described in Section 6.2.
- T-Mobile submitted wireless coverage data that provided one of the more interesting validation issues. T-Mobile provided separate information about three different varieties of 3GPP-based wireless technology, each of which supports broadband data services through mobile terrestrial wireless service capability; namely: UMTS, HSPA21 (i.e., HSPA) and HSPA42 (i.e., HSPA+)[1]. In order to avoid duplicates – that is, rows of T-Mobile data with identical shapes and the same technology and spectrum codes, differing only in maximum speed, we performed spatial joins separately for each of UMTS, HSPA21 and HSPA42. We then submitted one shape for each technology.
- The End_User_Category for Census Blocks or Road Segments is an optional field for designating the geography as being primarily Residential, Non-Residential, or Other (primarily neither Residential nor Non-Residential). We have elected not to complete this field as we do not have a trusted data source for this information.

---

[1] Here are a few more technical details. UMTS is based upon 3GPP release 99 and is the oldest and slowest of the three varieties. HSPA (HSPA21) is 3GPP R6 which supports HSDPA and HSDPU for downlink and uplink high-speed packet access and offers intermediate speeds. HSPA+ (HSPA42) is 3GPP R7. It is the most advanced of the three and supports high-speed packet access evolution with peak data rate increases from MIMO and higher-order modulation, among other technical advances.

We applied the business rules in the script supplied by the NTIA and other data-specific validations after the data were loaded into the tables. These were applied as a check on both the data supplied by the providers and on the process we used for data collections, reception and loading. Moreover, other business rules were applied above and beyond those in the NTIA script, as described below.

We checked uniqueness of the entries in each table, using the following definitions of uniqueness:

Layer	Unique key	Notes
Middle Mile	frn, latitude, longitude	
CAI	anchorname, address	
Census Block	frn, fullfipsid, transtech	
Street Segment	frn, tlid, transtech	Tlid is an internal column.
Wireless	frn,transtech, spectrum, maxadup, maxaddown	

We also performed the following additional validations:

Layer	Validation Rules
Middle Mile	• Check (dbaname, provname, frn) against our FRN reference table • Valid census block id within the state of New Jersey • Check latitude not between 38.7 and 41.4 • Check longitude not between -75.6 and -73.8 • Shape should not be empty • All check_submission rules
CAI	• Valid zip code • Check latitude not between 38.7 and 41.4 • Check longitude not between -75.6 and -73.8 • SubScrbDown is less than SubSrbUP • CAIID is null for schools and libraries • Mismatch of transtech with SubScrbDown and SubSrbUP • Shape should not be empty • All check_submission rules
Census Block	• Check (dbaname, provname, frn) against our FRN reference table • Valid census block id within the state of New Jersey • The area of a census block should be less than < 2 square Mile • Shape should not be empty • All check_submission rule
Street Segment	• Check (dbaname, provname, frn) against our FRN reference table • Street segment is present in a census block >= 2 square miles • Shape should not be empty • All check_submission rule

Wireless	• Check (dbaname, provname, frn) against our FRN reference table • Shape should not be empty • All check_submission_rule

5.2 Verification through Gap Analysis of Neighboring Census Blocks

We have continued to assess coverages in the latest data using gap analysis, as first described in our last submission. The analysis of the survey data identified some instances where a survey respondent identified their service provider and then the service provider's data did not show coverage in that respondent's Census Block. Further analysis indicated that a number of these instances occurred in 'gaps' or 'holes' in submitted provider coverage data. One way to define a simple hole is that it is a single CB that is not in the stated provider coverage area when all neighboring CBs are in the stated coverage area. Our investigations of these simple holes showed that some are associated with zero-population CBs – e.g., a CB that comprises a strip of land neighboring a major roadway. Other simple holes, however, appear to be anomalies in service provider data as we find examples of a residential CB, surrounded by other residential CBs, and no clear rationale to explain why the initial (middle) CB would not have coverage when all neighboring CBs do have coverage.

The next figure shows a few simple holes in Comcast data from Cranbury Township at a fine resolution.

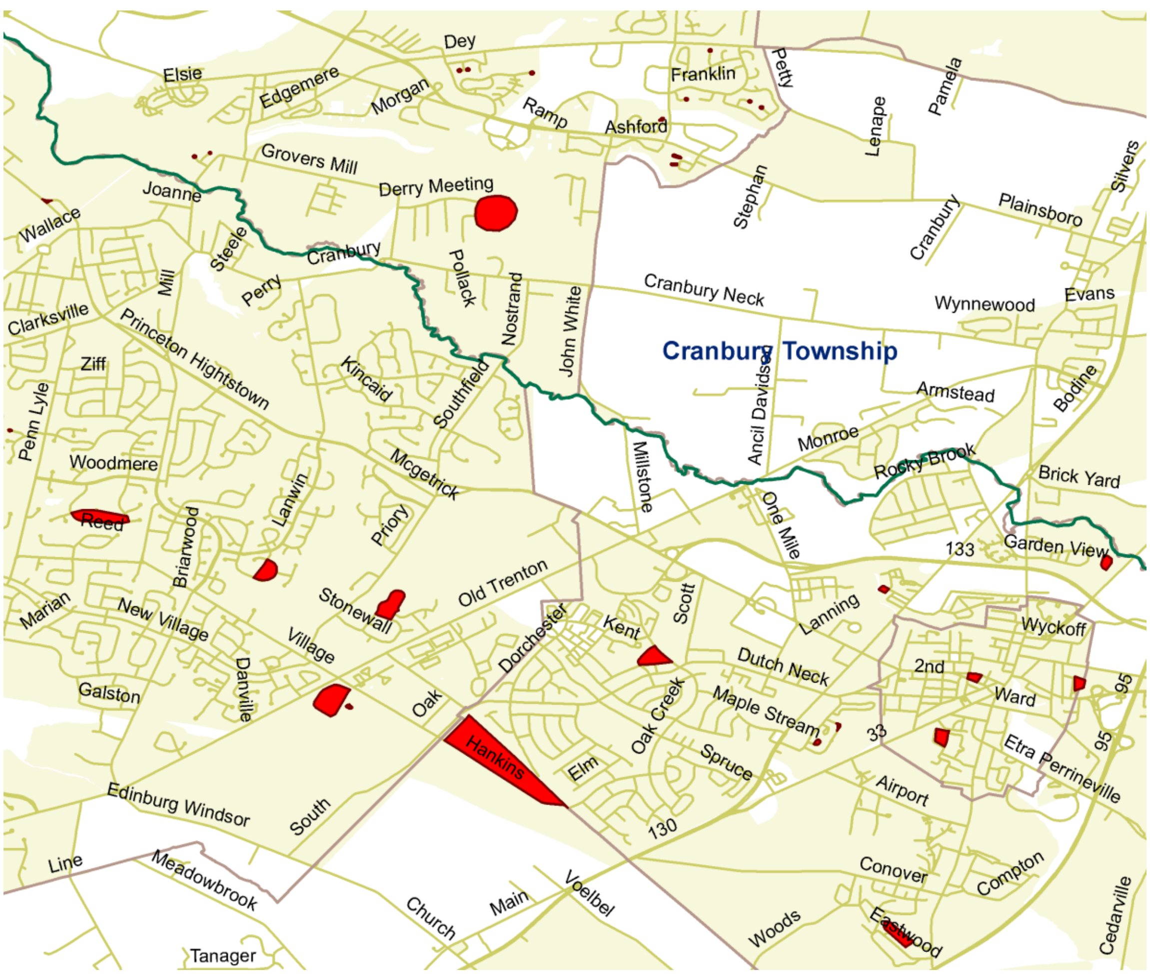

Figure 1: Detailed view of "Doughnut Holes" in coverage

Our analysis of the simple holes shows that some are anomalies that may provide a way to improve the accuracy of provider data. To pursue such possible improvements, we developed software that automates the identification of simple holes. Somewhat to our surprise, when we ran this software on the data for this submission, we found rather sizeable numbers of holes for some of the providers. For example, we identified almost 250 simple holes for Cablevision (including Lightpath) and over 1400 for Comcast. The following graphic illustrates the simple holes for Comcast.

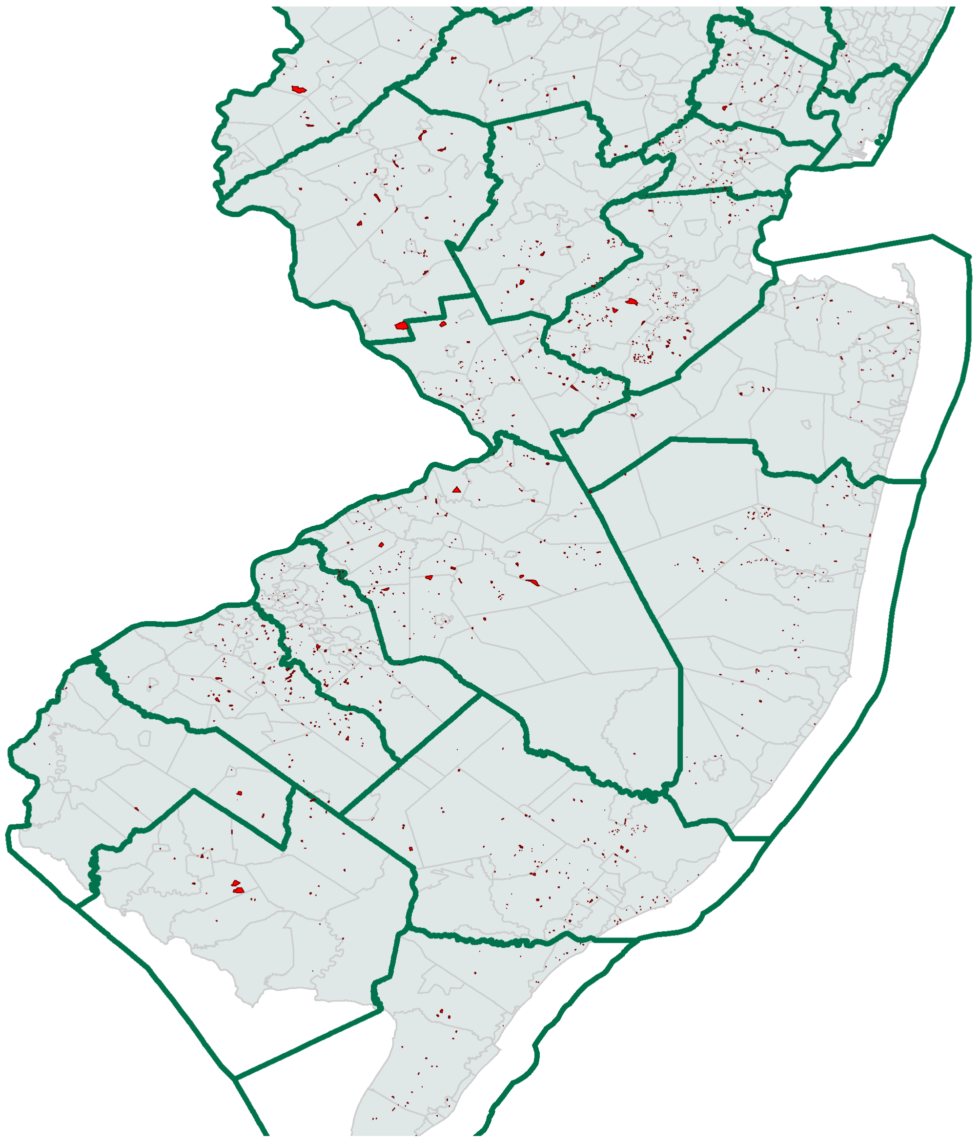

Figure 2: Graphic of Holes in Comcast Data:

For the providers where we identified such holes in the data they submitted for the Fall 2011 round, we generated a complete listing of the holes and a document containing a description of the process of identifying the holes and a detailed analysis of a few sample holes that appear in the provider's coverage. This information was sent to the providers along with the request for revised data for this round.

In the course developing the tools for this analysis, we noticed that Verizon has made changes in their process for generating submitted data, because while such holes had been present in the data they submitted previously, their current data has no such holes.

5.3 Fixed Wireless Processing

NTIA had questioned us about the coverage areas associated with two providers who offer fixed-wireless service in New Jersey. In one case, the provider, Global Online Electronic Services, uses fixed wireless links as a substitute for wireline connections and serves a single location with each link. We therefore generated a "coverage area" by using the census block that contains the address. This is clearly not the result of propagation model analysis, but due to the nature of the service they provide accurately reflects their capabilities.

We also receive information from a new fixed wireless provider, Jersey Shore Wireless. They provided us with image files (e.g., jpegs) with coverage maps that had been hand-drawn based on a drive-test they had conducted in 2008. Given the source of the information, the shapes tend to align with major roadways. Jersey Shore Wireless did not have the resources available for propagation modeling and we did not have sufficient time to assist them in performing this task. For this round, we manually converted their images into shape files. It was clear that these shapes would understate, rather than overstate coverage, and thus it seemed reasonable to include them.

5.4 Process Verification

We instituted a thorough review of our process steps. The review involved investigation of each process step by an individual other than the person who had created the process or executed it in the past. As a result of this process, we were able to implement several process improvements. The corrections and improvements include:

- For CenturyLink, altered Census Block process to allow provider's speed values, with validation-related adjustments, rather than setting all values the same.
- For Hometown Online, adjusted Census Block process to account for the fact that provider reported different transtech and speed values in one census tract.
- For Service Electric – Sparta, set middle mile capacity and type values, which had inadvertently been left null in the previous submission. Adjusted technology and speed values to reflect DOCSIS 3.0.
- For ViaSat, corrected spectrum value to reflect that they offer satellite service.
- For Verizon, corrected the ownership value of the middle mile locations, which had been inadvertently left as null in previous rounds.
- For Xchange Telecom, set provider type to "reseller", based on interaction with provider that indicated that they lease facilities from Verizon.
- Revised CAI processing rules to insert "NA" for building number when no value was available.
- Made multiple improvements to CAI address processing to enhance the automated address extraction and mapping to reference data.

5.5 Validation Warnings

We received warning messages from the NTIA data validation tool when processing submission data from several providers. The details of these warnings and our reaction to them are included in the individual provider reports later in this document. Here we provide a convenient summary of those warnings that are still present in the submitted data.

5.5.1 Provider Warnings

The following table describes the warnings we received from the validation script and provides our explanations for submitting these values.

Provider	Warning
AT&T	We received a warning on the wireless shape record for the combination of downstream speed code of 7 (10-25 Mbps) with a transtech code of 80 (Mobile Wireless) for the LTE service. The maximum advertised speed tier provided in the cover letter that came with the provider's submission is 7. Provider confirmed that the value is correct.
Century Link	We received warnings on 7083 census blocks and 1690 street segments for the combination of a downstream speed code of 7 (10-25 Mbps) with a transtech code of 10 (ADSL). The provider had originally reported speeds exceeding 25 Mbps, or a speed code of 8. When we questioned these, the provider could not confirm those values, but asserted that all areas were covered with speeds exceeding 10 Mbps.
Covad	We received warnings on 9681 census blocks for the combination of a downstream speed code of 7 (10-25 Mbps) with a transtech code of 10 (ADSL). Note that the provider confirmed that they support 15 Mbps with their ADSL2+ service in limited regions in the state.
Global Online	We received warnings on the wireless shape record for the combination of upstream and downstream speed codes of 7 (10-25 Mbps) with a transtech code of 70 (Fixed Wireless - Unlicensed). The provider has only a single fixed wireless site, and it is used for point-to-point links, rather than to provide a coverage area. The provider confirmed that the speed is 10 Mbps.
Service Electric Broadband Cable	We received warnings on 5265 census blocks and 985 street segments for the combination of a downstream speed code of 8 (25-50 Mbps) with a transtech code of 40 (DOCSIS 3.1). The provider was not willing to commit that they offered anything faster. A search of their Web site confirmed that the fastest speed they advertise is 35 Mbps down and 3 Mbps up.
Skycasters	We received a warning on the wireless shape record for the combination of downstream speed code of 6 (6-10 Mbps) with a transtech code of 60 (Satellite). A search of their Web site confirmed that the fastest speed they advertise is 6.09 Mbps down and 1.5 Mbps up.
T-Mobile	We received a warning on the wireless shape record for the combination of downstream speed code of 7 (10-25 Mbps) with a transtech code of 80 (Mobile Wireless). Investigation of the T-Mobile Web site showed that they are advertising average speeds "approaching 10 Mbps" and peak speeds of 27 Mbps. Sent a note to the provider to verify the value. Provider confirmed that those values are correct.
Verizon Wireless	We received a warning on the wireless shape record for the combination of downstream speed code of 7 (10-25 Mbps) with a transtech code of 80 (Mobile Wireless). The maximum advertised speeds provided in the cover letter that came with the provider's submission are 600 - 9.99 mbps down and 3.00 - 5.99 mbps up. The typical speeds are provided as ranges: 5 - 12 Mbps down and 2 - 5 Mbps up. For max adv speeds we had originally encoded the submitted down speed as value 6 (range 6-10Mbps) and encoded the submitted up speed as value 5 (range 3-6mbps). Based on the email from Anne Neville data 2/21/2012, we modified the down speed to code 7.
ViaSat	We received a warning on the wireless shape record for the combination of downstream and

	upstream speed code of 7 (10-25 Mbps) with a transtech code of 60 (Satellite). Provider said that in most locations, speeds are significantly in excess of the speeds set forth in the NTIA Tiers for "Satellite Technology" so they are reporting the actual maximum advertised upload and download speeds. Provider confirmed that they launched two new services named Exede 5 and Exede 12 and Exede 12 has a maximum advertised upload speed of 3 Mbps and a maximum advertised download speed of 12 Mbps.
Warwick Online	We received warnings on 404 census blocks for the combination of a downstream speed code of 7 (10-25 Mbps) with a transtech code of 10 (ADSL). We searched the provider's Web site for speed information. We only found one reference to speed packages, and these values and the Web page seemed out of date. We sent a request for clarification to the provider. The provider acknowledged the validation requirements, indicated that the Web page found by our search was in error and confirmed the submitted speed values. The president of the company also indicated that they would be launching a new Web site with corrected speed information in the near future.
Xchange Telecom	We received warnings on 1012 census blocks for the combination of a downstream speed code of 7 (10-25 Mbps) with a transtech code of 10 (ADSL). Note that the provider confirmed, and we validated via their Web site that they advertise, 10 Mbps, which is just at the bottom of the range for code 7.

5.5.2 CAI Warnings

The validation script produced 10718 warnings on our CAI data for 10695 null values of transtech and 23 zero values of transtech. This is a result of our decision to include all the CAIs that we could reliably identify and geo-locate, even if we have not been able to ascertain the broadband usage at the site as yet. The 23 records with zero for transtech are a result of two forms of data submission. 16 of these records were a result of submissions to our website where the CAIs selected it to signify a technology other than the NTIA defined ones. These are accompanied by valid speed tiers. The remaining 7 were from records where the technology, downstream speed and upstream speed were all zero. We are in the process of ascertaining if this indicates that there is no broadband connection or if it is unknown.

This full list provides us with a target for our outreach efforts to these institutions. The set of "complete records", which include full broadband access information, is a key metric we are using to track progress in obtaining information about the broadband access. The counts of these records by category are included in the table above and in the CAI data processing section in Appendix B.

5.6 Analysis of FCC Third Party Data Comparisons

For this submission the NJ BB Mapping Team benefited from having received feedback from NTIA/Michael Baker with results of comparisons they made between the data we had submitted in June-11 and Dec-11 and their third-party data. After a careful analysis of these results (provided in Appendix C) we determined that most of the discrepancies reported back to us could be attributed to data submitted by the following six providers: Comcast, DIECA/COVAD/Megapath, Sprint, T-Mobile, Verizon Online, and Verizon Wireless/Cellco. It is important to note that the NJ BB Mapping Team was not given copies of the third-party data, so the reasons for mismatches between the data we submitted and these third-party data were not clear. Our intent was two-fold: (1) to try and understand the scope of possible reasons underlying the discrepancies and (2) share with providers problematic fields, such as provider name or speed tier, which seemed to generate a lot of mismatches, and do some further inquiry to better validate the provider's data. Obviously, by working more closely with providers in this way, we hope to continue to improve data quality in future submissions. The table below summarizes the apparent source of discrepancies and the provider's explanation, for those who responded.

Provider	Probable Source of Discrepancy	Provider Explanation
Comcast	• Most mismatches on max advertised downstream speed (principally tier 10) and maximum advertised upstream speed (principally tier 7) for Cable Modem DOCSIS 3.0.	I believe this issue is one that we have encountered in other states, and results from the method by which we submit data. We provide maximum advertised speed data by MSA, but not all Census blocks within an MSA may offer D3 service--in which case, a D2 Census block may reflect a maximum advertised speed coded as "10." Similarly, but less frequently, Comcast may be in the process of upgrading service to D3 but has not yet initiated advertising for D3 speeds in that area--in which case, a D3 Census block may reflect a maximum advertised speed coded as "7." Accordingly, if a D2 Census block is in a MSA in which the overwhelming majority of Census blocks are coded as a "10," those D2 blocks should be coded as a "7." If a D3 Census block is in an MSA coded as a "7," that is likely due to the fact that Comcast has not begun advertising the D3 speeds in that MSA. I believe in our last submission, Comcast showed 100% D3 blocks throughout the state of New Jersey and a maximum advertised download speed of "10." I am waiting for this cycle's data to confirm that this remains the case. Comcast provides D3 throughout New Jersey, so there should be no disconnect between the Census block data and maximum advertised speeds.
DIECA/COVAD/Megapath	• Many provider name mismatches. Might this be attributed to recent M&A activities? • On records where provider name matches third-party data, large number of transfer technology mismatches, primarily involving transtech code 20 (SDSL) and code 30 (Other Copper Wireline). • Most mismatches on max advertised downstream speed involve tiers 5 & 7. • Most mismatches on max advertised upstream speed involve tiers 3, 5 & 7.	More than half of our lines in each state are supplied via ISP resellers, where we provide the underlying internet connectivity in a wholesale capacity for service that is otherwise branded, billed and supported as the ISP's own service. For over 90 of our resellers, we perform a layer 2 network handoff, such that the reseller's IP address space is what would be visible via the internet as well. This makes it impossible for a third party data collector to know these are being served by our last mile infrastructure without detailed cooperation from each ISP. Of course, if supplied a few example instances of these purported mismatches, we could readily provide an exact analysis. Our branding does not necessarily make it clear what underlying technologies are being used to provide service, so it is likely that a third party data collector has made incorrect assumptions in some situations. For example, we offer "TeleSpeed" and "Ethernet" branded services that may be utilizing symmetric DSL or other copper wireline technology. In a few cases, we also have legacy residential "TeleSurfer" services

		that may be utilizing symmetric or asymmetric DSL technology. Again, if we could be supplied a few examples, we could readily provide a exact analysis. In the case where a third party data provider may have found faster than reported speed, this may be due to the filing requirement that we report only services that can be installed within a typical service interval. From time to time, we also change our network deployment which could result in an increase or decrease in maximum available speed. Also, in our own direct business, we did not always sell our maximum provisionable speed, even though we made these offerings available to our resellers. We will be happy to provide more precise explanation if given actual examples.
Sprint	• Most mismatches on max advertised downstream speed tier 3. Possibility that tier 3 understates downstream speed? • Most mismatches on max advertised upstream speed for tier 2. Possibly understating upstream speed?	No explanation offered
T-Mobile	• Most mismatches on max advertised downstream speed tiers 4 & 6. Possibly understated downstream speed in lowest tiers? • Most mismatches in max advertised upstream speed for tier 2. Possibly understating your upstream speed?	No explanation offered
Verizon Online	• Most mismatches on max advertised downstream speed involve tiers 4, 5 & 6 for ADSL. • Most mismatches on max advertised upstream speed involve tiers 2 (ADSL) & 7 (Optical Fiber). • Mismatches have to do with the way provider identifies ADSL speed tiers?	No explanation offered
Verizon Wireless/Cellco	• Most mismatches on max advertised downstream speed tiers 3 & 7. Possibility 3 understates downstream speed and 7 overstates it? • - Most mismatches in max advertised upstream speed is for tier 2. Possibly understating upstream speed?	No explanation offered

The complete set of email exchanges with these providers regarding these analyses is included in their respective data reports (see Appendix A). A set of six questions related to this analysis of discrepancies between NJ and third-party data was also transmitted to the NTIA/Michael Baker team and discussed in a teleconference call involving members of this team and the NJ Broadband Mapping Team. These questions, along with answers provided by the NTIA/Michael Baker participants, are provided in Appendix C.

6 Appendix A: Individual Provider Process Descriptions

6.1 Advanza

Connecting New Jersey - Broadband Provider Data Report

Provider: Advanza
Received: August 2011
Submission date: October 2012

This report presents details on processing of broadband data for delivery to the National Telecommunications and Information Administration.

For October 2012:

This is a stub report, since data from the previous submission was reused unchanged. The complete report from the previous submission begins on the next page. Notable differences from the processing done on the previous submission are listed next.

Section 1: NDA Status

Advanza states that NONE is required.

Section 2: Submission Overview

<table>
<tr><th colspan="3">AVAILABILITY DATA – RECEIVED AUGUST, 2010</th></tr>
<tr><td rowspan="5">ID</td><td>Provider name</td><td>Advanza Telecom Inc</td></tr>
<tr><td>“Doing business as” name</td><td>Advanza</td></tr>
<tr><td>FRN</td><td>0017029141</td></tr>
<tr><td>Holding Company Name</td><td>Advanza Telecom, Inc.</td></tr>
<tr><td>Holding Company Number</td><td>180002</td></tr>
<tr><th colspan="3">FOR WIRELINE</th></tr>
<tr><td>Filetypes</td><td colspan="2">1 xlsx spreadsheet</td></tr>
<tr><td>File size</td><td colspan="2">NJBB_0017029141_AddressLevelAvailability-20110630.xls file has 47 records</td></tr>
<tr><td>Speeds</td><td><table><tr><th>Type</th><th></th><th>Spatial Resolution (address, street seg, census block, RSA/MSA, zipcode,etc)</th></tr><tr><td>Typical-upstream</td><td>X</td><td>address</td></tr></table></td><td>All provided speeds have code 4 (1.5 mbps ≤ BW < 3.0 mbps) for all records, which would make sense if all service is T1</td></tr>
</table>

	Typical-downstream	X	address	
	Advertised-upstream	X	address	
	Advertised-downstream	X	address	
	Subscriber-weighted-up	☐	Not provided	
	Subscriber-weighted-down	☐	Not provided	
Technology Type	Code 30 (= Other Copper Wireline) given for all records			
End-user specification	Values 2, 3 or 4 (Government, Small Business or Enterprises).			
Comments: Data was submitted for Fall 2011 submission. Provider did not respond to requests for revised data. Confirmed via Web site that they offer these services (T1 and NxT1). Web site lists possibility of higher speeds as well. Based on this information, it was determined that the data is likely still accurate and decision was made to re-use prior data.				

INTERCONNECTION DATA – NO DATA PROVIDED	
ID	
File size	
Ownership	
Transport Type	
Data Rates/Capacity

Comments:	

Section 3: Submission File Details

Received one file by secure upload to the connectingnj web site.

Size **Name**

71,168 NJBB_0017029141_AddressLevelAvailability-20110630.xls

The addresses in this file appear to be for individual customers (as opposed to addresses of multi-tenant buildings in a central business district).

Section 4: Data Validation,Transformation and Loading

The standard NDA prohibits us from submitting address-level data to the NTIA. Instead, we discover the census block for each customer address, and then report the census block shape drawn from Census Bureau TigerLine reference data.

NTIA Table BB_Service_CensusBlock

Loaded from the file mentioned above. The following table explains the transformations that were applied to load the target table.

Table Column	**Data Source / Transformation**
PROVNAME	Set to " Advanza Telecom Inc" (no trailing period)
DBANAME	Not supplied; set same as PROVNAME
PROVIDER_TYPE	Set to 1
FRN	Set to "0017029141"
STATEFIPS	Set to “34” (NJ)
COUNTYFIPS	Populated from Census Block FIPS Code (first 3 digits)
TRACT	Populated from Census Block FIPS Code (next 6 digits)
BLOCKID	Populated from Census Block FIPS Code
FULLFIPSID	Populated from Census Block FIPS Code
TRANSTECH	As supplied in column Tehcnology of Transmission (sic)
MAXADDOWN	As supplied in column Maximum Advertised Downstream Speed
MAXADUP	As supplied in column Maximum Advertised Upstream Speed
TYPICDOWN	Set to null (see below)
TYPICUP	Set to null (see below)
ENDUSERCAT	Set to null (see below)
SHAPE	Copied from Census Bureau TigerLine 2010, as matched by spatial join on geocoded address

Internal processing notes.

1. Following steps were performed for Fall 2011 submission
    a. Geocoded the addresses using an Arroyo flow and the Yahoo geocoder, leaving the result with address and lat, long data in an Excel spreadsheet. All addresses were successfully geo-coded.
    b. Imported the spreadsheet to a simple ESRI geodatabase table
    c. Added point shapes corresponding to each Latitude,Longitude pair by creating a feature

class from the table using ArcCatalog's "Create Feature Class from XY Table" option

d. Added a column containing the ID of the containing year 2010 census block using ArcCatalog's spatial join feature. The newly created point shapes are joined against census block shapes from reference data. All records successfully spatially joined on 2010 NJ Census Block shapes.
e. Discarded typical speeds since they were in all cases identical to maximum advertised speeds, not measured values.
f. The end user category value as originally supplied applied to an address, but we must anonymize the addresses and report census blocks. The NTIA directs us to report the "predominant" end-user category, which is not supplied here.
g. Copied contents to the target data model table with the transformations specified above. Discarded 15 rows with duplicate census blocks.

2. Copied prior data into new BB_Service_CensusBlock table.
3. All data passed NTIA validations.

Section 5: Clarification Questions and Responses

Subject: URGENT: Response Requested: Get your Broadband Services on the National Broadband Map
Date: Fri, 17 Aug 2012 14:34:18 -0400
From: Connecting NJ <ConnectingNJ@appcomsci.com>
To: TomG@advanza.net

Tom,

Will Advanza Telecom be submitting map data updates in this round? Time is running out. If you require assistance, please contact us so we can include your service area in the latest National Broadband Map: connectingNJ@groups.appcomsci.com or 732-699-2380.

Regards,

Cliff Behrens

Subject: Re: URGENT: Response Requested: Get your Broadband Services on the National Broadband Map
Date: Fri, 17 Aug 2012 14:40:38 -0400
From: Tom Garrison <tomg@advanzasystems.com>
To: Connecting NJ <ConnectingNJ@appcomsci.com>, TomG@advanza.net

Hi,

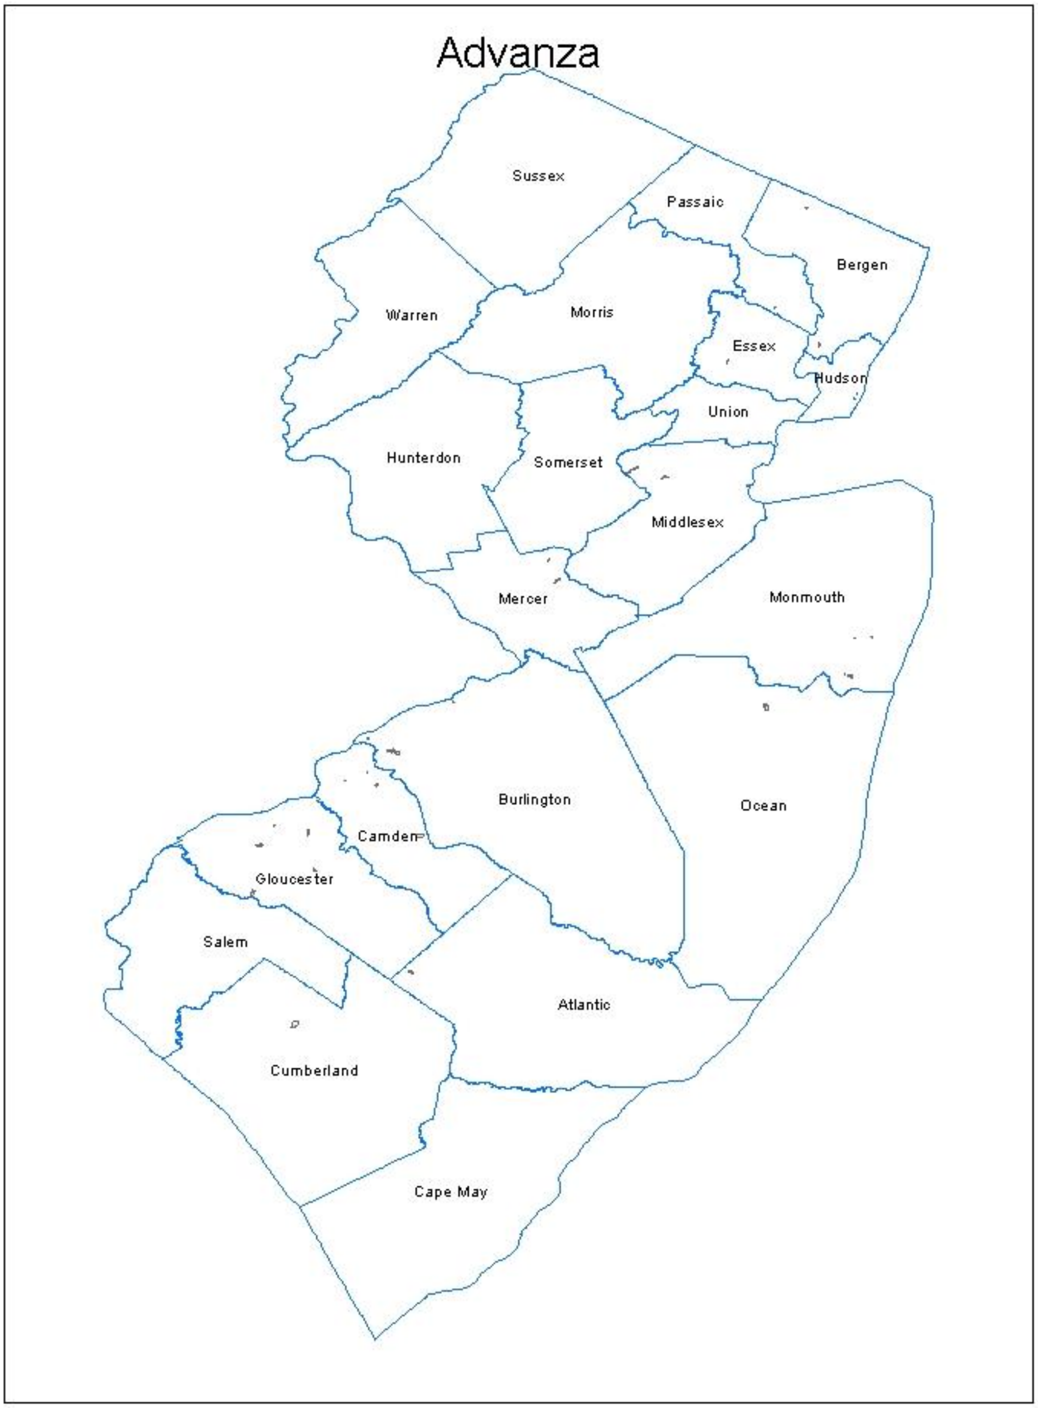
If it's not absolutely required I would prefer not to. We're a small company with less than 100 circuits in service and I really don't have time to gather the data.

Thank You.

Tom

Section 6: Notes and Open Issues

Section 7: Overview Map of Submitted Data



6.2 AT&T Mobility

Connecting New Jersey - Broadband Provider Data Report

Provider: AT&T Mobility LLC
Received: August 2012
Submission date: October 2012

This report presents details on processing of the broadband data for delivery to the National Telecommunications and Information Administration.

Section 1: NDA Status

NDA was executed with NJ OIT.

Section 2: Submission Overview

AVAILABILITY DATA		
ID	Provider name	AT&T Mobility LLC
	"Doing business as" name	AT&T Mobility LLC
	FRN	0004979233 for mobility NB: "AT&T Corporation, Inc." with FRN 0004979244 for middle mile
FOR WIRELESS		
Filetypes	shapefile collection: shp/dbf/prj/shx, mdb, gdb, imagefile etc.	Spreadsheet (XLSX) and shapefile that uses projection GCS_WGS_1984
Speeds	Type	Spatial Resolution (address, street seg, census block, RSA/MSA, zipcode)
	Upstream max adv	State
	Downstream max adv	State
	Upstream typical	Not provided
	Downstream typical	Not provided
	Subscriber-weighted	Not provided
Technology	Spectrum (Mhz, FCC code)	Cellular (code 1) and PCS (code 3)

NJ_ATT_4G_July2012.PRJ	1 KB
NJ_ATT_4G_July2012.shp	112 KB
NJ_ATT_4G_July2012.SHX	1 KB

Section 4: Data Validation, Transformation and Loading

NTIA Table BB_ConnectionPoint_MiddleMile

Loaded from supplied Excel Spreadsheet "ATT Router Locations NJ June 2012.xlsx" (1 row). Since data is identical to that included in previous submission, we copied the previous data.

The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	As supplied
DBANAME	As supplied
FRN	Added leading zeroes to read 0004496774 (see below)
OWNERSHIP	As provided in column "Ownership"
BHCAPACITY	As provided in column "Serving Facility Capacity"
BHTYPE	As provided in column "Serving Facility Type"
LATITUDE	As provided in column "Latitude_geo"
LONGITUDE	As provided in column "Longitude_geo"

ELEVFEET	Set to "0" (zero)
STATEABBR	Set to "NJ"
FULLFIPSID	ID of containing census block from Year 2010 Census Bureau TigerLine reference data
SHAPE	Created using ESRI ArcDesktop

Internal notes on processing:

1. Used the provider name, DBA name, and FRN as supplied, after adding back leading zeros to the FRN. Note that the middle-mile entity is different than the mobility entity and per clarification from AT&T during the October 2010 submission round, should indeed be reported differently.
2. Imported the excel sheet to a geo-database table.
3. Added point for the Latitude, Longitude pair by creating a feature class from the table using ArcCatalog's "Create Feature Class from XY Table" option.
4. Mapped to separate shape file to correct tolerance.
5. Added a column containing the ID of the containing year 2010 census block via a spatial join of the points and the census block shapes from reference data.

NTIA Table BB_Service_Wireless

Different from the last submission where only one shape file, UMTS, is submitted, there are 3 shape files submitted this time: ATT_LTE_July2012_NJ with 47 records, NJ_ATT_3G_July2012 with 25 records, and NJ_ATT_4G_July2012 with 9 records.

The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	Set to "AT&T Mobility LLC"
DBANAME	As supplied in file Mobility Response NJ June 2011.xlsx
FRN	Set to 0004979233
TRANSTECH	As supplied in file Mobility Response NJ June 2010.xlsx
SPECTRUM	Set to "3" per translation shown below
MAXADDOWN	Set to "4", see below.
MAXADUP	Set to "3", see below.
TYPICDOWN	Not provided, set to null
TYPICUP	Not provided, set to null

STATEABBR	Set to “NJ”
SHAPE	As supplied.

Internal notes on processing:

1. File “Mobility Response Template June 2012 New Jersey.xlsx” (different than the one in the previous submission) contains three rows with provider name, DBA name, FRN, technology of transmission, a specification of the spectrum bands used, and the maximum advertised up/down speeds. The FRN is missing the leading zeros. The TechTrans code is valid. The max speed values are plausible.
2. The shape files have no text attributes associated with the row. The coverage area is most of the State of New Jersey, broken into separate shapes by various horizontal and vertical lines. The map strongly resembles the map shown at www.wireless.att.com.
3. The supplied shapes use geographic coordinate system name GCS_WGS_1984. The NTIA data model requires the same coordinate system. No geographic transformation was required, but the XY Tolerance value differs from the required value. Imported shape then mapped to separate shape with proper tolerance which resulted in a new feature class with the suffix “_tol”.
4. NTIA requires shapes to be contained in the NJ state boundary. Although we visually verified that it is the case, we clipped the shape using ESRI: Analysis Tools-> Extract -> Clip with, select feature class refdata_2010.tl_2010_34_state10_wgs. The feature classes have the suffix "_clip"
5. Coalesced the single-part polygons into one multi-part polygon using the ArcGIS “Dissolve” tool, which resulted in a new feature class with the suffix “_Dissolve”.
6. Spectrum: AT&T Mobility provided multiple columns of data about their spectrum use. Searching on the web suggests that AT&T 3G uses frequencies 850MHz and 1900Mhz. The NTIA data model has a single column for spectrum. No mapping is provided for frequency 850MHz. Frequency 1900MHz corresponds to NTIA “SPECTRUM USED” code value 3 – this was used for the 3G and 4G services.
7. Speeds were given as index values conforming to the NTIA model.
8. The only data imputed was the state abbreviation.
9. Validation rules produced a warning on the wireless shape record for the combination of downstream speed code of 7 (10-25 Mbps) with a transtech code of 80 (Mobile Wireless) for the LTE service. The maximum advertised speed tier provided in the cover letter that came with the provider’s submission is 7. Provider confirmed that the value is correct.

Section 5: Clarification Questions and Responses

From: Connecting NJ [mailto:ConnectingNJ@appcomsci.com]
Sent: Friday, August 31, 2012 3:17 PM
To: WAGNER, GREGORY G
Subject: Re: NJ Broadband Data Collection - Fall 2012

Greg,

Before we submit provider data to the NTIA it must be validated by an NTIA script.
When we processed your submission with this script, it generated a warning and

recommended that for transtech=80 the maxaddown speed should be changed from "7" to "6." In other words, the NTIA believes that the maximum advertised downstream Service Speed for Terrestrial Mobil Wireless cannot equal 10 mbps or greater (hence the recommended value "6", see table below). I just need to confirm from you that you think "7" is the value you intended to submit and the speed you support.

Best regards,

Cliff

Section 4: Data Transformation and Loading

NTIA Table BB_ConnectionPoint_MiddleMile

Since data was not provided for the October 2012 submission, the April 2012 data was copied.

The following describes how the data was loaded in previous submission.

Loaded from data supplied in the XLS sheet. Only one row describes a connection point in New Jersey. The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	Set to “CSC HOLDINGS INC”
DBANAME	Set to “CABLEVISION”
FRN	As supplied in column frn_name
OWNERSHIP	Set to code 1, leased
BHCAPACITY	Set to code 4; 1gbps falls in range 600mbps – 2.4gbps

BHTYPE	Set to code 1, fiber
LATITUDE	Obtained by geocoding the address
LONGITUDE	Obtained by geocoding the address
ELEVFEET	Set to “0” (zero)
STATEABBR	Set to “NJ”
FULLFIPSID	ID of containing census block from Year 2010 Census Bureau TigerLine reference data
SHAPE	Point shape created using ESRI ArcDesktop

Internal notes on processing:

6. Reused the table created for the October 2010 submission, but mapped Lat/Long to 2010 census block.
7. Since the data was not provided for the April 2012, the October 2010 data was reused.

NTIA Table BB_Service_CensusBlock

Loaded from the two supplied feature classes (shapefiles) with census blocks, one for Cablevision and one for LightPath. The following table explains the transformations that were applied to load the target table. The Cablevision has 60,706 records and LightPath has 1,242 records.

Table Column	**Data Source / Transformation**
PROVNAME	As supplied in column proname
DBANAME	As supplied in column dbaname
PROVIDER_TYPE	Set to 1
FRN	As supplied in column frn
STATEFIPS	Set to “34” (NJ)
COUNTYFIPS	Populated from cenblock (digits 3-5)
TRACT	Populated from cenblock (digits 6-11)
BLOCKID	Populated from cenblock (digits 12-15)
FULLFIPSID	As supplied in column cenblock
TRANSTECH	As supplied - For Cablevision: column trechtrans2 - For Lightpath: column techtrans
MAXADDOWN	As supplied in column maxaddnsp
MAXADUP	As supplied in column maxadupsp

TYPICDOWN	Set to null, not supplied
TYPICUP	Set to null, not supplied
ENDUSERCAT	Set to null, not supplied
SHAPE	As supplied in column shape

Internal processing notes:

1. Import the features with XY Coordinate System " GCS_North_American_1983" via the following three-step process. (A simple Import using ArcCatalog yields an incompatible tolerance value.)
    a. First, copy the data from the shapefiles to the geodatabase using a geographic transformation “NAD_1983_to_WGS_1984_5”. This yields feature classes with the required coordinate system but an incorrect tolerance value. Names are "cv_nj_ar_av_cb_lt_2mi_wgs" and "lp_nj_ar_av_cb_lt_2mi_wgs".
    b. Second, create new feature classes with the same schema as the provided shapefile feature classes and the required coordinate reference system (GCS_WGS_1984) and tolerance (0.000000002 degrees). Names are " cv_nj_ar_av_cb_lt_2mi _wgs_tol" and "lp_nj_ar_av_cb_lt_2mi _wgs_tol".
    c. Third, load the data into the newly created feature classes to ensure perfect compatibility with the required coordinate reference system and tolerance.
2. Ignored the column "techtrans1" in the Cablevision feature class. The presence of two transport technologies indicates that they can support both DOCSIS 3.0 and Other on the all lines.
3. All of the cenblock values correspond to valid Year 2010 Census Block IDs.
4. All census blocks were confirmed to be less than 2 square miles.
5. There were no duplicates in terms of census block and transtech.

NTIA Table BB_Service_RoadSegment

Loaded from the two supplied features with line segments. The following table explains the transformations that were applied to load the target table. The Cablevision has 1,276 records and Lightpath has 111 records.

Table Column	**Data Source / Transformation**
PROVNAME	As supplied in column prvd_name
DBANAME	As supplied in column dba_name
PROVIDER_TYPE	Set to 1
FRN	As supplied in column frn_name
ADDMIN	Set to the least of the non-empty address numbers
ADDMAX	Set to the greatest of the non-empty address numbers

PREDIR	Set to null (no value supplied)
STREETNAME	As supplied (has all street components, not just name)
STREETTYPE	Set to null (no value supplied)
SUFFDIR	Set to null (no value supplied)
CITY	Set to null (no value supplied)
STATECODE	Set to "NJ"
ZIP5	Set to null (no value supplied)
ZIP4	Set to null (no value supplied)
TRANSTECH	As supplied in column tech_trans
MAXADDOWN	As supplied in column max_ad_dwn
MAXADUP	As supplied in column max_ad_up
TYPICDOWN	Set to null (no value supplied)
TYPICUP	Set to null (no value supplied)
SHAPE	As supplied

Internal processing notes:

1. Feature classes were imported exactly as discussed above for table BB_Service_CensusBlock.
2. Ignored the column "techtrans1" in the Cablevision feature class. The presence of two transport technologies indicates that they can support both DOCSIS 3.0 and Other on the all lines.
3. Three records in the Cablevision set were determined to be duplicates, in terms of county and Tiger Line ID. One record in the Lightpath set was found to be duplicate. These records were discarded.

Section 5: Clarification Questions and Responses

From: NJ Broadband Data Collection [mailto:ConnectingNJ@groups.appcomsci.com]

Ted,

We have performed our initial review of the data you submitted and we have a clarification question. Your recent submission did not include any middle mile information. The last middle-mile data you submitted is from a year ago. Is that data still valid? If not, could you please supply us with revised information?

Thanks for your cooperation.

Section 4: Data Validation,Transformation and Loading

NTIA Table BB_ConnectionPoint_MiddleMile

According to the email below, there is no change in middle mile data in the 2012 April. Since the middle mile data is not submitted, we assume that there is no change in this submission.

The following table explains the transformations that were applied in earlier submission.

Table Column	Data Source / Transformation
PROVNAME	Set to “CenturyLink, Inc.” per email
DBANAME	As supplied in DbaName
FRN	As supplied in FRN
OWNERSHIP	As supplied in Own
BHCAPACITY	As supplied in BHCap
BHTYPE	As supplied in BHType
LATITUDE	As supplied in Lat
LONGITUDE	As supplied in Long
ELEVFEET	Set to “0” (zero)
STATEABBR	Set to “NJ”
FULLFIPSID	ID of containing census block from Year 2010 Census Bureau TigerLine reference data
SHAPE	Point shape created using ESRI ArcDesktop

Internal notes on processing:

8. Loaded 1 row of data from Excel Spreadsheet “middlemile_NJ.txt” (1 row) that was supplied for the April 2011 submission. Data in that table had previously been spatially joined to find containing census block.

NTIA Table BB_Service_CensusBlock

Loaded from supplied shapefile feature “CTL_NJ_2011_12_region”. The following table explains the transformations that were applied to load the target table.

Table Column	Data Source / Transformation
PROVNAME	Set to “CenturyLink, Inc.” per email
DBANAME	As supplied in column “dba_name”
PROVIDER_TYPE	Set to 1
FRN	Set to "0018626853"
STATEFIPS	Set to “34” (NJ)
COUNTYFIPS	Populated from census_blo (digits 3-5)
TRACT	Populated from census_blo (digits 6-11)
BLOCKID	Populated from census_blo (digits 12-15)

BLOCKSUBGROUP	Set to null
FULLFIPSID	As supplied in column census_blo
TRANSTECH	As supplied in column technology
MAXADDOWN	Set to 7 for all records
MAXADUP	Set to 4 for all records
TYPICDOWN	Set to null
TYPICUP	Set to null
SHAPE	As supplied

Internal notes on processing

10. Differently from the 2012 April submission, the supplied shapes use geographic coordinate system GCS_North_American_1983. The NTIA data model requires coordinate system GCS_WGS_1984. To change the projection we applied the ESRI geographic transformation NAD_1983_To_WGS_1984_5 (per ESRI KB article 24159). The resulting table is named with suffix "_wgs".
11. We had to create a new feature class and reload the data so that the tolerance value matches the NTIA transfer model's tolerance value exactly, resulting in a feature class with a suffix of "_tol".
12. Shapefile (feature class) CTL_NJ_2012_06 _region provides coverage data for census blocks with an area less than or equal to 2 square miles. It contains 7,369 records. All of the IDs shown in the shapefile correspond to valid Year 2010 Census Block IDs and all are smaller than 2 square miles.
13. The feature class "region" has 286 rows with duplicate census block IDs and identical technology codes (confusingly the speeds are different for the some of these duplicates). We discarded these to avoid creating duplicate shapes in the table.
14. The feature class has 11 rows with technology 10 and downstream speed code 8. This combination produced a validation warning. The provider could not confirm that these values were correct, but asserted that all areas were covered with speed tiers 7 down and 4 up. We changed the speed tiers on these values to 7/4.
15. We loaded 7083 records into the bb table.

NTIA Table BB_Service_RoadSegment

Loaded from supplied shapefile feature "CTL_NJ_2012_06_polyline". The following table explains the transformations that were applied to load the target table.

Table Column	**Data Source / Transformation**
PROVNAME	Set to "CenturyLink, Inc." per email
DBANAME	As supplied in column "dba_name"
PROVIDER_TYPE	Set to 1

FRN	Set to "0018626853"
ADDMIN	Set to the least of the non-empty address numbers
ADDMAX	Set to the greatest of the non-empty address numbers
PREDIR	Set to null (no value supplied)
STREETNAME	As supplied
STREETTYPE	Set to null (no value supplied)
SUFFDIR	Set to null (no value supplied)
CITY	Set to null (no value supplied)
STATECODE	Set to “NJ”
ZIP5	Set to null (no value supplied)
ZIP4	Set to null (no value supplied)
TRANSTECH	As supplied
MAXADDOWN	Set to 7
MAXADUP	Set to 4
TYPICDOWN	Set to null
TYPICUP	Set to null
TLID	Set to Null – not supplied
SHAPE	As supplied

Internal notes on processing:

1. Shapefile (feature class) CTL_NJ_2012_06 _polyline shows street segments for census blocks larger than 2 square miles. In contained 3098 records.
2. Differently from the 2012 April submission, the supplied shapes use geographic coordinate system GCS_North_American_1983. The NTIA data model requires coordinate system GCS_WGS_1984. To change the projection we applied the ESRI geographic transformation NAD_1983_To_WGS_1984_5 (per ESRI KB article 24159). The resulting table is named with suffix “_wgs”.
3. We had to create a new feature class and reload the data so that the tolerance value matches the NTIA transfer model’s tolerance value exactly, resulting in a feature class with a suffix of “_tol”.
4. We discarded 734 records with no street name (field empty), leaving 2364 full records. These entries typically had no min/max address information as well.
5. We checked for uniqueness using the county number, street name, min and max address and the string portion of the shape object. Including the string description of the shape object had the effect of including the number of points in the shape as part of the uniqueness test. We discarded 674 records as duplicates using this method. There is a chance that this discarded some non-duplicates, but our manual inspection of the data made it appear valid.
6. Based on provider instructions that they have 10 Mbps coverage in all their NJ exchanges, we set all down/up advertised speeds to 7/4.

7. We loaded 1690 rows.

Validation rules produced a warning on 7084 census blocks and 1690 street segments for the combination of a downstream speed code of 7 (10-25 Mbps) with a transtech code of 10 (ADSL). The provider had originally reported speeds exceeding 25 Mbps, or a speed code of 8. When we questioned these, the provider could not confirm those values, but asserted that all areas were covered with speeds exceeding 10 Mbps.

Section 5: Questions

Subject: NJBB Data Clarification - CenturyLink

Gerry,

We have reviewed the data you submitted and have a few questions:

1. The NTIA wants us to verify cases where speeds over 10 Mbps are reported for DSL. You reported instances of download speeds in the 10-25 Mbps and 25-50 Mbps for your DSL service. Are these correct values?
2. In previous rounds, you had submitted a single middle mile point. Do you have updated information, or should we use that same data for this round?
3. In prior submissions, your street-segment data included the TigerLine ID of each segment. Is it possible for you to include that information this round?

We appreciate your participation in the program.

Subject: NJBB Data Clarification - CenturyLink

Gerry,

We have reviewed the data you submitted and have a few questions:

1. The NTIA wants us to verify cases where speeds over 10 Mbps are reported for DSL. You reported instances of download speeds in the 10-25 Mbps and 25-50 Mbps for your DSL service. Are these correct values?

[G. Flurer] Yes. CTL uses ADSL2 and VDSL2 in certain areas to achieve those speeds.

2. In previous rounds, you had submitted a single middle mile point. Do you have updated information, or should we use that same data for this round?

[G. Flurer] No updates for that data.

3. In prior submissions, your street-segment data included the TigerLine ID of each segment. Is it possible for you to include that information this round?

[G. Flurer] In several other states we found Tiger ID data from Pitney Bowes to be invalid. For this round we adopted the use of the TIGER street data. I'm looking at possibly including the TIGER ID in future submissions.

We appreciate your participation in the program.

Gerry,

Thanks for the quick response. Can you give us any sense of where you have the ADSL2/VDSL2 operational? The NTIA would prefer not to overstate capabilities.

Thanks,

John

Subject: RE: NJBB Data Clarification - CenturyLink

John: We have 10 mbps service available in all our NJ exchanges. The few spots we have listed as Speed Tier 8 look pretty remote to me. I'll have to check into them more specifically. For now, though, can we consider them as a lower speed tier for this round? Let's make them tier 7 and I'll look into them for the next round.

5KB	NJ_WiMAX_063012_region.shx

Section 4: Data Validation,Transformation and Loading

NTIA Table BB_Service_Wireless

Loaded from the supplied shapefiles as augmented by email and phone conversations. The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	Set to “Clearwire Corporation” per email
DBANAME	Set to “Clearwire Corporation” per email
FRN	Set to “0017775628”
TRANSTECH	Set to “80” (terrestrial mobile wireless) based on statement of WiMAX
SPECTRUM	Set to “5” per email
MAXADDOWN	Set to “5” (code for range of 3-6Mbps) per email
MAXADUP	Set to “3” (code for range that includes 1Mbps) per email
TYPICDOWN	Set to null
TYPICUP	Set to null
STATEABBR	Set to “NJ”
SHAPE	As supplied.

Internal notes on processing:

16. The shape file contains 520 polygon shapes, as well as an attribute, ID_UNIQUE (a 6 digit number).
17. The supplied shape file uses geographic coordinate system name GCS_WGS_1984. The NTIA data model requires the same coordinate system. No geographic transformation was required. Loaded into our geo-database to feature class name NJ_WiMAX_063012_region.
18. The XY Tolerance value differs on the supplied data from the required NTIA model. Imported the table schema and the table data in two separate operations, thereby ensuring perfect compatibility with the NTIA data model. The table has the suffix “_tol”.
19. The shape extends beyond the NJ State boundary. Clipped the shape using ESRI: Analysis Tools-> Extract -> Clip with, select feature class ntia_oct2012.State_Boundary. The feature class has the suffix "_clip". 269 rows are left after clip operation.
20. Coalesced the single-part polygons into one multi-part polygon using the ArcGIS ESRI: Data Management Tools->Generalization->Dissolve (without choosing anything in the Dissolve_Field(s) option), which resulted in a new feature class with the suffix “_dissolved” with a single row.

Section 5: Clarification Questions and Responses

The email has no info about advertized and typical speed. (7/12/2012)

Subject: RE: NJ Broadband Data Collection - Spring 2012

Taj,

A few additional questions regarding the service you deliver over the covered area. From your previous submissions, we have the following information:

Provider Name = Clearwire Corporation

FRN = "0017775628"

Transmission technology = 80 (wireless)

spectrum = 5 (Broadband Radio Service/Educational Broadband Service spectrum (2496-2690 MHz))

Maximum Advertised Download Speed = "5" (Greater than or equal to 3 mbps and less than 6 mbps)

Maximum Advertised Upload Speed = "3" (Greater than or equal to 768 kbps and less than 1.5 mbps)

Are these values still accurate?

6.6 Cogent Communications

Broadband Provider Data Report

Provider: Cogent Communications
Received: August 2012
Submission date: October 2012

This report presents details on processing of the broadband data for delivery to the National Telecommunications and Information Administration.

Sections:

16. NDA Status
17. Submission Overview
18. Submission File Details
19. Data Validations and Results
20. Data Transformation and Loading
21. Clarification Questions and Provider Responses
22. Notes and Open Issues

Section 1: NDA Status

No NDA was executed. All data were taken from the provider's public web site, FCC filings and/or information supplied by the provider via email

Section 2: Submission Overview

<table>
<tr><th colspan="4">MAPPING DATA</th></tr>
<tr><td rowspan="3">ID</td><td colspan="2">Provider name</td><td>Cogent Communications, Inc.</td></tr>
<tr><td colspan="2">“Doing business as” name</td><td>Not provided</td></tr>
<tr><td colspan="2">FRN</td><td>0019898303</td></tr>
<tr><th colspan="4">FOR WIRELINE</th></tr>
<tr><td>Filetypes</td><td colspan="2">Txt, xls, pdf, etc.</td><td>Email and pointers to Web site and SEC filings</td></tr>
<tr><td>File size</td><td colspan="2">Number of records, data elements</td><td>List of 21 addresses where they offer service</td></tr>
<tr><td rowspan="2">Speeds</td><td>Type</td><td>Spatial Resolution (address, street seg, census block, RSA/MSA, zipcode)</td><td rowspan="2">Provided building addresses. Adver down and up are 10/11, very fast.</td></tr>
<tr><td>Adver down</td><td>Address</td></tr>
</table>

	Adver up	Address	
	Typical down	Not provided	
	Typica up	Not provided	
	Subscriber-weighted	Not provided	
Technology Type	DOCSIS, xDSL, fiber, etc.		Fiber
End-user specification	Business, consumer, gov't etc		
Comments: They offer service directly to businesses at the addresses they provided. They are a reseller of broadband access to businesses at other locations. They had previously refused to provide data on Typical and Subscriber Weighted speeds.			

INTERCONNECTION DATA		
ID	Provider name "Doing business as" name FRN	
File size	Number of records, data elements	
Ownership	Leased/owned	
Transport Type	Fiber, wireless, copper	
Data Rates/Capacity		
Location	Street address, lat/lon, elevation	
Comments: We had previously extracted data for Middle Mile sites, based on the assumption that Cogent's Data Centers were interconnection points. We were instructed by the provider that these sites did not meet the definition of Middle Mile sites and thus should be removed.		
DATA COMPLETENESS		
Data Validation/ Verification		

Section 3: Submission File Details

Data received and processed in previous submissions was updated (address information) via a query of "Service Locations" from provider's Web site (http://www.cogentco.com/?lang=en&option=com_content&view=article&id=40&action=search).

There were two new records in the data from the Web site – one was an update of a previously present record, another was a truly new record (for 3003 Woodbridge Ave.). The CDNC field together with information obtained in previous rounds were used to determine the advertised speeds for that record.

Section 4: Validations and Results

During previous rounds provider reported data rates were confirmed with their published information and SEC filings.

The only other validation to be done is whether each address can be successfully geocoded. See next section. One address is not

Section 5: Data Transformation and Loading

The standard NDA prohibits us from submitting address-level data to the NTIA. Instead, we discover the census block for each customer address, then report the census block shape drawn from Census Bureau TigerLine reference data.

NTIA Table BB_Service_CensusBlock

We copied the information to a spreadsheet. The following table explains the transformations that were applied to load the target table.

Table Column	**Data Source / Transformation**
PROVNAME	Set to “Cogent Communications, Inc.”
DBANAME	Same as PROVNAME
PROVIDER_TYPE	Set to 1
FRN	Set to “0019898303”
STATEFIPS	Set to “34” (NJ)
COUNTYFIPS	Populated from Census Block FIPS Code (first 3 digits)
TRACT	Populated from Census Block FIPS Code (next 6 digits)
BLOCKID	Populated from Census Block FIPS Code
BLOCKSUBGROUP	Set to null
FULLFIPSID	Populated from Census Block FIPS Code
TRANSTECH	Set to “50”
MAXADDOWN	Populated from column “Maximum Advertised Speed Down”
MAXADUP	Populated from column “Maximum Advertised Speed Up
TYPICDOWN	Set to null

TYPICUP	Set to null
SHAPE	Copied from Census Bureau TigerLine 2010, as matched by spatial join on geocoded address

Internal processing notes:

9. Geocoded the addresses using the Google geocoder to obtain a Latitude, Longitude pair for each..
10. Created an excel sheet and imported it to a geodatabase table.
11. Added point shapes corresponding to each Latitude, Longitude pair by creating a feature class from the table using ArcCatalog's "Create Feature Class from XY Table" option.
12. Added a column containing the ID of the containing year 2010 census block via a spatial join of the point shapes and the census block shapes from reference data.
13. Discarded 6 rows with duplicate census blocks.

Subject: For your information: NJ Broadband Data Collection

Fine. The website may have changed slightly, but you can still get a list of address locations fairly easily from Cogent's public facing data. Just limit your searches to NJ as the jurisdiction of interest.

Subject: RE: NJ BB Data Collection - Spring 2011
Sensitivity: Private

Ried,

The attached spreadsheet integrates the data you submitted to us last year with and the data we could obtain from your Web site and SEC filings. We will use this data as the basis for the submission to the NTIA. If you have any comments or corrections on the data, please let me know.

We did notice that the "Service Location" form on your Web site did not return a valid zip code for the 5851 Westside Ave in North Bergen. We assigned an zip code of 07047 based on a Google search.

Of the data requested by NTIA, we were not able to obtain data on Typical speeds and the Subscriber Weighted Nominal Speed. You indicated last time that you were not prepared to offer this information. If your position on this matter has changed, we would be happy to receive the data.

Thanks for your cooperation

"We did notice that the "Service Location" form on your Web site did not return a valid zip code for the 5851 Westside Ave in North Bergen. We assigned an zip code of 07047 based on a Google search." Seems reasonable; since zip codes are fairly irrelevant to Cogent's business the zip code is not something that hits out A list of priorities in any database – nor is geocode.

9KB	New Jersey Maximum Advertised Speeds June 30 2012.xlsx

Section 4: Validation, Data Transformation and Loading

NTIA Table BB_Service_CensusBlock

The following table explains the transformations that were applied to load the target table.

Table Column	Data Source / Transformation
PROVNAME	As supplied in column “Provider_Name” but without trailing period
DBANAME	As supplied in column “DBA_NAme”
PROVIDER_TYPE	Set to 1

FRN	As supplied in column “FRN”
STATEFIPS	Set to “34” (NJ)
COUNTYFIPS	Populated from Census_Block_FIPS_Code (first 3 digits)
TRACT	Populated from Census_Block_FIPS_Code (next 6 digits)
BLOCKID	Populated from Census_Block_FIPS_Code (last 4 digits)
FULLFIPSID	As supplied in column Census_Block_FIPS_Code
TRANSTECH	As supplied in column Technology_of_Transmission
MAXADDOWN	Set to “8”, “9” or “10” (see below)
MAXADUP	Set to “7” (see below)
TYPICDOWN	Set to null, not supplied
TYPICUP	Set to null, not supplied
SHAPE	Copied from Census Bureau TigerLine 2010, As matched by Census block 2010 ID

Processing notes:

4. File 34-blocks-NJ.xlsx contains 70,672 records. No shape was provided, but a Census Block ID is provided. Every ID is 15 digits long.
5. Census Blocks: Comcast supplied Census 2010 block IDs. We referenced the Census Bureau reference database for Year 2010 to extract and submit geographic features (i.e., shapes) for each census block based on the supplied Census_Block_FIPS_Code.
6. Speeds: Data for maximum advertised down and up speeds were taken from file “New Jersey Maximum Advertised Speeds June 30 2012.xlsx”. Comcast listed the same upload speed (7) and download speed (10) for all seven MSAs they serve. However, for records with a technology of transmission code 41, we reported a download speed to code 8.

NTIA Table BB_Service_RoadSegment

Loaded as discussed below. The following table explains the transformations that were applied to load the target table.

Table Column	**Data Source / Transformation**
PROVNAME	Set to “Comcast Cable Communications, LLC”
DBANAME	Set to “Comcast”
PROVIDER_TYPE	Set to 1
FRN	Set to “0004441663”
ADDMIN	Set to the least of the non-empty address numbers for the line segment

ADDMAX	Set to the greatest of the non-empty address numbers for the line segment
PREDIR	Set to null (no value supplied)
STREETNAME	As obtained with the procedure outlined bellow (has all street components, not just name)
STREETTYPE	Set to null (no value supplied)
SUFFDIR	Set to null (no value supplied)
CITY	Set to null (no value supplied)
STATECODE	Set to “NJ”
ZIP5	Set to value of zipl column for the line segment
ZIP4	(no value supplied)
TRANSTECH	As supplied (40)
MAXADDOWN	See below
MAXADUP	Set to 7
TYPICDOWN	Set to null
TYPICUP	Set to null
SHAPE	Copied from Census Bureau TigerLine 2010, As matched by County + Tiger Line ID

File 34-streets-NJ.xlsx contains 656 records. No shape is provided, and no reference ID such as Tiger Line ID is provided either. We cannot validate these segments against reference data, nor can we accurately generate shapes for these segments. Instead we gathered a list of segments in large census blocks based on the municipalities served by Comcast. We processed 3142 street segments.

For municipalities served in their entirety by Comcast, the following approach was used. (Note: steps 1-4 were performed previously and not repeated for this round.)

1. Adjusted the Municipality names provided by Comcast with the following rules to enable matching with official New Jersey Municipality reference data
    a. Changed to upper case
    b. Performed the following string replacements on the Municipality field
        i. TOWNSHIP -> TWP
        ii. BOROUGH -> BORO (only when preceded by a space)
        iii. MT. -> MOUNT
        iv. PT. -> POINT
        v. ORANGE CITY -> CITY OF ORANGE TWP (ORANGE at start of line)
    c. Removed any additional information in parentheses (I.e., appended county name)
2. Performed join between two data sources, using Municipality and County as keys
3. Dropped four military bases that did not match any municipality

4. Generated a file with Municipality, Type, County and Municipal Code
5. Joined this information with the large census blocks for each municipality, and then joined that result with the street segments for each large census block.
6. Loaded the resulting set of street segments and shapes after removing duplicates.

Download Speed

1. Speeds: Data for maximum advertised down and up speeds were taken from file "New Jersey Maximum Advertised Speeds June 30 2012.xlsx". Comcast listed the same upload speed (7) and download speed (10) for all seven MSAs they serve so these values were used. (Note: all the streets included in the street-segment data submitted by Comcast had technology code of 40, so there was no need to insert a lower speed for code 41, as was done for census block data.)

Section 5: Clarification Questions and Responses

Subject: NJBB Clarification

Michael,

We wanted to verify that our processing strategy is still appropriate. During the previous rounds, we had difficulties in mapping the street-level data you provided for the large census blocks. The data is generally the same, so we anticipate similar issues. The approach we have taken was to assume Comcast offered full coverage for a set of municipalities (the list you provided is attached.) You also named three municipalities where that approach would not be advisable (Mount Olive Twp, Toms River, Berkeley Twp.). Can we use that same approach during this submission? Can you provide an updated list of municipalities or confirm that the attached list still applies?

Michael,

The process we defined works well for the communities you serve completely. However, if it is still the case that you do not cover Mount Olive Twp, Toms River, Berkeley Twp completely, then address level data might be helpful there.

Date: Fri, 27 Jul 2012 11:39:08 -0400
From: Connecting NJ <ConnectingNJ@appcomsci.com>
To: Michael_Ruger@comcast.com

Mr. Ruger,

The NJ Broadband Mapping team has received feedback from the NTIA regarding our 4/11 and 10/11 data submissions. The NTIA contracted the Michael Baker firm who, using third-party data, evaluated the quality of data submissions it received from its grantees. Since the feedback we have received for the last two submissions is consistent, we would like to share it with you. Please note that we were not given copies of the third-party data, so the reasons for mismatches between the data we submitted and these third-party data are not always clear. Our intent is merely to share with you problematic fields, such as provider name or speed tier, that have a lot of mismatches, and do some further inquiry to better validate the provider's data. Obviously, by working more closely with you, we hope to reduce data mismatches in future submissions. Here are some of the questions we have about your data.

Comcast
- Most of your mismatches are on max advertised downstream speed (principally tier 10) and maximum advertised upstream speed (principally tier 7) for Cable Modem DOCSIS 3.0. (Please refer to speed tier tables below.)

Can you please explain how you are determining these speeds?

Thank you for your interest and continued support in our NJ BB Mapping program.

Subject: RE: Questions about previous data submissions
Date: Fri, 27 Jul 2012 15:52:01 +0000
From: Ruger, Michael <Michael_Ruger@comcast.com>
To: Connecting NJ <connectingnj@appcomsci.com>

Mr. Behrens--

I believe this issue is one that we have encountered in other states, and results from the method by which we submit data. We provide maximum advertised speed data by MSA, but not all Census blocks within an MSA may offer D3 service--in which case, a D2 Census block may reflect a maximum advertised speed coded as "10." Similarly, but less frequently, Comcast may be in the process of upgrading service to D3 but has not yet initiated advertising for D3 speeds in that area--in which case, a D3 Census block may reflect a maximum advertised speed coded as "7."

Accordingly, if a D2 Census block is in a MSA in which the overwhelming majority of Census blocks are coded as a "10," those D2 blocks should be coded as a "7." If a D3 Census block is in an MSA coded as a "7," that is likely due to the fact that Comcast has not begun advertising the D3 speeds in that MSA.

I believe in our last submission, Comcast showed 100% D3 blocks throughout the state of New Jersey and a maximum advertised download speed of "10." I am waiting for this cycle's data to confirm that this remains the case.

Please let me know if this helps, or if you would like to discuss.

Thanks--

Section 4: Data Validation and Results

Section 5: Data Transformation and Loading

The following describes the validations and transformations that were applied to the submitted data.

NTIA Table BB_ConnectionPoint_MiddleMile

Since the data is exactly the same as the last submission with one less record and there is no change in NTIA data model, the table is copied from the 2012 April table, using an ESRI tool, "ArcToolBox->Data Management Tools->General->Append" with NO_TEST in the Schema Type option and one record is removed.

Below is description for the April 2012 model as a reference.

Loaded from supplied file "..MiddleMileConnection..". The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	As supplied in column Provider Name
DBANAME	As supplied in column DBA Name
FRN	As supplied in column FRN
OWNERSHIP	As supplied in column Ownership
BHCAPACITY	As supplied in column Serving Facility Capacity
BHTYPE	As supplied in column Service Facility Type
LATITUDE	As supplied in column Latitude
LONGITUDE	As supplied in column Longitude
ELEVFEET	As supplied in column Elevation
STATEABBR	Set to "NJ"
FULLFIPSID	ID of containing census block from Year 2010 Census Bureau reference data
SHAPE	Point shape created using ESRI

Internal notes on processing:

14. The data included the following fields:
    a. Provider Name
    b. DBA Name
    c. FRN
    d. Ownership
    e. Serving Facility Capacity
    f. Service Facility Type
    g. Latitude
    h. Longitude
    i. Street Address (blank)
    j. Elevation
15. There are 6 rows, different from the last submission. Viewing the data in ArcMap indicates that all points are in New Jersey.
16. Created an Excel sheet and imported to a geodatabase table.

    (The column data format of the FRN should be Text, not General. Save the excel in the 97-2003 format)
17. Added a point shape to each row corresponding to the Latitude, Longitude pair by creating a feature class from the table using ArcCatalog's "Create Feature Class from XY Table" option. Specify WGS84 for the coordinate system of the points. Result is feature class middlemile_point_tol.
18. Added a column "geoid10" with the ID of the containing year 2010 census block via a spatial join of the points. Result is feature class middlemile_point_tol_cb.
19. Populated stateabbr and FRN column during data transformation and loaded table.

NTIA Table BB_Service_CensusBlock

Loaded from supplied file "..CensusBlockAvailability..". The following table explains the transformations that were applied to load the target table.

Table Column	**Data Source / Transformation**
PROVNAME	As supplied in column Provider_Name
DBANAME	As supplied in column DBA_Name
PROVIDER_TYPE	Set to 1
FRN	As supplied in column FRN
STATEFIPS	Set to "34" (NJ)
COUNTYFIPS	Populated from Census_Block_ID (digits 3 to 5)
TRACT	Populated from Census_Block_ID (next 6 digits)
BLOCKID	Populated from Census_Block_ID (remaining 4 digits)
FULLFIPSID	As supplied in column Census_Block_ID
TRANSTECH	As supplied in column Technology_of_Transmission

MAXADDOWN	As supplied in column Maximum_Advertised_Downstream_Speed
MAXADUP	As supplied in column Maximum_Advertised_Upstream_Speed
TYPICDOWN	As supplied in column Typical Downstream Speed
TYPICUP	As supplied in column Typical Upstream Speed
ENDUSERCAT	Set to null because not supplied
SHAPE	As found in Census Bureau year 2010 reference data

Internal processing notes:

6. Following data fields were supplied:
    a. Provider Name
    b. DBA Name
    c. FRN
    d. Census Block ID
    e. Street NameStreet Segment ID (TLID)
    f. Technology of Transmission
    g. Maximum Advertised Downstream Speed
    h. Maximum Advertised Upstream Speed
    i. Typical Downstream Speed
    j. Typical Upstream Speed
7. The supplied text file has 214,332 rows which exceeds number of census blocks in New Jersey because multiple technologies were submitted.
8. Typical speeds were used as provided.
9. We used Census Bureau reference data for Year 2010 to locate and submit geographic features (i.e., shapes) for each census block.
10. Total rows (shapes) loaded is 214,331.
11. Validation rules produced a warning on 9,681 census blocks that had a transtech of 10 (ADSL) and a download speed code of 7 (10-25 Mbps). We reported this to the provider, who confirmed the submitted data. The provider offers ADSL2+, with a download speed of 15 Mbps, in select areas in New Jersey.

NTIA Table BB_Service_RoadSegment

Loaded from supplied File "..AddressSegmentAvailability..". The following table explains the transformations that were applied to load the target table.

Table Column	Data Source / Transformation
PROVNAME	As supplied in column Provider_Name
DBANAME	As supplied in column DBA_Name
PROVIDER_TYPE	Set to 1
FRN	As supplied in column FRN

ADDMIN	Set to the least of the non-empty address numbers from TigerLine
ADDMAX	Set to the greatest of the non-empty address numbers from TigerLine
PREDIR	Set to null (no value supplied)
STREETNAME	As supplied (has all street components, not just name)
STREETTYPE	Set to null (no value supplied)
SUFFDIR	Set to null (no value supplied)
CITY	Set to null (no value supplied)
STATECODE	Set to “NJ”
ZIP5	Set to zipl from TigerLine
ZIP4	Set to null (no value available in reference data)
TRANSTECH	As supplied in column Technology_of_Transmission
MAXADDOWN	As supplied in column Maximum_Advertised_Downstream_Speed
MAXADUP	As supplied in column Maximum_Advertised_Upstream_Speed
TYPICDOWN	As supplied in column Typical Downstream Speed
TYPICUP	As supplied in column Typical Upstream Speed
SHAPE	Road segment shape from Year 2010 TigerLine reference data, as matched by TLID

Internal processing notes:

1. The following data fields were submitted
    a. Provider Name
    b. DBA Name
    c. FRN
    d. Census Block ID
    e. Technology of Transmission
    f. Maximum Advertised Downstream Speed
    g. Maximum Advertised Upstream Speed
    h. Typical Downstream Speed
    i. Typical Upstream Speed
2. There were 704 input rows. One was row was removed as a duplicate, in terms of county and Tiger Line ID. After a join against Census Bureau 2010 reference data, no rows were discarded based on compound key of county, TLID, and tech_transmission fields. Total rows (shapes) loaded is 703.

Section 6: Clarification Questions and Responses

Subject: NJ Broadband Clarification

Stefanie,

The NTIA has provided additional validation rules for us to apply to the data during this round. One of these rules raises and warning, and requires additional clarification, in cases where ADSL is reported with a speed code of 7 (10-25 Mbps). In the data you supplied, there are about 15,000 census blocks that meet this condition. Can you please confirm that these values are correct? A few of the census blocks with this combination are listed below.

Thanks for your help,

John Wullert

Subject: RE: NJ Broadband Clarification

John,

Our highest bandwidth asymmetric DSL is ADSL2+ for which we have a 15.0Mbps/1.0Mbps offering, in limited parts of the state. Actually, at the beginning of this month, we reduced our ADSL2+ deployment in NJ from 54 central offices down to 35 central offices, but the blocks specified in our Round 5 submission indeed represent our 2011 Year End coverage.

Thanks,

Stefanie

Subject: Questions about previous data submissions

From: Connecting NJ <ConnectingNJ@appcomsci.com>
To: SSanta@covad.com

Stefanie,

The NJ Broadband Mapping team has received feedback from the NTIA regarding our 4/11 and 10/11 data submissions. The NTIA contracted the Michael Baker firm who, using third-party data, evaluated the quality of data submissions it received from its grantees. Since the feedback we have received for the last two submissions is consistent, we would like to share it with you. Please note that we were not given copies of the third-party data, so the reasons for mismatches between the data we submitted and these third-party data are not always clear. Our intent is merely to share with you problematic fields, such as provider name or speed tier, that have a lot of mismatches, and do some further inquiry to better validate the provider's data. Obviously, by working more closely with you, we hope to reduce data mismatches in future submissions. Here are some of the questions we have about your data.

Provider Name: DIECA Communications, Inc.; DBA Name: Covad Communications Co.
- Your data seem to have many provider name mismatches. Might this be attributed to recent M&A activities?
- On those records where the provider name matches the third-party data, there seem to be a large number of transfer technology mismatches, and these primarily involve transtech code 20 (SDSL) and code 30 (Other Copper Wireline).
- Most mismatches on max advertised downstream speed involve tiers 5 & 7. (Please refer to downstream speed tier table below.)
- Most mismatches on max advertised upstream speed involve tiers 3, 5 & 7. (Please refer to upstream speed tier table below.)

We are wondering whether you can help us better understand these discrepancies?

Thank you for your interest and continued support in our NJ BB Mapping program.

Best regards,

Cliff Behrens

Subject: RE: Questions about previous data submissions

From: Katherine Mudge <Katherine.Mudge@megapath.com>
To: Connecting NJ <ConnectingNJ@appcomsci.com>
CC: Stefanie Santa-Esparza <Stefanie.Santa-Esparza@megapath.com>

Cliff:

Sorry for the delay in responding - I ended up on some unexpected business travel.

Here are our observations and responses to your questions. Once you've had a chance to review, please let us know if you have any other questions.

NJ: Your data seem to have many provider name mismatches. Might this be attributed to recent M&A activities?

Response: More than half of our lines in each state are supplied via ISP resellers, where we provide the underlying internet connectivity in a wholesale capacity for service that is otherwise branded, billed and supported as the ISP's own service. For over 90 of our resellers, we perform a layer 2 network handoff, such that the reseller's IP address space is what would be visible via the internet as well. This makes it impossible for a third party data collector to know these are being served by our last mile infrastructure without detailed cooperation from each ISP. Of course, if supplied a few example instances of these purported mismatches, we could readily provide an exact analysis.

NJ: On those records where the provider name matches the third-party data, there seem to be a large number of transfer technology mismatches, and these primarily involve transtech code 20 (SDSL) and code 30 (Other Copper Wireline).

Response: Our branding does not necessarily make it clear what underlying technologies are being used to provide service, so it is likely that a third party data collector has made incorrect assumptions in some situations. For example, we offer "TeleSpeed" and "Ethernet" branded services that may be utilizing symmetric DSL or other copper wireline technology. In a few cases, we also have legacy residential "TeleSurfer" services that may be utilizing symmetric or asymmetric DSL technology. Again, if we could be supplied a few examples, we could readily provide a exact analysis.

NJ: Most mismatches on max advertised downstream speed involve tiers 5 & 7. (Please refer to downstream speed tier table below.) AND Most mismatches on max advertised upstream speed involve tiers 3, 5 & 7. (Please refer to upstream speed tier table below.)

Response: In the case where a third party data provider may have found faster than reported speed, this may be due to the filing requirement that we report only services that can be installed within a typical service interval. From time to time, we also change our network deployment which could result in an increase or decrease in maximum available speed. Also, in our own direct business, we did not always sell our maximum provisionable speed, even though we made these offerings available to our resellers. We will be happy to provide more precise explanation if given actual examples.

Again, I trust that our additional information responds to your questions. Please let us know if you need anything else.

Katherine K. Mudge
Director, State Affairs & Litigation

1835-B Kramer Ln., Ste. 100

Section 3: Submission File Details

Received 1 file by email:

Size **Name**

20,000 20120228 Telcordia.xls

The file contains a list of addresses and max speeds; e.g., the “up-to” limit of their rate plan. The addresses in this file appear to be for individual customers (as opposed to addresses of multi-tenant buildings in a central business district).

Section 4: Data Validation, Transformation and Loading

NTIA Table BB_Service_CensusBlock

Loaded from supplied file "20120228 Telcordia_update.xls" (24 data rows). The following table explains the transformations that were applied to load the target table.

Table Column	Data Source / Transformation
PROVNAME	Set to "Global Online Electronic Services, Inc."
DBANAME	Not supplied; set same as PROVNAME
PROVIDER_TYPE	Set to 1
FRN	Set to "0011437746"
STATEFIPS	Set to "34" (NJ)
COUNTYFIPS	Populated from Census Block FIPS Code (digits 2-5)
TRACT	Populated from Census Block FIPS Code (next 6 digits)
BLOCKID	Populated from Census Block FIPS Code
BLOCKSUBGROUP	Set to null
FULLFIPSID	Populated from Census Block FIPS Code
TRANSTECH	As supplied in column Technology Code
MAXADDOWN	Set to code 4 per March 2011 email response to questions
MAXADUP	Set to code 3 per March 2011 email response to questions
TYPICDOWN	Set to null, not provided
TYPICUP	Set to null, not provided
SHAPE	Copied from Census Bureau 2010, as matched by spatial join on geocoded address point

Internal processing notes:

7. Geocoded the addresses using the Google geocoder to obtain latitude, longitude value pairs. Of 24 original records, all were successfully geocoded.
8. Created point shapes using ESRI from lat, long value pairs.
9. Spatially joined the points with Census Bureau Year 2010 reference data to find the containing census block. This yielded census-block attributes including the block ID ("geoid10").
10. Verified that all 24 records joined successfully with NJ census blocks
11. Dropped 16 records that did not have broadband speeds
12. Dropped 2 records because of duplicate census blocks (caused by multiple customer addresses in the same census block).

13. All remaining records were verified to be in small (< 2 square miles) census blocks.
14. Loaded the resulting data into an SDE feature class.

NTIA Table BB_Service_Wireless

Loaded using shapes from reference data for the records that indicates wireless technology. The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	Set to “Global Online Electronic Services, Inc.”
DBANAME	Not supplied; set same as PROVNAME
FRN	Set to "0011437746"
TRANSTECH	Set to 70 as supplied in XLS sheet
SPECTRUM	Set to 6
MAXADDOWN	Set to 7
MAXADUP	Set to 7
TYPICDOWN	Set to null
TYPICUP	Set to null
STATEABBR	Set to “NJ”
SHAPE	Year 2010 Census Block shape obtained from reference data.

Internal processing notes:

21. Processed, as described above (points 1 – 7).
22. Spectrum: Set to 6, Unlicensed
23. Speeds: The fixed-wireless link is reported with 10Mbph, which we confirmed with provider is actually 10Mbps in each direction (symmetric). That corresponds to NOFA speed code 7. Provider also noted that they only have one fixed-wireless site.

Validation rules produced a warning on the wireless shape record for the combination of upstream and downstream speed codes of 7 (10-25 Mbps) with a transtech code of 70 (Fixed Wireless - Unlicensed). The provider has only a single fixed wireless site, and it is used for point-to-point links, rather than to provide a coverage area. The provider confirmed that the speed is 10 Mbps.

Section 5: Clarification Questions and Responses

From: NJ Broadband Data Collection [mailto:ConnectingNJ@groups.appcomsci.com]
Sent: Friday, March 02, 2012 7:15 AM

To: 'georgeb@tricaps.com'
Subject: RE: Goes Telecom Telicordia data

George,

I wanted to confirm the speed values you included in the data you submitted. I have three questions:

1. In the past, we had used the data from your Web site to determine your maximum advertised upload and download speeds. I still see 1536K Downstream/768K Upstream as the fastest DSL speed you deliver. Is that correct?
2. You report two fixed wireless sites as “10mpbh”. Is that really mega-bits-per-hour? That comes to about 2.8 Mbps. Is that correct?
3. When we have spoken in the past, you reported that you use fixed wireless for point-to-point links, rather than to cover a wider area. Is that still correct?

Thanks for your participation,

John Wullert

Hi John,

I got the answers. See blow.

Thanks,

George

George,

I wanted to confirm the speed values you included in the data you submitted. I have three questions:

1. In the past, we had used the data from your Web site to determine your maximum advertised upload and download speeds. I still see 1536K Downstream/768K Upstream as the fastest DSL speed you deliver. Is that correct?

   Yes

2. You report two fixed wireless sites as “10mpbh”. Is that really mega-bits-per-hour? That comes to about 2.8 Mbps. Is that correct?

   No, the correct speeds are 10mbps and we now only have a single fixed wireless link instead of two.

3. When we have spoken in the past, your reported that you use fixed wireless for point-to-point links, rather than to cover a wider area. Is that still correct?

   Yes

Comments: Address data with some indications of qualification for different data services.	
INTERCONNECTION DATA	
ID	
File size	
Ownership	
Transport Type	
Data Rates/Capacity	
Location	
Comments: No connection-point data provided	

Section 3: Submission File Details

Received one (1) file by EMAIL:

Size	**Name**
1,061,712	NJ Final 8-14-12.xlsx

The file contains 7054 rows of data. Each row has a street address. All rows have an indication of maximum possible DSL speed. Some indicate 5Mbps, some 15Mpbs and some 30Mbps. Also has information about TV qualification, which we will ignore.

Section 4: Data Validation, Transformation and Loading

This section details the validations and transformations we applied to the provider submitted data.

NTIA Table BB_Service_CensusBlock

Loaded from the supplied file after geocoding. The following table explains the transformations that were applied to load the target table.

Table Column	**Data Source / Transformation**
PROVNAME	Set to “Hometown Online Inc.”

DBANAME	Set to “Warwick Online”
PROVIDER_TYPE	Set to 1
FRN	Set to “0006651244”
STATEFIPS	Set to “34” (NJ)
COUNTYFIPS	Populated from Census Block 2010 (digits 2-5)
TRACT	Populated from Census Block 2010 (next 6 digits)
BLOCKID	Populated from Census Block 2010 Code
BLOCKSUBGROUP	Set to null
FULLFIPSID	Populated from Census Block 2010 Code
TRANSTECH	Census blocks in census tracts starting with 3714 were set to code “20” (SDSL) All others set to code “10” (ADSL), (per provider email)
MAXADDOWN	Set to code “7” (range includes 15Mbps, per email)
MAXADUP	For ADSL: Set to code “3” (range includes 1Mbps, per email) For SDSL: Set to code “7” (range includes 15Mbps, per email)
TYPICDOWN	Set to null, not supplied
TYPICUP	Set to null, not supplied
SHAPE	Copied from Census Bureau TigerLine 2000, as matched by spatial join on geocoded address point

Internal processing notes:

15. The following steps were performed when the data was submitted and the results were re-used for this round
    a. All addresses were successfully geocoded using Arroyo with the Yahoo geocoder. Four records failed to spatially join on 2010 NJ Census Block shapes.
    b. Created an excel sheet and imported to a geodatabase table.
    c. Added point shapes corresponding to each Latitude, Longitude pair by creating a feature class from the table using ArcCatalog’s “Create Feature Class from XY Table” option.
    d. Added a column containing the ID of the containing year 2010 census block via a spatial join of the point shapes and the census block shapes from reference data.
16. Discarded 6579 rows with duplicate census blocks, leaving 465 unique census blocks.
17. Discarded 3 census blocks larger than 2 square miles.
18. Loaded 462 blocks.
19. Validation rules produced a warning on 404 census blocks that had a transtech of 10 (ADSL) and a download speed code of 7 (10-25 Mbps). We searched the provider’s Web site for speed information. We only found one reference to speed packages, and these values and the Web page seemed out of date. We sent a request for clarification to the provider. The provider

acknowledged the validation requirements, indicated that the Web page found by our search was in error and confirmed the submitted speed values. The president of the company also indicated that they would be launching a new Web site with corrected speed information in the near future.

Subject: RE: Reminder - NJ Broadband Data Collection

Scott,

As I mentioned, we have additional validations to perform. NTIA is questioning reported DSL speeds over 10 Mbps. In our previous interactions, you had given us the following speeds:

ADSL: 15 Mbps and uploads of 800 kbps.

SDSL: 15 Mbps up and down (available in Census tract 3714)

I see on your Web site now the packages you offer are at 512, 1 Mbps and 2 Mbps. Should we be using 2 Mbps as the download speed? Does this apply for both ADSL and SDSL?

Thanks in advance for the clarification.

John Wullert

Warwick, NY 10990

Section 6: Notes and Open Issues

Provider had provided the following information via email in prior rounds and confirmed again this round:

Maximum advertised download speed is 15 Mbps for both ADSL and SDSL

Maximum upload speed for ADSL is 800 Kbps

SDSL is available in census tract 3714xx, all other locations are ADSL

Section 3: Submission File Details

Received an email containing a link to the submission data (census blocks) together with the necessary credentials. All other information reused from the previous rounds.

Section 4: Data Validation, Transformation and Loading

NTIA Table BB_Service_Wireless

The following table explains the transformations that were applied.

Table Column	**Data Source / Transformation**
PROVNAME	Set to "Hughes Network Systems, LLC"
DBANAME	Set to "HughesNet"
FRN	Set to 0017434911
TRANSTECH	Set to 60
SPECTRUM	Set to 9 per translation shown below
MAXADDOWN	Set to 4, see below.

MAXADUP	Set to 2", see below.
TYPICDOWN	Not provided, set to null
TYPICUP	Not provided, set to null
STATEABBR	Set to "NJ"
SHAPE	Single shape created from CBs (See below).

Internal notes on processing:

24. Spectrum: No statement was provided. The NTIA data model has a single column for spectrum. As per the latest clarifications, satellite corresponds to NTIA "SPECTRUM USED" code value 9.
25. We concatenated the fips code, census tract and block values into a census block ID. In some cases the census tract values had less than six digits. In some cases the block id had less than four digits. In these cases, leading zeros were added to the values to pad the values to the correct length.
26. In 21 cases, the values for block ID and census tract were filled in with spaces. We attempted to pad these out with zeros, but the resulting census block IDs did not match any NJ census block. These 21 records represent the amount by which the submission exceeded the count of Y2000 NJ census blocks. These were dropped.
27. We verified that all of the resulting census block IDs were unique.
28. We compared the census block IDs generated from the submission with the set of 141,342 Y2000 census blocks for New Jersey. All NJ census blocks (large and small) were matched. .
29. Speeds: For maximum advertised speeds we encoded the down speed as value 4 (range 1.5-3 Mbps) and encoded the up speed as value 2 (range 200 Kbps -- 768 Kbps).
30. We merged the census blocks into a single shape with the suffix "_dissol" using the ArcGIS "Dissolve" tool.
31. The resulting shape passed all NTIA validations

From: Connecting NJ <ConnectingNJ@appcomsci.com>
To: Alok Mathur <Alok.Mathur@hughes.com>

Alok,

Sorry for another note but the word I am getting back from the person who is loading all of the data we receive is that the attached CSV file is effectively identical to the zipped file (and to the file from your previous submission). Moreover, after downloading the files once again (from the exact location you indicated) and comparing the data with the previous submission, there are no differences. After unzipping, the date on the file is 1/27/2012 even though the zip file itself has the date 8/14/2012.

Please understand that, if necessary, we are willing to resubmit your data without updates; I just was operating on the impression that you wished to submit data more recent than the last April submission. Please let me know what you want to do.

Regards,

Cliff

Subject: RE: URGENT: Response Requested: Get your Broadband Services on the National Broadband Map

Transport Type			
Data Rates/Capacity			
Location			
Comments:			

Section 3: Submission File Details

Provider pointed us to information on their Web site, including coverage maps and speed offerings.

Section 4: Data Validation, Transformation and Loading

The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	Set to "Jersey Shore Wireless"
DBANAME	Set to "Duxpond Communications"
FRN	Set to 0011543782
TRANSTECH	Set to 70, for fixed wireless
SPECTRUM	Set to "6" for unlicensed
MAXADDOWN	Set to "6", see below.
MAXADUP	Set to "3", see below.

TYPICDOWN	Not provided, set to null
TYPICUP	Not provided, set to null
STATEABBR	Set to “NJ”
SHAPE	Generated, see below

Internal notes on processing:

1. Provider directed us to their Web site, which included image files (jpeg) depicting coverage maps, along with listings of the speed plans they offer.
2. We manually created shape files that replicated the coverage in their image files to produce the SHAPE
3. Their Web site had two different listings for download speeds, one showing speeds of 1, 2 and 5 Mbps and the other showing speeds of 1, 2, 3 and 10 Mbps. Given the discrepancy between the two lists, and without any confirmation from the provider, we elected to map this to speed tier 6, ranging from 6 to 10 Mbps.
4. The Web site did not include advertised upload speeds. There was an indication of typical upload speeds of 800 Kbps. We mapped that value to a speed tier of 3.

NJ_Broadband_Map_region.shp	2,008 KB
NJ_Broadband_Map_region.shx	1 KB
NJ_Broadband_Map_region.TAB	2 KB

Section 4: Data Validation, Transformation and Loading

Loaded from the supplied file, with transformations as:

Table Column	Data Source / Transformation
PROVNAME	As supplied in column prov_name
DBANAME	As supplied in column dba_name

FRN	Set to " 0002963528"
TRANSTECH	As supplied in column tech_trans
SPECTRUM	Set to “4” per translation shown below
MAXADDOWN	As supplied in column down_speed.
MAXADUP	As supplied in column up_speed..
TYPICDOWN	Not supplied, set to null
TYPICUP	Not supplied, set to null.
STATEABBR	Set to “NJ”
SHAPE	As supplied.

Internal notes on processing:

5. The shape file contains a single row with a multipolygon shape (see above for preview picture). The columns identify that the technology of transmission is wireless and that two different spectrum ranges are in use.
6. The supplied shape uses geographic coordinate system GCS_WGS_1984, same as that required by the NTIA data model. No geographic transformation was required, but the XY Tolerance values differ if the shape file is imported trivially into the geo-database. Imported shape then mapped to separate shape with proper tolerance which resulted in a new feature class with the suffix “_tol”.
7. NTIA requires shapes to be contained in the NJ state boundary. Although we visually verified that it is the case, we clipped the shape using ESRI: Analysis Tools-> Extract -> Clip with, select feature class refdata_2010.tl_2010_34_state10_wgs. The feature class has the suffix "_clip"
8. Spectrum: Leap provided “Y” value in the columns spectrum_pcs and spectrum_aws. In response to previous queries on this, the provider had indicated that they covered separate areas, with PCS coverage limited to a few counties, but did not provide separate shapes. We sent a request again. Therefore, we uniformly use value 4 (AWS) for the entire coverage, at this time.

ID	Provider name	Level 3 Communications, LLC
	"Doing business as" name	Level 3
	FRN	0003723822

<table>
<tr><th colspan="3">FOR WIRELINE</th></tr>
<tr><td>Filetypes</td><td colspan="2">Text file spreadsheets</td></tr>
<tr><td>File size</td><td colspan="2">350 data rows</td></tr>
<tr><td>Speeds</td><td>
<table>
<tr><th>Type</th><th></th><th>Address level data</th></tr>
<tr><td>Typical-upstream</td><td></td><td>Yes</td></tr>
<tr><td>Typical-downstream</td><td></td><td>Yes</td></tr>
<tr><td>Advertised-upstream</td><td></td><td>Yes</td></tr>
<tr><td>Advertised-downstream</td><td></td><td>Yes</td></tr>
<tr><td>Subscriber-weighted-nominal speed</td><td></td><td>Not provided</td></tr>
</table>
</td><td>All set to same value: 11 (>= 1gpbs)</td></tr>
<tr><td>Technology Type</td><td colspan="2">50 (optical carrier/fibre)</td></tr>
<tr><td>End-user specification</td><td colspan="2">Yes (addresses)</td></tr>
<tr><td colspan="3">Comments: typical and Advertised UP and DOWN are ALL THE SAME VALUE: 11 (>= 1gpbs)</td></tr>
</table>

INTERCONNECTION DATA	
ID	
File size	text spreadsheet with 338 rows. (See comment)
Ownership	Not provided
Transport Type	provided
Data Rates/Capacity	provided
Location	Address provided as well as lat/long
Comments: A large number of duplicate rows were confusing. This is worth asking the provider. Provider indicates that they are separate instances and should NOT be removed as duplicates.	

Section 3: Submission File Details

Received 2 files by secure upload:

Size kb	**Name**
45	AddressAvailability_NewJersey_8-18-2011.txt
41	MiddleMile_New Jersey_8-18-2011.txt

Section 4: Validations and Results

The "address" file has 350 rows. All speed codes set the same, code 11 (1+ Gbps), suggesting these are all commercial customers.

The "middlemile" file has 338 rows, including many rows that are exact duplicates which we will have to discard despite the provider's assurances that they are "different".

Section 5: Data Transformation and Loading

The standard NDA prohibits us from submitting address-level data to the NTIA. Instead, we discover the census block for each customer address, and then report the census block shape drawn from Census Bureau TigerLine reference data.

NTIA Table BB_ConnectionPoint_MiddleMile

Loaded from the supplied tab-separated file. The following table explains the transformations that were applied.

Table Column	**Data Source / Transformation**
PROVNAME	As supplied in column "DBA" (no provider name supplied separately)
DBANAME	As supplied in column "DBA"
FRN	As supplied in column "FRN" after removing dashes
OWNERSHIP	Set to null (not supplied)
BHCAPACITY	As provided in column "Serving Facility Capacity"
BHTYPE	As provided in column "Serving Facility Type"
LATITUDE	As supplied
LONGITUDE	As supplied
ELEVFEET	As supplied (all zero values)
STATEABBR	Set to "NJ"
FULLFIPSID	ID of containing census block from Year 2010 Census Bureau TigerLine reference data
SHAPE	Point shape created using ESRI ArcDesktop

Internal notes on processing:

20. Imported the data to a geodatabase table
21. Added a point for each Latitude, Longitude pair by creating a feature class from the table using ArcCatalog's "Create Feature Class from XY Table" option.
22. Added a column containing the ID of the containing year 2010 census block via a spatial join of the points and the census block shapes from reference data. All records successfully spatially joined on 2010 NJ Census Block shapes.
23. Discarded 149 records with identical lat, long values and addresses.
24. Loaded 188 records.

NTIA Table BB_Service_CensusBlock

Loaded from the supplied tab-separated file. The following table explains the transformations that were applied to load the target table.

Table Column	**Data Source / Transformation**
PROVNAME	As supplied in column "DBA" (no provider name supplied separately)
DBANAME	As supplied in column "DBA"
PROVIDER_TYPE	Set to "1"
FRN	As supplied in column "FRN"
STATEFIPS	Set to "34" (NJ)
COUNTYFIPS	Populated from Census Block FIPS Code (first 3 digits)
TRACT	Populated from Census Block FIPS Code (next 6 digits)
BLOCKID	Populated from Census Block FIPS Code
FULLFIPSID	Populated from Census Block FIPS Code
TRANSTECH	As supplied in column "Technology of Transmission"
MAXADDOWN	As supplied in column "Maximum Advertised Download Speed"
MAXADUP	As supplied in column "Maximum Advertised Upload Speed"
TYPICDOWN	Set to null (see below)
TYPICUP	Set to null (see below)
ENDUSERCAT	Set to null (see below)
SHAPE	Copied from Census Bureau TigerLine 2010, as matched by spatial join on the geocoded address

Internal processing notes:

20. Geocoded the addresses using an Arroyo flow and the Yahoo geocoder, leaving the result with address and lat, long data in an Excel spreadsheet. All addresses were successfully geocoded,

although 1 was not placed in New Jersey.

21. Imported the spreadsheet to an ESRI geodatabase table
22. Added point shapes corresponding to each Latitude,Longitude pair by creating a feature class from the table using ArcCatalog's "Create Feature Class from XY Table" option
23. Added a column containing the ID of the containing year 2010 census block using ArcCatalog's spatial join feature. The newly created point shapes are joined against census block shapes from reference data. All but three records successfully spatially joined on 2010 NJ Census Block shapes.
24. Discarded typical speeds since they were in all cases identical to maximum advertised speeds, not measured values.
25. The end user category value as originally supplied applied to an address, but we must anonymize the addresses and report census blocks. The NTIA directs us to report the "predominant" end-user category, which is not supplied here.
26. Discarded 79 duplicate census block records, which result from multiple addresses in the same census block.
27. Loaded 270 records.

Section 6: Clarification Questions and Responses

From: NJ Broadband Data Collection [mailto:ConnectingNJ@research.telcordia.com]

Subject: NJBB Data Clarification

Greg,

We have reviewed the data you submitted to the New Jersey Broadband Mapping program. We have one question. The middle-mile data you submitted in MiddleMile_New Jersey_8-18-2011.txt includes many rows that are duplicates. Can we safely discard these duplicate entries?

Thanks for you participation,

John Wullert

Manager – NJ BB Data Collection

Subject: RE: NJBB Data Clarification

John, this issue came up with our CA submission as well. We investigated and determined that there were in fact some differences, albeit small, with some of the sites such that each site is in fact unique. Give that, I would not treat them as duplicates.

Greg

6.15 Monmouth Telephone and Telegraph

Connecting New Jersey - Broadband Provider Data Report

Provider: Monmouth Telephone and Telegraph
Received: August 2012
Submission date: October 2012

This report presents details on processing of the broadband data for delivery to the National Telecommunications and Information Administration.

Section 1: NDA Status

Signed NDA is in place with NJ OIT.

Section 2: Submission Overview

AVAILABILITY DATA		
ID	Provider name "Doing business as" name FRN	Monmouth Telephone & Telegraph same 0004325205
FOR WIRELINE		
Filetypes	Csv (NJBB_0004325205_AddressLevelAvailability june 30 2012.csv)	
File size	94 Kbytes, 946 records	
Speeds	Type	Spatial Resolution (address, street seg, census block, RSA/MSA, zipcode,etc)
	Typical-upstream	Address
	Typical-downstream	Address
	Advertised-upstream	Address
	Advertised-downstream	Address
	Subscriber-weighted-up	None provided
	Subscriber-weighted-down	Not provided
Technology	Code 30 – other copper line	

Type	Code 50 - Optical Carrier/Fiber to the End User
End-user specification	Code 4 – Medium or Large Enterprise
Comments:	
INTERCONNECTION DATA	
ID	
File size	
Ownership	
Transport Type	
Data Rates/Capacity	
Location	
Comments: No middle mile was provided at this time. Monmouth gave the following explanation: Please note that Table 8, "Middle-mile and Backbone Interconnection Points Data", is not included per instructions on page 11 of the Data Submission Specifications" "Middle-mile and Backbone Interconnection Point information should focus on the connectivity at a point. That is, if a point at which network elements or segments are joined would not reasonably offer the possibility of technical connectivity with the network[s], it should not be reported".	

Section 3: Submission File Details

The data are very similar to the last submission.

Received 1 zip file:

Size	**Name**
20Kb	Broadband Mapping.zip

The zip archive contains the following files:

Size	**Name**
94Kb	NJBB_0004325205_AddressLevelAvailability june 30 2012.csv
1Kb	NJBB_0004325205_CMAAdvertisedAvailability June 30 2012.csv

1Kb	NJBB_0004325205_SubscriberWeightedNominalSpeed June 30 2012.csv
22Kb	Read Me.doc

File details:

NJBB_0004325205_AddressLevelAvailability june 30 2012.csv:

The file contains 946 records. Note that data file does not have a header row, but follows (largely) the ADDRESS DATA table from the NTIA "State Broadband Data and Development Grant Program" document. The columns and the corresponding headers are:

A	- Provider Name
C	- FRN
D-L	- Address
M	- EndUserCat
N	- TransTech
O	- MaxAdvDown
P	- MaxAdvUp
Q	- TypicDown
R	- TypicUp

The FRN is missing leading zeros. Most of the zip codes do not have the required leading zeros. It was established (prior interactions) that the DBA is Monmouth Telephone & Telegraph. Certain addresses will need to be fixed for geocoding (also per prior interactions).
Some records have speed tiers of 2 or less.

NJBB_0004325205_CMAAdvertisedAvailability June 30 2012.csv

The file contains 16 records. Note that data file does not have a header row, but follows the CMA data submission template that we posted on the connectingnj web site. The columns and the corresponding headers are:

A	- Provider Name
C	- FRN
D	- CMA
E	- TransTech
F	- MaxAdvDown

G - MaxAdvUp

NJBB_0004325205_SubscriberWeightedNominalSpeed June 30 2012.csv

The file contains 16 records. Note that data file does not have a header row, but follows the Subscriber-Weighted Nominal Speed data submission template that we posted on the connectingnj web site. The columns and the corresponding headers are:

A - Provider Name

C - FRN

D - CMA

E - TransTech

F - SubsWeightedSpeed

Read Me.doc

The file contains explanations of the submission.

Section 4: Data Validation, Transformation and Loading

NTIA Table BB_Service_CensusBlock

We loaded from supplied Excel spreadsheet after suitable geo-spatial operations that obtained latitude/longitude pairs for each address. The following table explains the transformations that were applied to load the target table.

Table Column	**Data Source / Transformation**
PROVNAME	Set to “Monmouth Telephone & Telegraph”
DBANAME	Set same as PROVNAME
PROVIDER_TYPE	Set to 1
FRN	Set to “0004325205”
STATEFIPS	Set to “34” (NJ)
COUNTYFIPS	Populated from Census Block FIPS Code (first 3 digits)
TRACT	Populated from Census Block FIPS Code (next 6 digits)

BLOCKID	Populated from Census Block FIPS Code
BLOCKSUBGROUP	Set to null
FULLFIPSID	Populated from Census Block FIPS Code
TRANSTECH	As supplied in column TransTech
MAXADDOWN	As supplied in column MaxAdvDown
MAXADUP	As supplied in column MaxAdvUp
TYPICDOWN	Set to null
TYPICUP	Set to null
SHAPE	Copied from Census Bureau TigerLine 2000, as matched by spatial join on geocoded address

Internal processing notes:

28. All NJBB_0004325205_AddressLevelAvailability.csv records were successfully geo-coded using the Google and Yahoo geocoders to obtain a Latitude, Longitude pair for each.. Addresses that yielded results with accuracy of 6 or below were excluded; only intersection (7) or rooftop (8) accuracy is acceptable.
    Created an Excel sheet and imported it to a geodatabase table.
29. Added point shapes corresponding to each Latitude, Longitude pair by creating a feature class from the table using ArcCatalog's "Create Feature Class from XY Table" option.
30. Added a column containing the ID of the containing year 2010 census block via a spatial join of the point shapes and the census block shapes from reference data.
31. Discarded one record that failed to spatially join on the 2010 NJ Census Block shapes.
32. Discarded 72 rows because the max adv down speed code was 1 or 2, which is not broadband according to the requirements of the NOFA
33. Discarded 163 rows with duplicate census blocks while preserving the greatest speed. These result from multiple customers in the same census block.
34. Discarded 4 large census blocks (greater than 2 square miles).
35. Final record count loaded is 703.

Location	Provided by street address			
One email with three addresses of their fiber ring interconnections, two in New Jersey.				

Section 3: Submission File Details

Received information via email:

Section 4: Data Validation, Transformation and Loading

NTIA Table BB_ConnectionPoint_MiddleMile

The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	Set to “Network Billing Systems LLC”
DBANAME	Set to “Network Billing Systems LLC”
FRN	Set to “0004965141”
OWNERSHIP	Set to null, not provided
BHCAPACITY	Set to 5, OC-48 is 2.5Gbps

BHTYPE	Set to 1, transport facility is fiber
LATITUDE	As computed from address
LONGITUDE	As computed from address
ELEVFEET	Set to "0" (zero)
STATEABBR	Set to "NJ"
FULLFIPSID	ID of containing census block from Year 2010 Census Bureau TigerLine reference data
SHAPE	Created using ESRI ArcDesktop

Internal notes on processing:

25. Used the provider name, DBA name, and FRN from FCC Form 477 reference data.
26. The following steps were performed for the October 2011 submission and the results re-used here:
    a. Geocoded the address to obtain a Latitude, Longitude value pair. All middle-point addresses were successfully geocoded using Arroyo with Yahoo geocoder.
    b. Imported the resulting data to a geodatabase table.
    c. Added a point for the Latitude, Longitude pair by creating a feature class from the table using ArcCatalog's "Create Feature Class from XY Table" option.
    d. Added a column containing the ID of the containing year 2010 census block via a spatial join of the points and the census block shapes from reference data. All records successfully spatially joined on 2010 NJ Census Block shapes.
27. Based on provider email response, set ownership value to leased.
28. Loaded 2 records.

Subject: RE: Reminder - NJ Broadband Data Collection

This is what I submitted – I think last summer.

Does this suffice?

To: Telcordia (NJ BB Data Collection)

From: Ray Wood (NBS, Product Manager).

Re: NJ BB Data Collection

I believe that we qualify for the BB Data Collection. However, what we do have that qualifies is only a portion of our business.

I don't believe we qualify as a fixed broadband or mobile broadband service provider.

However, we probably do qualify as a middle mile infrastructure provider.

We have a fiber ring that runs through the addresses listed below:

60 Hudson Street

NY, NY

(Carrier Hotel)

155 Halsey Street

Newark, NJ 07102

(Carrier Hotel)

282 Main Street

Little Ferry NJ

(Verizon Central Office)

We can offer bandwidth increments from T1 to OC-48.

Please let me know if you require further detail on this.

Thank you,

Ray Wood

Ray,

This is great. The NTIA is collecting data every six months, and wants us to get revised data or verify previous data.

A couple of clarifications:

1. I am assuming you lease space at these facilities, rather than own them. Is that true in all three cases?
2. When you say you can offer T1 to OC-48, how is that configured? Do you resell facilities from other providers to connect to your locations?

Ray,

No...your are not required by law to participate in this mapping activity. You are strongly encouraged to do so, but the decision is yours. The map is used primarily for national and state-level planning and informational purposes. Having said all of this, the reason I contacted you is because you are on my list of those who made previous data submissions. I looked at the report for NBS Voice, and found the following:
:
:
:
If there haven't been any changes in the services you offer since last December, then we can resubmit the same data that we used last April.

Regards,

Cliff Behrens

12	NJ_Broadband_Mapping-Backbone-090711.xls

Section 4: Data Transformation and Loading

The following describes the processing applied to load the tables

NTIA Table BB_ConnectionPoint_MiddleMile

Loaded from the supplied Excel Spreadsheet. The following table explains the transformations that were applied.

Table Column	**Data Source / Transformation**
PROVNAME	As supplied in column “Provider Name” but changed “c” to “C”
DBANAME	As supplied in column “DBA” but changed “c” to “C”
FRN	As supplied in column “FRN”
OWNERSHIP	As provided in column “Ownership”
BHCAPACITY	As provided in column “Serving Facility Capacity”
BHTYPE	As provided in column “Serving Facility Type”
LATITUDE	As computed from address
LONGITUDE	As computed from address
ELEVFEET	Set to “0” (zero); values such as “Fl 1” were not parsed
STATEABBR	Set to “NJ”
FULLFIPSID	ID of containing census block from Year 2010 Census Bureau TigerLine reference data
SHAPE	Created using ESRI ArcDesktop

Internal notes on processing:

29. Used the provider name, DBA name, and FRN as supplied.
30. Following steps were performed for Fall 2011 submission and the results reused:
    a. Geocoded the address to obtain a Latitude, Longitude value pair. All middle-point addresses were successfully geocoded using Arroyo with Yahoo geocoder.
    b. Imported the resulting data to a geodatabase table.
    c. Added a point for the Latitude, Longitude pair by creating a feature class from the table using ArcCatalog’s “Create Feature Class from XY Table” option.
    d. Added a column containing the ID of the containing year 2010 census block via a spatial join of the points and the census block shapes from reference data. All records successfully spatially joined on 2010 NJ Census Block shapes.
    e. Loaded 11 records.
31. These records were copied over into a new BB_ConnectionPoint_MiddleMile table
32. Results passed all NTIA validations.

NTIA Table BB_Service_CensusBlock

The following table explains the transformations that were applied to load the target table.

Table Column	**Data Source / Transformation**
PROVNAME	As supplied in column “Provider Name” but changed “c” to “C”

DBANAME	As supplied in column “DBA” but changed “c” to “C”
PROVIDER_TYPE	Set to “1”
FRN	As supplied in column “FRN”
STATEFIPS	Set to “34” (NJ)
COUNTYFIPS	Populated from Census Block FIPS Code (first 3 digits)
TRACT	Populated from Census Block FIPS Code (next 6 digits)
BLOCKID	Populated from Census Block FIPS Code
FULLFIPSID	Populated from Census Block FIPS Code
TRANSTECH	As supplied in column “Technology Code”
MAXADDOWN	As supplied in column “Max Ad Download Speed”
MAXADUP	As supplied in column “Max Ad Upload Speed”
TYPICDOWN	Set to null (see below)
TYPICUP	Set to null (see below)
ENDUSERCAT	Set to null (see below)
SHAPE	Copied from Census Bureau TigerLine 2010, as matched by spatial join on geocoded address

Internal processing notes:

36. Following steps were performed for the Fall 2011 submission:
    a. Geocoded the addresses using an Arroyo flow and the Yahoo geocoder, leaving the result with address and lat, long data in an Excel spreadsheet. All addresses were successfully geocoded (note: Excel file has an empty record at the end).
    b. Imported the spreadsheet to a simple ESRI geodatabase table
    c. Added point shapes corresponding to each Latitude,Longitude pair by creating a feature class from the table using ArcCatalog’s “Create Feature Class from XY Table” option
    d. Added a column containing the ID of the containing year 2010 census block using ArcCatalog's spatial join feature. The newly created point shapes are joined against census block shapes from reference data. All but three records successfully spatially joined on 2010 NJ Census Block shapes.
    e. Discarded typical speeds since they were in all cases identical to maximum advertised speeds, not measured values.
    f. The end user category value as originally supplied applied to an address, but we must anonymize the addresses and report census blocks. The NTIA directs us to report the “predominant” end-user category, which is not supplied here.
    g. Discarded 324 duplicate census block records, which result from multiple addresses in the same census block.
    h. Discarded 1 large census block record (340297351041013).
    i. Loaded 567 records.

37. Copied result into new BB_Service_CensusBlock

Comments: In telephone conversation, Provider described locations of interconnection huts and provided information on technology and speeds.			

Section 3: Submission File Details

Received email for October submission with information on the municipalities served in entirety, the technology of transmission, and the speed tiers offered to customers. Confirmed that information via phone on March 4, 2011

Section 4: Data Validation, Transformation and Loading

NTIA Table BB_ConnectionPoint_MiddleMile

The following table explains the transformations that were applied.

Table Column	Data Source / Transformation

PROVNAME	Set to “Service Electric Cable TV of Hunterdon, Inc.”
DBANAME	Not supplied; set same as PROVNAME
PROVNAME	As supplied
DBANAME	As supplied
FRN	Set to “0003760014”
OWNERSHIP	Set to 1 for leased
BHCAPACITY	Set to 4 for 1 Gbps
BHTYPE	Set to 1 for fiber
LATITUDE	Obtained by geo-coding addresses
LONGITUDE	Obtained by geo-coding addresses
ELEVFEET	Set to “0” (zero)
STATEABBR	Set to “NJ”
FULLFIPSID	ID of containing census block from Year 2010 Census Bureau TigerLine reference data
SHAPE	Created using ESRI ArcDesktop

Internal notes on processing:

1. Provider gave a set of addresses. These addresses were geo-coded using Google geo-coder into an Excel spreadsheet.
2. Imported the Excel sheet to a geo-database table.
3. Added point for the Latitude, Longitude pair by creating a feature class from the table using ArcCatalog’s “Create Feature Class from XY Table” option.
4. Mapped to separate shape file to correct tolerance.
5. Added a column containing the ID of the containing year 2010 census block via a spatial join of the points and the census block shapes from reference data.

NTIA Table BB_Service_CensusBlock

Loaded based on email received on August 23, 2010. We submitted all census blocks in the named municipalities. The following table explains the transformations that were applied to load the target table.

Table Column	Data Source / Transformation
PROVNAME	Set to “Service Electric Cable TV of Hunterdon, Inc.”
DBANAME	Not supplied; set same as PROVNAME
RESELLER	Set to “N”

FRN	Set to “0003760014”
STATEFIPS	Set to “34” (NJ)
COUNTYFIPS	Populated from Census Block FIPS Code (first 3 digits)
TRACT	Populated from Census Block FIPS Code (next 6 digits)
BLOCKID	Populated from Census Block FIPS Code
BLOCKSUBGROUP	Set to null
FULLFIPSID	Populated from Census Block FIPS Code
TRANSTECH	Set to 41 (Cable Modem – Other) per email Docsis-2.0
MAXADDOWN	Set to 7 (15 Mbps) per email
MAXADUP	Set to 3 (1 Mbps) per email
TYPICDOWN	Set to null, not provided
TYPICUP	Set to null, not provided
SHAPE	Copied from Census Bureau TigerLine 2000, as matched by spatial join on geocoded address

Internal processing notes:

38. Following steps were performed for October 2011 submission
    a. Created a file with municipality names that match exactly names in the “name” column in the Year 2000 Census Bureau TigerLine database. Primarily this meant changing “Boro” to “Borough”.

Municipality	**County**
Alexandria Township	Hunterdon
Alpha Borough	Warren
Bloomsbury Borough	Hunterdon
Frenchtown Borough	Hunterdon
Greenwich Township	Warren
Harmony Township	Warren
Holland Township	Hunterdon
Kingwood Township	Hunterdon
Lopatcong Township	Warren
Milford Borough	Hunterdon
Phillipsburg	Warren

Pohatcong Township Warren

b. Joined against municipalities against reference data to identify corresponding list of census blocks.

39. Ran all NTIA validations.

NTIA Table BB_Service_RoadSegment

Loaded with street segments in census blocks larger than 2 square miles as listed in Census Bureau TigerLine reference data. The following table explains the transformations that were applied to load the target table.

Table Column	**Data Source / Transformation**
PROVNAME	Set to "Service Electric Cable TV of Hunterdon, Inc."
DBANAME	Not supplied; set same as PROVNAME
RESELLER	Set to "N"
FRN	Set to "0003760014"
ADDMIN	From reference data
ADDMAX	From reference data
PREDIR	From reference data
STREETNAME	From reference data
STREETTYPE	From reference data
SUFFDIR	From reference data
CITY	From reference data
STATECODE	From reference data
ZIP5	From reference data
ZIP4	From reference data
TRANSTECH	Set to 41 (Cable Modem – Other) per email Docsis-2.0
MAXADDOWN	Set to 7 (10Mbps) per email
MAXADUP	Set to 3 (800Kbps) per email
TYPICDOWN	Set to null, not provided
TYPICUP	Set to null, not provided
SHAPE	From reference data

6.19 Service Electric Cable TV of Sparta

Connecting New Jersey - Broadband Provider Data Report

Provider: Service Electric Cable TV of Sparta
Received: March 2012
Submission date: October 2012

This report presents details on processing of the broadband data for delivery to the National Telecommunications and Information Administration.

For October 2012:

This is a stub report, since data from the previous submission was reused unchanged. The complete report from the previous submission begins on the next page. Notable differences from the processing done on the previous submission are listed next.

Section 1: NDA Status

No NDA executed.

Section 2: Submission Overview

<table>
<tr><th colspan="5">AVAILABILITY DATA</th></tr>
<tr><td>ID</td><td colspan="3">Provider name

<tr><td>Advertised-downstream</td><td></td><td>Municipality</td></tr>
</table>

	Subscriber-weighted-up		Not provided	exchange that they offer DOCSIS 3.1 over their entire footprint. He provided list of speeds, which we confirmed with him.
	Subscriber-weighted-down		Not provided	
Technology Type	Docsis 3.1 (will use code 40)			
End-user specification	Not provided			
Comments:				

INTERCONNECTION DATA	
ID	
File size	Several addresses provided
Ownership	Owned
Transport Type	Fiber
Data Rates/Capacity	One says “Fiber 10 gbps”; others have no statement - Clarified this via email. See answers below.
Location	Address
Comments:	

Section 3: Submission File Details

Received one (1) file by EMAIL:

Size	**Name**
9728	Broadband data Information.xls

Received a spreadsheet with information on the municipalities served in entirety, the technology of transmission, the modem speeds offered to customers, and some connection points.

We will gather all the census blocks in the municipality based on the TigerLine reference data and report those shapes in the BB_service_censusblock table.

Section 4: Data Validation, Transformation and Loading

NTIA Table BB_ConnectionPoint_MiddleMile

Loaded from 8 rows in the supplied Excel spreadsheet. The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	Set to "Service Electric Cable TV of NJ Inc." per email response
DBANAME	Set to "Service Electric Broadband Cable" per email response
FRN	Set to "0005007125" per email response
OWNERSHIP	Set to 0 to indicate owned
BHCAPACITY	Set to 6 or 4, see below
BHTYPE	Set to 1, provider indicated fiber.
LATITUDE	Created by geocoding the supplied address
LONGITUDE	Created by geocoding the supplied address
ELEVFEET	Set to "0" (zero)
STATEABBR	Set to "NJ"
FULLFIPSID	ID of containing census block from Year 2000 Census Bureau TigerLine reference data
SHAPE	Created using ESRI ArcDesktop

Internal notes on processing:

6. Following steps were performed during prior submission
   a. Created an excel sheet and imported to a geodatabase table.
   b. Added points corresponding to each Latitude,Longitude pair by creating a feature class from the table using ArcCatalog's "Create Feature Class from XY Table" option.
   c. Added a column containing the ID of the containing year 2000 census block via a spatial join of the points and the census block shapes from reference data.
7. Provider indicated that two sites are served by dual 10 Gbps links (code 6) and the rest are served by dual 2 Gbps links (code 4).

NTIA Table BB_Service_CensusBlock

Loaded based on the supplied file "Broadband data Information.xls". We submitted all census blocks less than 2 square miles in the named municipalities. The following table explains the transformations that were applied to load the target table.

Table Column	Data Source / Transformation
PROVNAME	Set to “Service Electric Cable TV of NJ Inc.” per email response
DBANAME	Set to “Service Electric Broadband Cable” per email response
PROVIDER_TYPE	Set to 1
FRN	Set to “0005007125” per email response
STATEFIPS	Set to “34” (NJ)
COUNTYFIPS	Populated from Census Block FIPS Code (digits 3-5)
TRACT	Populated from Census Block FIPS Code (next 6 digits)
BLOCKID	Populated from Census Block FIPS Code (next 5 digits)
BLOCKSUBGROUP	Set to null
FULLFIPSID	Populated from Census Block FIPS Code
TRANSTECH	Set to 40 per file (DOCSIS 3.0)
MAXADDOWN	Set to code 8 as reported by provider
MAXADUP	Set to code 5 as reported by provider
TYPICDOWN	Set to null, not provided
TYPICUP	Set to null, not provided
SHAPE	Copied from Census Bureau TigerLine 2010, as matched by spatial join on geocoded address

Internal processing notes:

40. Created a file with municipality names supplied by provider in a form that match exactly names the “name” column in the Year 2010 Census Bureau TigerLine database. Primarily this meant changing “Boro” to “Borough”.
41. Joined against reference data to discover census blocks, for a total of 4,135 blocks.

NTIA Table BB_Service_RoadSegment

Loaded with street segments in census blocks larger than 2 square miles as gathered from Census Bureau TigerLine reference data. The following table explains the transformations that were applied to load the target table.

Table Column	Data Source / Transformation
PROVNAME	Set to “Service Electric Cable TV of NJ Inc.” per email response
DBANAME	Set to “Service Electric Broadband Cable” per email response
PROVIDER_TYPE	Set to 1

FRN	Set to “0005007125” per email response
ADDMIN	From reference data
ADDMAX	From reference data
PREDIR	Set to null, not available in reference data
STREETNAME	From reference data
STREETTYPE	Set to null, not available in reference data
SUFFDIR	Set to null, not available in reference data
CITY	From reference data
STATECODE	Set to "NJ"
ZIP5	From reference data
ZIP4	Set to null, not available in reference data
TRANSTECH	Set to 40 (DOCSIS 3.0)
MAXADDOWN	Set to code 8 as reported by provider
MAXADUP	Set to code 5 as reported by provider
TYPICDOWN	Set to null, not provided
TYPICUP	Set to null, not provided
SHAPE	From reference data

Internal processing notes:

1. Discovered all street segments that touch census blocks larger than 2 square miles in the municipalities served by the provider as discussed for table BB_Service_Censusblock.
2. Joined against reference data to discover street segment, for a total of 2,223 entries.

Validation rules produced a warning on 5265 census blocks and 985 street segments for the combination of a downstream speed code of 8 (25-50 Mbps) with a transtech code of 40 (DOCSIS 3.1). Provider was not willing to commit that they offered anything faster. Internet search confirms that the fastest speed they advertise is 35 Mbps down and 3 Mbps up.

Section 5: Clarification Questions and Responses

From: James Galliford [mailto:jamesg@secable.com]
Sent: Monday, March 05, 2012 4:04 PM
To: Fiuk, Marek J
Cc: Wullert, John R II
Subject: Re: Tiger lines

Marek,

Thank you for your understanding.

These are the changes in speeds:

- 1.5/256 -> 2.0/256
- 7/1 -> 8/1
- 12/2 - 15/2
- 35/3 - No Change

We are going to work on compiling the detailed information using information that apparently has become available from our billing system recently. As soon as we get this information, we'll pass it on to you.

Thanks again.

-James

On 3/12/12 12:30 PM, Fiuk, Marek J wrote:

James,

Thank you for your cooperation in providing us with data needed for the forthcoming New Jersey Broadband submission.

While processing your data we have encountered some issues that we would like to clarify with you, in order to assure the best possible quality of the information we are going to submit.

You have provided us with a list of speed tiers that you support. Are all these speeds (in particular, the highest one) advertised in ALL municipalities from the list you supplied to us ?

If this is not the case, would you be able to provide the speed list on the per-municipality basis?

We also have a similar question regarding the cable technology - DOCSIS 3.0 and DOCSIS 1.1. Our current understanding is that you provide both of these in all covered municipalities. Is that correct ? If not, would you be able to provide us with the per-municipality list?

Regards,

Marek Fiuk

Comments:	

Section 3: Submission File Details

The Excel file was created from data gleaned from the Skycasters WEB site:
http://www.skycasters.com/satellite-internet-coverage/skycasters-coverage-NewJersey.html

There are 729 records. The file has latitude and longitude for county, city, zip code, and area code. It looks like the latitude and longitude is a centroid of area codes. Since we do not have shape files for area codes, we will use the latitude and longitude as a centroid of zip codes.

Section 4: Data Validation, Transformation and Loading

NTIA Table BB_Service_Wireless

The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	Set to "Skycasters, LLC"
DBANAME	Set to "Skycasters, LLC"
FRN	Set to 0018756155
TRANSTECH	Set to 60
SPECTRUM	Set to 9 per translation shown below
MAXADDOWN	Set to 6.
MAXADUP	Set to 4.
TYPICDOWN	Not provided, set to null

TYPICUP	Not provided, set to null
STATEABBR	Set to “NJ”
SHAPE	Single shape created from Municipalities (see below).

Internal notes on processing:

9. The excel sheet is imported to a geodatabase table.
10. Added point shapes corresponding to each Latitude, Longitude pair by creating a feature class from the table using ArcCatalog’s “Create Feature Class from XY Table” option. The name is skycasters_cov.
11. Refdata.nj_zip_poly_wgs is our reference data that contains shapes for zip codes in NJ. Spatial join nj_zip_poly_wgs with skycasters_cov, using the “contains match” option and unselecting “keep all target features”. The output is skycasters_cov_zip_poly. This is a subset of the nj_zip_poly_wgs table that contains the points in the skycasters_cov table.
12. Coalesced the single-part polygons into one multi-part polygon using the ArcGIS “Dissolve” tool, which resulted in a new feature class with the suffix “_dissol”.
13. Spectrum: Skycasters uses Ku-Band spectrum (12-18 GHz band). While this is not specifically included in the list of satellite frequencies associated with Code 9, we used code 9 anyway. This is consistent with the approach taken for WildBlue.

Validation rules produced a warning on the wireless shape record for the combination of downstream speed code of 6 (6-10 Mbps) with a transtech code of 60 (Satellite). A search of their Web site, http://www.skycasters.com/broadband-satellite-compare/compare.html, confirmed that the fastest speed they advertise is 6.09 Mbps down and 1.5 Mbps up.

Section 3: Submission File Details

Received these files by upload to the secure web site:

Size	**Name**
1KB	Confidential_Middlemile_NJ.zip
3413KB	Sprint_AreaAvailability_NJ.zip

The zip archives contained these files:

Size	**Name**
1KB	Confidential_Middlemile_NJ.txt
2KB	Sprint_AreaAvailability_NJ_region.dbf
1KB	Sprint_AreaAvailability_NJ_region.prj
5647KB	Sprint_AreaAvailability_NJ_region.shp

1KB Sprint_AreaAvailability_NJ_region.shx

Section 4: Validations and Results

Section 5: Data Transformation and Loading

Loaded 4 rows from the text file "Confidential_Middlemile_NJ.txt" supplied. The following table explains the transformations that were applied.

Table Column	**Data Source / Transformation**
PROVNAME	As supplied in column "provider_name"
DBANAME	As supplied
FRN	As supplied in column "frn", after removing hyphens
OWNERSHIP	As supplied
BHCAPACITY	As supplied in column "servingfacilitycapacity"
BHTYPE	As supplied in column "servicefacilitytype"
LATITUDE	As supplied
LONGITUDE	As supplied
ELEVFEET	As supplied in column "elevation" (all zero)
STATEABBR	Set to "NJ"
FULLFIPSID	Year 2010 Census Bureau TigerLine reference data
SHAPE	Created via ArcMap "Add XY Data" feature for lat/long value pairs

Internal notes on processing:

8. Removed a space in the longitude of the last line of the input file: `"-74.1610 "`
9. Created an excel sheet with the data and export to dBase from the excel 97-2003 format. Make sure the types of latitude and longitude are double.
10. Created a feature class from the table by creating a Point shape using ArcMap's "Add XY Data" feature corresponding to each Latitude, Longitude pair, using the wgs 1984 coordinate. The name of the feature class is sprint_middlemile_shape_wgs_tol.
11. Added a column containing the census block id of the containing year 2010 census block via a spatial join of the points and the census block shapes from reference data. The name of the feature class is sprint_middlemile_shape_wgs_tol_cb.
12. The only data imputed was the state abbreviation.

NTIA Table BB_Service_Wireless

Loaded two rows from from the supplied shapefile "Sprint_AreaAvailability_NJ_region. The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	As supplied in column "provider_name"
DBANAME	As supplied in column "dbaname"
FRN	As supplied in column "frn" after removing hyphens
TRANSTECH	As supplied in column "techtrans"
SPECTRUM	Set to 3 or 5 per translation shown below
MAXADDOWN	As supplied in column "maxaddnsp"
MAXADUP	As supplied in column "maxadupsp"
TYPICDOWN	As supplied in column "typdnsp"
TYPICUP	As supplied in column "typupsp"
STATEABBR	Set to "NJ"
SHAPE	As supplied.

Internal notes on processing:

14. The supplied shape uses geographic coordinate system name GCS_WGS_1984 The NTIA data model requires the same coordinate system. No geographic transformation was required, but the XY Tolerance values differ when the shapefile is imported into the geodatabase. Imported the table schema and the table data in two separate operations, thereby ensuring perfect compatibility with the NTIA data model. The table has the suffix "_tol".
15. NTIA requires shapes to be contained in the NJ state boundary. Although we visually verified that it is the case, we clipped the shape using ESRI: Analysis Tools-> Extract -> Clip with, select feature class refdata_2010.tl_2010_34_state10_wgs. The feature class has the suffix "_clip"
16. Details on spectrum transformation: Sprint provided input columns: spectrum1, spectrum2, spectrum3, spectrum4, spectrum5, spectrum6, spectrum7. Sprint put a "Y" in columns spectrum3 (representing range 1850-1915 MHz) and spectrum5 (representing range 2496–2690 MHz). The NTIA data model has a single column for spectrum. The corresponding NTIA "SPECTRUM USED" coded values are 3 and 5.
17. The only data imputed was the state abbreviation.

Section 6: Clarification Questions and Responses

The midde mile data is almost identical except the last line has 5 instead of 6 for the "Serving Facility Capacity" column

Subject: NJ BB data update for Fall 2012
Date: Fri, 13 Jul 2012 09:41:25 -0400
From: Connecting NJ <ConnectingNJ@appcomsci.com>
To: jack.delaney@sprint.com

Mr. Delaney,

I just wanted to confirm that we have received your data update for the Fall 2012 NJ BB submission to NTIA. Thank you for being "out in front" of this. We do have the following question regarding this update.

As you can see in the attachment, the middle mile data is almost identical to the 2012 April data except the last line has a value of "5" (instead of "6") for the "Serving Facility Capacity" column. Is this intentional?

Sincerely,

Cliff Behrens

Subject: RE: NJ BB data update for Fall 2012
Date: Fri, 13 Jul 2012 14:46:42 +0000
From: Delaney, Jack L [LEG] <Jack.Delaney@sprint.com>
To: Connecting NJ <ConnectingNJ@appcomsci.com>

Cliff,

Thanks for alerting me to that. Yes, that's correct. It is a correction. It should have been '5' in the last round. By next round, it should be '6' again, since we are in the process of upgrading the system.

Thanks again,

Jack Delaney

Subject: Questions about previous data submissions
Date: Fri, 27 Jul 2012 11:49:32 -0400
From: Connecting NJ <ConnectingNJ@appcomsci.com>
To: jack.delaney@sprint.com

Mr. Delaney,

The NJ Broadband Mapping team has received feedback from the NTIA regarding our 4/11 and 10/11 data submissions. The NTIA contracted the Michael Baker firm who, using third-party data, evaluated the quality of data submissions it received from its grantees. Since the feedback we have received for the last two submissions is consistent, we would like to share it with you. Please note that we were not given copies of the third-party data, so the reasons for mismatches between the data we submitted and these third-party data are not always clear. Our intent is merely to share with you problematic fields, such as provider name or speed tier, that have a lot of mismatches, and do some further inquiry to better validate the provider's data. Obviously, by working more closely with you, we hope to reduce data mismatches in future submissions. Here are some of the questions we have about your data.

Sprint
- Most mismatches result from reporting of max advertised downstream speed tier 3. (Please refer to downstream speed tier table below.) One possibility is that tier 3 understates your downstream speed.
- Most mismatches in your reporting of max advertised upstream speed is for tier 2. (Please refer to upstream speed tier table below.) Might you possibly be understating your upstream speed?

Thank you for your interest and continued support in our NJ BB Mapping program.

Best regards,

Cliff Behrens

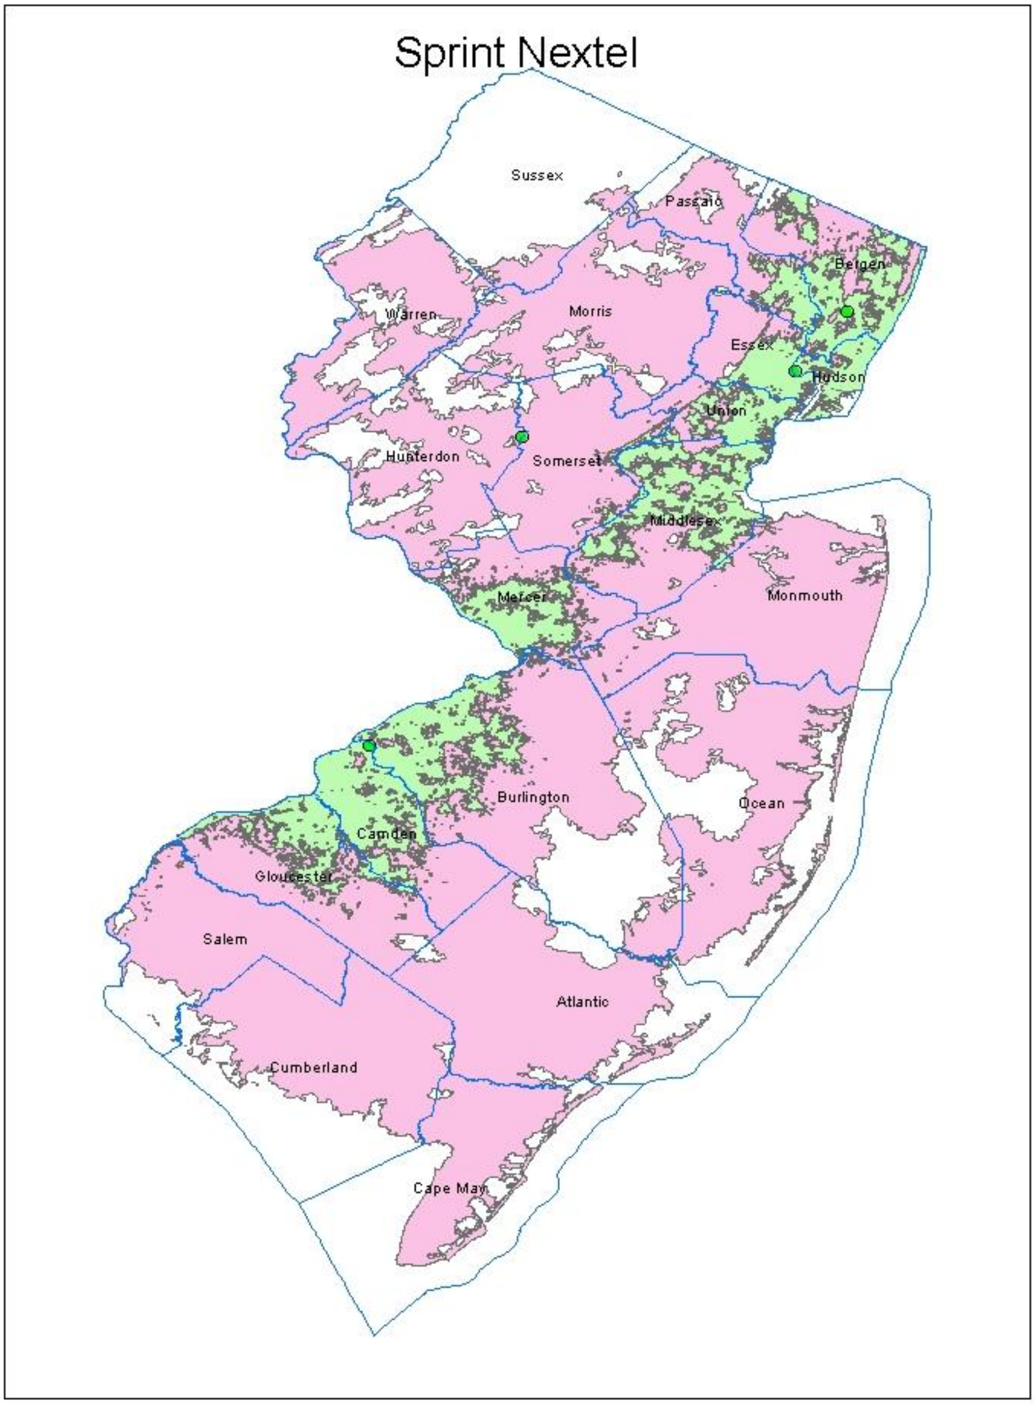
Section 8: Overview Map of Submitted Data



6.22 Starband Communications

Connecting New Jersey - Broadband Provider Data Report

Provider: Starband
Submission date: October 2012

This report presents details on processing broadband data for delivery to the National Telecommunications and Information Administration (NTIA).

This is a stub report, since data from the previous submission was reused with the spectrum set to 9 being the only change. The complete report from the previous submission begins on the next page. Notable differences from the processing done on the previous submission are listed next.

NTIA Table BB_Service_Wireless

Total rows loaded: 1 (shape of The State of New Jersey).

Since there is no change in the data and NTIA data model, the table is copied from the 2012 April table, using an ESRI tool, "ArcToolBox->Data Management Tools->General->Append" with NO_TEST in the Schema Type option.

As per the latest clarification, the value in column "SPECTRUM" was set to 9.

Provider Interactions

Subject: RE: NJ Broadband Data Collection - Spring 2012

Lesley,

Does Starband have any information on actual coverage areas, taking into account topography, building shadows, etc? Such data, perhaps from modeling and simulations, could improve the accuracy of the coverage map.

Subject: RE: NJ Broadband Data Collection - Spring 2012

Dear John,

Sorry for my delay in getting back to you. For each site that StarBand installs, prior to the actual installation our installers will go out to the site and make an assessment as to where the antenna should be placed so that it has adequate line of site.

Hope this helps.

Thanks,

Lesley

Section 3: Submission File Details

Received email explaining their service offering. Satellite service is provided in all of New Jersey.

On subscriber weighted values, they say:

"Since we have only 1 service that meets the definition of broadband service, the weighted average is the same as the average for that service. Upload speed is 256 Kbps and download speed is 1.5Mbps."

Section 4: Validations and Results

No rows of data need to be validated.

Section 5: Data Transformation and Loading

NTIA Table BB_Service_Wireless

Loaded county shapes from reference data for counties in the State of New Jersey based on emailed statements that all counties are covered. The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	Set to "StarBand Communications Inc."
DBANAME	Set to "StarBand"
FRN	Set to 0005087457
TRANSTECH	Set to 60
SPECTRUM	Set to 7 per translation shown below
MAXADDOWN	Set to 4, see below.
MAXADUP	Set to 2, see below.
TYPICDOWN	Not provided, set to null
TYPICUP	Not provided, set to null
STATEABBR	Set to “NJ”
SHAPE	County shape read from reference data.

Internal notes on processing:

18. Spectrum: No statement was provided. The NTIA data model has a single column for spectrum. Satellite corresponds to NTIA “SPECTRUM USED” code value 7.
19. Speeds: The maximum advertised speeds provided in the emailed brochure are as discussed above For max adv speeds we encoded the submitted down speed as value 4 (range 1.5-3 Mbps) and encoded the submitted up speed as value 2 (range 200 Kbps -- 768 Kbps).

Section 6: Clarification Questions and Responses

1. What is DBA name if different than provider name?

Section 3: Submission File Details

Received e-mail with address-level information for their only two broadband customers in NJ (located in Montvale and Secaucus).

Section 4: Data Validation, Transformation and Loading

NTIA Table BB_Service_CensusBlock

Using information from the e-mail, manually prepared an Excel file "TataBBInfo.xls" which was later geocoded, joined to NJ census blocks and loaded into an SDE table providerInput. Subsequently, the BB_Service_CensusBlock table was loaded from providerInput, with the fields (columns) set as detailed bellow:

Table Column	Data Source / Transformation
PROVNAME	Set to "Tata Communications (America) Inc."
DBANAME	Set to "Tata Communications (America) Inc."
PROVIDER_TYPE	Set to 3, as per the e-mail info
FRN	Set to "0009480302"

STATEFIPS	Set to “34” (NJ)
COUNTYFIPS	Populated from Census Block FIPS Code (digits 2-5)
TRACT	Populated from Census Block FIPS Code (next 6 digits)
BLOCKID	Populated from Census Block FIPS Code
BLOCKSUBGROUP	Set to null
FULLFIPSID	Populated from Census Block FIPS Code
TRANSTECH	Set to 20, as per the e-mail info
MAXADDOWN	Set per records provided in the e-mail.
MAXADUP	Set per records provided in the e-mail.
TYPICDOWN	Set to null, not provided
TYPICUP	Set to null, not provided
SHAPE	Copied from Census Bureau 2010, as matched by spatial join on geocoded address point

Diana,

Could you please tell use what technology you use to deliver broadband service to each of these two customers?

> 1. 155 Chestnut Ridge Road, Montvale, New Jersey 07645-3Mbps, and
>
> 2. 275 Hartz Way, Secaucus, New Jersey 07094 - 1Mbps

Here are the possibilities:

0= Asymmetric xDSL.
20= Symmetric xDSL.
30= Other Copper Wireline
40= Cable Modem—DOCSIS 3.0.
41= Cable Modem—Other.
50= Optical Carrier/Fiber to the End User
60= Satellite.
70= Terrestrial Fixed Wireless—Unlicensed.
71= Terrestrial Fixed Wireless—Licensed.
80= Terrestrial Mobile Wireless.
90= Electric Power Line.
0 = All Other

Thank you for you assistance,

Cliff Behrens

From: Connecting NJ <ConnectingNJ@appcomsci.com>
To: Diana Peneva <Diana.Peneva@tatacommunications.com>

Diana,

We understand Internet Protocol Security (IPsec) to be a protocol suite for securing Internet Protocol (IP) communications by authenticating and encrypting each IP packet of a communication session. For reporting the technology of transmission, the NTIA requests reporting the technology used by the portion of the connection that terminates at the end-user location. If different technologies are used in the two directions of information transfer (‘‘downstream’’ and ‘‘upstream’’), report the connection in the technology category for the downstream direction. The technology of transmission should be entered as an integer based on the following reference:

0= Asymmetric xDSL.
20= Symmetric xDSL.
30= Other Copper Wireline

```
40= Cable Modem-DOCSIS 3.0.
41= Cable Modem-Other.
50= Optical Carrier/Fiber to the End User 60= Satellite.
70= Terrestrial Fixed Wireless-Unlicensed.
71= Terrestrial Fixed Wireless-Licensed.
80= Terrestrial Mobile Wireless.
90= Electric Power Line.
0 = All Other

Cliff

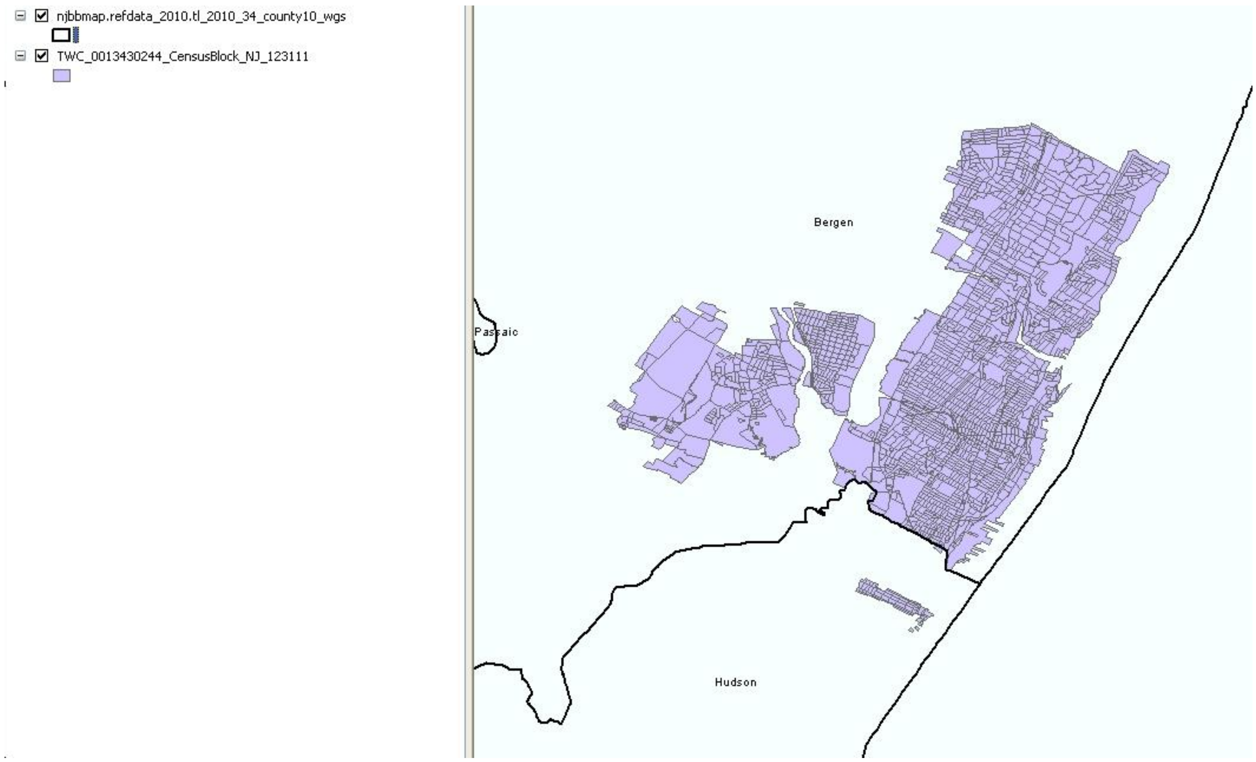
Figure 1. Loaded results



Section 4: Data Validation, Transformation and Loading

NTIA Table BB_ConnectionPoint_MiddleMile

NJ 6th BB Cltr.pdf states that the middle mile data has not been changed. Therefore we copied the 2012 April middle mile data.

The following describes how to create the middle mile data in the previously submitted data which dates from the 2010 October submission.

Loaded from supplied file “0013430244_middlemile_NJ_06302009.txt” (19 rows, only 1 in New Jersey) received in **June 2010** (and apparently unchanged since). The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	Set to “Time Warner Cable LLC” (“LLC” was missing)
DBANAME	As supplied in column ”DBAName”

FRN	Set to “0013430244”
OWNERSHIP	As supplied in column ”Ownership”
BHCAPACITY	As supplied in column ”Serving Facility Capacity”
BHTYPE	As supplied in column ”Serving Facility Type”
LATITUDE	As supplied in column “Latitude”
LONGITUDE	As supplied in column “Longitude”
ELEVFEET	As supplied in column “Elevation”
STATEABBR	Set to “NJ”
FULLFIPSID	ID of containing census block from Year 2010 Census Bureau reference data
SHAPE	Point corresponding to Lat, Long created using ESRI

Internal processing notes from prior report:

13. Created an excel sheet and imported to a geodatabase table.
14. Added points corresponding to each Latitude,Longitude pair by creating a feature class from the table using ArcCatalog’s “Create Feature Class from XY Table” option.
15. We dropped all locations outside the New Jersey state boundary, leaving just one. In this row, the elevation value is 30, and we were told in June 2010 that the connection point is on the 7^{th} floor of a building, so we did not change the value.
16. Added a column with the ID of the containing Year 2000 Census block via a spatial join of the points and the census block shapes from reference data.

NTIA Table BB_Service_CensusBlock

The census block information was loaded from the supplied shape file. The following table explains the transformations that were applied to load the target table.

Table Column	Data Source / Transformation
PROVNAME	Set to “Time Warner Cable LLC” (“LLC” was missing in submitted data)
DBANAME	As supplied in column ”DBAName”
PROVIDER_TYPE	Set to 1
FRN	Set to “0013430244”
STATEFIPS	Set to “34”
COUNTYFIPS	Populated from cb_fips (digits 3-5)
TRACT	Populated from cb_fips (next 6 digits)
BLOCKID	Populated from cb_fips (next 4 digits)
FULLFIPSID	As supplied in column cb_fips

TRANSTECH	As supplied in column tech_trans
MAXADDOWN	As supplied in column max_ad_dwn
MAXADUP	As supplied in column max_ad_up
TYPICDOWN	Submitted as “0” in provided data, set to null
TYPICUP	Submitted as “0” in provided data, set to null
ENDUSERCAT	Not provided, set to null
SHAPE	As supplied

Internal notes on processing

1. The shapefile TWC_0013430244_CensusBlock_NJ_063012 contains 1973 rows (polygons). See above for a preview picture.
2. The shapes use XY coordinate system GCS_North_American_1983. Provides census-block shapes and associated speed data. All census block IDs are length 15. All submitted block IDs are unique and were found in Census Bureau Year 2010 reference data. Only technology code 40 is present. Maximum advertised speed codes are present.
3. Geographic coordinate system: The supplied shape uses geographic coordinate system name GCS_North_American_1983. The NTIA transmittal data model requires coordinate system GCS_WGS_1984. To change the projection we applied the geographic transformation NAD_1983_To_WGS_1984_5 (per ESRI KB article 24159). We also had to load the data into a second feature class such that the tolerance value matches the NTIA transmittal model’s value of 0.000000002.
4. Checked that all census blocks were valid NJ blocks and that no duplicates were present.

NTIA Table BB_Service_Overview

The following data were submitted in 0013430244_blendedaverage_NJ_6302012.txt. However, the service provider stated that the data are proprietary, not for public consumption or dissemination in any form. Since we are not sure if the BB_Service_Overview table has proper protection, we did not submit the data in that table and are instead including it here..

```
NAME  DBA   FRN   COUNTY     STATE TECH CODE  SWNOMSPEED

Time Warner Cable LLC Time Warner Cable     0013430244 003   34    40
     7630.1

Time Warner Cable LLC Time Warner Cable     0013430244 017   34    40
     6477.1
```

Subject: RE: FW: NJ State Broadband Mapping Program - 6th Round

Scott

The question raised below has not been raised by any other SBI grantee regarding data submissions.

SBI receives sizeable amounts of data each round that is not for public distribution, for example middle mile data which is collected, stored, and not released.

If Time-Warner has previously contributed to the NJ data gathering effort I'm not certain why this is now a concern if the statement below is new to the submission.

It may be a pro forma notice.

SBI recommends you submit the data.

For assurances, you can flag the submission to SBI with Time Warner's expressed prohibition accordingly.

If time permits SBI may review past submissions from NJ and contact you if additional information is needed

Thanks

Brian

Brian,

Here's the email thread regarding the Provider Weighted Nominal Speed data sent in by TWC. The question is whether or not we can submit this data to the NJ or National maps due to them saying it is not for public disclosure. Can you let us know if you've seen this before in other states or what to make of it?

Thanks,

Scott

Subject: Re: FW: NJ State Broadband Mapping Program - 6th Round

Thanks, Shelley.

Let's add to our agenda for tomorrow a discussion item related to the implications of the confidentiality of this information; i.e., under these restrictions, do we deliver to NTIA and, if so, how?

Hello Shelly:

Attached is the Time Warner Cable Confidential Subscriber-Weighted Nominal Speed data showing the blended average of our advertised maximum broadband download speeds as of June 30, 2012 for New Jersey. This information is highly Confidential and is protected under the confidentiality requirements set forth in Section 106 (h) of the Broadband Data Improvement Act and the Nondisclosure Agreement. The information is not for public disclosure.

If you have any questions regarding this submission please let me know.

Best regards,

6.25 T-Mobile

Connecting New Jersey - Broadband Provider Data Report

Provider: T-Mobile
Received: August 2012
Submission date: October 2012

This report presents details on processing broadband data for delivery to the National Telecommunications and Information Administration.

Section 1: NDA Status

Executed with NJ OIT.

Section 2: Submission Overview

AVAILABILITY DATA		
ID	PROVIDER NAME	T-Mobile USA, Inc.
	DBA NAME	T-Mobile
	FRN	0006945950
	Holding company name	T-Mobile USA
	Holding company number	130403
FOR WIRELESS		
Filetypes	T-mobile supplies .xls, .txt. and shapefiles (availability). They supply 3 sets of shape files: 2 for HSPA+ coverage and another for 3G coverage.	
Speeds	(see table below)	**Notes: "T-Mobile submitted three sets of map files for this state. The file names correspond with maximum advertised speed data above. HSPA42 represents increased 4G download speed (it does not affect upload speed)."**

Type	Spatial Resolution (address, street seg, census block, RSA/MSA, zipcode)
Upstream max adv	yes (shapefiles for both 3G and 4G)
Downstream max adv	yes (shapefiles for both 3G and 4G)
Upstream typical	not found.
Downstream typical	not found.
Subscriber-	Provided as a table of valuesin

	weighted	mbps (not kbps) correlated to 21 FIPS codes (code 80)	
Technology Type	Spectrum (Mhz, FCC code)		Advanced Wireless Services spectrum (1710-1755 MHz; 2100-2155)
Comments:			
INTERCONNECTION DATA			
ID			
File size	10 rows		
Ownership	Code 1		
Transport Type	Type 1		
Data Rates/Capacity	codes 4 and 6		
Location	lat/longs given for all (either A or Z end is in NJ)		
Comments: T-Mobile had reported with their submission that this information would be delayed			

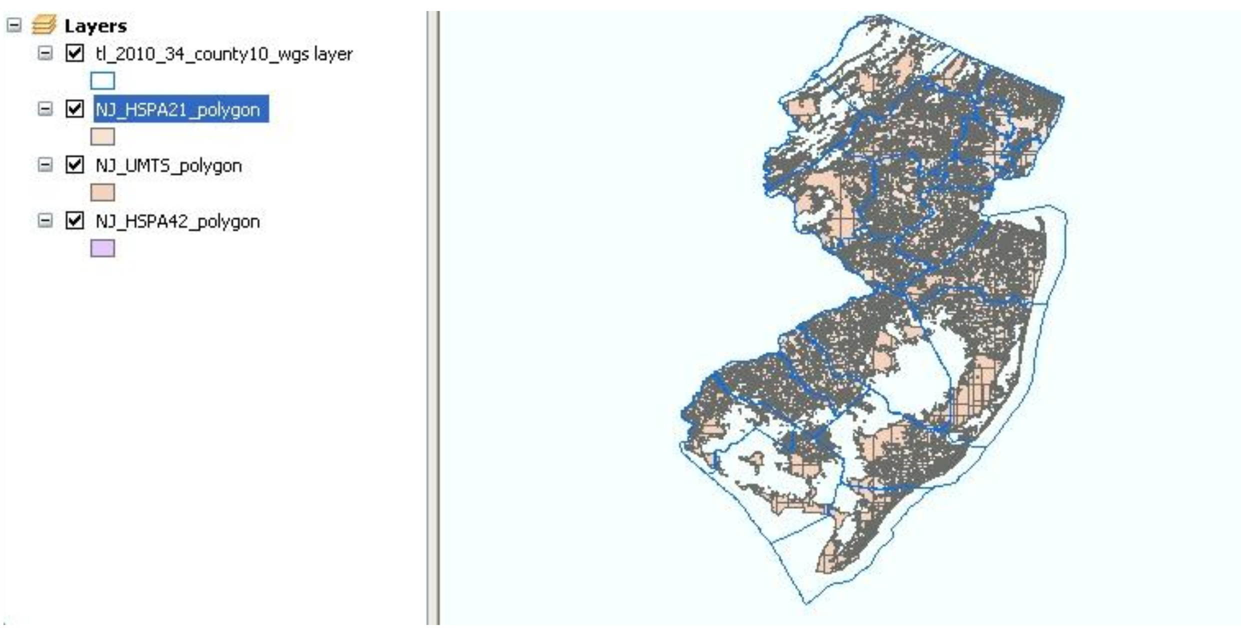

Figure 1. Preview of submitted data in ESRI

Section 3: Submission File Details

The original submission includes the following files:

Name	Size
area_availability_NJ.txt	4 KB
area_availability_NJ.zip	7,023 KB
avg_speed_NJ.xlsx	12 KB
confidential_NJ.txt	1 KB
Cover Letter_NJ.pdf	23 KB
middle-mile_NJ.xlsx	10 KB
NJ_HSPA21_polygon.dbf	105 KB
NJ_HSPA21_polygon.prj	1 KB
NJ_HSPA21_polygon.shp	11,092 KB
NJ_HSPA21_polygon.shx	47 KB
NJ_HSPA42_polygon.dbf	10 KB
NJ_HSPA42_polygon.prj	1 KB
NJ_HSPA42_polygon.shp	5,527 KB
NJ_HSPA42_polygon.shx	25 KB
NJ_UMTS_polygon.dbf	150 KB
NJ_UMTS_polygon.prj	1 KB
NJ_UMTS_polygon.shp	5,980 KB
NJ_UMTS_polygon.shx	18 KB
T-Mobile_BB Data_NJ.zip	7,056 KB

Section 4: Data Validation, Transformation and Loading

NTIA Table BB_ConnectionPoint_MiddleMile

Loaded from supplied file “middle_mile_NJ.xlsx” (8 rows). The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	Set to “T-Mobile USA, Inc."
DBANAME	Set to "T-Mobile"
FRN	Set to “0006945950”
OWNERSHIP	As provided in column Ownership (value 1)l
BHCAPACITY	As provided in column Serving Facility Capacity
BHTYPE	As provided in column Serving Facility Type
LATITUDE	Created by geocoding the supplied address

LONGITUDE	Created by geocoding the supplied address
ELEVFEET	Set to “0” (zero)
STATEABBR	As provided in column State
FULLFIPSID	ID of containing census block from Year 2010 Census Bureau reference data
SHAPE	Point created using ESRI tools

Internal notes on processing:

17. Created an excel sheet with the original data, remove the first 3 header lines, add the Latitude and Longitude columns, copied the NJ lat/long from the A or Z lat/long to the Latitude and Longitude columns, and imported to a geo-database table. (If A and Z are all NJ, copy Z which is arbitrarily chosen.)
18. Added points corresponding to each Latitude, Longitude pair by creating a feature class from the table using ArcCatalog’s “Create Feature Class from XY Table” option.
19. Added a column containing the ID of the containing year 2010 census block via a spatial join of the points and the Year 2010 census block shapes from Tiger Line reference data. Ensured that all entries were successfully mapped to 2010 census blocks.
20. Dropped 4 records that were as duplicate census blocks
21. Loaded 4 records.

NTIA Table BB_Service_Wireless

Loaded from the supplied shapefiles NJ_HSPA21_polygon (5944 rows), NJ_HSPA42_polygon (3171 rows), and NJ_UMTS_polygon (2286 rows). The following table explains the transformations that were applied.

Table Column	**Data Source / Transformation**
PROVNAME	Set to "T-Mobile USA, Inc." per area_availability_NJ.txt
DBANAME	Set to “T-Mobile" per area_availability_NJ.txt
FRN	Set to “0006945950”
TRANSTECH	Set to 80 per area_availability_NJ.txt
SPECTRUM	Set to “4” per translation shown below
MAXADDOWN	Set as follows: • HSPA 21 is 6; • HSPA 42 is 7; • UMTS is 4; as specified in file area_availability_NJ.txt
MAXADUP	Set as follows: • HSPA 21 is 4;

	• HSPA 42 is 4; • UMTS is 2; as specified in file area_availability_NJ.txt
TYPICDOWN	Set to null (not supplied)
TYPICUP	Set to null (not supplied)
STATEABBR	As supplied in column “state” with “NJ”
SHAPE	As supplied.

Internal notes on processing:

20. Received three shape files; see above for preview of shapefiles in ESRI. (Note that we do not check duplicate since the shapes will be merged to a single shape for each technology)
    a. NJ_HSPA21
        i. 5944 candidates
    b. NJ_HSPA42
        i. 3171 candidates
    c. NJ_UMTS
        i. 2286 candidates
21. The data rows carry no technology, speed, or other broadband data. This data is provided in a separate file. File “area_availability_NJ.txt” provides technology and spectrum codes that are within the valid set. It also provides maximum-advertised speeds for each wireless technology.
22. File “avg_speed_NJ.xls” provides subscriber-weighted nominal speeds, which we will not be using for this round (no overview table required).
23. Spectrum: NOFA defines 7 spectrum columns. T-Mobile provided a “Y” value in column 4 (Advanced Wireless Services, ranges 1710-1755 MHz; 2100-2155) in file area-availability_NJ.txt, so we coded the value as '4'.
24. The supplied shapes use Z coordinate. We need to remove it using ArcToolbox > Conversion Tools > To Geodatabase-> Feature Class to Geodatabase (multiple) tool. The resulting tables are named with suffix “_z”.
25. The supplied shapes use geographic coordinate system GCS_North_American_1983. The NTIA data model requires coordinate system GCS_WGS_1984. To change the projection we applied the ESRI geographic transformation NAD_1983_To_WGS_1984_5 (per ESRI KB article 24159). The resulting tables are named with suffix “_wgs”.
26. The supplied shapes use tolerance values different from the NTIA transmittal model. The transformed feature classes with suitable tolerances are named with suffix “_tol”.
27. NTIA requires shapes to be contained in the NJ state boundary. Although we can visually verified that it is the case, we clipped the shape using ESRI: Analysis Tools-> Extract -> Clip with, select feature class refdata_2010.tl_2010_34_state10_wgs. The feature class has the suffix "_clip".
28. The NJ_HSPA42 and NJ_UMTS shapefiles contained some identical rows as determined by spectrum, technology, and shape; the rows only differed in the maximum advertised speed. To prevent the problem of duplicate shapes in the merged data, we took the following actions:
    a. Merged shapes in NJ_HSPA21_polygon_wgs_tol_clip into a single shape, using ArcGIS Dissolve tool: Data Management Tools->Generalization->Dissolve (without choosing

anything in the Dissolve_Field(s) option). The transformed table is named with suffix "_z_wgs_tol_clip_Dissolve".

b. Merged shapes in NJ_HSPA42_polygon_wgs_tol_clip into a single shape, using ArcGIS Dissolve tool. The transformed table is named with suffix "_z_wgs_tol_clip_Dissolve".
c. Merged the shapes in NJ_UMTS_polygon_wgs_tol_clip into a single shape, using ArcGIS Dissolve tool. The transformed table is named with suffix "_z_wgs_tol_clip_Dissolve".

29. Validation rules produced a warning with the HSPA42 having a Maximum Advertised Download Speed code of 7(10-25 Mbps). Investigation of the T-Mobile Web site showed that they are advertising average speeds "approaching 10 Mbps" and peak speeds of 27 Mbps. Sent a note to the provider to verify the value. Provider confirmed that those values are correct.

Section 5: Clarification Questions and Responses

From: NJ Broadband Data Collection [mailto:ConnectingNJ@groups.appcomsci.com]
Sent: Tuesday, February 28, 2012 8:21 AM
To: 'jeni.wilcox@t-mobile.com'
Cc: 'NJ Broadband Data Collection'
Subject: NJ Broadband Clarification

Jeni,

As part of the validation of the Broadband Data, the NTIA has defined a set of speed ranges associated with various technologies and asked us to verify any submission values outside those ranges. In the case of the T-Mobile data, the value of 7 (10 to 25 Mbps) associated with download on HSPA42 is outside the NTIA's expected range. Can you please confirm that you are reporting download speeds of greater than or equal to 10 Mbps and less than 25 Mbps?

Thanks,

John Wullert

To: NJ Broadband Data Collection
Subject: RE: NJ Broadband Clarification

Hi John,

Sorry, this one slipped by me. Yes, T-Mobile is reporting **≥ 10 mbps < 25 mbps** as the maximum advertised download speed for its HSPA+42 network.

Thank you,

Jeni Wilcox
Senior Specialist, State Regulatory Affairs

Subject: Questions about previous data submissions
Date: Fri, 27 Jul 2012 11:52:45 -0400
From: Connecting NJ <ConnectingNJ@appcomsci.com>
To: jeni.wilcox@t-mobile.com

Ms. Wilcox,

The NJ Broadband Mapping team has received feedback from the NTIA regarding our 4/11 and 10/11 data submissions. The NTIA contracted the Michael Baker firm who, using third-party data, evaluated the quality of data submissions it received from its grantees. Since the feedback we have received for the last two submissions is consistent, we would like to share it with you. Please note that we were not given copies of the third-party data, so the reasons for mismatches between the data we submitted and these third-party data are not always clear. Our intent is merely to share with you problematic fields, such as provider name or speed tier, that have a lot of mismatches, and do some further inquiry to better validate the provider's data. Obviously, by working more closely with you, we hope to reduce data mismatches in future submissions. Here are some of the questions we have about your data.

T-Mobile
- Most mismatches result from your reporting of max advertised downstream speed tiers 4 & 6. (Please refer to downstream speed tier table below.) One possibility is that you have understated downstream speed in the lowest tiers.
- Most mismatches in your reporting of max advertised upstream speed is for tier 2. (Please refer to upstream speed tier table below.) Might you possibly be understating your upstream speed?

Thank you for your interest and continued support in our NJ BB Mapping program.

Best regards,

Cliff Behrens
Manager - NJ BB Data Collection
Applied Communication Sciences
ConnectingNJ@groups.appcomsci.com

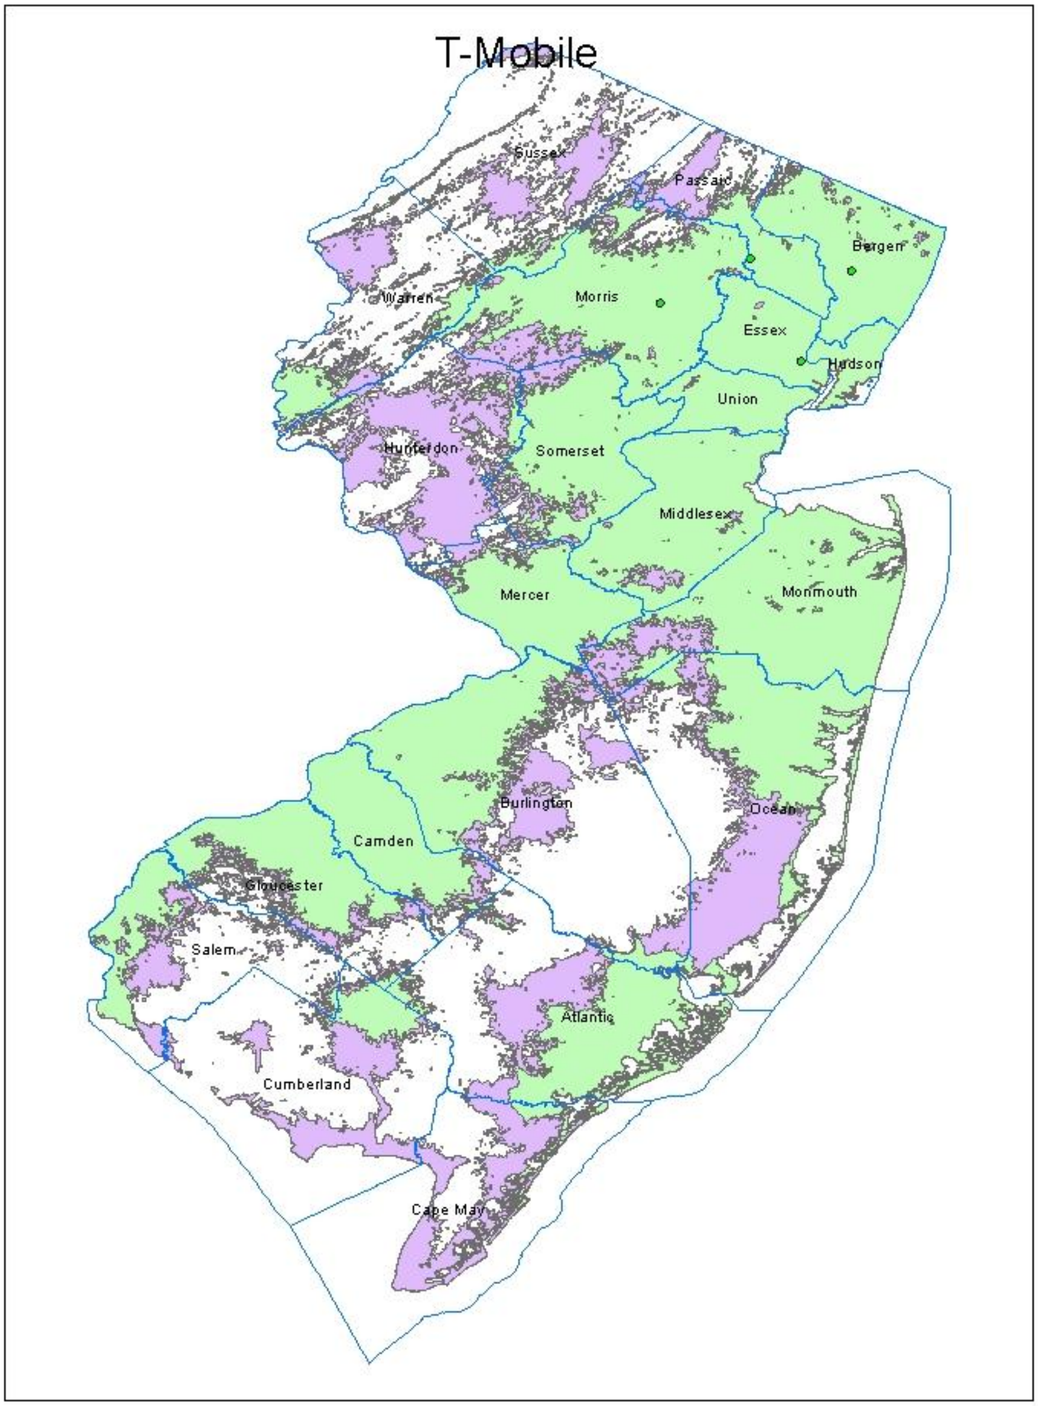
Section 6: Notes and Open Issues

This provider has given us three sets of shapes, one for "HSPA21", one for "HSPA42" and one for "UMTS". All are submitted to us as technology code 80 and all in spectrum code 4. But they have different speeds. The validations complain about duplicate rows, based on the shape column and the technology code. Here it seems the technology and spectrum codes do not adequately capture what we have received from the provider.

We solved the problem by using the ArcGIS “Dissolve” tool to merge all the polygons in each submitted feature class into a single polygon. The submission has exactly three rows, one shape for each speed tier, and is not flagged as duplicates.

Section 7: Overview Map of Submitted Data



6.26 tw telecom of New Jersey

Connecting New Jersey - Broadband Provider Data Report

Provider: tw telecom of New Jersey
Received: August 2012
Submission date: October 2012

This report presents details on processing of the broadband data for delivery to the National Telecommunications and Information Administration.

Section 1: NDA Status

NONE

Section 2: Submission Overview

AVAILABILITY DATA

Advertised-downstream		Address; values 2..11
Subscriber-weighted-up		Not provided

	Subscriber-weighted-down		Not provided	
Technology Type	30 (Other copper) and 50 (fiber)			
End-user specification	4 (medium – large enterprise) in all cases			
Comments:				

INTERCONNECTION DATA	
ID	
File size	
Ownership	
Transport Type	
Data Rates/Capacity	
Location	
Comments: None provided	

Section 3: Submission File Details

Received 1 file by secure upload:

Size	**Name**
3970	NJBB_0004351417_AddressLevelAvailability.txt

The file has 41 records. All are addresses; no apartment/suite/unit numbers are provided. Some addresses are repeated, sometimes with different speed numbers, suggesting that these entries are customer service addresses. Several are the addresses of multi-tenant buildings. Technology code 30 is present with symmetric speeds, codes range from 4 to 7. Technology code 50 is present with symmetric speeds; codes range from 4 to 11. This is a result of the provider collecting information about the services subscribed to by current customers at these addresses.

Section 4: Data Validation, Transformation and Loading

NTIA Table BB_Service_CensusBlock

Loaded from supplied file "NJBB_0004351417_AddressLevelAvailability.txt". The following table explains the transformations that were applied to load the target table.

Table Column	**Data Source / Transformation**
PROVNAME	As supplied in column "Provider Name", but removed "l.p." from the end of the address.
DBANAME	Not supplied; set same as PROVNAME
PROVIDER_TYPE	Set to 1
FRN	As supplied in column "FRN", with leading zeroes appended
STATEFIPS	Set to "34" (NJ)
COUNTYFIPS	Populated from Census Block FIPS Code (digits 3-5)
TRACT	Populated from Census Block FIPS Code (next 6 digits)
BLOCKID	Populated from Census Block FIPS Code (next 5 digits)
BLOCKSUBGROUP	Set to null
FULLFIPSID	Populated from Census Block FIPS Code
TRANSTECH	As supplied in column Technology of Transmission
MAXADDOWN	For technology 30: Set to 7, the max val in MaxAdDown For technology 50: Set to 11, the max val in MaxAdDown
MAXADUP	For technology 30: Set to 7, the max val in MaxAdDown For technology 50: Set to 11, the max val in MaxAdDown
TYPICDOWN	Set to null, not provided
TYPICUP	Set to null, not provided
SHAPE	Copied from Census Bureau TigerLine 2000, as matched by spatial join on geocoded address

Internal processing notes:

22. Geocoded the addresses using the Google geocoder to obtain a Latitude, Longitude pair for each.
23. Created an excel sheet and imported it to a geodatabase table.
24. Added point shapes corresponding to each Latitude, Longitude pair by creating a feature class from the table using ArcCatalog's "Create Feature Class from XY Table" option.
25. Added a column containing the ID of the containing year 2010 census block via a spatial join of the point shapes and the census block shapes from reference data. All addresses were

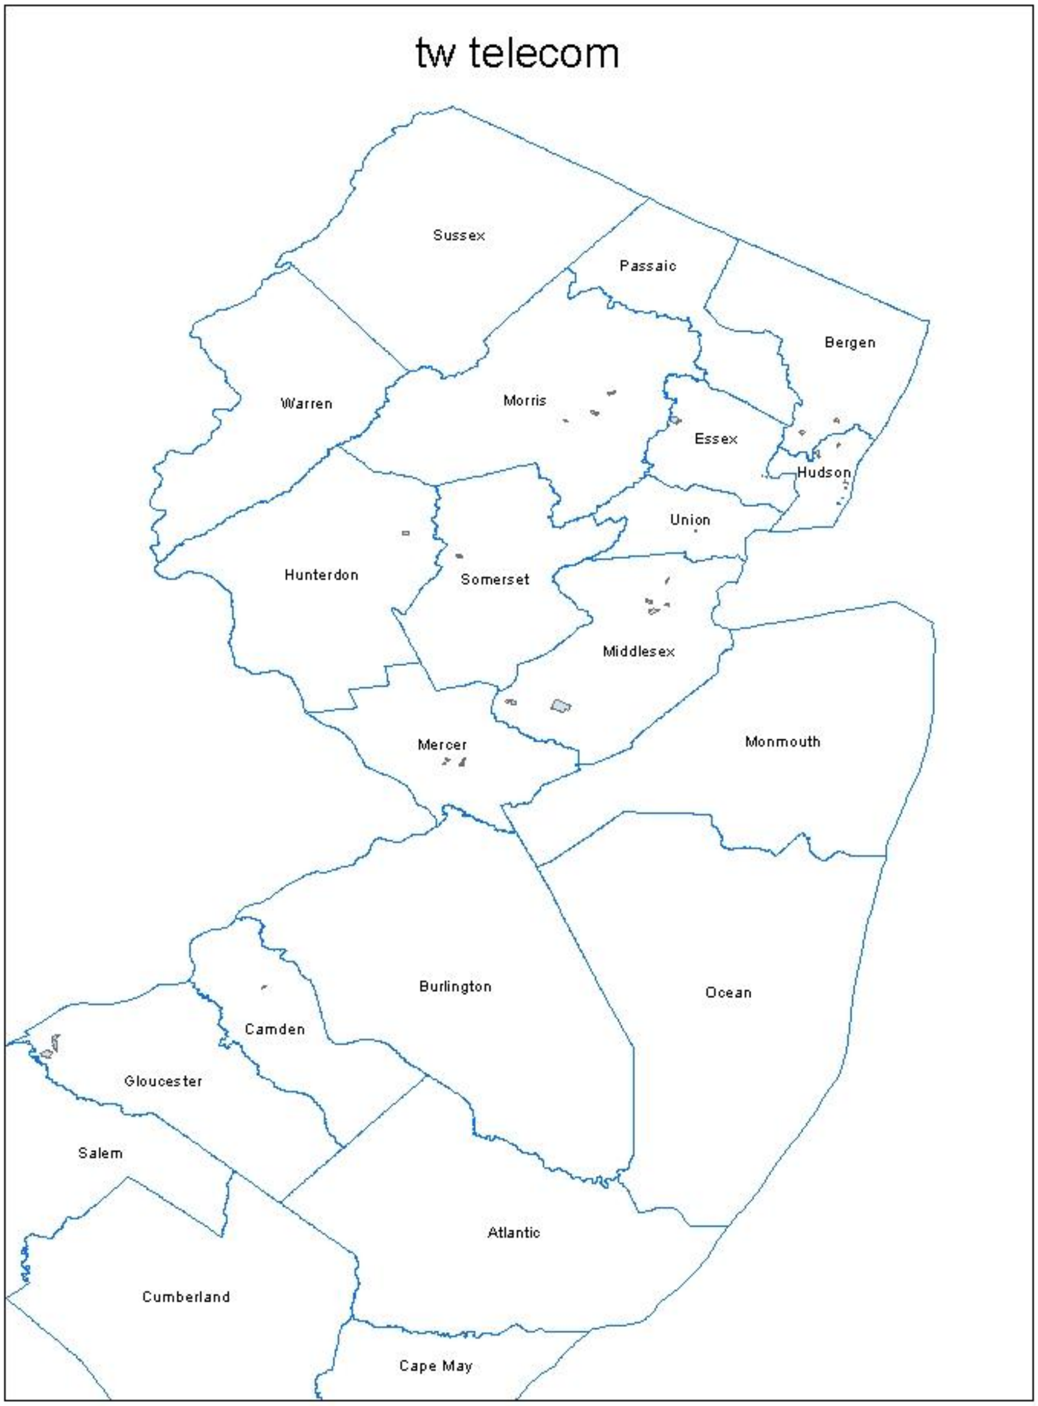
successfully joined with a census block.

26. Discarded rows with duplicate census blocks, generated from the multiple entries at the same addresses
27. Verified that all census blocks were in New Jersey and that no census block was greater than 2 square miles
28. Loaded 28 records into the transfer model table.

Section 5: Clarification Questions and Responses

Section 6: Notes and Open Issues

Section 7: Overview Map of Submitted Data



6.27 Verizon

Broadband Provider Data Report

Provider: Verizon
Received: August 2012
Submission date: October 2012

This report presents details on processing of the broadband data for delivery to the National Telecommunications and Information Administration.

Section 1: NDA Status

Verizon executed an NDA with NJ OIT.

Section 2: Submission Overview

AVAILABILITY DATA		
ID	Provider name	Verizon Online LLC

Comments: Sent email to Verizon requesting additional information on Middle Mile points.	

Section 3: Submission File Details

Received these files via email, sent to Shelley Bates in an encrypted zip archive.

Size	**Name**
131,072	NJ - Broadband Data Cover Letter (8-6-12).pdf
6,791,528	NJ - Wireline Service By Census Block with Speeds (June 2012).txt
143,837	NJ - Wireline Service By Street Segment with Speeds (June 2012).txt
2,580	NJ - Pricing (June 2012).txt

30,123 NJ - POP List (June 2012).pdf

Section 4: Data Validation Transformation and Loading

NTIA Table BB_ConnectionPoint_MiddleMile

Started with information supplied in Excel Spreadsheet "NJ - POP List (June 2011).pdf". Since the data is the same as the previous submission, we copied the previous data.

The following table explains the transformations that were applied in the previous submission.

Table Column	Data Source / Transformation
PROVNAME	Set to "Verizon Online LLC""
DBANAME	Set to "Verizon"
FRN	Set to "0012254363"
OWNERSHIP	Set to 0, owned, based on cover letter information
BHCAPACITY	Set to null
BHTYPE	Set to null
LATITUDE	Created by geocoding the supplied addresses
LONGITUDE	Created by geocoding the supplied addresses
ELEVFEET	Set to "0" (zero)
STATEABBR	Set to "NJ"
FULLFIPSID	ID of containing census block from Year 2010 Census Bureau TigerLine reference data
SHAPE	Created using ESRI ArcDesktop

Internal notes on processing:

29. We geocoded the addresses to obtain latitude, longitude value pairs. Both addresses were found. Verizon did not supply information on the elevation, serving facility capacity, and service facility type of these addresses. Sent request to Verizon regarding this information.
30. Created an excel sheet and imported to a geodatabase table.
31. Added points corresponding to each Latitude,Longitude pair by creating a feature class from the table using ArcCatalog's "Create Feature Class from XY Table" option.
32. Added a column containing the ID of the containing year 2010 census block via a spatial join of the points and the census block shapes from reference data.

NTIA Table BB_Service_CensusBlock

Loaded from supplied text file "NJ - Wireline Service By Census Block with Speeds (June 2012).txt". The following table explains the transformations that were applied to load the target table.

Table Column	Data Source / Transformation
PROVNAME	Set to "Verizon Online LLC"
DBANAME	Set to "Verizon"

PROVIDER_TYPE	Set to 1
FRN	Set to "0012254363"
STATEFIPS	Set to "34" (NJ)
COUNTYFIPS	Populated from 2010_Census_Block_FIPS_Code (Digits 3-5)
TRACT	Populated from 2010_Census_Block_FIPS_Code (next 6 digits)
BLOCKID	Populated from 2010_Census_Block_FIPS_Code (next 4 digits)
BLOCKSUBGROUP	Set to null
FULLFIPSID	First 15 digits of 2010_Census_Block_FIPS_Code See discussion of Census blocks below.
TRANSTECH	As supplied in column Technology_of_Transmission
MAXADDOWN	As supplied
MAXADUP	As supplied
TYPICDOWN	Set to null
TYPICUP	Set to null
SHAPE	Copied from Year 2000 Census Bureau reference data, As matched by Census block 2000 ID

Internal processing notes:

1. No anomalies were noted in the data

NTIA Table BB_Service_RoadSegment

Loaded from supplied text file "NJ - Wireline Service By Street Segment with Speeds (June 2012).txt" and from road segments discovered in large census blocks our calculations put at slightly larger than two square miles (See item 2 above). The following table explains the transformations that were applied to load the target table.

Table Column	Data Source / Transformation
PROVNAME	Set to "Verizon Online LLC"
DBANAME	Set to "Verizon"
PROVIDER_TYPE	Set to 1
FRN	Set to "0012254363"
ADDMIN	Set to the least of the address numbers, if any

ADDMAX	Set to the greatest of the address numbers, if any
PREDIR	Set to null (no value supplied)
STREETNAME	As supplied (has all street components, not just name)
STREETTYPE	Set to null (no value supplied)
SUFFDIR	Set to null (no value supplied)
CITY	Set to null (no value supplied)
STATECODE	Set to “NJ”
ZIP5	Set to null (no value supplied)
ZIP4	Set to null (no value supplied)
TRANSTECH	As supplied
MAXADDOWN	As supplied
MAXADUP	As supplied
TYPICDOWN	Set to null (no value supplied)
TYPICUP	Set to null (no value supplied)
TLID	As supplied
SHAPE	Copied from Census Bureau TigerLine 2010, As matched by County + Tiger Line ID

Internal notes on processing:

1. All rows were supplemented with a line-segment shape from the Census Bureau’s TigerLine data set.
2. We removed 110 records from the Verizon submitted data that were duplicates, based on county and tlid.
3. We removed 12 records from the Verizon submitted data that had entries in the tlid field that did not match our list of street segments in large census blocks.

To: 'laura.a.shine@verizon.com'
Cc: 'Clemons, Keefe B'
Subject: Question on NJ Broadband Data from Verizon

Laura and Keefe,

I believe we raised this issue in the past, but the NTIA wants us to ensure that we have the most accurate and complete data possible. The data you submitted on the middle mile access points (NJ - POP List (Dec 2011).xls) does not include information on elevation, serving facility capacity, or service facility type at these addresses. Would you be willing and able to provide this information?

John Wullert

Subject: RE: Question on NJ Broadband Data from Verizon

John:

The data we provided is consistent with the data that we have provided for all prior rounds of data collection, and is consistent with the level of detail we provide in every state in which we provide this data. Given the sensitivity of this information, we are not prepared to provide additional information regarding our middle mile facilities.

Feel free to contact me if you have any additional questions.

Sincerely,

Keefe

Mr. Clemons,

The NJ Broadband Mapping team has received feedback from the NTIA regarding our 4/11 and 10/11 data submissions. The NTIA contracted the Michael Baker firm who, using third-party data, evaluated the quality of data submissions it received from its grantees. Since the feedback we have received for the last two submissions is consistent, we would like to share it with you. Please note that we were not given copies of the third-party data, so the reasons for mismatches between the data we submitted and these third-party data are not always clear. Our intent is merely to share with you problematic fields, such as provider name or speed tier, that have a lot of mismatches, and do some further inquiry to better validate the provider's data. Obviously, by working more closely with you, we hope to reduce data mismatches in future submissions. Here are some of the questions we have about your data.

Provider Name: Verizon Online LLC; DBA Name: Verizon
- Most mismatches on max advertised downstream speed involve tiers 4, 5 & 6 for ADSL. (Please refer to downstream speed tier table below.)
- Most mismatches on max advertised upstream speed involve tiers 2 (ADSL) & 7 (Optical Fiber). (Please refer to upstream speed tier table below.)

Might these mismatches have to do with the way you are identifying ADSL speed tiers?

Thank you for your interest and continued support in our NJ BB Mapping program.

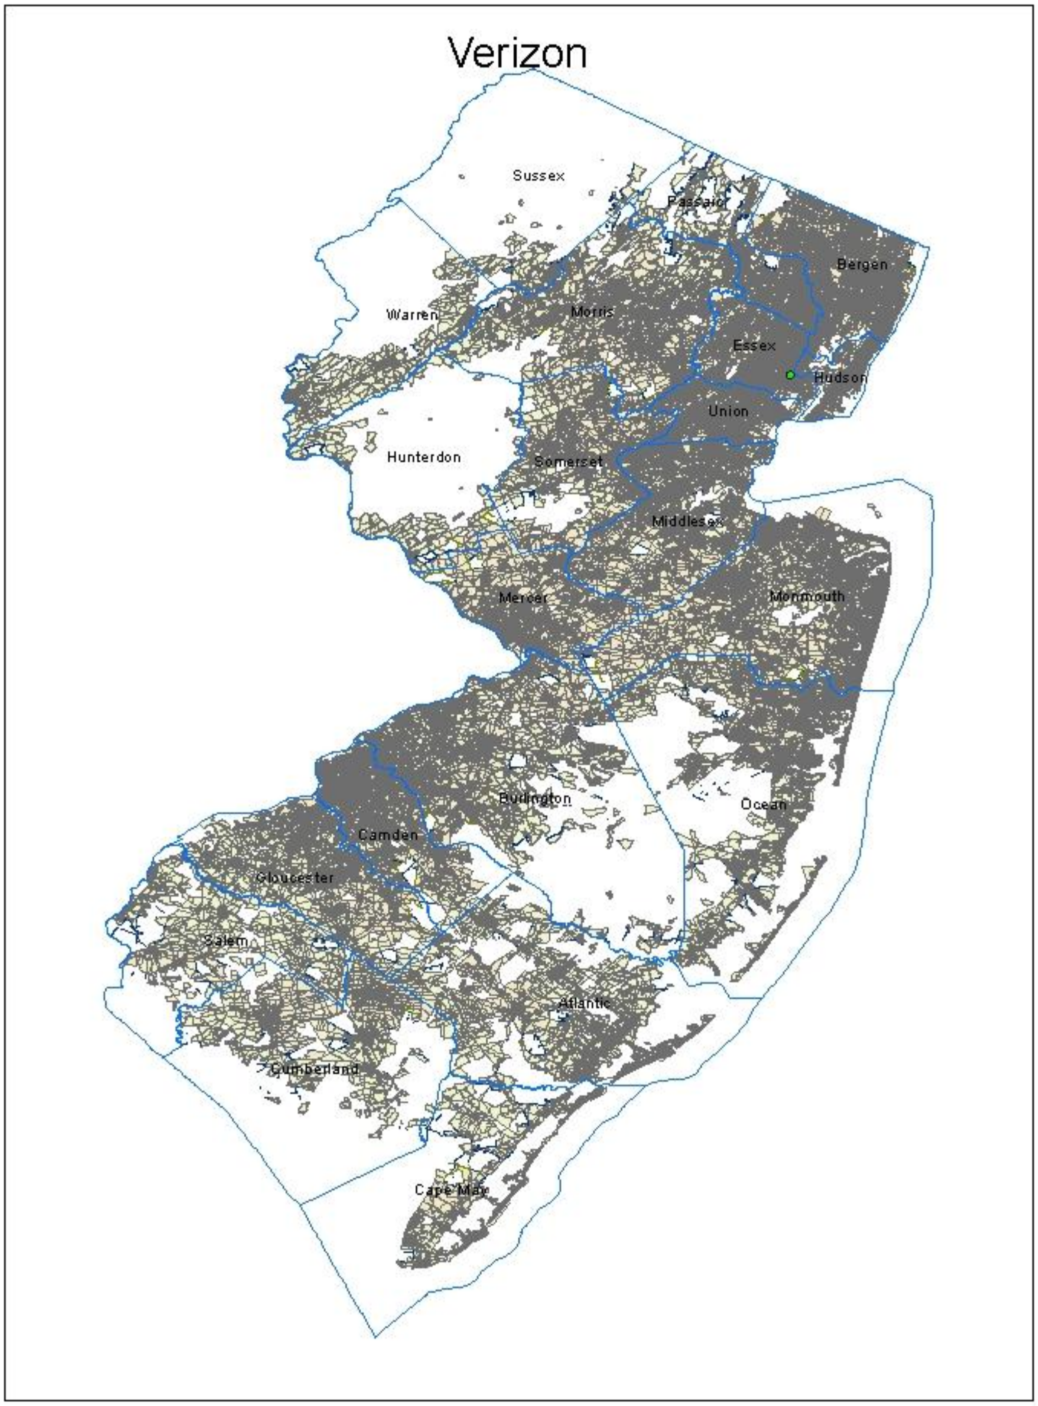
Section 7: Overview Map of Submitted Data



6.28 Verizon Wireless

Connecting New Jersey - Broadband Provider Data Report

Provider: Verizon Wireless
Received: July 2012
Submission date: October 2012

This report presents details on processing of the broadband data for delivery to the National Telecommunications and Information Administration.

Section 1: NDA Status

NDA was executed.

Section 2: Submission Overview

AVAILABILITY DATA		
ID	Provider name	Cellco Partnership
	"Doing business as" name	Verizon Wireless
	FRN	0003290673
	Holding company name	Verizon Communications Inc.
	Holding company number	131425
FOR WIRELESS		
Filetypes	shapefile collection: shp/dbf/prj/shx, mdb, gdb, imagefile etc. Two sets of data provided – one for EVDO and one for LTE (this was not explicitly stated - infered from the file names).	Supplied 2 shapfiles (zip archive) with 21 and 39 rows. Shapefiles use projection GCS_WGS_1984..
Speeds		

Type	Spatial Resolution (address, street seg, census block, RSA/MSA, zipcode)	
Upstream max adv	201 - 767 kbps	
Downstream max adv	768 kbps - 1.49 mbps	
Upstream typical	500k-800kbps	
Downstream	600kpbs-1.4mbps	

	typical		
	Subscriber-weighted	Not provided	Ranges provided instead of single values. Lower end of the Down Typical range is OUTSIDE of the Broadband speed definition (will use upper end values for the time being).
Speeds	Type	Spatial Resolution (address, street seg, census block, RSA/MSA, zipcode)	
	Upstream max adv	3.00 - 5.99 mbps	Ranges provided instead of single values.
	Downstream max adv	600k - 9.99 mbps	
	Upstream typical	2mbps -5mbps	
	Downstream typical	5mbps -12mbps	
	Subscriber-weighted	Not provided	
Technology Type	Spectrum (Mhz, FCC code)		Code 80 [Cellular (824-849Mhz, 869-894 Mhz); PCS 1850-1990 Mhz; AWS (1710-1755Mhz, 2110-2155Mhz); 700 (757-758Mhz, 776-779Mhz, 787-788Mhz, 805-806Mhz)] One of the provided Spectrum ranges (1st set) is 869-894 Mhz, which is not within ranges defined for that spectrum The shapefiles are named "NJ_evdo" and NJ_lte suggesting that the availability is only for EVDO and LTE. Verizon Wireless documents on the web suggest the company uses spectrum 850 MHz and 1900 MHz for their EVDO.

Data Rates/Capacity	
Location	
Comments:	

Section 3: Submission File Details

A link to download the data was supplied by email.

Received overview file "VerizonWireless - Email Speed_Technology Informatoin.pdf" with spectrum and speed information.

Received 2 zip files:

- NJ_evdo.zip (1,493,718 bytes)
- NJ_lte.zip (2,572,820 bytes)

2 shapefiles contain the following contents. The NJ_EVDO shapefile has 21 polygons for each county, and the NJ_lte shapefile has 39 polygons.

Size	Name
498	NJ_evdo.dbf
145	NJ_evdo.prj
324	NJ_evdo.sbn
132	NJ_evdo.sbx
2046156	NJ_evdo.shp
11512	NJ_evdo.shp.xml
268	NJ_evdo.shx

Size	Name
10575	NJ_lte.dbf
145	NJ_lte.prj
500	NJ_lte.sbn

148	NJ_lte.sbx
3669928	NJ_lte.shp
9798	NJ_lte.shp.xml
412	NJ_lte.shx

Cover letter "Verizon Wireless Broadband Statistics.pdf" is missing in this submission.

Section 4: Data Validation, Transformation and Loading

NTIA Table BB_Service_Wireless

Loaded from the supplied shapefiles. The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	As supplied in Word document
DBANAME	As supplied in Word document
FRN	Set to "0003290673"
TRANSTECH	Set to 80 per Word document
SPECTRUM	NJ_EVDO: Set to "3" per translation shown below VZW_NJ_LTE: Set to "2"
MAXADDOWN	NJ_EVDO: Set to "3", see below. VZW_NJ_LTE: Set to "7" per email clarification
MAXADUP	NJ_EVDO: Set to "2", see below. VZW_NJ_LTE: Set to "5" per email clarification
TYPICDOWN	NJ_EVDO: Set to "3", see below. VZW_NJ_LTE: Set to "6" per email clarification
TYPICUP	NJ_EVDO: Set to "2", see below. VZW_NJ_LTE: Set to "5" per email clarification
STATEABBR	Set to "NJ"
SHAPE	As supplied.

Internal notes on processing:

30. Shapefile NJ_evdo: The total shape apparently covers the entire state of New Jersey. Some

differences are visible along the water body edges. No need to check duplicates since they will be coalesced into 1 polygon. The supplied shape uses geographic coordinate system name GCS_WGS_1984. The NTIA data model requires the same coordinate system. No geographic transformation was required.

31. Shapefile NJ_lte: The shape covers portions of central-Northern New Jersey; the NJ Turnpike appears to be covered for its entire length. No need to check duplicates since they will be coalesced into 1 polygon.The supplied shape uses geographic coordinate system name GCS_WGS_1984. The NTIA data model requires the same coordinate system. No geographic transformation was required.
32. The XY Tolerance value differs on the supplied data from the required NTIA model. Imported the table schema and the table data in two separate operations, thereby ensuring perfect compatibility with the NTIA data model. The tables have the suffix "_tol".
33. Coalesced the EVDO single-part polygons into one multi-part polygon using the ArcGIS ESRI: Data Management Tools->Generalization->Dissolve (with choosing state in the Dissolve_Field(s) option), which resulted in a new feature class with the suffix "_dissolved".
34. Coalesced the LTE single-part polygons into one multi-part polygon using the ArcGIS ESRI: Data Management Tools->Generalization->Dissolve ((with choosing state in the Dissolve_Field(s) option), which resulted in a new feature class with the suffix "_dissolved".
35. NTIA requires shapes to be contained in the NJ state boundary. Although we visually verified that it is the case, we clipped the shapes using ESRI: Analysis Tools-> Extract -> Clip with, select feature class refdata_2010.tl_2010_34_state10_wgs. The feature class has the suffix "_clip"
36. Spectrum:
    a. NJ_EVDO: Verizon Wireless provided a statement in their cover letter about their licensed spectrum. Searching on the web indicates that EV-DO uses frequencies 850MHz and 1900Mhz. The NTIA data model has a single column for spectrum. No mapping is provided for frequency 850MHz. Frequency 1900MHz corresponds to NTIA "SPECTRUM USED" code value 3.
    b. VZW_NJ_LTE: Verizon wireless web site advertises "nationwide contiguous 700 Mhz 4G spectrum. The NTIA coding table provides value 2 for 700Mhz spectrum.
37. Speeds:
    a. NJ_EVDO: The maximum advertised speeds provided in the cover letter are 768 kbps - 1.49 mbps down and 201 - 767 kbps up. The typical speeds are provided as ranges: 600k to 1.4 Mbps down and 500Kbps-800Kpbs up. For both max adv and typical speeds we encoded the submitted down speed as value "3" (range 768k-1.5Mbps) and encoded the submitted up speed as value "2" (range 200-768kbps). This matches the values provided in the email from Anne Neville data 2/21/2012.
    b. VZW_LTE_NU: The supplied Word document suggests speeds are "10 times EVDO". The maximum advertised speeds provided in the cover letter are 600 - 9.99 mbps down and 3.00 - 5.99 mbps up. The typical speeds are provided as ranges: 5 - 12 Mbps down and 2 - 5 Mbps up. For max adv speeds we had originally encoded the submitted down speed as value "6" (range 6-10Mbps) and encoded the submitted up speed as value "5" (range 3-6mbps). Based on the email from Anne Neville data 2/21/2012, we modified the down speed to code "7". Compliant with the same NTIA email directive, we encoded typical down speed as "6" (range 6 mbps – 10 mbps), and typical up speed as "5" (range 3 mbps – 6 mbps).

38. The only data imputed was the state abbreviation.

Section 5: Clarification Questions and Responses

We received a warning on the wireless shape record for the combination of downstream speed code of "7" (10-25 Mbps) with a transtech code of "80" (Mobile Wireless). The maximum advertised speeds provided in the cover letter that came with the provider's submission are 600 - 9.99 mbps down and 3.00 - 5.99 mbps up. The typical speeds are provided as ranges: 5 - 12 Mbps down and 2 - 5 Mbps up. For max adv speeds we had originally encoded the submitted down speed as value "6" (range 6-10Mbps) and encoded the submitted up speed as value "5" (range 3-6mbps). Based on the email from Anne Neville data 2/21/2012, we modified the down speed to code "7". In addition, we previously had assigned the same set of values for maximum advertised speeds to typical speeds for both Verizon Wireless 3G and 4G LTE services. In this submission, the first for which we actually have typical speeds for this provider, we complied with the directions given in the previously referenced email, and encoded typical 4G LTE down speed as "6" (range 6-10Mbps) and up speed as "5" (range 3-6mbps).

Subject: Questions about previous data submissions
Date: Fri, 27 Jul 2012 11:45:50 -0400
From: Connecting NJ <ConnectingNJ@appcomsci.com>
To: francis.malnati@verizonwireless.com

Mr. Malnati,

The NJ Broadband Mapping team has received feedback from the NTIA regarding our 4/11 and 10/11 data submissions. The NTIA contracted the Michael Baker firm who, using third-party data, evaluated the quality of data submissions it received from its grantees. Since the feedback we have received for the last two submissions is consistent, we would like to share it with you. Please note that we were not given copies of the third-party data, so the reasons for mismatches between the data we submitted and these third-party data are not always clear. Our intent is merely to share with you problematic fields, such as provider name or speed tier, that have a lot of mismatches, and do some further inquiry to better validate the provider's data. Obviously, by working more closely with you, we hope to reduce data mismatches in future submissions. Here are some of the questions we have about your data.

Verizon Wireless/Cellco
- Most mismatches result from your reporting of max advertised downstream speed tiers 3 & 7. One possibility is that 3 understates downstream speed and 7 overstates it. (Please refer to downstream speed tier table below.)
- Most mismatches in your reporting of max advertised upstream speed is for tier 2. (Please refer to upstream speed tier table below.) Might you possibly be understating your upstream speed?

Thank you for your interest and continued support in our NJ BB Mapping program.

Best regards,

Cliff Behrens
Manager - NJ BB Data Collection

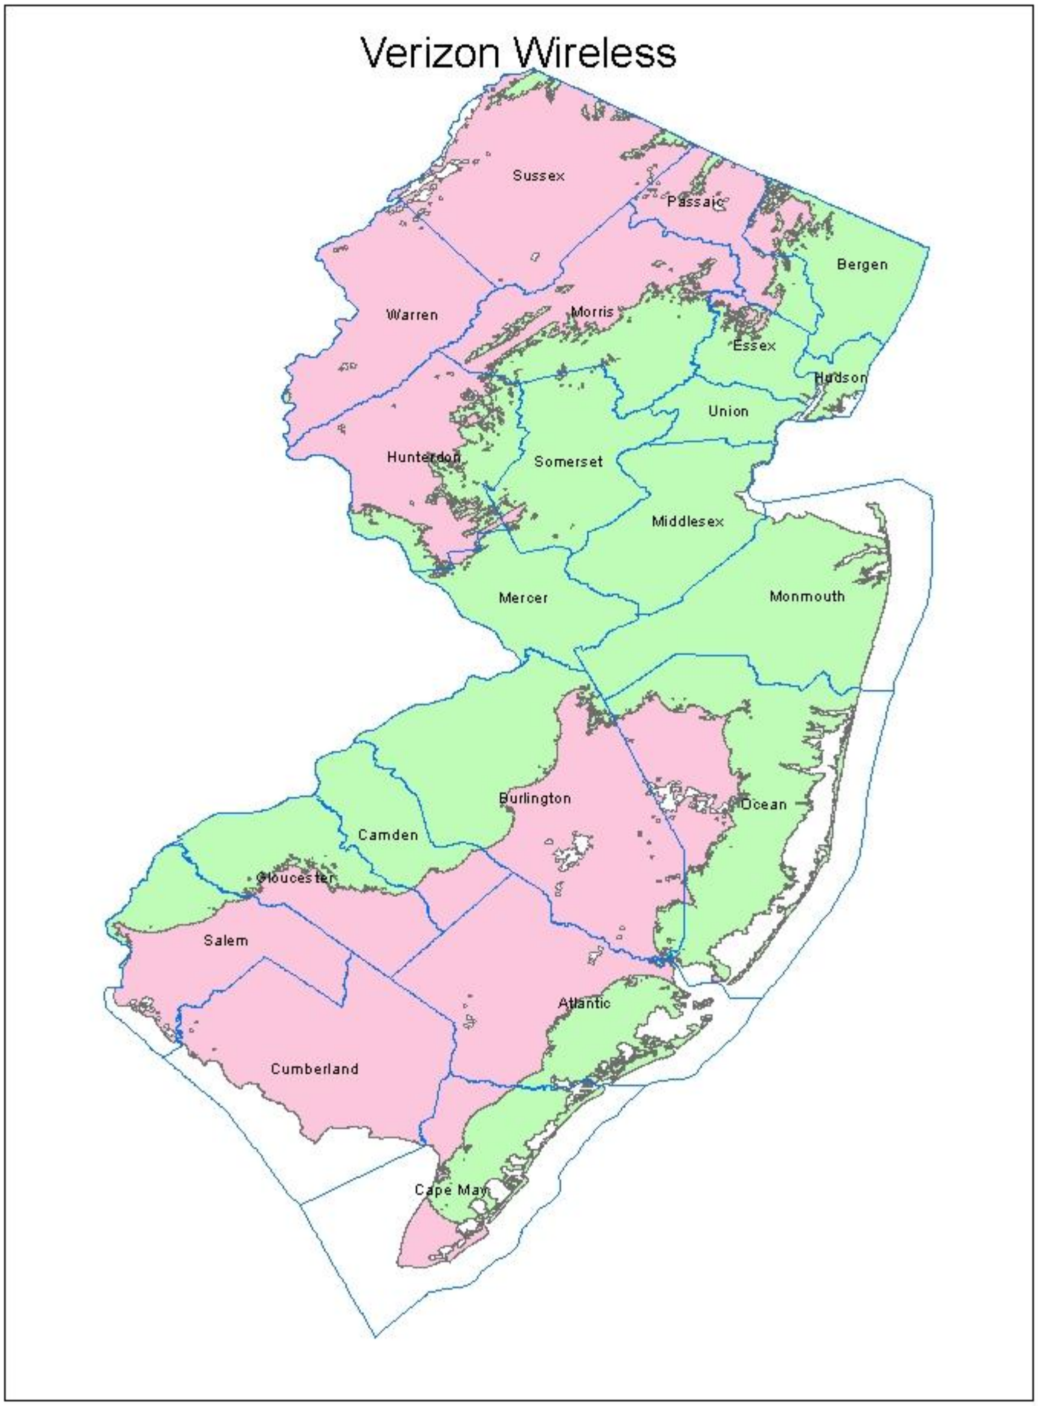
Section 7: Overview Map of Submitted Data



6.29 Voxitas

Connecting New Jersey - Broadband Provider Data Report

Provider: Voxitas
Received: August 2010
Submission date: October 2012

This report presents details on processing of the broadband data for delivery to the National Telecommunications and Information Administration.

For October 2012:

This is a stub report, since data from the previous submission was reused unchanged. The complete report from the previous submission begins on the next page. Notable differences from the processing done on the previous submission are listed next.

Section 1: NDA Status

Executed.

Section 2: Submission Overview

Comments: Not provided			

Section 3: Submission File Details

Received 1 file by secure upload.

Size	Name
9767	NJBroadband.xlsx

The file has 4 (four) rows of data. All have customer names and addresses. Three records describe DS1 service, one describes something else. Speeds listed are probably the provisioned speeds, not typical or advertised. No cover letter with DBA name, FRN, or other company data is present. No coded representations of data such as end user type, technology of transmission, etc. are provided.

Section 4: Data Validation, Transformation and Loading

NTIA Table BB_Service_CensusBlock

Loaded from supplied file “NJBroadband.xlsx” (4 rows). The following table explains the transformations that were applied to load the target table.

Table Column	**Data Source / Transformation**
PROVNAME	Set to “Netlogic, Inc.”
DBANAME	Set to “Voxitas”
RESELLER	Set to “N”
FRN	Set to “0006825954”
STATEFIPS	Set to “34” (NJ)
COUNTYFIPS	Populated from Census Block FIPS Code (first 3 digits)
TRACT	Populated from Census Block FIPS Code (next 6 digits)
BLOCKID	Populated from Census Block FIPS Code
BLOCKSUBGROUP	Set to null
FULLFIPSID	Populated from Census Block FIPS Code
TRANSTECH	Set to “30”
MAXADDOWN	As supplied in column Downstream
MAXADUP	As supplied in column Upstream
TYPICDOWN	Set to null, not provided
TYPICUP	Set to null, not provided
SHAPE	Copied from Census Bureau TigerLine 2000, as matched by spatial join on geocoded address

Internal processing notes:

33. Following steps were performed when data was initially submitted and results were reused in this round
    a. Geocoded the addresses using the Google geocoder.
    b. Created an excel sheet and imported to a geodatabase table.
    c. Added point shapes corresponding to each Latitude,Longitude pair by creating a feature class from the table using ArcCatalog’s “Create Feature Class from XY Table” option.
    d. Added a column containing the ID of the containing year 2000 census block via a spatial join of the point shapes and the census block shapes from reference data.
    e. Discarded NN rows with duplicate census blocks.
34. Ran NTIA validations and all passed

Section 3: Submission File Details

Size	**Name**
116	ViaSat_AreaAvailability_NJ_region.shx
654	ViaSat_AreaAvailability_NJ_region.dbf
165	ViaSat_AreaAvailability_NJ_region.prj
179,268	ViaSat_AreaAvailability_NJ_region.shp

Section 4: Data Validation, Transformation and Loading

NTIA Table BB_Service_Wireless

The following table explains the transformations that were applied.

Table Column	Data Source / Transformation
PROVNAME	Set to "ViaSat, Inc."

DBANAME	Set to "ViaSat, Inc."
FRN	~~Set to 0007843766~~ Set to 0004963088
TRANSTECH	Set to 60
SPECTRUM	Set to 9 per translation shown below
MAXADDOWN	As provided, confirmed from speed data
MAXADUP	As provided, confirmed from speed data
TYPICDOWN	Not provided, set to null
TYPICUP	Not provided, set to null
STATEABBR	Set to “NJ”
SHAPE	County shape read from reference data.

Internal notes on processing:

39. Spectrum: WildBlue uses Ka-Band spectrum (uplink in the 29.5 – 30 gigahertz band and downlink in the 19.7 – 20.2 gigahertz band). While this is not specifically included in the list of satellite frequencies associated with Code 9, we used code 9 anyway. This is a change from previous submissions. (from the last submission)
40. The shape file contains 2 polygon shapes.
41. The supplied shape file uses geographic coordinate system name GCS_North_American_1983. The NTIA data model requires GCS_WGS_1984 geographic coordinate system. Thus transformation is required. The XY Tolerance value differs on the supplied data from the required NTIA model. Imported the table schema and the table data in two separate operations, thereby ensuring perfect compatibility with the NTIA data model. The table has the suffix “_wgs_tol”.
42. NTIA requires shapes to be contained in the NJ state boundary. Although we visually verified that it is the case, we clipped the shape using ESRI: Analysis Tools-> Extract -> Clip with, select feature class refdata_2010.tl_2010_34_state10_wgs. The feature class has the suffix "_clip"
43. Validation rules produced a warning on the wireless shape record for the combination of downstream and upstream speed code of 7 (10-25 Mbps)

    with a transtech code of 60 (Satellite). Provider said that in most locations, speeds are significantly in excess of the speeds set forth in the NTIA Tiers for “Satellite Technology” so they are reporting the actual maximum advertised upload and download speeds. Provider confirmed that they launched two new services named Exede 5 and Exede 12 and Exede 12 has a maximum advertised upload speed of 3 Mbps and a maximum advertised download speed of 12 Mbps.

Section 5: Clarification Questions and Responses

Subject: Round 6 Broadband Mapping Project New Jersey
Date: Tue, 24 Jul 2012 21:45:30 +0000
From: Hill, Janel <Janel.Hill@viasat.com>
To: connectingnj@appcomsci.com <connectingnj@appcomsci.com>

Greetings,

The attached data is being submitted by ViaSat, Inc. for Round 6 of the Broadband Mapping Program. Please note the following:

1.ViaSat, Inc. is the parent company of ViaSat Communications, Inc. which was formerly known as WildBlue Communications, Inc. Prior submissions were made in the name of WildBlue Communications. Please update your state's map to reflect that ViaSat, Inc. is now the name of the provider.

2.ViaSat provides high speed internet service over several ka band satellites which together cover the entire United States.

3.The speed of the service depends on which satellite is covering the particular area. The attached data consists of the maximum advertised upload and download speeds at the census block level. In most locations, ViaSat's speeds are significantly in excess of the speeds set forth in the NTIA Tiers for "Satellite Technology" so we are reporting the actual maximum advertised upload and download speeds.

4.During the first quarter of 2012, ViaSat launched two new services named Exede 5 and Exede 12. Exede 5 has a maximum advertised upload speed of 1 Mbps and a maximum advertised download speed of 5 Mbps. Exede 12 has a maximum advertised upload speed of 3 Mbps and a maximum advertised download speed of 12 Mbps. The attached data shows which of the two services are available on a census block basis. In limited geographic areas, neither of the two new services are available, in which case the data reflects the maximum advertised upload and download speeds for ViaSat's legacy service called the WildBlue service. The WildBlue service has a maximum advertised upload speed of 256 Kbps and a maximum advertised download speed of 1.5 Mbps.

5.The attached data is current as of June 30, 2012.

Thank you for the opportunity to participate. We look forward to seeing ViaSat's updated information included in your state's broadband map. If you have any questions, feel free to contact me.

Kind Regards,

Janel Hill//

Paralegal | ViaSat, Inc | 6155 El Camino Real | Carlsbad, CA 92009

Subject: Re: Round 6 Broadband Mapping Project New Jersey

Janel,

We have a couple of questions regarding your name change:

1. We are using "0007843766" for your FRN. Should we use this or do you have another?
2. What is your DBA name? Should we also use ViaSat for this?

Thanks,

Cliff

Subject: RE: Round 6 Broadband Mapping Project New Jersey

From: Hill, Janel <Janel.Hill@viasat.com>
To: Connecting NJ <ConnectingNJ@appcomsci.com>

Hi Cliff,

The filing is being sent by ViaSat, Inc., which is the parent company of ViaSat Communications, Inc. It is not a DBA situation but rather, a parent/subsidiary relationship.

We have two FRN's, please use these:

ViaSat: 0004963088
ViaSat Communications: 0007843766

Kind Regards,

Janel Hill

To: Hill, Janel <Janel.Hill@viasat.com>

Janel,

The NTIA provides its grantees with a script that is used to validate data submissions. When the script produces warnings, we make an attempt to understand the reason. In the case of the ViaSat data, we received a warning and the following recommendation:

transtech = 60 AND maxaddown IN ('3','4','5') AND maxadup IN ('2','3','4')

In your latest submission, your data stated transtech=60, maxaddown=7, and maxadup=5. We interpret the warning to mean that, as far as the NTIA is concerned, these speeds are too fast for transtech=60; in other words, these speeds aren't possible for satellite broad band service? FYI, in your last data submission, you stated transtech = 60, maxaddown = 4 and maxadup = 2 for all of New Jersey.

We can report the warning in our data report but, before we do, I thought I would give you a chance to explain what you think are the possible reasons you believe these faster speeds are valid.

Thanks,

Cliff

To: 'ConnectingNJ@appcomsci.com' <ConnectingNJ@appcomsci.com>
CC: Hill, Janel <Janel.Hill@viasat.com>

Hi Cliff. Janel forwarded your email to me. As Janel explained below in the email she sent with the data, during the first quarter of 2012, ViaSat launched two new services named Exede 5 and Exede 12. Exede 5 has a maximum advertised upload speed of 1 Mbps and a maximum advertised download speed of 5 Mbps. Exede 12 has a maximum advertised upload speed of 3 Mbps and a maximum advertised download speed of 12 Mbps. Almost the entire state of New Jersey (with the exception of one small area of around 35 sq. miles) has access to Exede 12.

ViaSat's new services have been made possible by ViaSat's launch of a new state-of-the-art satellite in late 2011. It is true that the speeds for the new services are faster than anything previously available through satellite internet.

Please let me know if you have additional questions.

Pam Strauss

> "...I am 99% confident that New Jersey is entirely covered by Exede 12. However, since we reported to the census block level, there are 4 census block boundaries that I believe extend out into the ocean. Since that area does not fall within our Exede 12 beams, that strip of census black fell out and was included in ProPlus. Unfortunately, this happens when boundaries don't match up exactly to the data in another file. If I look at our data, the beam boundary slices through those census blocks, but I am pretty confident that those blocks are not entirely on land. I didn't want to make the assumption since I am not familiar with that area (i.e, are there vacation islands that people live on part of the year out there)? Usually if the census block extends into water, there is a population count."

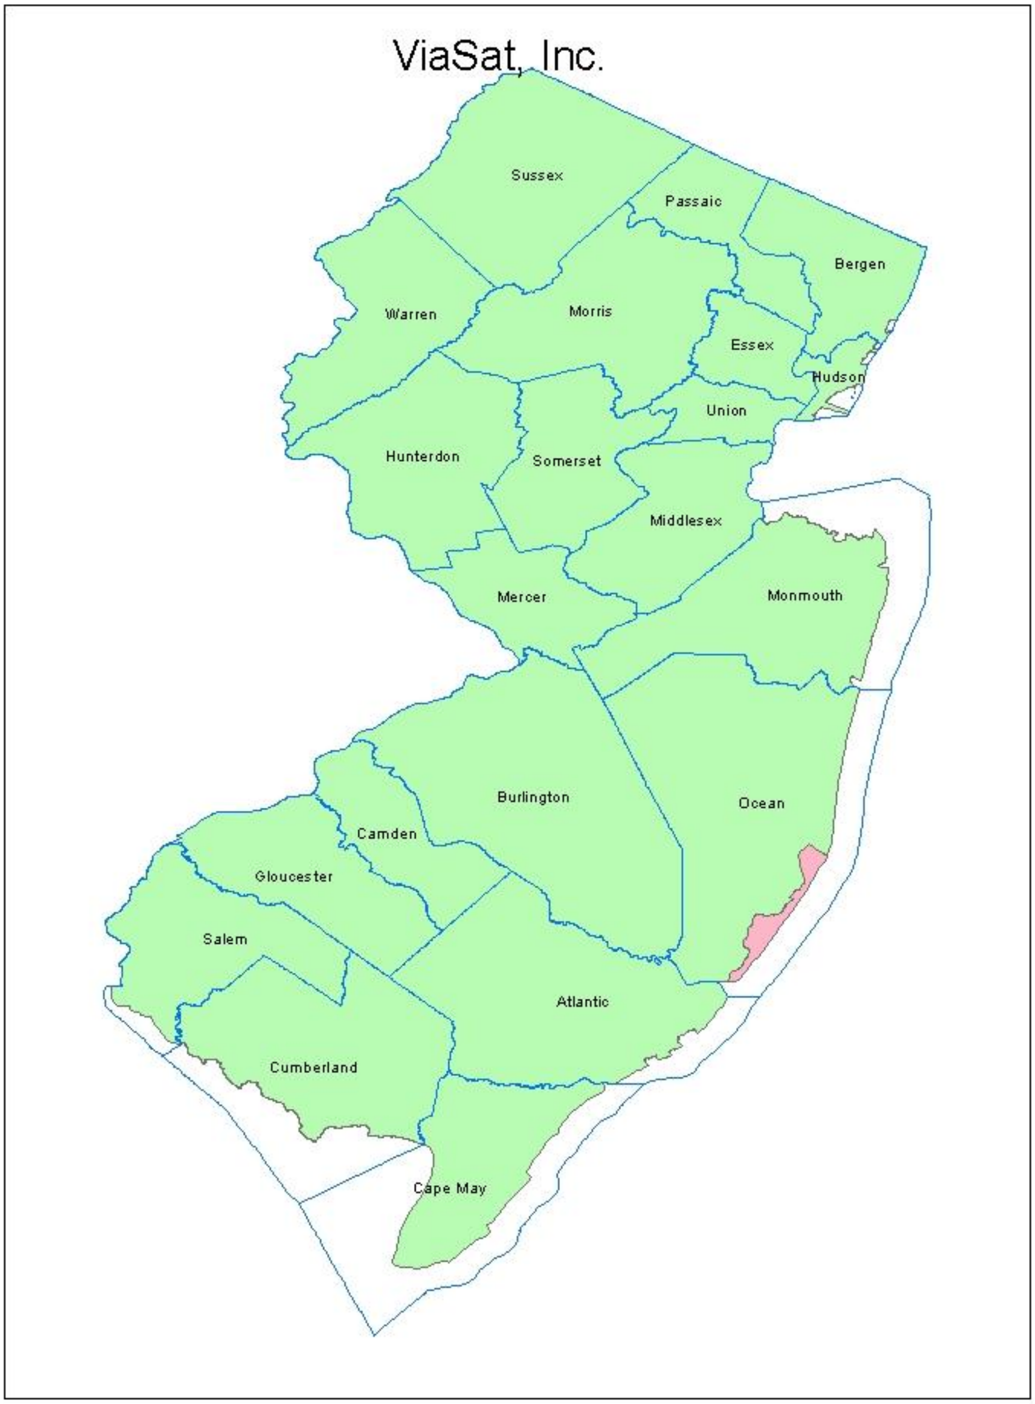
Section 7: Overview Map of Submitted Data



6.31 Xchange Telecom

Connecting New Jersey - Broadband Provider Data Report

Provider: Xchange Telecom
Received: March 2011
Submission date: October 2012

This report presents details on processing of the broadband data for delivery to the National Telecommunications and Information Administration.

This is a stub report, since data from the previous submission was reused unchanged. The complete report from the previous submission begins on the next page. Notable differences from the processing done on the previous submission are listed next.

Section 3: Submission File Details

Received no file submission, only statements by email.

Section 4: Data Validation, Transformation and Loading

NTIA Table BB_Service_CensusBlock

Based on the emailed statement coverage area, we selected all of the census blocks in Lakewood Township, Ocean county, New Jersey. We submitted all census blocks less than 2 square miles in this municipality. The following table explains the transformations that were applied to load the target table.

Table Column	Data Source / Transformation
PROVNAME	Set to "Xchange Telecom Corp" per email response
DBANAME	Set to "Xchange Telecom"
PROVIDER_TYPE	Set to 2 (reseller leasing plant from Verizon)
FRN	Set to "0006831713" per email response
STATEFIPS	Set to "34" (NJ)

COUNTYFIPS	Pre-populated from Census Block FIPS Code (digits 3-5)
TRACT	Pre-populated from Census Block FIPS Code (next 6 digits)
BLOCKID	Pre-populated from Census Block FIPS Code (next 5 digits)
BLOCKSUBGROUP	Set to null
FULLFIPSID	Populated from Census Block FIPS Code
TRANSTECH	Set to 10 (ADSL) per email
MAXADDOWN	Set to code 7 per email
MAXADUP	Set to code 4 per email
TYPICDOWN	Set to null, not provided
TYPICUP	Set to null, not provided
SHAPE	Census block

Internal processing notes:

42. Created a file with a municipality name that matches exactly the "name" column in the Year 2010 Census Bureau TigerLine database.
43. Joined against reference data to discover census blocks, for a total of 1012 blocks.
44. Verified that all the census blocks discovered for Lakewood Township are smaller than 2 square miles, so no road segments were loaded.
45. Validation script produced a warning on 1012 census blocks regarding downstream speed code of 7 (10-25 Mbps). We were unable to obtain any confirmation of advertised speeds from provider Web site, because it required entry of a specific phone number. The provider confirmed via email that they offer 10 Mbps download speeds.

Duvid,

The data we have states that you cover all of Lakewood township, offering DSL service, with download speeds of 10 Mbps and upload speeds of 2 Mbps. Is that all correct?

Thanks,

John Wullert

Subject: NJ Broadband Data Collection - Fall 2012
Date: Thu, 12 Jul 2012 12:36:11 -0400
From: Connecting NJ <ConnectingNJ@appcomsci.com>
To: drottenberg@xchangetele.com

Mr. Rottenberg,
We are writing to you on behalf of the New Jersey Office of Information Technology (NJ-OIT) which is responsible for collecting broadband availability data for the National Telecommunications and Information Administration (NTIA) State Broadband Data and Development Grant Program.

We thank you for your participation in the previous round of broadband data collection. We now ask once again for your assistance by submitting data describing your broadband service offerings in the State of New Jersey. To meet the NTIA's data submission timeline, we will need your data submission no later than Friday, August 10, 2012. The data should represent your broadband service offerings as of 6/30/2012.

For this round, the NTIA is particularly interested in receiving from providers "typical" downstream and upstream speeds. By the NTIA definition, "typical" is the "data transfer throughput rate that most subscribers to service at the maximum advertised downstream speed can achieve consistently during expected periods of heavy network usage."

We encourage you to submit data via our secured Web server at http://connectingnj.state.nj.us/. If this presents a problem, please contact us via email and we can make other arrangements.

As mentioned in the previous request, the organization collecting and validating this data on behalf of NJ OIT is now Applied Communication Sciences, formerly Telcordia Advanced Technology Solutions. This is a result of the acquisition of Telcordia by Ericsson. The same people will be the collecting and validating the data, but the email address has changed.

We look forward to hearing from you. Please feel free to contact us with any questions, comments or suggestions.

Sincerely,

Cliff Behrens

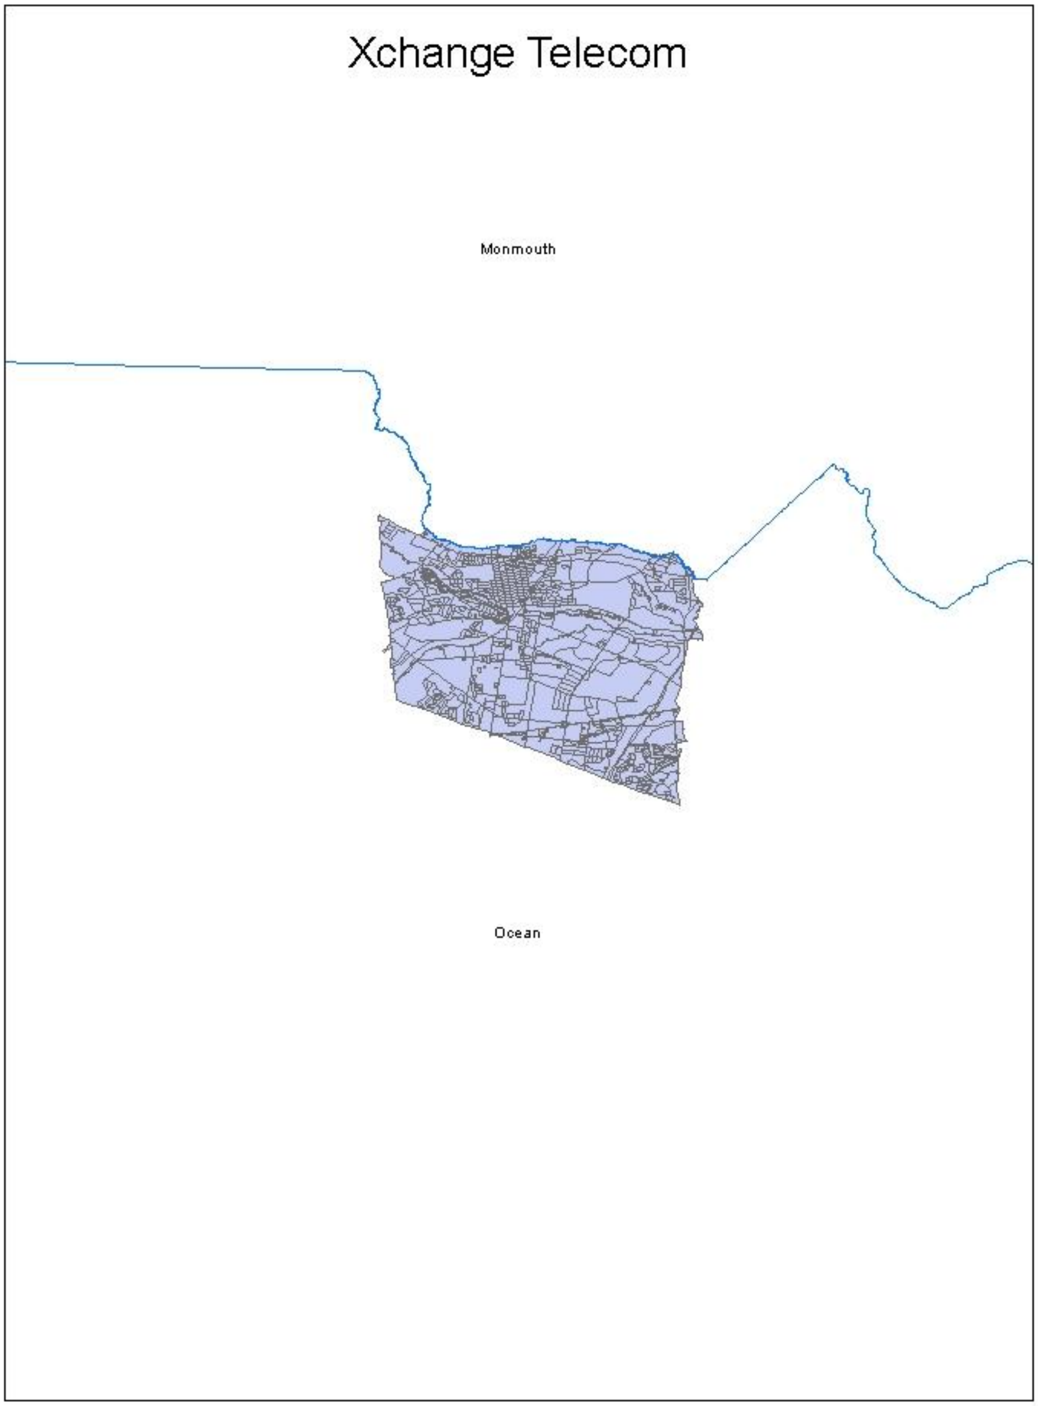
Section 7: Overview Map of Submitted Data



6.32 XO Communications

Connecting New Jersey - Broadband Provider Data Report

Provider: XO Communications
Received: July 2011
Submission date: October 2012

This report presents details on processing broadband data for delivery to the National Telecommunications and Information Administration (NTIA).

For October 2012:

This is a stub report, since data from the previous submission was reused unchanged. The complete report from the previous submission begins on the next page. Notable differences from the processing done on the previous submission are listed next.

For April 2012:

This is a stub report, since data from the previous submission was reused unchanged. The complete report from the previous submission begins below. Notable differences from the processing done on the previous submission are listed next.

The provider reported that there were no changes to the reported data. Given that the data we have was submitted in August 2010, we verified with the provider that there were no changes to the coverage area and speeds that they offered.

NTIA Table BB_Service_CensusBlock

Since there is no change in the data and NTIA data model, the table is copied from the 2011 October table, using an ESRI tool, "ArcToolBox->Data Management Tools->General->Append" with NO_TEST in the Schema Type option.

Sharon,

The last time that you submitted data to us was in August of 2010. Are you saying that the area covered by XO services, and the service speeds offered over that area, have not changed in the last year and a half? I just want to make sure that we can accurately reflect the capabilities you have available in the state of New Jersey.

Thanks,

Connecting New Jersey - Broadband Provider Data Report

Provider: XO Communications

Submission date: October 2011

This report presents details on processing broadband data for delivery to the National Telecommunications and Information Administration (NTIA).

This is a stub report, since data from the previous submission was reused unchanged. The complete report from the previous submission begins below. Notable differences from the processing done on the previous submission are listed next.

The provider reported that there were no changes to the reported data. Given that the data we have was submitted in August 2010, we verified with the provider that there were no changes to the coverage area and speeds that they offered.

NTIA Table BB_Service_CensusBlock

1. Column " blocksubgroup" was dropped.
2. Column "endusercat" was added; set to null because data was not supplied.

Notes

1. Discarded 28 records with missing or slow maximum download speed codes.
2. Total rows loaded: 879

Connecting New Jersey - Broadband Provider Data Report

Provider: XO Communications

Submission date: April 2011

This report presents details on processing broadband data for delivery to the National Telecommunications and Information Administration (NTIA).

This is a stub report, since data from the previous submission was reused unchanged. The complete report from the previous submission begins on the next page. Notable differences from the processing done on the previous submission are listed next.

NTIA Table BB_Service_CensusBlock

1. Column "reseller" was dropped.
2. Set the new column "provider_type" to value 1 ("Broadband provider as described in the NOFA")
3. Set the max advertised speed code values (down and up) to 9, which is the maximum value among all records provided to us.
4. Dropped non-measured typical up/down speed code values.

Subject: XO NJBB Data Clarification

Sharon,

We have performed our initial review of your data and have a clarification question:

> We see several locations where your download speeds are a tier 2, which the NTIA does not consider broadband. This appears that it might be the provisioned speed sold to the customer. Is there a higher, advertised speed that you could provision to these locations if the customer

asked? One option would be for us to use the highest speed you deliver in a larger area as the maximum advertised speed. Would that accurately represent your ability to deliver service?

Received 1 file by SECURE UPLOAD.

Size	**Name**
41358	NJBroadbandData63009.xlsx

Section 4: Validations and Results

The spreadsheet provides census block IDs and associated max adv and typical speeds. The last two rows of the sheet are different from the 447 data rows proceeding them, and one of those last two is in New York. The DBA name looks unusual and the technology of transmission codes are not valid. After receiving clarification by email we created a corrected spreadsheet based on the original submission as follows:

1. Dropped the last two rows that have addresses instead of provider name, DBA name, etc.
2. Changed DBA Name entries to “XOCSI”
3. Changed technology of transmission codes: 1 to 10, 2 to 20, and 3 to 30.

Section 5: Data Transformation and Loading

NTIA Table BB_Service_CensusBlock

Loaded from the supplied spreadsheet. The following table explains the transformations that were applied to load the target table.

Table Column	Data Source / Transformation
PROVNAME	As supplied in column “Provider Name”
DBANAME	As supplied in column “DBA Name”
RESELLER	Set to “N”
FRN	As supplied in column “FRN”, after adding leading zeros
STATEFIPS	Set to “34” (NJ)
COUNTYFIPS	Populated from column census_block (1st 3 digits)
TRACT	Populated from column census_block (next 6 digits)
BLOCKID	Populated from column census_block (last 4 digits)
BLOCKSUBGROUP	Set to null
FULLFIPSID	As supplied in column census_block
TRANSTECH	As supplied in column Tech Code
MAXADDOWN	As supplied in column MaxDownload
MAXADUP	As supplied in column MaxUpload
TYPICDOWN	As supplied in column TypDownload
TYPICUP	As supplied in column TypUpload

SHAPE Copied from Census Bureau TigerLine 2010,
As matched by Census block ID

Internal processing notes:

1. No duplicate census blocks were found.

Section 6: Clarification Questions and Responses

From: NJ Broadband Data Collection [mailto:ConnectingNJ@research.telcordia.com]

To: 'Adams, Sharon E'
Cc: ConnectingNJ@research.telcordia.com
Subject: RE: NJ Broadband Data Collection

Sharon,

We realized that we have a potential issue with processing the data you submitted previously. The NTIA has transitioned from using the 2000 census block geometry to the 2010 census block geometry. While it is possible for us to translate your prior data, there is a high risk of overstating or understating your actual coverage area due to the many-to-many mappings between the two sets of census blocks.

Is it possible for you to provide your data using the 2010 geometry?

John Wullert

Manager – NJ BB Data Collection

Telcordia Technologies

732-699-2687

To: ConnectingNJ@research.telcordia.com
Subject: RE: NJ Broadband Data Collection

Hi John,

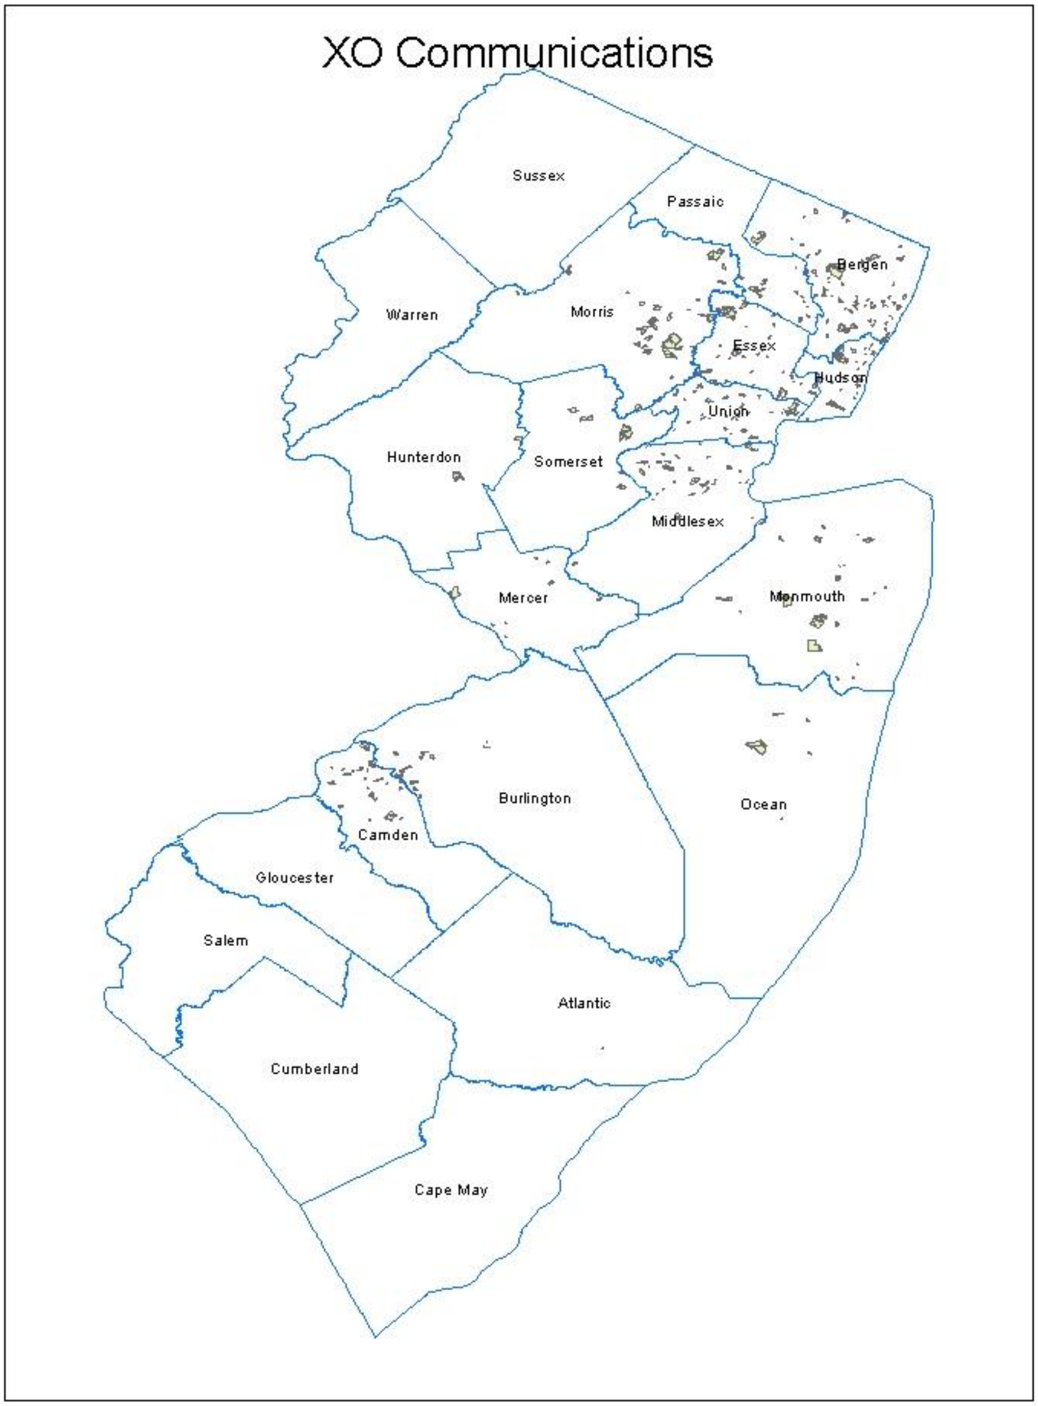
It's fine to restate our data with the new census block geometry. I do not have the new 2010 geometry to restate the data.

Thanks,

Sharon Adams

Section 7: Notes and Open Issues

Section 8: Overview Map of Submitted Data



7 Appendix B: Community Anchor Institution Processing

7.1 Summary

For each category of community anchor institution, we generally obtained data from two sources. One source was a reference source that provided a list of institutions with name, address and ID number where applicable. This reference source was expected to be nearly complete, representing all the institutions of the specified type in the state. The other source provided the broadband information. In many cases, the broadband information was supplied by the institutions via our Web site.

There were exceptions, however, to these procedures. In the case of Higher Education, we obtained the broadband access information from NJEdge, an organization that collects data via its own survey. In the case of State Government, we obtained a list of broadband circuits provided to the state by Verizon; there was no reference list for comparison. We similarly had no reference list for local government and non-governmental organizations; we used only data collected via our Web site for these classes of institution.

There were a couple of significant changes in the data and methodology for this round of submission that are described in further detail in the following sections. First, we obtained broadband data for public schools from the NJ Department of Education (NJDOE) based on the survey responses they received from the public schools. Secondly, we obtained a list of healthcare institutions from NJOIT that we used as the reference list instead of one we obtained from the NJ HHS and NJHA previously. In addition to hospitals, this list includes pharmacies and clinical laboratories.

For each CAI category, the following table provides the number of records we obtained from the reference source, the number of broadband access records we obtained, the total number of records we submitted to the NTIA and the number of complete records, with verified address information and broadband access information.

Table 1 CAI Submission Summary

CAI Category	Reference Records	Broadband Records	Total Records Submitted	Complete Records Submitted
School K-12 (Public) School K-12 (Private)	2686 (DOE) 1159 (NCES)	2428 (DOE) 796 (Web)	3762	2465
Libraries	461 (IMLS)	89	460	43
Medical/Healthcare	9265	5	8604	5
Public Safety	343 (NJ 911 Comm.)	120	337	76
University	160	39	159	34

	(NCES IPEDS)	(NJEdge)		
Other – State and Local Government		2007 (state gov't) 54 (Web)	1694	1694
Other – Non Government	0	8	8	8

7.2 Local Government and Non-Government Organizations

The procedure and data in this section are unchanged from the previous submission.

1. There were no new submissions to the web site since the October 2011 report. Accepted data were submitted by 54 local government and 8 non-governmental organizations via our specially designed Web site. We merged data submitted to this Web site for April 2011 delivery with that submitted between April and September. The flow named SubmittedCAI_GovNGO_Process.arroyo was used to process the data. (Files lib_20110323-edit.xml and lib_20110907.xml) Data collected included:
   i. Community Anchor Institution Category
   ii. Community Anchor Institution Name (System, Branch)
   iii. Address: Street, City, State, Zip, County
   iv. Contact info: Name, Phone, Email, Web address
   v. Wi-Fi access
   vi. Broadband info: Provider, Technology, Upstream and Downstream speeds
   vii. Comment
2. Generated Latitude and Longitude via geo-coding using Yahoo geocoder API.
   a. Ensured no errors were present, that at least one entry was returned and that quality metric was over 75. Also ensured that result was in New Jersey and that city and zip were not both blank. Output is in file Submitted_GovNGO_CAIs.xls.

7.3 State Government

The procedure and data in this section are unchanged from the previous submission.

1. Obtained a listing of 2007 connections provided by the primary broadband service provider, Verizon, to the state. List of connections included the following data:
   a. Service address
      i. This field included an indication of the office or department being served and an extremely abbreviated version of the address
      ii. e.g.: "(SPNL)STATE OF NJ-TLS 19 LANDIS AV, UP DRFLD T"
   b. Speed (single value, 1.5 to 1000 Mbps)
   c. Technology (ATM, Ethernet, Frame Relay, PRI, Point-to-Point)
2. Used an automated process to expand the town names in the Service Address field (flow for steps 2-6 is in file VerizonList_Geocode.arroyo; input file is Broadband Mapping Prod Sum 2500 Feb 11_Addressed_Ida_Murray4.xlsx)
   a. For example, replaced "PRSPY" with "Parsippany" and "FR LN" with "Fair Lawn"
   b. Improved the mapping of abbreviated city names to their expansions

i. BRIG: Brigantine
ii. BRDTN: Bordentown
iii. DVR: Dover
iv. HMTN: Hammonton
v. LWR TWP: Lower Township
vi. MAN: Manchester
vii. MANT: Mantua
viii. MIDL TWP: Middle Township
ix. MIDLTN TWP: Middletown
x. OAKLN: Oaklyn
xi. PIT: Pitman

3. Extracted address information from Service Address field by removing the following:
   a. Digits following and including a pound sign (e.g., NJ STATE PAROLE DIST **#6** 210 S BROAD)
   b. P.O Box NNNN,
   c. Anything in parentheses (e.g., **(SPNL)**STATE OF NJ:OIT 90 STATE HWY NO 183)
   d. Any string consisting solely of letters, backslashes, colons, dashes, ampersands and spaces prior to the first number string in the address (e.g., **SONJ:DOE** 7 GLENWOOD AV, E O BLDG FLR 4;DES SUITE 401-402)
   e. Any string after the first comma (e.g., 7 GLENWOOD AV, **E O BLDG FLR 4;DES SUITE 401-402**
   f. Text prior to and including an ampersand (e.g., **NJ STATE DOT @** ROUTE 23)
   g. Replacing AV, with AVE,
   h. Any text between commas (e.g., 3810 NEW JERSEY AV, **WILD DES DEPT LABOR,**)
   i. Any number preceded by “PROJECT” or “PRJCT”
4. Merged city information and state information with extracted addresses.
5. Generated Latitude and Longitude via geo-coding using Yahoo geocoder API.
   a. Ensured no errors were present, that at least one entry was returned.
   b. Ensured that state was New Jersey and that city and state values were populated.
6. For those that failed test with Yahoo geocoder API, attempted to match with Google geocoder API.
   a. Ensured no errors were present, that at least on entry was returned.
   b. Ensured that state was New Jersey and that city and state values were populated.
7. Resulted in successful geocoding of 1941 of the 2007 entries. Entries that could not be geocoded were ones with no street address and those whose street addresses were deliberately disguised.
   a. Results are in file Verizon_Geocoded_new.xls.

7.4 Healthcare

In this submission, the healthcare category was expanded to include hospitals, pharmacies and clinical laboratories.

1. Obtained a listing of 1174 hospitals from NJ OIT (All Licensed Acute Care Facilities 3 12 12.xls). List of hospitals included the following data:
   a. Facility Name
   b. Address: Street, City, State, Zip

2. The hospitals were geocoded using the Yahoo Goecoder API (HospitalProcess.arroyo). The output was checked to ensure that the street address was not blank, the state was New Jersey and the city was not blank. This resulted in successful geocoding of 1128 hospitals.
3. Obtained listing of 2010 pharmacies from NJ OIT (2012-06 pharmacies.csv) which included the following data:
    a. Pharmacy Name
    b. Address: Street, City, State and Zip
4. The pharmacies were geocoded using the Yahoo Goecoder API in the flow PharmacyProcess.arroyo. The output was checked to ensure that the street address was not blank, the state was New Jersey and the city was not blank. This resulted in successful geocoding of 1940 pharmacies.
5. Obtained listing of 6081 clinical laboratories from NJ OIT. The source was the Centers for Medicare and Medicaid that provides the list of medical labs through the Clinical Laboratory Improvement Amendment (CLIA). The list (CLIA Labs 2012-08-14_edit.xlsx) provides name, address and location of laboratory.
    a. The name, address, type of lab and location were extracted using CLIA_Labs_Process.arroyo.
    b. Of this list, we eliminated the labs that were located in hospitals and pharmacies because of the overlap with the other sub-categories and because the NTIA data model only identifies a single category for all healthcare institutions.
    c. The remaining labs were geocoded using the Yahoo Geocoder API and the Google Geocoder API. This resulted in successfully geocoding 5554 labs using the flow CLIA_Labs_Geocode.arroyo.
6. The three lists formed the reference list of healthcare institutions.
7. Merged reference data with data collected from 5 hospitals via our hosted Web site to merge address and ID information with speed and Wi-Fi availability information. We merged data submitted to Web site for April 2011 delivery with that submitted between April and September. No new data after September 2011. (Files lib_20110323-edit.xml and lib_20110907.xml)
    a. Performed exact match between and submitted data on institution name
        i. Facilitated matching by Converting names to upper case, removing certain common words (THE, HOSPITAL, MEDICAL, CENTER, SYSTEM, HEALTHCARE), removing double spaces and trimming leading and trailing spaces.

    This portion of the process occurs in SubmittedCAI_Healthcare_Process.arroyo.
    Output is in file Healthcare_Submitted_Matched.xls.
8. Produced about 8600 healthcare records at the end of the processing with 5 that included broadband information.

7.5 Higher Education

1. Obtained the following data from the named sources in August 2012
    a. List of higher education institutions from National Center for Education Statistics IPEDS Data Center (http://nces.ed.gov/collegenavigator/?s=NJ). Table included information on 160 institutions with the following fields:
        i. Institution Name
        ii. Address: Street, City, County, State, ZIP
        iii. IPEDS ID

    Final input data, including a few manual edits (see below) is in file CollegeNavigator_Search_NJ_2012-08-17_edit.xlsx

   b. Generated Latitude and Longitude via geo-coding using Yahoo geocoder API (flow IPEDS_HigherEd_Geocode.arroyo).
      i. Ensured no errors were present, that at least one entry was returned
      ii. Ensured that state was New Jersey and that city and state values were populated.
   c. For those that failed test with Yahoo geocoder API, attempted to match with Google geocoder API (Flow IPEDS_HigherEd_Geocode.arroyo)
      i. Ensured no errors were present, that at least on entry was returned
      ii. Ensured that state was New Jersey and that city and state values were populated.
   d. All 159 institutions were properly geocoded.
2. Obtained an updated list of members of NJEdge (Format-edited version is in file Mapping Bandwidth_Mb_07162012_edit.xlsx). Table included information on 52 institutions, most of which (39) were unique state, community or private institutions of higher learning. Information from NJEdge included:
      i. Institution Name
      ii. Address
      iii. Technology Type
      iv. Upstream and downstream speeds
3. Merged IPEDS and NJEdge data to match institution data with broadband access information (HigherEd_Merge.arroyo)
   a. Performed exact match on institution name
      i. Facilitated matching by Converting names to upper case and trimming excess spaces
   b. Of those NJEdge data entries that did not match, used approximate matching based on institution name
      i. Preprocess prior to approximate match involved
         1. Removing strings COLLEGE, UNIVERSITY, NEW JERSEY
         2. Removing any punctuation
      ii. Matched using Levenshtein Distance metric with threshold of 4.
   c. Reviewed unmatched NJEdge data manually and identified three additional matches.
4. Successfully merged data from 37 NJEdge institutions into IPEDS data
   a. Note that remaining NJEDGE institution (Fairleigh Dickenson) has different address than either of the campuses in the IPEDS data.
   b. Note that Rutgers entry in NJEdge data has different address than the IPED entries

Final output is in file HigherEd_Geocoded_RateMatched_07162012.xls

7.6 Libraries

1. Obtained the following data from the named sources
   a. Obtained the file Public Libraries Survey Fiscal Year 2010 from http://harvester.census.gov/imls/data/pls/index.asp. Used file puout10a.txt
      i. Manually extracted 462 records for the state of New Jersey
      ii. Used the following data items:
         1. FSCSKEY
         2. FSCS_SEQ
         3. LIBNAME
         4. ADDRESS

5. CITY
6. ZIP
7. LATITUDE
8. LONGITUDE

Manually changed the town name for W. Patterson Library to new official name of Woodland Park.

b. Data submitted by 89 library organizations via specially designed Web site. No new data was submitted after September 2011. Corrected the category type for Summit Public Library, which was mis-categorized as a hospital. Data collected included same fields listed above for Local Governmental organizations

2. Merged library survey data with data collected from libraries via our hosted Web site to merge address and ID information with speed and Wi-Fi availability information (SubmittedCAI_Library_Process.arroyo).
   a. Performed exact match between survey and submitted data on library name
      i. Facilitated matching by Converting library names to upper case, cutting submitted names to fixed-field length of survey data (60 characters) and trimming excess spaces
   b. For those submitted data entries that did not match, performed an approximate match based on library name
      i. Preprocess prior to approximate match involved
         1. Removing strings P.L., FREE, PUBLIC, LIBRARY, TOWNSHIP, TSWP, PUB, LIB, THE, SYSTEM
         2. Removing any punctuation
         3. Converting NO/SO at start of line to NORTH and SOUTH respectively
      ii. Matched using Levenshtein Distance metric with threshold of 3.
   c. Manually changed the names of some libraries to make them consistent between reference data and submitted entries with respect to library name (town name vs. specific name).
   d. Successfully matched all but ten submitted entries to Library Survey Data
      i. Remaining ten were branches of Newark Public Library, but all were submitted with the same address, so they could not be successfully geocoded.

   Results (LibraryPlusSubmitted.xls) include 469 Library entries. This is larger than the 462 from the survey because some libraries submitted more than one broadband provider.

7.7 Private K-12 Schools

1. Obtained the following data from the named sources:
   a. Latest list of private K-12 education institutions from National Center for Education Statistics Private School Universe Survey (http://nces.ed.gov/surveys/pss/privateschoolsearch/). Table included information on 1159 institutions with the following fields:
      i. Name
      ii. Address: Street, City, State, ZIP
      iii. PSS_ID
   b. Data submitted by schools via specially designed Web site. There was no new data submitted after September 2011. Data collected included same fields listed above for Local Governmental organizations. Total number of Public and Private schools submitting information was 796.
   c. Data from the USAC eRate program was not used in this submission.

2. Merged NCES private school with data collected from private schools via our hosted Web site to merge address and ID information with speed information (SubmittedPrivateSchool_Process.arroyo and PrivateSchool_Process.arroyo).
    a. Performed exact match between NCES and submitted data on institution name and zip code
        i. Facilitated matching by:
            1. Converting school names to upper case
            2. Removing string , NJ
            3. Converting string SAINT to ST
    b. For those submitted data entries that did not match NCES data, performed an approximate match based on institution name
        i. Preprocess prior to approximate match involved
            1. Replacing string SCHOO or SCHO with SCHOOL
            2. Replacing string HIGH SCHOOL with HS and string ELEMENTARY with ELEM
            3. Removing strings SCHOOL, THE, REGIONAL, HIGH, ACADEMY and ACA
            4. Trimming excess spaces
        ii. Matched using Levenshtein Distance metric with threshold of 3.
    c. Successfully merged data from submitted private school into NCES institutions
        i. Manual comparison resulted in matching of additional institutions
        ii. Remaining institutions were ambiguous or not present in the NCES data.
3. School records were geocoded using the Yahoo geocoder API.
4. Generated 1154 records to submit, of which 57 were merged with submitted broadband data.
    a. Output file is PrivateSchool_GeoMatched.xls

7.8 Public K-12 Schools

We obtained the reference list and broadband records for public and charter schools from NJ DOE and geolocation information for public and charter schools from the NJ Geographic Imagery Network (NJGIN) team. NJGIN and NJ DOE provided two sources data that were merged to get the geolocation and NCES ID of the schools.

1. Obtained the following data from the named sources:
    a. List of schools with broadband data provided by NJ DOE (StateOIT_ARRA_Broadband.csv). This table contained records of 2428 schools with the following fields:
        i. School Name
        ii. Combined_Code that comprises of a concatenation of county, district and school.
        iii. WiFi availability
        iv. ISP Provider Name
        v. Technology
        vi. Downstream Speed
        vii. Upstream Speed
    b. Geolocation data for 3784 schools that included public, private and charter schools. The data included the following fields:
        i. School Name
        ii. Address
        iii. Latitude
        iv. Longitude

v. County Code (2 digits)
vi. District Code (4 digits)
vii. School Code (3 digits)
viii. Type of school – Public, Private or Charter

The last 3 codes were concatenated to get the Combined Code. However, neither this list nor the broadband data contained the NCES ID which is information required by the NTIA. Therefore, a third list provided by the NJ DOE was used to obtain the NCES ID.

c. List of public K-12 and charter schools in New Jersey (NJ SCH EXTRACT.XLSX) from NJ DOE. Table included information on 2641 institutions with the following fields:
    i. Name
    ii. FIPS State Code
    iii. Two codes ID 4 LEA ID (State) and ID 5 School ID (State), that when combined gave the combined ID used by the DOE in identifying schools.
    iv. Two codes ID 1 LEA ID (NCES) and ID 529 School ID (NCES) that when combined give the NCES ID of the school.

    Because information was not available for private schools, the NJ GIN geolocation information was only used for public and charter schools in this submission.

The data from the website and eRATE data were no longer needed in this submission for public schools as the NJ DOE provided all the necessary data providing greater coverage than the other sources.

2. Merged the two data sources listed in items b and c above to get the list of public schools with goelocation and NCES ID (NJ_Schools_Process.arroyo). The key for merging the two lists was the Combined Code used by the NJ DOE that consists of county, district and school codes.
    a. 2464 records were matched between the two lists
    b. Many of the records in the NJ GIN list could not be matched. Of these, the 67 that were public or charter schools were added to the list of schools.
    c. 178 schools were not in the NJ GIN list. Of these, we were able to geocode 155 schools using Yahoo geocoder API.
        i. Ensured no errors were present, that at least on entry was returned and that quality metric was over 75.
        ii. Ensured that state was New Jersey and that city and/or zip value was populated.
        iii. This process yielded a total of 2686 schools with geolocation.
3. The NJ DOE list of schools with broadband data was merged with the list of schools generated in step 2. The two lists were merged using the Combined Code as the key (Schools_NJDOE_Merge.arroyo). 2421 of the 2428 NJ DOE records were matched.

    Output file is PublicSchools_GeoMatched.xls. It has a total of 2686 schools, 2421 with broadband data.

7.9 Public Safety Organizations

The procedure and data in this section are unchanged from the previous submission.

1. Obtained the following data from the named sources:
    a. List of local and state public safety organizations obtained from NJ State 911 Commission. (Reused data from April 2011 - PSAP's & PSDP's_Geocoded.xls) Table included information on 343 institutions with the following fields:
        i. Name
        ii. Address: Street, City, State, ZIP, County

iii. NCES_ID

b. Data submitted by 120 public safety organizations via specially designed Web site. Data collected included same fields listed above for Local Governmental organizations

2. Generated on 911 Commission Data Latitude and Longitude via geo-coding using Yahoo geocoder API.
   a. Ensured no errors were present, that at least on entry was returned and that quality metric was over 75.
3. Merged 911 Commission data with PSAP data collected from via our hosted Web site (120 entries) to merge address and ID information with speed information.
   a. Performed exact match between 911 and submitted data on institution name
      i. Facilitated matching by:
         1. Converting names to upper case
         2. Removing the Strings DEPARTMENT, DEPT, TOWNSHIP, TWP
         3. Removing punctuation and double-spaces
         4. Replacing string PD with POLICE and string BOROUGH with BORO
   b. Performed manual merging to integrate additional submitted records that were not matched.
      i. Successfully merged 85 submitted PSAP entries with 911 Commission data.

   Output in file PSAP_911_Matched.xls

7.10 Additional CAI Processing

All of the CAI data was put through additional processing and validation that achieved the following:

a. Extracted the building number from the street address
b. Checked and verified that all records had a 5 digit zip code
c. Eliminated records that had only PO Boxes for their street addresses
d. Verified that all the records were in New Jersey
e. Removed duplicate entries
f. Checked if the downstream speed was greater than or equal to the upstream speed. There were 163 records where this failed. In these cases, the upstream speed was made equal to the downstream speed in the submitted records. The records that had down less than up are as listed in Table 2. They span almost all of the CAI categories.

This processing resulted in elimination of many records and yielded the final count of submitted records as shown in Table 1.

Table 2 CAI Records with Downstream Speed Less than Upstream Speed

Anchorname	Address	caicat	Transtech	Down	Up

7.11 Summary of DOE Data Review

Contact: D E Duffy
September 20, 2012

The major focus of this brief review is on data quality with the goal of identifying questionable data records for further follow-up by the State of New Jersey. A couple of high-level summaries are provided at the end to identify schools with the lowest speeds. Quality assessments which identified questionable records are flagged with **FOLLOW UP REQUESTED**.

1. There are 5 records that are exact duplicates across all fields in the NJ DOE data. We omitted duplicate records for the following schools:
    - Buckshutem Road School
    - Shore Regional High School
    - Brick Township High School
    - John P. Holland Charter
    - Environment Community Opportunity

2. There was one geographic coding error due to an incorrect zip code for the Millville Public Charter School at 1101 Wheaton Avenue in Millville, NJ. The zip code was given as 08333. The correct Millville zip code is 08332 (one digit different) and we made this correction.

3. **FOLLOW UP REQUESTED:** There were 7 records where the transtech code was zero. We do not know definitively whether this means that the broadband status is Unknown (that is, there may or may not be broadband at this school) or whether it means that the broadband status is No (that is, it has been confirmed that there is no broadband at this school). For the October 1 submission to the NTIA, we coded these 7 records as Unknown. This decision was made largely due to the fact that there is a regional high school, a

middle school and a charter school on this list, so we find it somewhat unlikely that it would have been confirmed that none of these had broadband capability. The 7 schools are:

- Estell Manor Elementary School in Estell Manor NJ
- Kittatinny Regional High School in Newton NJ
- Monmouth Beach Elementary School in Monmouth Beach NJ
- Renaissance Regional Leadership CS in Vincentown NJ
- Vineland Public Charter School in Vineland NJ
- Collingswood Middle School in Collingswood NJ
- Downe Township Elementary School in Newport NJ

It is worth noting that, of these 7 schools, the first one only – Estell Manor – was coded as having an ISP provider of “Comcast”. The other 6 schools had zero coded for their ISP provider. Note also that these schools were coded with 0 for both the download speed and the upload speed.

4. **<u>FOLLOW UP REQUESTED:</u>** There are 19 records with transtech coded as 90, which is the code for broadband over powerline technology (BPL). This is an unexpected outcome as we don’t have any information about BPL providers operating within the state of New Jersey. These records are further suspect because each one of them is also flagged by the verification and validation script with warnings to indicate that there may be potential speed mismatches between the transtech code and the reported speeds. All 19 of these records are associated with Bergen County; however, not all the town addresses lie within Bergen County. Here are the details on these 19 records:
   - 7 records are located in Lodi, NJ and are identified as Lodi Public Schools. These records appear to include 5 lower schools, 1 middle school, and 1 high school and they all have their provider coded as “other”.
   - 5 records are associated with Bergen County Vocational Technical Schools. Of these, 2 schools are in Hackensack, 2 schools are in Paramus and 1 school is in Teterboro. These 5 records all have their provider coded as “Verizon” and we do not believe Verizon offers BPL-based services.
   - 7 records are identified as Bergen County Special Services. These 7 records are further subdivided as follows:
     - 5 records are in Paramus and identified with schools which address hearing impaired, multiply handicapped, emotionally disturbed, life skills and autistic. These 5 records also have the provider coded as “Verizon”.
     - 1 record is identified as the Norman A Bleshman Regional Day School in Paramus and, again, the provider is coded as “Verizon”.
     - 1 record is identified at the Millburn Regional Day School in Millburn, NJ with the provider coded, again, as “Verizon”. Millburn, NJ is in Essex County so the indication of Bergen County is inaccurate.

5. **<u>FOLLOW UP REQUESTED</u>**: There are 45 records for which the download speed has been coded in a lower tier than the upload speed. Broadband technologies are either symmetric (in which case down speed and up speed are in the same tier) or asymmetric (in which case down speed is at a higher tier than up speed). The NTIA validation and acceptance script does not reject these records; however this issue was brought up at the NTIA webinar on September 19. These 45 records are as follows:

- 16 of these records are identified as Passaic City Public Schools. All 16 of these records have the provider identified as "Cablevision"; the transtech as "50" which is Optical Carrier or Fiber to the End User; the download tier as 9; and the upload tier as 10.
- 7 of these records are identified as the same Bergen County Special Services schools discussed above in the previous item. These records all have the provider identified as "Verizon"; the transtech as 90 which or BP; the upload speed at the highest tier of 11 and download speed at tier 10.
- 6 records are identified as in the Rahway Public School District. All 6 of these records have the provider identified as "Comcast"; the transtech as "50" which is Optical Carrier or Fiber to the End User; the download tier as 8; and the upload tier as 9.
- 4 records are identified as Ridgefield Public Schools. All 4 of these records have the provider identified as "Cablevision"; the transtech as "50" which is Optical Carrier or Fiber to the End User; the download tier as 9; and the upload tier as 10.
- 2 records are associated with the East Greenwich Township Board of Education in Mickleton, NJ. Both of these records have the provider identified as "Comcast"; the transtech as "41" which is Cable Modem – Other; the download tier as 7; and the upload tier as 8.
- 2 records are associated with Collingswood Public Schools in Collingswood NJ. Both of these records have the provider identified as "Comcast"; the transtech as "40" which is Cable Modem – DOCSIS 3.0; the download tier as 6; and the upload tier as 7.
- 2 records are associated with the Long Beach Island Consolidated School District. One of these schools is in Surf City, NJ and one is in Ship Bottom, NJ. Both of these records have the provider identified as "Comcast"; the transtech as "41" which is Cable Modem – Other; the download tier as 5; and the upload tier as 6.
- The 6 remaining records are as follows:
    - Watchung Hills Regional High School; Cablevision; Optical Carrier or Fiber to the End User; download tier 7; upload tier 8.
    - A Jamesburg Public School in Jamesburg, NJ; Comcast; Cable Modem – Other; download tier 4; upload tier 6.
    - Hoboken Dual Language Charter School in Hoboken, NJ; Cablevision; Cable Modem – Other; download tier 5; upload tier 6.
    - The Ethical Community Charter School in Jersey City, NJ; Verizon; Cable Modem – Other; download tier 6; upload tier 8.
    - Charter Tech High School for the Performing Arts in Somers Point, NJ; Comcast; Cable Modem – DOCSIS 3.0; download tier 7; upload tier 8.
    - Soaring Heights School in Jersey City, NJ; Comcast; Cable Modem – DOCSIS 3.0; download tier 7; upload tier 8.

It is worth noting that for the October, 2012, submission we are using the following methodology for any CAI record with upload speed higher than download speed: We are replacing the upload speed tier with the download speed tier. This is documented in our methodology report.

6. There are a number of more sophisticated validation and verification checks that we can perform based upon combinations of provider, transtech, downspeed and upspeed.
    - First we note that the data do not include any records with the following four possible transtech codes: "60" for Satellite; "70" for Terrestrial Fixed – Unlicensed; "71" for Terrestrial Fixed –

Licensed; or “80” for Terrestrial Mobile Wireless”. Further, the case of transtech coded as “90” for BPL is covered in item 4 above.

- The remaining data includes only these transtech codes: “10” for Asymmetric xDSL; “20” for Symmetric xDSL; “30” for Other Copper Wire; “40” for Cable Modem -- DOCSIS 3.0, “41” for Cable Modem – Other; and “50” for Optical Carrier / Fiber to the End User.
- AT&T is not a cable provider. Hence, we would not expect records where the service provider is “AT&T” and the transtech is “40” for Cable Modem -- DOCSIS 3.0, or “41” for Cable Modem – Other. We have confirmed that there are no such records.
- **FOLLOW UP REQUESTED:** Cablevision and Comcast are both cable providers. Hence, we would not expect records with the service provider as “Cablevision” or “Comcast” and a transtech of “10” for Asymmetric xDSL; “20” for Symmetric xDSL; or“30” for Other Copper Wire. We identified 4 suspect records as follows:
    - Great Oaks Charter School in Newark, NJ, has Cablevision and transtech 10.
    - South Harrison Township Elementary School in Harrisonville, NJ, has Comcast and transtech 10.
    - Sterling High School in Somerdale, NJ, has Comcast and transtech 30.
    - The International Charter School of Trenton has Comcast and transtech 30.
- Service Electric Cable, Service Electric Television and Time-Warner Cable are all cable providers. As such, we would not expect records with any of these three providers and a transtech of “10” for Asymmetric xDSL; “20” for Symmetric xDSL; or“30” for Other Copper Wire. We have confirmed that there are no such records within the data.
- **FOLLOW UP REQUESTED**: Verizon is not a cable provider. Hence, we would not expect records where the service provider is “Verizon” and the transtech is “40” for Cable Modem -- DOCSIS 3.0, or “41” for Cable Modem – Other. There are 3 unexpected records:
    - Robert L Craig School in Moonachie, NJ has Verizon and transtech 41.
    - Elysian Charter School in Hoboken, NJ has Verizon and transtech 41.
    - Ethical Community Charter School in Jersey City, NJ has Verizon and transtech 41.
- **FOLLOW UP REQUESTED**: Transtech 20 is Symmetric xDSL. Since this is an explicitly symmetric technology, one would expect all records with a transtech of 20 to have the same tier for down and up speeds. There are 7 unexpected records:
    - There are 5 records associated with Rutherford Public Schools in Rutherford, NJ which have a transtech of 20, a downspeed of 8 and an upspeed of 7. All of these records have the service provider coded as “Other.”
    - Weymouth Township Elementary School in Dorothy, NJ has a transtech of 20, a downspeed of 4 and an upspeed of 3. The service provider is coded as “Verizon”.
    - Unity Charter School in Morristown, NJ, has a transtech of 20, a downspeed of 4 and an upspeed of 3. The service provider is coded as “Verizon”.
- It is worth noting that we have not, at this time, analyzed the data to check that records with transtech of 10 for Asymmetric xDSL have different speed tiers for downspeed and upspeed. The reason for this is the following – While it is true that transtech 10 is an explicitly asymmetric technology, speeds are coded not as actual speed values but as tiers. Speed tier 4, for example, denotes a speed that is greater than 1.5 Mbps and less than 3 Mbps. It is possible, at least in theory, to have asymmetric speeds both of which fall within this range.

7. As part of our data processing work for the NTIA deliverable, we use reference data sources and matching techniques to identify the NCES (National Center for Educational Statistics) codes for schools. There were 17 schools in the DOE data for which we did not identify an NCES code. Details are below and, as you can see, all 17 are non-traditional schools of various types.
    - 16 of the 17 schools were identified as an adult, evening, continuing education, or alternative high school, vocation technical school or learning center.
    - 1 school is the MCVS Health Careers Center in Hamilton, NJ in Mercer County.

8. Summary of download speeds
    - 93% of schools (~2250) have reported download speeds of at least 10 Mbps (tier 7 or higher).
    - 78% of schools (~1890) have download speeds of at least 25 Mbps (tier 8 or higher).
    - 59% of schools (~1425) have download speeds of at least 50 Mbps (tier 9 or higher).

9. There is no immediately obvious geographic pattern to the schools which reported the very lowest download speeds. The 8 schools with the lowest reported download speeds (tier 2 or tier 3 and less than 1.5 Mbps) are located as follows:
    - One in River Edge, Bergen County
    - Two in Berlin Township, Camden County
    - One in Greenwich, Cumberland County
    - One in Mine Hill, Morris County
    - Two in Sussex County – One in Sandytown-Walpack and one in Walkill Valley

10. There are about 30 schools with download speeds of 1.5 and 3 Mbps (tier 4). They are distributed among New Jersey counties as follows:
    - 6 in Bergen
    - 4 in Passaic
    - 4 in Sussex
    - 3 in Atlantic
    - 3 in Somerset
    - 3 in Union
    - 2 in Camden
    - 2 in Mercer
    - 1 in Burlington
    - 1 in Essex
    - 1 in Hudson
    - 1 in Middlesex
    - 1 in Morris

8 Appendix C: Third-Party Comparisons

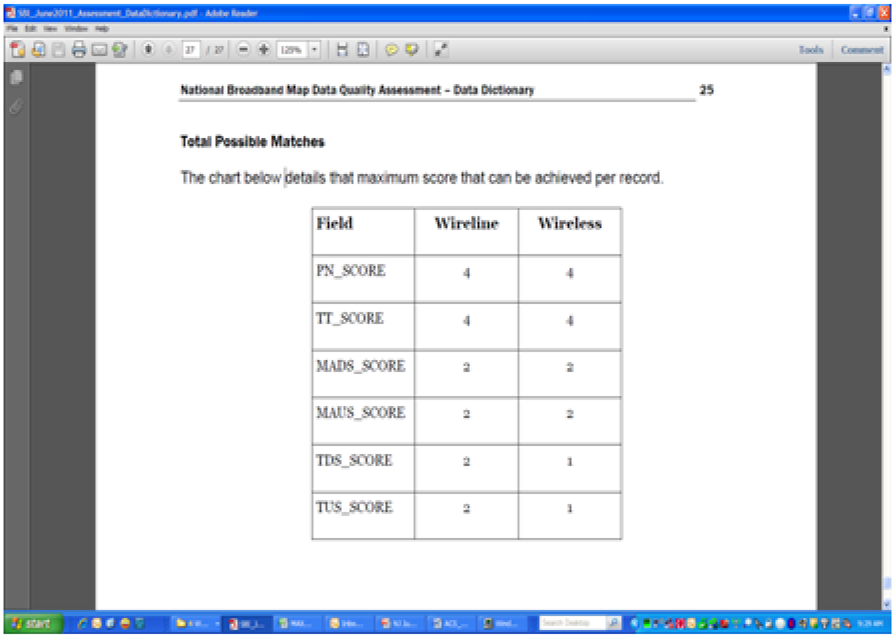
8.1 Analysis of Discrepancies between June 2011 Submission and Third-Party Data

NJ June 2011 Assessment Summary

- Based on government provided assessment that used data from third party sources for comparison
  - Appears that there were 4 sources, not all provided all the data
  - Data dictionary indicates max possible comparisons for each field (slide 3)
  - Note that even within these, the number of available data sources were lower for some records
- Database overview:
  - New fields appended to submitted datasets (BB_Service_Address, BB_Service_CensusBlock, BB_Service_RoadSegment)
    - PN_SCORE (provider name comparison score)
    - TT_SCORE (transtech comparison score)
    - MADS_SCORE (Max adv upstream tier comparison score)
    - MAUS_SCORE (Max adv downstream tier comparison score)
    - TDS_SCORE (Typical upstream tier comparison score)
    - TUS_SCORE (Typical downstream tier comparison score)
  - Score field values
    - 0 – no match
    - 1 to 4 – number of matches
    - ? – un-scored record (no analytics)
  - Comparison data is not provided – only resulting match or no match
  - When PN_M_COUNT=0, TT_T_COUNT, MADS_T_COUNT, MAUS_T_COUNT are set to 0

Notes on Comparison Data

- Summary tables of unmatched records in NJ_June2011_Summary.pdf cover both wireline and wireless
- Wireless_by_Block table gives the wireless data by census block (2010 Census blocks)
- Wireless results include the number of comparison datapoints available for each element
  - *_M_COUNT: number of matches in our data, e.g. TT_M_COUNT
  - *_T_COUNT: number of possible matches, i.e. number of comparisons that were made for each field, upper bound of achievable score for each record, e.g. TT_T_COUNT
- Issues with comparison analysis results
  1. Wireline data does not include number of available comparison values, i.e. upper bound on achievable score for each record
  2. With wireless, where upper bound is provided, how to interpret results where we achieved a score > 0 but less than the bound – appears that reference datasets were not aligned
  3. Database only provides number of mismatches - No way of telling which providers overstated their speed vs understated



National Broadband Map Data Quality Assessment – Data Dictionary 25

Total Possible Matches

The chart below details that maximum score that can be achieved per record.

Field	Wireline	Wireless
PN_SCORE	4	4
TT_SCORE	4	4
MADS_SCORE	2	2
MAUS_SCORE	2	2
TDS_SCORE	2	1
TUS_SCORE	2	1

Transtech Mismatch Count

Wireless & Satellite

Transtech=80 TT_M_COUNT < TT_T_COUNT	Transtech=70 TT_M_COUNT < TT_T_COUNT	Transtech=60 TT_M_COUNT < TT_T_COUNT	Transtech=50 TT_SCORE < PN_SCORE	Transtech=30 TT_SCORE < PN_SCORE	Transtech=20 TT_SCORE < PN_SCORE	Transtech=10 TT_SCORE < PN_SCORE
Terrestrial Mobile Wireless	Terrestrial Fixed Wireless - Unlicensed	Satellite	Fibre	Other Copper	SDSL	ADSL
78625	0	0	12012	29311	27881	12737
78625	0	0	14585	29550	27882	12749

- Numbers in second row in table are obtained from querying GDB (wireless and wireline) for each Transtech code
- Numbers in the bottom row are from NTIA's table "Un-matched Technology Of Transmission Records"
- Wireless numbers match what's in NTIA's table exactly
- Wireline numbers are off by varying degrees, most are close except Transtech=50
- Note: Transtech table counts all mismatches, for all the comparison datasets, not enough to have one match
  - Wireless database provides the target count and so is easy to get
  - For wireline ended up using PN_SCORE as indirect measure of target set for each record – possible cause of deviation

Verizon Wireless Transtech Comparison

- All transtech mismatches in wireless are only in Transtech=80 (Wireless mobile)
  - total 78625 records
- All are for Cellco Partnership (Verizon)
- Our data has it as Transtech =80, their comparison data has them spread across Transtech=10, 20, 30 and 50! (all wireline transtech codes)
- All of these are records where provider name had no mismatch
- Issue: If provider name matched to Cellco Partnership (uniquely wireless provider) how could the reference transtech codes be in the wireline space?

8.2 Analysis of Discrepancies between December 2011 Submission and Third-Party Data

What's New?

To improve the usefulness of the Awardee file geodatabase, the following changes have been made to the format that was presented in the June 2011 SBI version of the Awardee file geodatabase.

1. The file geodatabase contains data current as of December 31, 2011.
2. Scores for BB_Service_RoadSegment are now shown at the Census Block level. This will provide the Awardee with a better understanding of the scoring for road segments that traverse multiple Census Blocks.
   a. The census block level scoring is contained in a new table named RoadSeg-ment_by_Block.
   b. The RoadSegment_by_Block table can be queried similar to the Wireless_by_Block table as described in the *How to Query Road Segment and Wireless Records* section of this document.
   c. The following fields have been dropped from BB_Service_RoadSegment
      i. PN_SCORE
      ii. TT_SCORE
      iii. MADS_SCORE
      iv. MAUS_SCORE
      v. TDS_SCORE
      vi. TUS_SCORE
3. The following field names in the Wireless_by_block and RoadSegment_by_Block tables have been added or updated to better reflect the original SBI field names
   a. PROVNAME (updated)
   b. DBANAME (added)
   c. FRN (added)
   d. TRANSTECH (updated)
   e. MAXADDOWN (added)
   f. MAXADUP (added)
   g. TYPICDOWN (added)
   h. TYPICUP (added)

- 926133 mismatches (mismatch for each source is counted separately)
- Only ~25% of these are non-green (15% yellow, 8% orange and 2% red)
- Tiers 5, 7 and 10 have most non-green mismatches
- Biggest differences from June 2011 are in the green cells

Jersey Shore Wireless	5702	3352
Hughes Network Systems, LLC	168588	144465
Clearwire Corporation	66463	2

All 3 with poor PN matching are satellite providers, Transtech = 60

Wireless – MADS and MAUS Mismatches

Provider	Total Records	MADS_M_COUNT=0	MAUS_M_COUNT=0
Cellco Partnership	256988	191450	103378
Sprint Nextel Corporation	174583	108140	108140
StarBand Communications Inc.	169588	124	0
T-Mobile USA, Inc.	384706	210657	127574
Global Online Electronic Services, Inc.	1	1	1
Hughes Network Systems, LLC	168588	6569	331
Clearwire Corporation	66463	66461	0

- Cellco (Verizon), Sprint Nextel and T-Mobile have the most mismatches
- Cellco, T-Mobile, AT&T and others have a large number of records where MADS_T_COUNT =0 or MAUS_T_COUNT=0 (not included in the table)
- Numbers in the table are a result of the query MADS_M_COUNT = 0 and MADS_M_COUNT<MADS_T_COUNT and TT_M_COUNT>0

Cellco Partnership (Verizon) Analysis

MADS Speed Tier	# Records	# Mismatches	Transtech Code
3	168903	103378	All are 80
7	88085	88072	All are 80

MAUS Speed Tier	# Records	# Mismatches	Transtech Code
2	168903	103378	All are 80
5	88085	0	All are 80

Sprint Nextel Analysis

MADS Speed Tier	# Records	# Mismatches	Transtech Code
3	108160	108140	All are 80
5	66423	0	All are 80

MAUS Speed Tier	# Records	# Mismatches	Transtech Code
2	108160	108140	All are 80
3	66423	0	All are 80

- Sprint has significant mismatches, but only in the lowest tier
- Sprint is not overstating speeds

T-Mobile Analysis

MADS Speed Tier	# Records	# Mismatches	Transtech Code
4	154225	126851	All are 80
6	132784	78587	All are 80
7	97697	5219	All are 80

MAUS Speed Tier	# Records	# Mismatches	Transtech Code
2	154225	126851	All are 80
4	230481	723	All are 80

8.3 Questions to Resolve Discrepancies with FCC

The six questions below (in italics) were reviewed on August 21, 2012 in a teleconference call involving ACS, NJ OIT, FCC and Michael Baker personnel. FCC responses are provided for each question.

1. *By far, the bulk of mismatches in the wireline data were from a single provider - Dieca Communications DBA Covad Communications - and in all the comparison fields. Deica/Covad has merged with Megapath and has subsequently explained to us that they provide facilities-based services which are then branded and sold by others. We would be interested in any information NTIA can provide on what FRN or names are being compared against Deica's data.*

   Provider names and FRNs are compared to Form 477 data to perform location matches. Mismatches often result from errors in the Form 477 data. Moreover, mismatches aren't often valid for MVN data.

2. *All transtech code mismatches in the wireless data were found to be associated with the provider called "Cellco Partnership" with DBA name of Verizon Wireless. NJ's submitted data has the transtech code of 80 that corresponds to "Wireless Mobile". From the Transtech mismatch table in the summary report, it appears that this data was being compared against records with transtech codes spanning across values in the wireline space. Can you confirm or correct our understanding, and, if this is a case of comparing wireless data against wired records, please advise as to how to correct?*

   With the Form 477 data, sometimes different services are grouped under the same FRN, e.g., data for DSL and "other copper" may be confounded. The problem is likely in the third-party data, so we can ignore these discrepancies.

3. *The bulk of provider name mismatches in wireless data came from satellite providers - Hughes, WildBlue and Starband. In addition, about 87% of the satellite provider records (445795 out of 508674) had provider name mismatches.Additional information on what they were compared against is needed to better understand the reason for this.*

   This problem likely has the same explanation as 1 above.

Finally, ACS would like to get clarification on the following aspects in order to help us in our analysis and interpretation:

4. *The wireless data include the number of sources that were available for comparison for each record and each compared element (T_COUNT).This helps in determining the true number of mismatches. However, the wireline data do not include such information and just include the score, without any indication of how many comparison sources were used. So, it is not clear if a score of 1 indicates a full match to a single available data source or only a match to a subset of sources.*

   NTIA will look into this issue for the Oct. 20012 submission.

5. *In the case of wireless, how should we interpret cases where M_COUNT 0 (indicating at least one match) but the M_COUNT < T_COUNT? This implies that the comparison sources were not in agreement.*

   This probably isn't a problem with the data submission. This happens more often in the wireless domain. One of the third party data sources used for wireless comparisons is FCC speed tests, which often have fewer records and the census block coverage is uneven.

6. *The summary results indicate by color code (grades from green to red) the amount by which the submitted data overstated the speed tier in comparison with the third party sources. However, it is not clear how to correlate this to specific providers because the geodatabase only indicates that a mismatch exists but does not indicate the comparison values of the speed tiers. Can you provide provider-specific color-coded data?*

   This problem is recognized and is already in the "NTIA court," i.e., is under consideration.

Mapping Methodology: October 1, 2012

Introduction

The State of New Mexico (hereafter, NM or State), through its agents Earth Data Analysis Center (EDAC [Mapping Team]) at The University of New Mexico and NM Department of Information Technology (DoIT), submitted the October 1, 2012 New Mexico Broadband (NMBB) Program data package, in compliance with the National Telecommunications and Information Administration (NTIA) State Broadband Initiative Program (SBI).

Data Submittal Description

The NMBB October 1, 2012 data submission includes:

- NMBB _DeliverableMemo_2012_10_01.pdf: This document describes NMBB data submittal components, state-restricted data fields, and contact information.
- NM_SBDD_2012_10_01.gdb: The NMBB geodatabase was created to NTIA standards and includes FGDC-compliant metadata for the database layers.
- NM_DataPackage_2012_06_30.xlsx: The FCC-prepared data-package spreadsheet consists of three worksheets for overview and checklist, record count, and provider table.
- NM_2012_10_01.txt: The data receipt file generated from running the Check Submission Tool, lists pass/fail for received data-submission layer and field entries.
- NM_ReadMe_2012_10_01.txt: This readme gives a brief description on the error or warning messages generated by the Check Submission Tool.
- NM_Methodology_2012_10_01.pdf: The Methodology document is included in the submitted package.
- NM_Changes_ and_Corrections_ 2012_10_01.pdf: The document corresponds to a readme document, especially for Internet Service Provider (ISP) information.
- NMBB_Provider_ Data_ Request_Template.xls: The data-request spreadsheet contains an overview and upload instructions in addition to eight worksheets for different types of service, subscriber speed, and community anchor institutions.

All files were zipped together and submitted as NM_SBDD_20121001.zip.

SBDD Geodatabase Layer	Number of Records: October 1, 2012
BB_Service_Address	0*
BB_Service_Road_Segment	6941
BB_Service_CensusBlock	160300
BB_Service_CAInstitutions	2964
BB_Service_Wireless	37
BB_Service_Overview	154
BB_ConnectionPoint_LastMile	0*
BB_ConnectionPoint_MiddleMile	469

***** Due to restrictions in the Non-disclosure Agreement (NDA) with New Mexico Internet Service Providers (ISPs), New Mexico cannot populate the Service Address and Last-Mile feature classes in the NMBB Geodatabase.

Provider Participation

The NMBB Program, in July 2012, requested broadband data for the October 2012 (Round 6) submittal from sixty-four (64) companies, which represented sixty-nine (69) NM Internet Service Providers (ISPs).

A total of thirty-seven different ISPs, representing thirty-two companies, responded to this data request. Of those, thirty-two ISPs (representing twenty-seven companies) provided data and the others indicated no changes to their previously-submitted data. One ISP was identified as not being a broadband provider due to the fact that the provided speeds did not meet broadband requirements. Six (6) ISPs contact information has been changed and we were not able to obtain their correct contact information.

Additionally, Baja Broadband Operating Company, LLC acquired US Cable of Coastal-Texas, LP., ViaSat, Inc. acquired Wildblue Communications, Inc. and Zayo Group acquired 360networks (USA), Inc.

Internet Service Providers	Number: October 1, 2012
Contacted	69
Responded: Provided Data	33
Responded: No Changes to Data	5
Responded: Will not Participate	0
Responded: Not NM Broadband Provider	1
Did Not Respond: Previously Submitted Data	7
Did Not Respond	23

See *Appendix A: Table of New Mexico Internet Service Providers* for those ISPs included in the data request and the participating ISPs.

Data Verification Techniques

Consistency Checks

- EDAC reviewed data provided by NM ISPs for completeness (and/or consistency), per NTIA Data Transfer Model requirements. The NMBB Program contacted ISPs by e-mail to request any missing information.
  This review included comparing newly provided data with the provider's previous data sets. Discrepancies or inconsistencies were noted and addressed through e-mail correspondence with the provider. *Appendix B: ISP-Data Verification and Validation* presents examples of these e-mails.
  See sections *1. Data Collection, 1.5 Data Evaluation* and *2. Data Validation, 2.1 Data Assessment, 2.6 Final Data Validation*.
- For those ISPs who provided block- or segment-level coverage, the Mapping Team checked for coverage containment within known service boundaries.
  See section *3. Data Processing, 3.3 GIS Data Verification*.
- For ISPs providing wireless coverage, the Team checked for coverage containment to New Mexico. (*3.3 GIS Data Verification*)

- If an ISP provided Census Block shapefiles, the Team checked the area of the block to confirm that it fell into the categories for area less than 2 sq mi or greater than 2 sq mi.
  (*3.3 GIS Data Verification*)
- The Mapping Team performed speed checks on data received from the ISPs to make sure they met broadband requirements.
  (*3.3 GIS Data Verification*)
- Topology is validated after loading the data into the geodatabase to identify any inconsistencies in data.
  See section *3. Data Processing, 3.6 Validate Geodatabase*.

Geocoding

- The Mapping Team geocoded address data using different reference street data sets to determine which road reference data set provided the best match. Sometimes a combination of reference data sets was used to obtain better address match rates.
  See section *3. Data Processing, 3.1, 3.2 GIS Data*.
- Unmatched records were sent to the ISP as part of the validation process, with a request for better address information.
  See section *3. Data Processing, 3.3, 3.4 GIS Data Verification, Updates, and Edits*.

NM ISP Feedback Loop

- After processing ISP data, the Mapping Team sent Feedback maps for approval. Any issues for how the service area was represented on the map, such as addition or removal of service, were addressed and corrected, as appropriate. Revised maps then were sent to the provider for review and approval. Feedback maps also included propagation-model results for Wireless broadband.
  See section *3. Data Processing, 3.3, 3.4 GIS Data Verification, Updates, and Edits*.
  See *Appendix C: Feedback and Propagation Model Map*.

Workflow Processing Scheme

New Mexico acknowledges the importance of understanding data reliability and integrity as the Provider data are processed for NTIA submittal. The NMBB Data Workflow and Processing Scheme includes four broad stages:

1. Obtain – Acquire raw Provider data.
2. Validate – Check for internal data consistency and for consistency with external data sources.
3. Process – Develop Geographic Information System (GIS) data and update NTIA Geodatabase.
4. Report – Submit the final Geodatabase to NTIA.

These stages and their relationships are depicted in the diagram below, and are discussed in the sections that follow. The October 1, 2012 Data Workflow and Processing Scheme did not change from the April 2011 scheme and so retained the V3.0 designation.

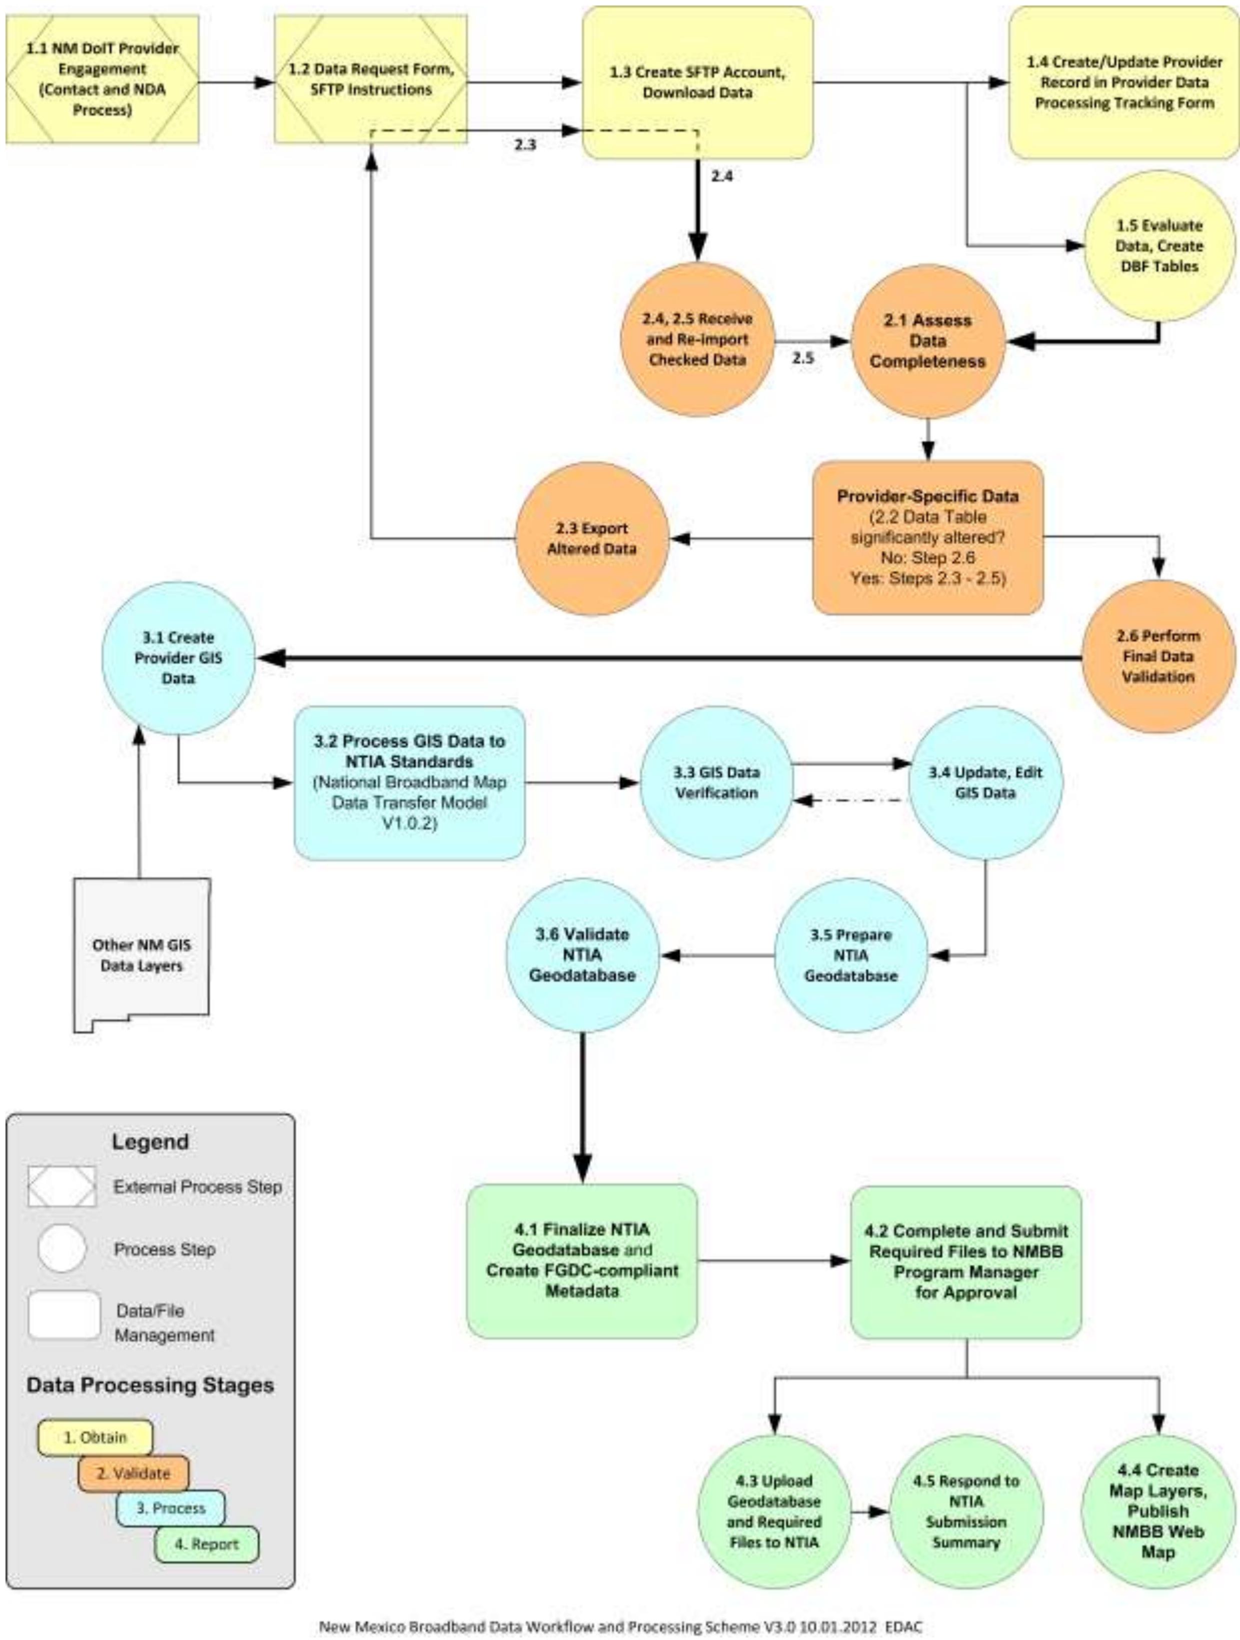

Figure 1 New Mexico Broadband Workflow and Processing Scheme

1. Data Collection

1.1 Provider Engagement

The NM Department of Information Technology established contact with each New Mexico Broadband Provider and negotiated a signed NDA with the State and with EDAC, as required.

1.2 Data Request

EDAC sent an e-mail requesting broadband data to sixty-eight NM companies (seventy-three ISPs) in July 2012, and a reminder e-mail in August to those who had not responded. In addition to an NMBB Program overview and formal request for data, the message included a Web link for the NM Broadband Data Request Form (MS Excel Worksheet); this form included instructions for completing the eight data worksheets and for securely uploading Provider data to the EDAC Secure FTP site.

Data Request Schedule

NMBB Round 6 Data Collection Announcement	07/09/2012
NMBB ISP Data Collection Due	08/31/2012
NMBB Feedback Maps to ISPs for Approval	09/13/2012
NMBB ISP Feedback Due	09/21/2012
NTIA Round 6 Data Due	10/01/2012

1.3 Data Receipt

EDAC created a Secure File Transfer Protocol (SFTP) site for broadband data upload, and created an account on the site for each NM Provider. Each Provider is assigned a unique username and password; this account information is stored in the NMBB SFTP Account Management form.

Provider data arrive in numerous formats, including NMBB or Provider spreadsheets, shapefiles, CAD files, and text files. These data are downloaded from the SFTP site to the EDAC network.

1.4 Provider and Data Tracking

EDAC creates or updates the specific Provider record in a Provider Data Processing Tracking Form. Throughout the data process, each Tracking Form step is recorded with analyst initials and date of task completion. Steps include:

- Record Provider name information and the assigned 2-digit Primary Key (PKey).
- Record the Holding Company Name, DBA Name, FRN (if available), and whether Community Anchor Institutions data are provided.
- Record type of files submitted; date of data submission and the initials of the receiving GIS analyst; and how data were submitted (e.g., FTP or physical medium).

1.5 Data Evaluation

EDAC evaluates the uploaded Provider data for consistency with the NTIA data model and previously submitted data and creates database-format tables.

2. Data Validation

2.1 Data Assessment

EDAC assesses the submitted data for completeness according to the National Broadband Map Data Transfer Model V1.0.2:

- Identify fields (names, types);
- Fill in missing data, if possible; and
- Check field codes, and standardize the values where appropriate.

2.3 Data Export

If the data are incomplete, based upon the above assessment steps, EDAC performs the *If required* steps, below; otherwise, EDAC proceeds with data validation. Changes and assumptions are documented.

If required:

- 2.2 Was the Data Table significantly altered? If yes, go to step 2.3. If no, go to step 2.6.
- 2.3 Return data in standardized format to the Provider for completion.
- 2.4 Receive modified data back from Provider.
- 2.5 Re-import data.

2.6 Data Validation

EDAC performs the final data validation for each Provider's data set: all missing data filled in; all field codes checked and standardized where appropriate. EDAC checks the ISP's provider name and FRN number using FCC's Commission Registration System (CORES) database. https://fjallfoss.fcc.gov/coresWeb/publicHome.do

3. Data Processing

3.1, 3.2 GIS Data

EDAC creates and verifies Provider-specific GIS data, using ArcGIS 10 software and third-party data sets.

- New Mexico Road Centerline (NM RCL) data files [Geocoding; Primary Roads Data Set]
- NM Telephone Exchange Boundaries 911 [Census Blocks Processing]
- U.S. Census TIGER/Line shapefiles [Geocoding]
- NAVTEQ Road data files [Geocoding]
- ESRI Road shapefiles [Geocoding]
- ESRI Cable Boundaries data file [Census Blocks Processing]
- Ancillary consistency checks include comparison with other data sources that are available through the New Mexico geospatial clearinghouse – Resource Geographic Information System (RGIS; http://rgis.unm.edu)
- Propagation model results

EDAC processes the GIS data according to the National Broadband Map Data Transfer Model V1.0.2.

Middle Mile Points

- ISPs provide the geographic coordinates for Middle Mile points. Those points are exported as shapefiles and a spatial join is performed against Census 2010 Blocks to obtain FULLFIPSID.
- Data sets are further processed by adding required fields based on the NTIA Data Model.

Census Blocks

- ISP data were requested for the Census 2010 Blocks, rather than the Census 2000 Blocks.
- If an ISP provides the Census Block IDs, then those tables are spatially joined with the Census 2010 Data and the blocks are extracted. Then, the Census Blocks (Area < 2 sq mi) are extracted.
- If the ISP provides address-specific data, those addresses are geocoded against the New Mexico Road Centerline (NM RCL) address locator. Unmatched addresses are processed against third-party data sets, such as the NAVTEQ Road data purchased by the State as a part of the NMBB project, and ESRI Road data. All of those matched records are appended together to obtain a single address data set. The address points are aggregated spatially to the Census Blocks, and the Census Blocks (Area < 2 sq mi) are extracted.
- If an ISP provides shapefiles of Census Blocks, EDAC verifies those to make sure they are less than 2 sq mi in area.
- If an ISP provides telephone exchange boundaries instead of addresses, then those boundaries are verified with the NM Telephone Exchange Boundaries 911 data set, and Census Blocks (Area < 2 sq mi) that lie within those boundaries are extracted. If an ISP provides the CO/RT locations, then a buffer of 1800 ft is drawn, and the Census Blocks (Area < 2 sq mi) that intersect with the buffer area are extracted.
- If an ISP provides service areas instead of addresses for Cable, then the service areas are verified with the ESRI Cable Boundaries data file. Census Blocks (Area < 2 sq mi) that lie within the boundaries are extracted.
- If an ISP does not provide data for this data-submittal round, data processed for the previous rounds are used for the current submittal.
- Data sets are further processed by adding required fields based on the NTIA Data Model.

Road Segments

- If an ISP provides address-specific data, EDAC geocodes those points (using a process similar to that explained above in *Census Blocks*). The address points are aggregated spatially to Census Blocks, and the blocks with area greater than 2 sq mi (Area > 2 sq mi) are extracted. NM RCL roads within those Census Blocks are exported, and the geocoded address points are spatially joined with adjacent road segments within a distance of 25 ft (or 30 ft for rural areas). The road segments with joined address points are selected and exported.
- If an ISP provides road segment data with address ranges, any one of the address range values (TO/FROM) for the road is taken and the data are geocoded. Or, if no address ranges are provided, the address file is joined with the NM RCL roads, based on Street Name, City, and Postal Code and the matched records are extracted. This involves manual data processing.
- If an ISP provides Tiger/Line roads data, those roads are extracted from the U.S. Census Tiger/Line shapefile by joining them based on the TLID (Tiger/Line ID). NM RCL road data that

match the Tiger/Line roads are exported. If there are no matched roads in RCL data then Tiger/Line roads are submitted to NTIA.

- If an ISP provides Telephone Exchange Boundaries or CO/RT locations or Cable service area boundaries, road segments for these data sets are not processed due to uncertainty about the NMBB procedures for these cases. EDAC checks for ISP-provided address-specific data and, if those data are present, processes the data using the first-listed *Road Segments* step. Otherwise, those roads are not further processed.
- Data sets are further processed by adding required fields based on the NTIA Data Model.

Community Anchor Institutions

- EDAC created an Anchor Geodatabase that has data for all the Community Anchor Institutions, such as Schools, Libraries, Health Care, Higher Education, Public Safety Facilities, Government Agencies, and Non-governmental Institutions throughout the State of New Mexico. These data were obtained from different sources, including the Public School Facilities Authority (PSFA), New Mexico State Library, Homeland Security Information Program (HSIP), and NM Resource Geographic Information System Program (RGIS).
- EDAC developed a Community Anchor Site Assessment (CASA) crowd-sourcing application to collect information about Institutions and their Broadband Internet Access in the State of New Mexico. These results are added to the Anchor Database after locations are validated against satellite and aerial imagery.
- The UNM Bureau of Business and Economic Research (BBER) created and conducted a digital-literacy survey to obtain non-governmental-organization (NGO) community support data. EDAC supplemented the Anchor Geodatabase with these NGO data.
- Broadband data provided by the ISPs are also included in the geodatabase. EDAC uses the third-party USAC (Universal Service Administrative Company) data set for broadband information for Schools and the NM State Library data set for broadband information for Libraries.
- The Anchor Geodatabase is further processed to meet the NTIA requirements. NCES IDs for schools, IPEDS IDs for higher education, and IMLS IDs for libraries are obtained from the respective Web sites and are joined with records in the geodatabase.
- Data sets are additionally processed by adding required fields based on the NTIA Data Model.

Wireless

- If an ISP has multiple spectra, the provided polygon is duplicated for each spectrum and then appended together to obtain a single shapefile with stacked geometry.
- If an ISP provides only tower locations (address or coordinates) instead of shapefiles showing their wireless coverage, EDAC generates wireless coverage using SiteSync propagation modeling software. For this, we request additional information from the ISP, such as: Location (address or coordinates), Antenna pattern (omni-directional, 180, 120, 90, etc.), Transmit frequency (MHz), Transmit Antenna Gain (dBi), and Antenna elevation.
- If an ISP provides tower location (address or coordinates), transmit radius and no other above mentioned variables, those locations are mapped and a buffer is drawn with the transmit radius.

- Wireless-coverage polygons with area less than 0.125 sq mi, whether ISP-provided or modeled, are eliminated from the coverage, per NTIA specifications.
- If an ISP indicates providing Satellite services state-wide, a state boundary file is added to the database, processed per NTIA requirements.
- If an ISP provides KMZ (or KML) files, those files are converted to shapefiles and are further processed to remove the polygons with area less than 0.125 sq. mi.
- Data sets are further processed by adding required fields based on the NTIA Data Model.

Overview

- This set of notes applies to wire-line data, only.
- If an ISP provides the Subscriber Weighted Nominal (SWNOM) Speed of respective technology types for the counties it serves, those values are joined with the County boundary file from the U.S. Census Tiger/Line shapefiles.
- If an ISP provides the technology of transmission, number of subscribers, and the maximum advertised speed for the Counties it serves, the SWNOM Speed is calculated and the values are joined with the County boundaries shapefile.
- These county files from each ISP are appended together to obtain a statewide stacked geometry. Data are further processed by adding required fields based on the NTIA Data Model.

3.3, 3.4 GIS Data Verification, Updates, and Edits

Processed data are developed as Provider-specific spreadsheet and GeoPDF products. As the first step in New Mexico's Provider feedback loop, EDAC places each Provider's products on the SFTP site and requests that Providers verify accuracy and identify needed edits and corrections. Four (4) ISPs responded to the verification request in the October 1, 2012 data submission cycle.

GIS and modeled data are updated and edited, based on Provider feedback, and modified data products (spreadsheet and GeoPDF) are delivered to the Provider through the SFTP site for final verification and to complete the feedback loop.

3.5 NTIA Geodatabase Preparation

EDAC produces a final "clean" GIS data set from the processed and Provider-specific, versioned feature data sets, and then prepares the NTIA Geodatabase from these finalized GIS data. Crowd-sourced data were not used for preparation or validation.

3.6 NTIA Geodatabase Validation

EDAC validates the geodatabase by performing the validation checks provided below and by running the geodatabase through the SBDD_CheckSubmission tool. EDAC then assigns Quality Assurance/Quality Control (QA/QC) values.

- Repair Geometry
- Validate Topology
- Check Provider identification fields by Frequency tool and Summarize tool
- Check for Provider Name, Census Block, and Transmission Technology. Each ISP (Provider Name) should have only one Census Block per Transmission Technology.

- Check for Null values in Transmission Technology codes, PROVIDER_TYPE, FULLFIPSID, STATEFIPS, COUNTYFIPS, TRACT, BLOCKID, GEOUNITTYPE, STATECOUNTYFIPS fields
- Check for Null values in OWNERSHOP, BHCAPACITY, BHTYPE, TRANSTECH, ANCHORNAME, ADDRESS (BLDGNBR, STREETNAME), CITY, ZIP5, STATE, Latitude, Longitude fields
- Check Maximum advertised and typical down/upload speed fields for null values and for valid domain values: MAXADDOWN/TYPDOWN < MAXADUP/TYPUP; MAXADDOWN < '0' OR MAXADDOWN > '11'
- BHCAPACITY <0 and >9, BHTYPE <0 and >4, CAICAT <1 and >7
- Check for SPECTRUM values <1 and >10
- Speed Tiers:
    - DSL download speed tier: if 7 or higher, contact ISP to verify
    - Cable Modem – DOCSIS 3.0 should not be 7 or lower
    - Cable Modem – Other should not be 9 or higher
    - Fixed Wireless download speed tier should not be 8 or higher

4. NMBB Report and Submittal

4.1 Finalized NTIA Geodatabase and Metadata

EDAC finalizes the Geodatabase per NTIA standards (National Broadband Map Data Transfer Model V1.0.2) and creates the associated metadata.

4.2 NMBB Program Manager

The NMBB Program Manager receives the finalized Geodatabase through the SFTP site and approves the files for submittal to NTIA.

EDAC completes and delivers all files to the NMBB Program Manager, as required by the Program. Files include correspondence logs with NM Providers, documentation for Web mapping activities, and the Provider-specific Data Processing Tracking Form.

4.3 NTIA Submittal

The Geodatabase and required files (data transmittal memorandum, Provider data request template [not a required file], data package spreadsheet, check-submission receipt, methodology, and changes and corrections) are uploaded, using the FCC/NTIA SFTP site.

4.4 NMBB Map Layers

Following the NTIA submittal, EDAC creates GIS map layers from the Geodatabase and publishes them to the New Mexico Broadband Program Mapping site, www.nmbbmapping.org/mapping/.

4.5 Response: NTIA Submission Summary

NM DoIT and EDAC developed a document template to respond to the NTIA Submission Summary, both to address NTIA-identified issues or gaps and to request clarification and additional information. New Mexico responds within one week of receiving NTIA's Submission Summary.

NMBB System Security

System Security

The NM Broadband Server is a fully patched Windows Server 2008. The server is protected by Symantec Endpoint Protection and a double firewall.

The first layer of firewall protection is a Cisco hardware firewall that protects the Server from any intrusion from outside the EDAC network. This firewall only allows connections on Ports 80 and 22.

- Port 80 allows Web browsing.
- Port 22 allows Secure FTP. SFTP service is fully encrypted with SHA1 stored passwords.

The Windows software firewall is configured to allow access on Ports 80, 22, 443, and 3389.

- Port 443 gives EDAC developers the ability to configure ArcGIS Server from within the EDAC network.
- Port 3389 gives EDAC system administrators the ability to configure the base Windows server from within the EDAC network.

Server Connections

Connect to the Server from the outside:

- HTTP: No authentication (simple Web browsing).
- SFTP: Authentication required and fully encrypted.

Connect to the Server from within the EDAC network:

- HTTPS: Authentication required and fully encrypted.
- RDP: Authentication required and fully encrypted.
- SMB: Port 445, Windows file-share port.

Virtual Machine and Networked Drive Back-ups

The NMBB Virtual Machine (VM) is a dedicated server.

Back-up: Development Networked Drive (not published)

- Daily: A differential back-up to a tape server is performed; the tape server is connected to a secure tape library.
- Friday/Weekend: A full back-up of the networked drive is performed to the secure tape server.

Back-up: Virtual Machine (published)

- Daily: The entire VM is backed up by VDR (VMware Data Recovery [application]) to a secure, self-contained data store.
- Weekly: The entire VM is backed up to a TrueCrypt volume in remote storage.

Physical Security

NM Broadband Server physical security is accomplished through:

- Controlled-environment floor space in a locked, code-protected room for system servers, and

- An uninterrupted power supply (UPS).

Lessons Learned

EDAC analyzed the results of prior data collections efforts and identified those methods that had the highest success rate and implemented those methods in the October 2012 data collection process. EDAC continues evaluating and updating data validation procedures to meet requirements for the data model.

NMBB Web Map

The New Mexico Broadband Map (www.nmbbmapping.org/mapping/) is developed as part of the NMBB Program for the State of New Mexico. This Web map displays all of the processed ISP broadband data that are submitted to NTIA for the National Broadband Map, and the processed statewide satellite-service data.

Figure 2 (below) is a screen-capture image of the New Mexico Broadband Map V 3.0 with Data Update: 1 April 2012 [map data are updated following each NTIA data submittal]. Map layers for DSL (green), Cable (dark red), Fiber (magenta), and Copper Wire (cyan) broadband coverage are displayed with Tribal Land Boundaries and the Streets base map. Fiber, Fixed Wireless, Mobile Wireless, and Satellite layers are not displayed. Tools include: layer selection; base map selection; dynamic legend; slider-bar and custom zoom; drag-and-drop and directional pan; full, previous, and next extent; identify; find address; scale bar; and print map. Additionally, the mapping site provides a feedback tool, help (online user guide), program information, and New Mexico's disclaimer.

Figure 3 (below) depicts a screen-capture image of the New Mexico Broadband Map V 3.0, which displays fixed wireless broadband coverage in Roswell, NM, generated using the SiteSync propagation modeling software.

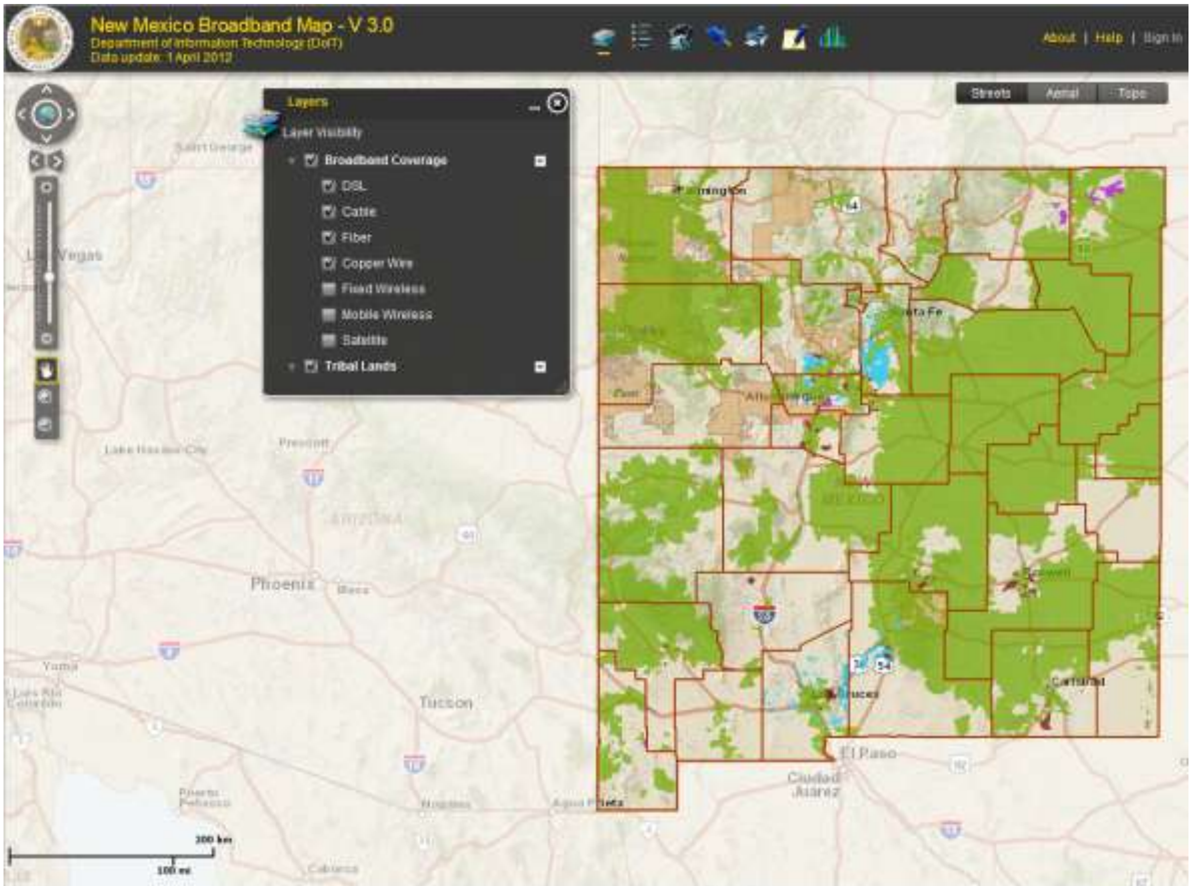

Figure 2 New Mexico Broadband Map V 3.0, www.nmbbmapping.org/mapping/; accessed 24 October 2012

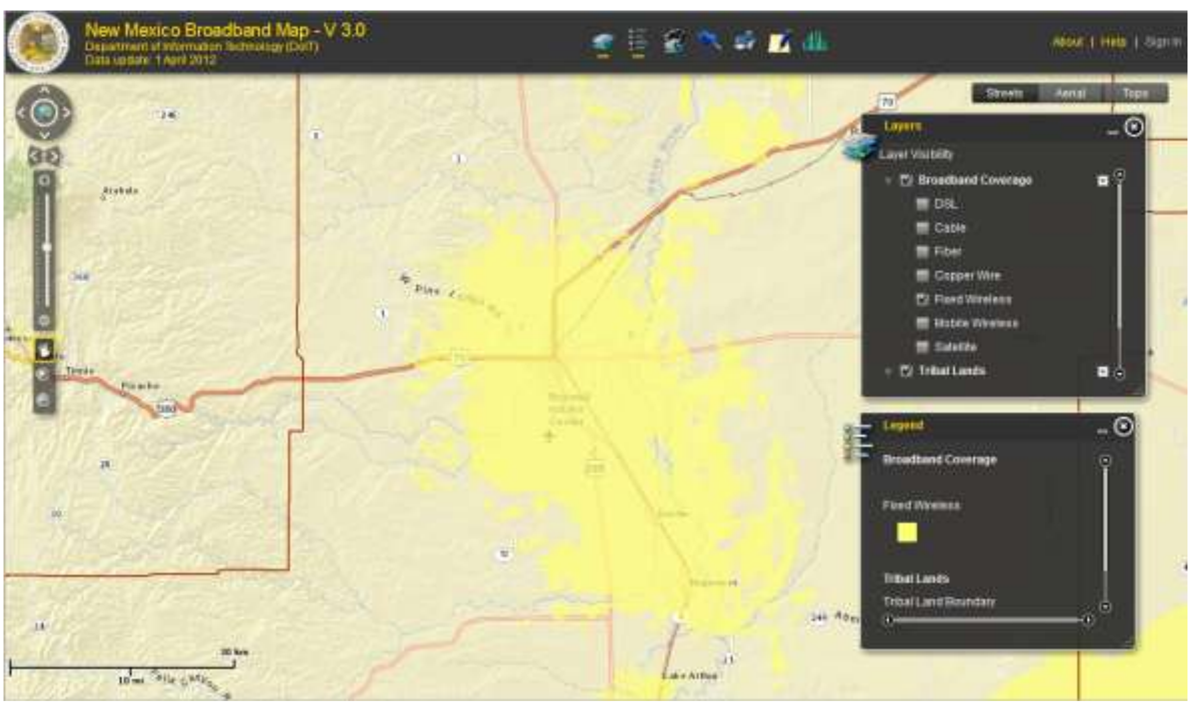

Figure 3 New Mexico Broadband Map: Modeled propagation for Fixed Wireless coverage; accessed 25 September 2012

Appendix A: Table of New Mexico Internet Service Providers

Internet Service Providers listed in black text were participating providers in NTIA Data Round 6. Providers listed in blue text did not respond to NTIA Data Round 6 data requests.

Identified New Mexico Internet Service Providers: NTIA Data Submittal, October 1, 2012	
Agave Broadband LLC	Tularosa Communications, Inc.
AT&T Corp, Inc.	TW Telecom of New Mexico, LLC
AT&T Mobility LLC	Valley Telecom Group (Copper Valley Telephone, Inc.)
Baca Valley Telephone Company, Inc.	Valley Telecom Group (Valley Telephone Cooperative, Inc.)
Baja Broadband	Verizon Wireless
Cable One	ViaSat, Inc.
CenturyLink	Windstream Communications SouthWest
Comcast	WNM Communications
Cricket Communications, Inc.	Yucca Telecom (Roosevelt County Rural Telephone Cooperative, Inc.)
Cyber Mesa Telecom	Yucca Telecom (Yucca Telecommunication Systems, Inc.)
Dell Telephone Cooperative, Inc.	Zayo Group
DIECA Communications, Inc. (Covad Communications Company)	
ENMR Telephone Cooperative	Action INTELEX
Frontier Navajo Communications (Navajo Communications Company, Inc.)	AmigoNet
Higher-Speed Internet, LLC	Azulstar, Inc.
Hughes Network Systems	BlackRock Networks, LLC
Kit Carson Electric	Brainstorm Internet
La Canada Wireless Association	CityLink Fiber Holdings, LLC
La Jicarita Rural Telephone Cooperative	Cnet Internet
Leaco Rural Telephone Cooperative	CNSP Internet
Level 3 Communications, LLC	Desertgate Internet
MATI Networks (Mescalero Apache Telecom, Inc.)	Huntleigh Telecommunications Group, Inc.
Penasco Valley Telecommunications	La Tierra Communications, Inc.
Plateau Telecommunications, Inc.	Lobo Internet Services, LTD.
PTCI (Panhandle Telephone Cooperative, Inc.)	MetTel
PVT Networks	Oso Grande Communications
Sacred Wind Communications, Inc.	RioLink, LTD
Sierra Communications (a subsidiary of Baca Valley Telephone)	SCS Connect
Southwestern Wireless	SentivaNet
Sprint	Southwest Cyberport
Suddenlink Communications	Spinn.Net
StarBand Communications, Inc. (Spacenet, Inc.)	TaosNet, LLC
T-Mobile	Tewa Communications
Time Warner Cable	Trilogy
Transworld Network, Corp	Virtual Los Alamos

OFFICIAL OCTOBER 2012 UPDATE SUBMISSION TO THE NATIONAL TELECOMMUNICATIONS AND INFORMATION ADMINISTRATION UNDER THE STATE BROADBAND INITIATIVE GRANT PROGRAM FOR THE STATE OF NEVADA

CONNECT Nevada®

October 1, 2012

TABLE OF CONTENTS

October 1, 2012

Ms. Anne W. Neville
SBI Grant Program Director
National Telecommunications and Information Administration
U.S. Department of Commerce
Room 4716
1401 Constitution Avenue, NW
Washington, DC 20230

Dear Ms. Neville:

As the State Broadband Designated Entity, in partnership with the Nevada Broadband Task Force, please accept this submission from Connected Nation on behalf of the state of Nevada's State Broadband Initiative (SBI) Grant Program, known as Connect Nevada.

The Connect Nevada program and its collective stakeholder community continue to be faithful and energized contributors to the National Telecommunications and Information Administration's (NTIA) SBI program. Now more than ever, the significance of complete and validated data as compiled through the Federal Communications Commission's (FCC) National Broadband Map is instrumental in forging the innovation economy of the 21st century. As the Commission relies upon this unique resource to distribute monies under the Connect America Fund, through the Universal Service Fund reform, the Connect Nevada program equally values this data in informing meaningful program interventions relating to broadband access, adoption, and use initiatives. Truly, this coordination embodies the spirit of the SBI and demonstrates the joint effort of the NTIA, FCC, state governments, industry, and non-profits like Connected Nation as it continues to serve as a key tool for the American public and policymakers. We are proud of the role that Connect Nevada has played in creating and maintaining such a powerful tool that has benefitted and surely will continue to benefit broadband providers, consumers, and businesses nationwide.

The artifacts that comprise this submission should be found to be compliant with the October 1, 2012, deadline for the semi-annual data update and in accordance with the terms of the July 1, 2009, Notice of Funds Availability (NOFA) and all subsequent clarifications pertaining to delivery of state-level mapping of broadband service availability. This packet includes:

Inventory of Deliverables, Connect Nevada: October 1, 2012

NOFA Requirement	Data Transfer Model	Data Description
Appendix A: 1(a)(i)	BB_Service_CensusBlock	Broadband Service Availability of Facilities-Based Providers in

			Census Blocks of No Greater Than Two Square Miles in Area
Appendix A:	1(a)(ii)	BB_Service_RoadSegment	Broadband Service Availability of Facilities-Based Providers by Road Segment in Census Blocks Larger in Area Than Two Square Miles
Appendix A:	1(b)	BB_Service_Wireless	Broadband Service Availability of Wireless Services Not Provided to a Specific Address
Appendix A:	3(b)	BB_ConnectionPoint_MiddleMile	Broadband Service Infrastructure Middle-Mile and Backbone Interconnection Points
Appendix A:	4	BB_Service_CAInstitutions	Community Anchor Institutions-Listing
Appendix A:	4	n/a	Community Anchor Institutions-Narratives
VII.A.1(a)		n/a	Accuracy and Verification Report
n/a		DataPackage.xlsx	Worksheets of Contact Information, Record Count, and Provider Summary Table
n/a		n/a	List of Changes and Corrections to the Dataset
n/a		n/a	Non-Participating Provider (NPP) Narratives
n/a		n/a	Broadband Provider Roster and Participation Status

In addition, this data update submission should be found to be compliant with the additional program requirements instituted by the National Telecommunications and Information Administration since the time of the April 2012 SBI data submission for the Connect Nevada program. Specifically, these new requirements are:

SBI Data Transfer Model
The submission of the broadband dataset for October 1, 2012, is contained within the SBI Data Transfer Model as released on the Grantee Workspace on August 9, 2012. All efforts have been made to comply with formatting, domain, and metadata requirements to include as much information on each provider as possible.

Additional Submission Guidance
New to the semi-annual submission for October 2012 is a more robust version of the ReadMe text file. As per the template released on the Grantee Workspace on May 18, 2012, this file contains a high-level summary of the items contained within the submission, including the exact file deliverables, a description of the errors and warnings from the Check Submission report, and extraneous information of which the NTIA and other users of the dataset should be made aware.

This submission continues to follow the speed technology guidance released by the Program Office on August 9, 2012, to review speed tier codes in correspondence with technology of transmission codes. In the April 2012 submission, descriptions were provided in the methodology paper that offered an explanation for any submitted technology of transmission and speed combinations that were outside of the expected value range. That practice continues in this submission as technology and speed combinations are reviewed and scrutinized; any questionable information supplied by providers is reviewed more in depth with the provider to ensure the information is accurately captured or a proper explanation is provided as to why the speed information should be submitted as supplied even if it falls outside the expected value range.

Also in this submission is a narrative describing the data and coverage estimation of a non-participating provider. While Connect Nevada continues outreach to all providers prior to each submission period, the need to submit broadband service data for all providers regardless of their participation is evident as the SBI program continues into this sixth round of data submissions. The submission of this estimated broadband service area for providers that have not supplied data to Connect Nevada is essential in being able to portray a more accurate depiction of the current broadband landscape.

In addition to the requirements mentioned above, please find this methodology paper to be inclusive of the ongoing section pertaining to industry mergers and acquisitions – specifically this section details any and all mergers or acquisitions that have taken place in Nevada since the April 2012 submission. The intent of this updated section is to provide a better understanding of how the broadband provider landscape has changed since the last submission cycle.

This October 2012 semi-annual data update under the SBI Grant Program continues to demonstrate our dedication to implementing the joint purposes of the Recovery Act and the Broadband Data Improvement Act (BDIA) by gathering comprehensive and accurate state-level broadband mapping data, developing state-level broadband maps, aiding in the development and maintenance of the National Broadband Map, and undertaking statewide initiatives for broadband planning.

Broadband Service Availability — Provider Outreach and Verification

This data update submission under the SBI program includes datasets for approximately 98.21 percent of the Nevada provider community, or 55 of 56 total providers. There are 54 participating providers and one additional non-participating provider whose estimated coverage areas have been submitted. Of the 54 participating providers, 21 supplied an update to their network or coverage area(s), while 28 have reported no change. The remaining 5 represent providers who previously supplied data but were non-responsive in the October 2012 update effort; therefore their previous dataset is being put forward as part of this compilation. A complete roster by provider depicting participation status and contact record is contained herein. The provider that is not represented in the attached datasets was non-responsive to multiple contact attempts.

As the aforementioned roster and attached methodology documentation will attest, it is the collective opinion of the Connect Nevada principals that all commercially reasonable efforts were made to account for 100 percent of the known Nevada broadband provider community, pursuant to this semi-annual data update submission.

Connect Nevada has also continued to perform broadband verification activities through several means. In addition to confirmation of service area(s) by each provider, Connect Nevada conducts field validation efforts. To date, 39(69.64 percent) providers have been validated through field verification activities. Additional details on verification activities are contained within the Field Validation Methodology.

The Connect Nevada website, (www.connectnv.org), continues to serve a prominent role in the outreach and data collection effort. This program asset provides a way for the general public to participate in the process by offering interactive tools for users to test their connection speed, submit broadband inquiries, or contact a program representative.

As an indicator of stakeholder penetration, the Connect Nevada website encountered 4,426 unique visits during this reporting period (14,436 total to date for the life of the grant awarded on December 20, 2009). Additionally, this pronounced Web activity netted 4 broadband inquiries over this same reporting period (44 grant inception to date). The website also provides access to the My ConnectView™ interactive mapping application, which allows consumers and broadband providers to confirm or dispute the coverage represented on the broadband inventory map. These consumer-initiated actions are facilitated through the Connect Nevada website and the Connect Nevada interactive mapping tool (My ConnectView™) that offer the stakeholders the vehicles to provide information regarding availability in their respective service area, either in affirmation or contest of the reported data represented in the Connect Nevada mapping artifacts. Since the initial data collection and release of corresponding maps, feedback in the form of broadband inquiries has allowed Connect Nevada to identify additional areas that are in need of field validation, which is scheduled as soon as possible.

Community Anchor Institutions

Connect Nevada has established an ongoing mechanism for gathering data on the location and broadband connectivity of Community Anchor Institutions (CAI), in accordance with the data requirements of the SBI NOFA Technical Appendix. Since the April 2012 data submission, the CAI outreach process method has been modified to improve data collection. Specifically, the outreach process is a more focused sector-specific and relationship-oriented approach that generates more responses than general contact.

Outreach was conducted during this data update reporting period by Connect Nevada to continue identification of existing, centralized sources for CAI connectivity data. Additionally, outreach was coordinated to distribute the CAI survey to institutions throughout the state through multiple methods including a customized online survey available on the Connect Nevada website. During this reporting period Connect Nevada has developed a number of new relationships with statewide associations such as the University of Nevada, Reno Raggio Research Center for STEM Education and the State of Nevada Department of Public Safety State Fire Marshal Administration, to promote the importance of broadband connectivity at anchor institutions and participation in this data collection process. It became apparent that these relationships are beneficial to the entire success of the Grant Program, and the CAI engagement is a logical extension of new and existing relationships. Connect Nevada will continue to build upon these new relationships over the coming months and utilize its contacts throughout the state to collect data and raise awareness of this project.

In addition to fostering and building relationships with state agencies, associations, and organizations, Connect Nevada has also developed a sector-specific calendar that supports CAI outreach as well as research and communications efforts. This focused approach allows a corporate commitment to capturing CAI data in addition to developing meaningful sector-specific content.

Connect Nevada is also working hard to clarify CAI information associated with wireless broadband. NTIA has requested in-depth questioning of CAI listing a wireless broadband service as their sole form of connectivity. This follow-up allows us to better understand the reason for adopting the wireless broadband service.

From our work in Nevada, as well as other states, we recognize the great value of this data to future collaboration efforts within the state as well as its value to the National Broadband Map. We plan to continue to bring best practices to the Connect Nevada efforts, along with an investment of both human and technical resources required to reach our goal of increasing the data that is secured and reported as part of this process.

The Connect Nevada program exists to improve data on the deployment and adoption of broadband services and to assist in the extension of broadband technology across all regions of the great state of Nevada, as well as the United States and its territories through contribution to the National Broadband Map. We look forward to the continuing work ahead and improving upon our data collection methods.

Respectfully submitted,

Thomas W. Ferree
President and Chief Operating Officer
Connected Nation, Inc.

DATA ACQUISITION: NEVADA COMMUNITY ANCHOR INSTITUTIONS METHODOLOGY

In this sixth reporting period of the SBI, Connect Nevada, working in close coordination with the state of Nevada, has established an ongoing mechanism for gathering data on the location and broadband connectivity of Community Anchor Institutions (CAI), in accordance with the data requirements of the SBI NOFA Technical Appendix. Since the April 2012 data submission, the CAI outreach process method has been modified to improve data collection. Specifically, the outreach process is a more focused sector-specific and relationship-oriented approach that generates more responses than general contact.

Connect Nevada has continued to identify and process CAI data obtained through an ongoing statewide outreach campaign. Physical address information continues to be augmented through manual sourcing and geocoded by Connect Nevada through Esri ArcGIS software.

Connect Nevada continues to utilize a customized online survey hosted through SurveyMonkey, with a landing page on the Connect Nevada website that was developed during the first reporting period. This survey, in combination with a customized data-gathering spreadsheet, was distributed on a regular basis to a targeted list of CAI throughout the state as well as organizations and agencies that work closely with the CAI. The distributions were completed with the support of the state client. Connect Nevada will continue to use these data-gathering tools for future targeted outreach efforts throughout the coming months leading up to the next reporting period. These materials are customized to fit the CAI categories as defined in the SBI NOFA.

The survey can be accessed at this link:
http://www.surveymonkey.com/s/7RSHPBS

In addition to the survey, Connect Nevada has developed a number of new relationships with statewide associations such as University of Nevada, Reno Raggio Research Center for STEM Education, and State of Nevada Department of Public Safety State Fire Marshal Administration to promote the importance of broadband connectivity at Community Anchor Institutions and participation in this data collection process. It is apparent that these relationships are beneficial to the entire success of the grant program, and the CAI engagement is a logical extension of new and existing relationships. Connect Nevada will continue to build upon these new relationships over the coming months and utilize its contacts throughout the state to collect data and raise awareness of this project.

In addition to fostering and building relationships with state agencies, associations, and organizations, Connect Nevada has also developed a sector-specific calendar that supports CAI outreach as well as research and communications efforts. This focused approach allows a corporate commitment to capturing CAI data in addition to developing meaningful sector-specific content.

Connect Nevada conducts significant research as part of an ongoing process to identify existing, centralized sources for CAI connectivity data. In tandem with these efforts to identify existing data, Connect Nevada continues to identify key CAI contacts in an effort to distribute and promote the online survey and raise awareness of the importance of CAI broadband connectivity. Also, when possible, Connect Nevada works with the Nevada Broadband Task Force to identify existing relationships that can support CAI outreach.

Connect Nevada has an ongoing mission to educate CAI throughout the state on the importance of participating in the project. Participation by these institutions will raise awareness about the importance of broadband connectivity and the need to report the requested data for inclusion on the National Broadband Map.

The greatest challenge with collecting CAI data continues to be educating the CAI about the Connect Nevada project as well as self-awareness of their own CAI connectivity (specifically upload and download speeds). Connect Nevada will continue to research key CAI organizations and agency contacts in an effort to raise awareness of this project among CAI. When applicable, the Nevada Broadband Task Force will continue to be briefed on the current CAI data and provided information so it can assist with outreach and promotion within the state.

A CAI summary of all processed and submitted data is provided below:

CAI Type	Total	Physical Address	Lat/Long	Technology of Transmission	Download Speed	Upload Speed
K-12 Schools	881	881	818	158	156	152
Libraries	108	108	100	61	64	64
Healthcare	5,045	5,045	4,684	27	4,888	4,888
Public Safety	127	127	119	10	11	11
Higher Ed Institutions	81	81	72	38	39	39
Other Government	881	881	847	71	117	117
Other Non-Government	907	907	845	20	59	61
Total	8,030	8,030	7,485	385	5,334	5,332

Since the last reporting period, Connect Nevada identified and deleted 665 Community Anchor Institutions. Several business (i.e. pharmacies, grocery stores, Target, Sam's Club, etc.) that were listed in the nongovernment category were removed; these businesses are not considered anchor institutions. In addition, 50 CAIs were incorrectly assigned to the nongovernment category. These CAIs were reassigned to the appropriate category.

During the coming months, CAI data collection will be supported by regular reporting to the Connect Nevada team. The CAI data is proving an invaluable resource to all components of the Connect Nevada effort. The data identifies potential local champions, sector trends, and opportunities for improvement as well as opportunities to educate CAI not familiar with their current connectivity.

SBI Data Submission Methodology

The submission of the broadband dataset for October 1, 2012, is contained within the SBI Data Transfer Model and additional components as released on the Grantee Workspace on August 9, 2012. Connected Nation (CN) has reviewed all literature that relates to the release and use of this data transfer model and recognizes that it does not replace or dictate how data is stored, processed, or displayed for the state, as it is meant primarily as a means to transfer the broadband data from all states and territories and populate the National Broadband Map in a seamless fashion.

Connected Nation has complied with the following guidance documents published by NTIA:

- Technical Mapping Guide, as released on the Grantee Workspace on March 24, 2011, was followed to ensure the completeness and validity of the submission through completion steps and checklists, completing the DataPackage spreadsheet, uploading broadband datasets into the Data Transfer Model, and checking the dataset using the SBDD_CheckSubmission receipt process.
- Naming Conventions and Category of End User, as released on the Grantee Workspace on March 26, 2012, was followed to ensure the consistency of individual file and zip package naming.

In addition to the methodologies contained herein, the Changes and Corrections documentation, as well as the DataPackage.xls containing contact information, the data dictionary, and a provider summary table, the following feature classes are submitted within the SBI Data Transfer Model for the state of Nevada.

Inventory of Deliverables, Connect Nevada: October 1, 2012

NOFA Requirement	Data Transfer Model	Data Description
Appendix A: 1(a)(i)	BB_Service_CensusBlock	Broadband Service Availability of Facilities-Based Providers in Census Blocks of No Greater Than Two Square Miles in Area.
Appendix A: 1(a)(ii)	BB_Service_RoadSegment	Broadband Service Availability of Facilities-Based Providers by Road Segment in Census Blocks Larger in Area Than Two Square Miles.
Appendix A: 1(b)	BB_Service_Wireless	Broadband Service Availability of Wireless Services Not Provided to a Specific Address.
Appendix A: 3(b)	BB_ConnectionPoint_MiddleMile	Broadband Service Infrastructure Middle-Mile and Backbone Interconnection Points.
Appendix A: 4	BB_Service_CAInstitutions	Community Anchor Institutions-Listing.

The provider data collected by CN on behalf of the state of Nevada have been formatted per the given specifications and uploaded into the appropriate feature classes of the SBI Data Transfer Model. Wireline availability is contained within census blocks and road segments, wireless availability is contained as polygons of coverage areas, and middle-mile connections and Community Anchor Institutions are contained as point data. All speed data is contained at the census block, road segment, or wireless polygon level of availability. All efforts have been made to comply with formatting, domain, and metadata requirements to include as much information as possible.

Connected Nation has continued outreach to satellite providers on their availability, technology, and speed information, but granular coverage is not yet available. Submitted within the wireless feature class are the satellite companies providing service to Nevada as a polygon of the state boundary. Efforts will continue to collect, process, or otherwise create more granular satellite data based on availability analyses and guidance received from NTIA. Process development is underway at CN as well to be able to create more granular satellite coverage based on satellite equipment positioning and geographic inputs.

Datasets for In-Kind Match

Connect Nevada received an in-kind match contribution to assist with SBI mapping goals which has been beneficial to the program in the following ways:

As part of an in-kind contribution, Connect Nevada received a dataset from the Lyon County School District containing Lyon County student records. This dataset provides statistics illustrating the number of parents who have checked on their child's progress via an online system set-up and maintained by the school. - $100.

Connect Nevada received a dataset from the state containing total population for counties, cities, and towns as part of an in-kind contribution that will be utilized by the project to assist with its mapping and planning goals. - $10,592.

Connect Nevada received a dataset from the state, containing age, sex, race, and Hispanic origin estimates and projections for 2010-2030 as part of an in-kind match contribution to assist the project with its mapping and planning goals. - $29,332.

Connect Nevada obtained a dataset containing Nevada healthcare Community Anchor Institution (CAI) data. Since the dataset was developed using federal funds, it was not valued nor was it counted as match toward the program.

As part of an in-kind contribution from the Nevada Department of Transportation, Connect Nevada received a dataset containing 2011 road segments. This was instrumental in processing the 2010 Census road data. Since the dataset was developed using federal funds, it was not valued nor was it counted as match toward the program.

As part of an in-kind contribution from the Nevada Department of Taxation, Connect Nevada received a dataset that contained all registered business locations with a sales or use tax account in the state. Connect Nevada used this dataset to create an in-depth analysis of business locations by sector and by rural/non-rural counties. This dataset will continue to be used to inform future Connect Nevada surveys and research reports. - $125,339.

NEVADA FIELD VALIDATION METHODOLOGY

CN focused a portion of its time on specific validation processes such as:

- conducting random spectrum analysis studies throughout the state using an Avcom PSA-37-XP spectrum analyzer;
- conducting mobile speed tests throughout the state using an iPhone, Android (or other smart phone) as well as provider-specific aircards (Sprint 3G/4G, Clearwire et al);
- identifying pre-selected, provider-submitted wireless transmit tower sites and cross-referencing data about that tower against the Federal Communications Commission (FCC) databases such as Antenna Structure Registration and/or the Universal Licensing System;
- cross-referencing Federal Registration Number data against available FCC Form 477 data as well as the FCC **CO**mmission **RE**gistration **S**ystem (CORES);
- validating provider submitted data (for example: latitude/longitude) using a handheld Garmin eTrex Summit GPS unit or GPS enabled software such as Microsoft Streets and Trips;
- locating physical wire-line attributes (such as Central Offices, Remote Terminals, CATV plant, etc.) and comparing them against provider submitted data; and
- conducting on-net and off-net speed tests using the FCC portal at http://www.broadband.gov/qualitytest/about/ or using the Ookla Net Metrics enabled speed test utility located on each of CN's program specific websites.

Additionally, CN cross-referenced numerous public documents in order to ensure that all known broadband providers were located and contacted. This included searching membership logs from trade associations (WISPA, WCAI, PCIA, etc.), the Cable Television Fact Book, Public Utility Commission records, Public Service Commission records, Chamber of Commerce, etc.

To date, Connected Nation's staff conducted on-site validation tests in Nevada on the following providers: Above All Communications (d.b.a. Express Internet); Air-Internet, Inc.; Arizona Nevada Tower Corporation; AT&T Inc.; Avant Wireless LLC; Baja Broadband LLC; Beehive Telephone Company Inc.; CalNeva Broadband LLC; CC Communications; CenturyLink; Charter Communications; Citizens Telecommunications Company of Nevada (d.b.a. Frontier Communications of Nevada); Clearwire Corporation; Cox Communications; ETAN Industries (d.b.a. Clark Cablevision and CMA Cablevision); EZZnet, Inc.; Great Basin Internet Services; High Desert Internet Services; Highlands Wireless Inc.; Hot Spot Broadband Inc.; InfoWest (d.b.a. A & J Hardy Enterprises, Inc.; Comnett Computer Services, and Peak Internet Services); JAB Wireless (formerly d.b.a. KeyOn Wireless and Wells Rural Electric Telephone); Las Vegas Net; Leap Wireless (d.b.a. Cricket License Company LLC); Lincoln County Telephone; Moapa Valley Telephone Company; Mt. Wheeler Power; Oasis Online Inc.; Performance Computing Internet; Reliance Connects (d.b.a. Rio Virgin Telephone & Cablevision); Robinson Communication Corporation (d.b.a. Oregon-Idaho Utilities, Inc. and Humboldt Telephone Company); Schatnet Internet LLC; Sprint Nextel; TelePacific Communications (d.b.a. Nextweb and Covad); T-Mobile USA Inc.; Vegas Wi-Fi Communications LLC; Verizon Wireless; WENR Corporation (f.k.a. Satview Broadband, Ltd.); and Yonder Media.

In addition to the field verification tests that have been conducted, Connect Nevada has also conducted work in the field to collect information for the non-participating provider, Avant Wireless, which, by nature of the methodology required for this collection, is also included in the above list.

From program initiation through this reporting period, CN has completed in-the-field validation testing against 39 companies (out of a universe of 56 viable providers) totaling 69.64 percent within the state of Nevada. This percentage also considers the non-participating provider (NPP) records submitted to NTIA as may be contained herein (see "Data Submission and Coverage Estimation of Non-Participating Provider" below).

CN has also continued to review provider datasets for accurate speed information, platform listings, and other intricacies that may fall outside of the standard SBI Data Transfer Model parameters, as published on the NTIA Grantee Workspace on August 9, 2012. Any providers whose submitted coverage and attributes are anticipated to come into question have been further reviewed and confirmed; details on a case-by-case basis are presented below.

AT&T Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 24 Mbps service; screenshot below.

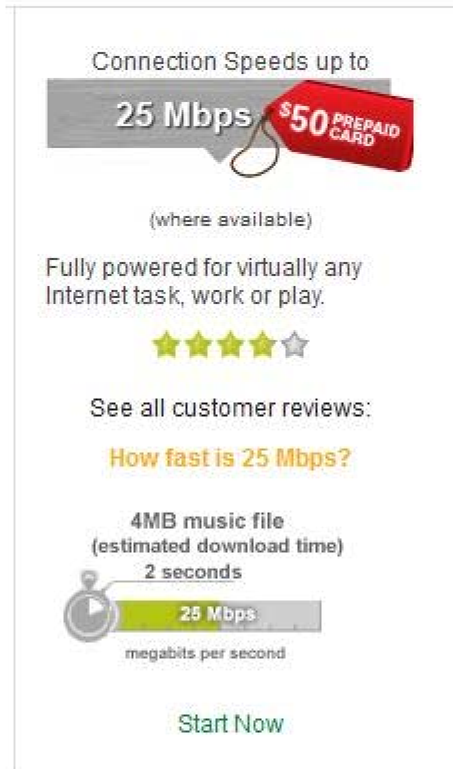
Compare Internet Packages

	Pro	Elite	Max	Max Plus	Max Turbo
Standard Monthly Rate	$38*	$43*	$48*	$53*	$63*
Downstream Speed	Up to 3 Mbps	Up to 6 Mbps	Up to 12 Mbps	Up to 18 Mbps	Up to 24 Mbps

AT&T Inc.
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider confirmed that tier 7 service is available.

CalNeva Broadband, LLC
Issue: Technology of transmission code 40 with maximum advertised download speed in tier 4, lower than expected value range for the technology.
Resolution: Provider representative confirmed that service area is DOCSIS 3.0, but lower speeds are still in use.

CenturyLink
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 25 Mbps service; screenshot below.



Filer Mutual
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.

DSL - 12Mbps

The ultimate package built to meet the heaviest demands - this package is built for gaming, multiple Netflix streams or Netflix HD, a home office, and several device hookups. With all of this speed you will meet the needs of anything that comes your way! Along side this we'll be there every step of the way if you need support!

- Gaming
- Netflix HD
- Streaming Media
- Home Office
- Multiple Devices

$79.95

Great Basin Internet Services
Issue: Fixed wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.

STARTER	1 x 1 (down vs. up mbps speed)	$24.95 (monthly)
	2 x 1 (down vs. up mbps speed)	$29.95 (monthly)
	4 x 2 (down vs. up mbps speed)	$39.95 (monthly)
	8 x 2 (down vs. up mbps speed)	$49.95 (monthly)
	12 x 3 (down vs. up mbps speed)	$69.95 (monthly)

Hot Spot Broadband
Issue: Fixed wireless platform with maximum advertised download speed in tiers 7 and 10, higher than expected value range for the technology.
Resolution: Provider confirmed that most areas have up to 20 Mbps download and upload service and some areas in Reno and Sparks have 100 Mbps download and upload service.

Lincoln Communications, Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider representative confirmed that tier 7 service is indeed available.

MegaPath
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 20 Mbps service; screenshot below.

> DSL service provides download speeds up to 20 Mbps over a nationwide, multi-redundant private network that optimizes performance and security. DSL is an ideal broadband solution for small and medium-sized businesses that download large files or use the Internet extensively.

Moapa Valley Telephone
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 15 Mbps service; screenshot below.

Bundle	Description	Pricing
1	6 Mb Internet	$59.95
2	10 Mb Internet	$69.95
3	15 Mb Internet	$79.95

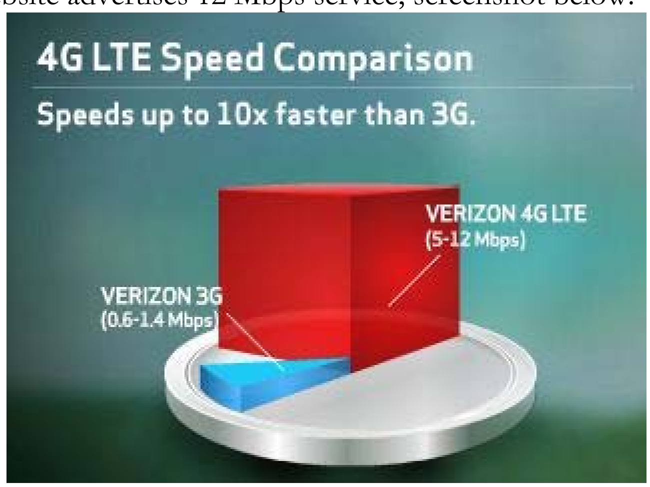
Rio Virgin Telephone
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.

Nevada	ADSL				
Introductory DSL Pricing	3.0Mb down/1.0Mb up	6.0Mb down/1.0Mb up	9.0Mb down/1.0Mb up	12.0Mb down/1.0Mb up	768Kb down/768Kb up
Total DSL/Internet Recurring Charge	$34.95	$39.95	$47.95	$54.95	$24.95
*DSL Activation Service Order Charge	**$185.00**	$185.00	$185.00	$185.00	$185.00

T-Mobile USA, Inc.
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises download speed greater than tier 6; screenshot below.

> T-Mobile customers with 4G phones are already experiencing data speeds that are comparable to or faster than the speed of a home broadband network. And with recent improvements to our 4G network-doubling our theoretical download speeds-we're giving our customers enhanced 4G data speeds. We've seen average download speeds on our HSPA+ 42 Mbps-capable data stick approaching 10 Mbps with peak speeds of 27 Mbps, and download speeds approaching 8 Mbps with peak speeds of 20 Mbps on our upcoming HSPA+ 42 Mbps-capable smartphones.

Verizon
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.



Data Submission and Coverage Estimation of Non-Participating Provider

As part of its ongoing broadband mapping efforts, CN has developed a series of processes with the goal of submitting coverage estimation mapping data to NTIA for every known and qualifying last-mile broadband provider, regardless of platform type (cable modem, DSL, fixed wireless, etc.). This state specific collection of coverage estimation methodology papers (see Appendix A) demonstrates the estimated broadband service territory for the providers in this state that have either been non-responsive or that have refused to participate in the SBI mapping initiative.

Accuracy and Verification: Provider Validation Methodology

Broadband providers maintain their service area data in many different formats, all in varying levels of complexity and granularity. In order to ensure that the data required by the NTIA is standardized across all providers and that it is as accurate as possible, CN translates and formats the data that providers are able to supply into a GIS shapefile and produces maps for the provider to review. The resulting map(s) and review process allow for providers to see their service area in a geographic format – for some providers, this is the first time they have seen maps of their broadband service area. Having the mapped service area allows providers to quickly identify any issues that appear in the data representation, whether the issue is in the data translation into a GIS format or from the original data collection and submission. Often data is provided from various sources and through the review and revision process, local engineers who operate the networks and work in the field are able to ensure that the tabular data that has been submitted is accurate and represents the real-world network extent. Any issues in how the service area is represented on the map(s) are remedied by CN, whether they are additions, removal of service, or any other revisions. Revised maps of service area representations are sent to the provider for review and approval; CN will revise data and return maps as many times as necessary until the provider is in agreement that the map represents their service area as accurately as possible. Once the review process has been completed and final approval of the data is provided, the data is deemed ready for NTIA submission.

Once the data collection has been aggregated at a statewide level, static maps of statewide and county-level availability are produced and made publicly available. In addition, consumers can visit the interactive online tool, My ConnectView, to create customized views of broadband service areas and analyze corresponding demographic information. Leveraging broadband service data on various platforms allows for public users, providers, and other stakeholders to review, scrutinize, and provide feedback on the represented data. This feedback becomes a validation method in itself as consumers submit inquiries to CN either affirming where service is not available or identifying areas where broadband service is shown on the map, but in actuality is not available. This allows for a follow-up to providers regarding revisions to the data as it is represented; it also allows for CN to identify locations where on-site visits may be necessary to complete field validation of available services. Public feedback on all forms of mapping products serves as a localized validation method for provider-supplied information and allows CN to resolve inaccuracies as they are identified to ensure that only the highest quality information is provided to stakeholders.

Additionally, non-participating provider narratives that were submitted in previous mapping cycles are subjected to the same level of scrutiny. Occasionally, a provider may elect to voluntarily participate (thus eliminating the need for future data estimation activities in the field). However, more often than not, the NPP narrative is updated with a combination of data gleaned from the provider's website, data obtained through FCC research and/or data collected/verified in the field by a CN staff engineer.

Estimates derived from provider-validated data indicate that approximately 0.93 percent of Nevada households do not have terrestrial fixed broadband service available, and approximately 0.36 percent of Nevada households have neither mobile nor fixed broadband service available.

Within rural areas of the state, results derived from provider-validated data indicate that approximately 3.53 percent of rural Nevada households do not have terrestrial fixed broadband service available, and approximately 0.87 percent of rural Nevada households have neither mobile nor fixed broadband service available. Please note that the availability estimates presented are based on Census 2010 household information.

The estimates above, in accordance with NTIA's definition of available broadband service as specified in the SBI NOFA, include broadband service with download speeds of at least 768 Kbps and upload speeds greater than 200 Kbps.

In addition, due to the nature of the SBI data collection methodology as defined by the NTIA and based on both census block geographic units and street segment data, the estimates of broadband availability derived from provider-validated data may include an overstatement of the actual number of households with broadband availability. Under the census block-based data collection method, a provider will typically report broadband availability for an entire census block whether its network is present across the whole or only a subset of that census block. This potential overestimation at the census block level can be amplified as the data is aggregated across the entire state.

WIRELESS METHODOLOGY

Broadband Service Availability in Provider's Service Area
Wireless Services Not Provided to a Specific Address

Data solicited from a fixed wireless provider to create propagation models include, but are not limited to:

1. The name of the structure.
2. Whether the transmitting device is operational or proposed.
3. The maximum advertised downstream speed, the maximum advertised upstream speed.
4. The typical downstream speed, the typical upstream speed (peak periods for both).
5. The frequency range of spectrum being used (as prescribed by NTIA). This may include (but is not limited to) spectrum authorizations identified within the Federal Communications Commission (FCC) Universal Licensing System (ULS) database or located on the FCC's Spectrum Dashboard. This research often proves to be exceptionally effective when estimating the coverage area of an NPP.
6. The primary population center(s) being served (for geopolitical boundary reference).
7. The physical address of the transmit site (in the event latitude/longitude is unavailable from the provider this allows a quick reference point for geocoding).
8. Latitude in either Degrees, Minutes, and Seconds and/or in Decimal Degrees (typically received as NAD 27 or NAD 83).
9. Longitude in either Degrees, Minutes and Seconds and/or in Decimal Degrees (typically received as NAD 27 or NAD 83).

10. Antenna pattern (e.g. omni-directional, 180°, 120°, 90°, etc.).
11. Azimuth of antenna (e.g. 360° with magnetic declination if known).
12. Approximate transmit radius (in feet, miles, or kilometers).
13. Polarity of transmit antenna (Vertical or Horizontal).
14. Transmit antenna gain (in dBi).
15. Line loss (applicable only to providers using coax, heliax, waveguide or other forms of cabling – excludes power-over-Ethernet devices).
16. Mechanical and/or Electrical beam tilt (if applicable).
17. Equipment Manufacturer (allows easy cross-reference against manufacturer's specification sheet).
18. Power output of the transmitting device (if unknown, FCC standards or manufacturer specifications are applied).
19. AMSL at base of tower site.
20. Antenna centerline AGL (height of antenna above ground level measured at the centerline of the actual antenna).
21. Foliage factors (Evergreens/Deciduous and percent of ground cover).
22. Ground Clutter (primarily used in rural areas to account for foliage and in metropolitan areas to account for types and heights of buildings if known).
23. Average gain of receive antenna.
24. Receive antenna is estimated at height above average terrain (HAAT) of 6.2 meters/20 feet.
25. Federal Registration Numbers (if applicable) which may allow opportunities to cross-reference and/or obtain additional data from the FCC's ULS and the **CO**mmission **RE**gistration **S**ystem.

Propagation modeling combines scientific data and empirical mathematical formulation for the characterization of radio wave propagation as a function of frequency, distance, and other conditions. Propagation software(s) typically use the Irregular Terrain Model (also known as Longley-Rice) of radio propagation for frequencies between 20 MHz and 20 GHz. This model is based on electromagnetic theory and statistical analyses of the combination of terrain features and radio measurements, then predicting the median attenuation of a radio signal as a function of distance and the variability of the signal in time and in space. For metropolitan areas, the software can typically be adjusted to use the Okumura-Hata model which accounts for predicting the behavior of cellular transmissions in areas where buildings are the primary obstructions. The resulting product from either model depicts a graphical illustration of the theoretical propagation characteristics of a selected frequency range based on defined variables (receiver sensitivity of the home/mobile device, foliage factor, and digital elevation terrain input).

After converting propagation models into a geospatial format, additional processing is completed to remove the small pixels representing service present in the resulting dataset. These areas are initially created based on the parameters entered in the software from the provider equipment information, the underlying data parameters of elevation, hillshade, etc., and the limitations of the software itself to display a broadband service area as accurately as possible. Generally, these random pixel striations appear as a result of signal levels reaching the highest elevated points within the prescribed radius. Typically, while this pixilation anomaly shows legitimate areas where signals can be received, these highly elevated points may have exceedingly sparse populations or are entirely void of population. As a result, and congruent to the *Wireless Technology Methodologies and Business Logic* white paper submitted to NTIA on January 20, 2011, all independent pixels representing service that are less than 0.125 square miles in area have been removed from the geospatial representation of each wireless provider.

BROADBAND INQUIRIES METHODOLOGY

CN collects consumer feedback in the form of broadband inquiries (BBIs). These inquiries represent any type of communication received from the public regarding broadband service. Once BBIs are received across the state, this information is overlaid with the broadband availability information which was collected through the SBI program. This allows for a real-world comparison of the broadband landscape to the information received from broadband inquiries. Consumers submitting these inbound comments and/or inquiries are able to provide information regarding five categories: 1) residents who do not have broadband but want it; 2) residents who have broadband but want a different provider; 3) residents who do not have broadband, but the broadband inventory maps indicate that they do; 4) residents who have broadband but want a faster connection speed; and 5) residents who have broadband but want a less expensive service option.

BBIs are submitted frequently by consumers via the Connect Nevada website. Inquiries often seek help to identify local broadband provider options, or to learn when a specific provider may be able to provide service to that consumer. Consumer comments also provide information which may help modify maps with actual service area information. The primary objectives of CN regarding these inquiries are 1) to improve the accuracy of the state maps with submitted consumer information and follow-up field research; 2) to provide broadband options to consumers through cooperation with mapped providers and by facilitating new broadband service options; and 3) to map and analyze information from consumers about areas of unmet broadband demand and alternatives to currently mapped services. A prime example of the second option is the utilization of the Rural Utility Service satellite eligibility tool. By simply entering the consumer's address, the CN engineer can quickly determine if the consumer meets the initial qualification status for BIP satellite subsidies.

New BBIs are assigned to either the GIS department or the Engineering & Technical Services (ETS) team depending on the category entered by the consumer on the website submission form. The GIS or ETS team members respond to each inquiry according to the information requested by the consumer. Many BBIs can be resolved through desktop research; however, if a BBI requires research in the field, the assigned ETS team member conducts such research when performing field validations in the area of the inquiry, or at other such time as is practical and appropriate. GIS and

ETS team members respond to and conclude BBIs via telephone contact and/or e-mail communication.

The broadband inquiry process has been implemented in each of the CN state programs with successful results. Altogether CN has received over 18,600 broadband inquiries since 2007, allowing the state programs to evaluate each inquiry for broadband demand and data verification. These inquiries are continuously examined against current broadband availability, updated every six months, to determine if previously unserved households have been expanded to and can now receive broadband at their residence. This database of broadband inquiries has also allowed the CN state programs to aggregate demand in concentrated areas to show providers the exact locations where the population has made it clear that they would purchase broadband if it was made available to them. Providers in the states have responded to this process and have expanded to areas knowing that their investment will be worthwhile. Data verification methods have also proven successful, as the state programs have been able to show those inquiries that indicate the broadband service areas are misrepresented on the map to providers, who then verify where service cannot reach in regard to that residence(s). The broadband coverage in these states has been altered to create a more accurate map based on the inquiries submitted by the public.

During this reporting period, the Connect Nevada project has received a total of 4 inquiries (44 grant inception to date). As more inquiries are submitted to Connect Nevada, a more thorough validation of the broadband landscape can be performed, while also allowing providers to see which areas have a high demand for broadband adoption.

My ConnectView Methodology

My ConnectView is an online, interactive mapping tool for viewing, analyzing, and validating broadband data. Developed using Esri's ArcGIS for Server and Adobe's Flex Framework and hosted and maintained by Connected Nation, My ConnectView is a multi-functional, user-friendly way for local leaders, policymakers, consumers, and technology providers to devise a plan for the expansion and adoption of broadband.

First and foremost, My ConnectView allows consumers to locate their residence and identify providers that offer broadband Internet service to that location. The interactive platform allows for users to build and evaluate broadband expansion scenarios using a wealth of data, including several coverage analysis layers, speed analyses, Community Anchor Institutions, and tools to search and export household demographic information, as well as extract data in GIS, spreadsheet, and/or PDF formats.

My ConnectView also features more interactive data layers and additional tools than ever before to allow the consumer to explore the broadband data. My ConnectView provides consumers with the ability to print, e-mail, and provide feedback on the broadband data displayed on the interactive map. Through the collection of this feedback, a visual demand for broadband is presented. This visualization allows the CN state programs the ability to validate the broadband availability for accuracy. If residents within a region state they are without broadband, but the interactive map shows otherwise, this allows CN to approach the providers within that area in an effort to trim down their coverage to more accurately represent real-world availability on the ground.

The Connect Nevada project launched My ConnectView on April 2, 2012, and has received 692 visits this reporting period; to date the interactive mapping applications have received 2,744 visits.

Speed Test Methodology

The 265 speed tests that are represented in the Connect Nevada Speed Test Report during this reporting period (1,210 grant inception to date) are the result of a partnership between CN and Ookla Net Metrics. Utilizing this relationship increases the level of confidence in the data being collected and provides for a far greater sample size than could be collected by a single testing site.

Ookla owns and operates Speedtest.net, as well as develops and deploys speed tests, such as the Connect Nevada speed test website, for partners around the world. This network of sites that is developed and run on its testing technology provides Ookla with a vast dataset that, due to the variability of geographic information collected across the varying speed test sites, is geocoded utilizing Geo-IP technology. This technology allows for tests to be geocoded to points of aggregation, typically larger nodes across provider networks. While there are hundreds of thousands of tests that have been conducted, the level of aggregation is only sufficient for county-level detail due to the test results being located at these larger nodes and not at an absolute location for each speed test.

In an effort to validate broadband data from the Connect Nevada project, speed test information is collected throughout the state. Speed tests provide speed information on the path taken through all networks (a provider's network as well as additional networks) a local machine must connect to in order to reach the host test. The benefit of this collection of speed information is two-tiered. First, it allows for a comprehensive dataset of speeds, while also providing Connect Nevada with the information on where broadband services are available. Second, unlike theoretical speed information which was received through the data collection process, the use of speed tests provide real-world information on the speeds that currently exist within the state of Nevada.

Providers Deemed Non-Viable

The following list of companies represents the remainder of the broadband provider universe that was originally identified as complete for outreach to begin for the State Broadband Initiative. These providers are not included in the Data Package for the October 2012 submission because they have been deemed non-eligible under the parameters and guidance of the SBI grant program. This list of companies includes, but is not limited to: providers offering service but below the current definition of broadband, those that have gone out of business, technology consulting firms, infrastructure or network construction companies, non-facilities based general resellers, etc.

	Company Name	URL	Comments
1	21Globe, Inc.	www.21globe.com/is/access/	General Reseller of DSL and backhaul.
2	360networks	http://www.360networks.com/	Acquired by another company.
3	650Net	www.650net.net/	Dial-up only except CA DSL Reseller.
4	A & J Hardy Enterprises, Inc.	http://comnett.net	Acquired by InfoWest.
5	A 007 Access	www.a007.com/	D.B.A. of Cyberonic Communications Inc. reselling DSL and mobile wireless; general reseller of Quest DSL and mobile wireless; DSL does not qualify as the max advertised speed is 768 kbps x 128 kbps.
6	A-1 Vegas.com	www.zekes.com	d.b.a. Zeke's Internet Service resells Qwest DSL.
7	AAA Internet Service	n/a	No longer in business.
8	Aaccess Network Communications	www.aaccess.net/	Not a broadband provider; provides services for business IT, home computer, web design.
9	Access123.net	n/a	No longer in business.
10	ACERX.NET	www.acerx.net/	General reseller of cable, DSL, and satellite broadband access.
11	ACI, Inc.	http://www.aci.net	Reseller; unresponsive to multiple attempts to gather data.
12	ACS Wireless	n/a	No longer in business.
13	Advanced Communications Integration	http://www.aci.net/	Company is currently not a viable provider.
14	Airewaves Broadband, LLC	n/a	No longer in business.
15	Airmail247.com	www.airmail247.com/	Business mailing list search site; not an ISP.

16	American Wireless Networks, Inc.	n/a	American Wireless does not provide broadband access in Nevada. The company is out of business.
17	Amigo.Net	www.amigo.net/cms/	Qwest reseller in Alamosa, CO offering fixed wireless in CO and NM.
18	Antioch Wireless Broadband	n/a	Resells DSL and cellular service in Antioch, IL only.
19	Arrowheadnet.com	www.arrowheadnet.com/	Domain registration and web-hosting company.
20	ATEK Communications	www.atekcommunications.com	Not an ISP; ATEK is a national data contractor specializing in structured data cabling and fiber optic distribution designs and installations.
21	bargainisp.net	www.bargainisp.net/	Generic web directory site; company does not offer broadband.
22	Big Kahuna Network	n/a	No longer in business.
23	Broadband National	www.broadbandnational.com	Nonfacilities-based general reseller of DSL and satellite for 36 companies (e.g. ACC Business, HughesNet, et al.).
24	CAC MediaNet, Inc.	www.cac.net/	DSL reseller; d.b.a. First Step
25	California Broadband Cooperative, Inc.	www2.ntia.doc.gov/grantee/california-broadband-cooperative-inc	$81 million BIP/BTOP grant to construct 10 Gbps middle mile fiber network that would mainly follow U.S. Route 395 from Carson City to Topaz Lake; project 5% done as of 8/11 report.
26	Camino-Net Internet Services	www.camino-net.com	Reseller; no longer in business; was dial-up only.
27	CCIS.net	www.ccis.net	Verizon reseller in DE and NJ.
28	Celito Communications	www.celito.net/	Raleigh, NC company supplying tech services to businesses (networks, VoIP, and broadband access) in North Carolina.
29	Cheetah Wireless Technologies, Inc.	www.cwti.us/cheeweb/homepage/	LV.Net has assumed CWTI's assets and is operating its networks.

30	Cleartouch.Com	www.cleartouch.com/	Reseller of DSL and cable and mobile wireless broadband for various national providers.
31	Clover Cable	n/a	Not an ISP; cable television line construction in Las Vegas, NV.
32	Colorado River Internet	n/a	No longer in business.
33	Comtech Communications Systems	www.comtechlv.com	Not an ISP; business telephone systems.
34	Connecting America	www.coam.net/	Dial-up ISP.
35	Corridor Communications	www.corridorcomms.ca	URL redirects to http://www.cciwireless.ca/, CCI Wireless, a Canadian company providing broadband access to Alberta.
36	Cyberonic Internet Communications, Inc.	http://www.cyberonic.com/	Reseller; A 007 Access (above) is d.b.a. of Cyberonic.
37	Deltaforce	www.deltaforce.net	Dial-up provider located in Raleigh, NC.
38	deluxehost.com	www.deluxe-host.com	Offers web hosting only.
39	DGUI	www.dgui.com/	No longer in business; domain name for sale.
40	Dial National	www.dialnational.com/	Inactive URL; out of business.
41	Dialer.net	www.dialer.net/internet_access/United_States.html	International reseller of dial-up and 3G wireless reseller.
42	DSL @ Interlync	www.interlync.com	Reseller of business DSL, T-1 and wireless.
43	DTS-NET.COM	www.dts-net.com/	Reseller; provides wholesale and retail telecommunications services.
44	Elko Broadband	n/a	No URL found; no info.
45	estream Wireless	www.estreamwireless.net/	Reseller; no longer in business.
46	ETI LLC	www.cyberenet.net/	General reseller of DSL services from infrastructure owned by Verizon, AT&T, and Covad.

47	Exwire	www.exwire.com/	Wi-Fi hotspot network where Exwire customers can easily access the Internet at several cafes, ski resorts, and other convenient public locations throughout Truckee and Lake Tahoe with Wi-Fi enabled devices.
48	Fast Dependable Access	www.fda.net/	No longer in business.
49	Go Mango Technologies	n/a	Can find no evidence that Go Mango is a company providing broadband in Nevada.
50	Hubwest Protected Networks LLC	www.hubwest.com	Dial-up and web hosting only; not a WISP; merged with Southwest Cyberport.
51	Imbris, Inc.	www.imbris.com	Broadband referral site.
52	IMGISP.NET	www.imgisp.net/	Broadband referral site.
53	In the Air Data	n/a	No URL found; no info.
54	Incredible Networks	n/a	No URL found; no info.
55	Inercom Communications Inc.	www.inercom.com	No longer in business.
56	Integra Telecom	http://www.integratelecom.com	Facilities-based B2B provider of communication and networking services in the western United States.
57	Interactiveinfo.com Inc.	www.rocketbroadband.com	Redirects to drumbeatnetworks.com, a Buffalo, NY company designing, developing, and managing the network infrastructure; offers cable television services in NY only.
58	iRadical	n/a	No URL found.
59	Ironwood Communications	www.ironwoodcommunications.com	Direct TV.
60	ISPartner.net	n/a	No URL found.
61	Jenco Speed Web	www.jencospeed.net	Ohio WISP only.
62	Jetstream Wireless	n/a	No URL found.
63	LANwaves	n/a	No longer in business.
64	LARIAT.NET	www.lariat.net/	WISP in Wyoming only.

65	LCSisp.com	www.lcsisp.com/index.cfm	National dial-up only.
66	Light Link Broadband	www.light-link.net/	Redirects to www.digis.net, a provider of fixed wireless broadband internet in Utah.
67	Lightyear Network Solutions, LLC	www.lightyear.net/	Telecommunications network company.
68	LinkAmerica.Net	www.linkamerica.net/	Shopping site.
69	MainBoard	www.mainboard.cc/internet.htm	VA-based computer store; general reseller; not a WISP
70	Maine Cable and Wireless	www.mainecableandwireless.com	Broadband referral site
71	Marcin Company	n/a	No URL found; no info
72	Millenicom Inc.	www.millenicom.com/internet_access.html	Resells mobile wireless on Sprint network EVDO cards.
73	Nanomega.Com	www.nanomega.com	Redirects to GoDaddy; out of business.
74	Nanosecond, Inc.	www.nanosecond.com	Provides computer repair, website design, website hosting, SEO, e-mail, and technology consulting.
75	Net Nevada	www.netnevada.net/	D.B.A. Intuitive Logic, providing IT management and consulting and solutions including colocation, remote network backup and monitoring, shared server hosting, and bandwidth aggregation
76	NetAccess, Inc.	www.nas.net/	Not a WISP; business portal site
77	Netriplex	www.netriplex.com/	Data center.
78	NetSpeed Online	www.netspeed-online.net	No URL found; no info.
79	NetVoice	www.netvoice.net/	VoIP search site.
80	Nevada Comstock Communications, LLC	nevadacomstock.com	Phone systems.
81	Nevada Hospital Association	www.nvha.net/	Not a broadband provider.
82	Nevada Telecommunications Association	www.nevtelassn.org	Not a broadband provider.
83	Nextlink Wireless, Inc.	www.nextlink.com	Acquired by XO Communications.

84	NextWeb, Inc.	n/a	Acquired by another company.
85	Northwest ISP	www.northwestisp.com/	No longer in business.
86	NuTel Broadband Corporation	www.nutelbroadband.com/	No evidence that this company offers broadband services in Nevada; it appears that this company was extremely vocal in 2006 then disappeared.
87	Overarch Broadband	www.overarch.com/	Broadband access in Idaho.
88	Pacific Internet Exchange	www.pie.us/, www.pacificinternetexchange.com	URLs not active; no longer in business.
89	Paknet Limited	www.ptcl.com.pk/pd_content.php?pd_id=279	Subsidiary of Pakistan Telephone Company; no USA services.
90	Planet Online	www.planetonline.net/	Offers website hosting services.
91	PremoWeb	www.premoweb.com/about_us/contact_us.html	URL inactive, out of business.
92	PrimeVision Communications, LLC	www.myprimevision.net	URL inactive, out of business.
93	Priority Wire & Cable	www.prioritywire.com	Not an ISP; priority wire and cable is a distributor of wire and cable serving electrical, utility, telecommunications, mining, and welding wholesale distributors.
94	Pyramid Lake Paiute Tribe	n/a	Not operational, BIP/BTOP funded project to deploy fiber-optic middle mile network across 742 square mile reservation.
95	Pyramid Net	http://www.pyramid.net/	Offers service, but below broadband threshold.
96	Rapid Cable	n/a	Rapid Cable was recently acquired by CalNeva Broadband in December 2008.
97	Renaissance Networks	www.renaissancenetworks.com/	IT support company based in New Mexico; not a WISP.
98	Sierra Internet Services, Corp.	http://www.sierranv.net/	Reseller of DSL services.
99	Silver State Internet	www.ssinternet.net	URL inactive; out of business.

100	Simply Dialup A Metrogeek Company	www.simplydialup.com/	Dial-up only; not a broadband supplier.
101	Sky Technologies, Inc.	www.skyforall.com	Dish network reseller.
102	SkyBridge Wireless	n/a	Not an ISP; renamed SkyBridge Technology Group; acquired aviation business.
103	Sling Broadband	www.slingbroadband.com/	Florida WISP.
104	SONNET Networking, LLC	www.sonnet.com/	California WISP.
105	Sparkplug Las Vegas, Inc.	www.airband.com/	Provides fixed wireless broadband to businesses.
106	Speakeasy, Inc.	www.speakeasy.net/	Business phone systems; not an ISP.
107	Spring Creek Wireless	www.springcreekwireless.com/index.htm	WiFi access for mobile home court in Spring Creek.
108	StarNetWX	www.starnetinc.com/	Dial-up and VoIP.
109	Surferz.Net	www.surferz.net/	Dial-up in upstate NY only; not a WISP.
110	Switch Communications Group LLC	www.switchnap.com/	Colocation; NOC services.
111	T1 Shopper	www.t1shopper.com/	Search engine for general reseller.
112	The-OnRamp.Net	www.the-onramp.net/	Access provider below NTIA definition.
113	Total Access Networks, Inc.	www.totalaccess.net	Fixed wireless provider in Elgin, TX.
114	TSISP.NET	www.tsisp.net	Shopping site.
115	U.S. TELEPACIFIC CORP	www.telepacific.com	Acquired by MegaPath.
116	UNEV Communications, Inc.	n/a	UNEV (Lovelock) does not offer Internet Access.
117	United Cable Management, Inc.	n/a	Out of business March 2011.
118	University Corporation for Advanced Internet Development	www2.ntia.doc.gov/grantee/university-corporation-for-advanced-internet-development	Currently ineligible under the parameters and guidance of the SBI grant program.

119	UNUM Telecommunications, Inc.	www.utinet.net/	URL inactive; out of business.
120	USA Airnet, Inc.	www.usaairnet.com	URL inactive; out of business.
121	Velocitus	www.velocitus.net	URL inactive; out of business.
122	Verde Communications	www.sparkplug.net/	Acquired by Sparkplug in July 2007.
123	Washoe Weblinks	www.washoeweblink.com	URL inactive; out of business.
124	Wireless Roanoke, Inc.	www.wirelessroanoke.com/	URL inactive; out of business.
125	Wireless TelCorp, Inc.	www.wirelesstelcorp.com/	Fixed wireless provider with offices in TX, NV, and NC.
126	Wireless Think Tank	www.wirelessthinktank.com/	URL inactive; out of business.
127	wisbin	www.wisbin.com/	Wisconsin ISP resells DSL.
128	WUE Inc.	www.lctsys.com/index.php?page=home	WUE provides mobile cellular and wireless services.
129	www.AmericanAngel.us	www.americanangel.us/	URL inactive; out of business.
130	YEYZOO.NET	www.yeyzoo.net/	URL inactive; out of business.
131	YLISP (Your Local ISP)	www.itsyournet.com	Provider inactive; no longer in business.
132	YourT1Wifi.com	www.yourt1wifi.com/	Providing service In Idaho, Washington, and Alaska.
133	ZOOM Internet Services, LLC	n/a	Acquired by another company.

Appendix A: Estimation of Non-Participating Provider: Avant Wireless, LLC

AVANT WIRELESS, LLC

As part of its ongoing broadband mapping efforts, Connected Nation has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying last-mile broadband provider, regardless of whether the provider has chosen to support and participate in the State Broadband Initiative (SBI) mapping program.

The following narrative provides detail regarding the recent data collection and coverage estimation activities related to Avant Wireless LLC (Avant), a wireless Internet service provider (WISP), located in Carson, Nevada with a service area around Reno, Washoe Valley, Spanish Springs, Palomino Valley, Pleasant Valley, and Stead Airport. The narrative will include information regarding how and where CN obtained publicly available data.

Background

Avant was initially contacted on February 11, 2010, and was less than courteous at the time. Although the provider representative voluntarily provided a contact e-mail address, the next telephonic contact attempt on February 25, 2012, ended abruptly when the provider hung-up the phone. On April 17, 2011, the provider responded to an e-mail effectively refusing to participate in the Connect Nevada and SBI project. This pattern was repeated on August 4, 2011, thus prompting CN to flag this provider for the development of a future coverage estimation document for submission to NTIA.

On December 8, 2011, a CN staff member completed desktop research and conducted on-the-ground site verification and data collection activities. Subsequently, on March 5, 2012, this data was used to create a wireless propagation model for submission during the April 2012 mapping submission to NTIA.

During this submission period, 2 additional contact attempts were made (July 11 and August 1, 2012) soliciting updated data and approval or rebuttal of the previously created coverage estimation document. On August 4, 2012, the provider responded by e-mail indicating that they continue to decline to participate.

The Issue

Despite 3 additional contact attempts with Avant, the provider has predicated its unwillingness to participate in the Nevada broadband mapping initiative.

CN has continued to closely monitor the provider's website to identify any changes in the coverage area or maximum advertised speeds but, as of this submission, has not located any new evidence of recent changes to either the coverage area or the maximum advertised speeds. To that end, CN is resubmitting this coverage estimation narrative, substantially in its original format, and will continue to monitor the provider's website as well as ensure ongoing outreach until either the expiration of the SBI grant or until such time as the provider voluntarily contributes data.

<u>Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing</u>

CN has built a file based on research information and, as time progressed, enriched the file with information obtained through the public domain and (as previously mentioned) through on-the-ground data extraction and site verification activities. For example, CN reviewed the provider's website (www.avantwireless.com) to determine the residential service plans **(Exhibit A)** and the service area **(Exhibit B)** of the provider's wireless network. A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) system for Avant Wireless LLC, Avant Wireless and Avant * (where * indicates wildcard search) yielded no FRN **(Exhibit C)**.

Exhibit A: Service Plans

<u>Typical Residential service is $45.95/month and $150 Installation fee</u>
<u>1 Install Rate</u>
Basic One-time Installation $150 standard $200-$400 for special/business installations, $300 typical • If customer purchases equipment (not recommended*) installation is free • If customer purchases equipment monthly, one time installation fee is $75 • Beyond Basic Installation contact us for details
<u>2 Equipment Purchase Price</u> (Not Recommended*)
• Radio, antenna, power supply and cable $249.99 + tax
<u>3 Equipment Lease Price</u>
• Radio, antenna, power supply and cable $17 + tax for 12 months
Choose Only One of the above 3 options
<u>Monthly Service Fees</u> (Residential) this is guaranteed rate, speed will typically be around Max speed.
128 kilobits/sec min rate - **7** megabits/sec Max • $45.95/month • $60/month Mt Rose area
2. 1 megabit/sec min rate - **10** megabits/sec Max • $60/month
*We do not recommend customer purchase or lease of equipment as the customer will not be covered for equipment failure after 3 months. The option is provided for customers who have special requirements for ownership of equipment on their property.

Exhibit B: Service Area as Presented on Provider's Website

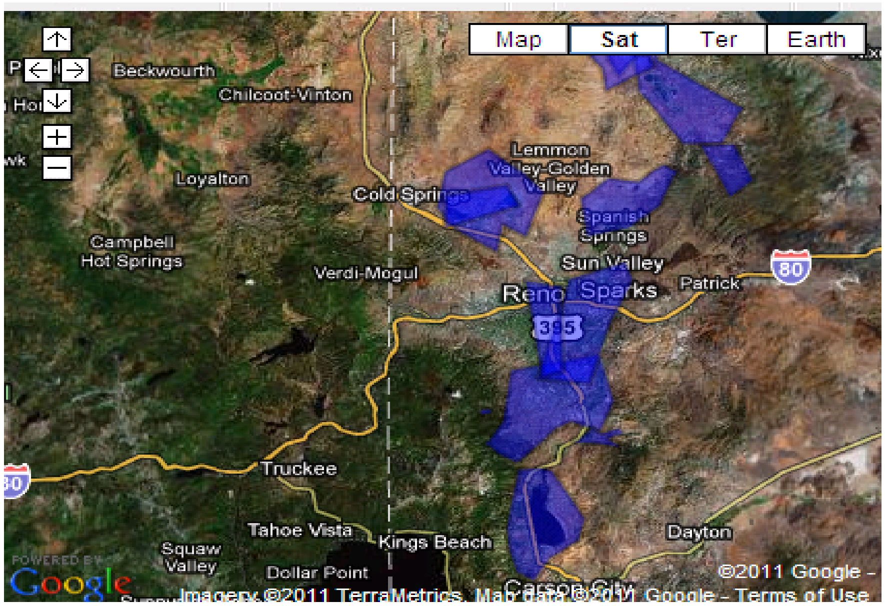


Exhibit C: Federal Registration Number Search Results

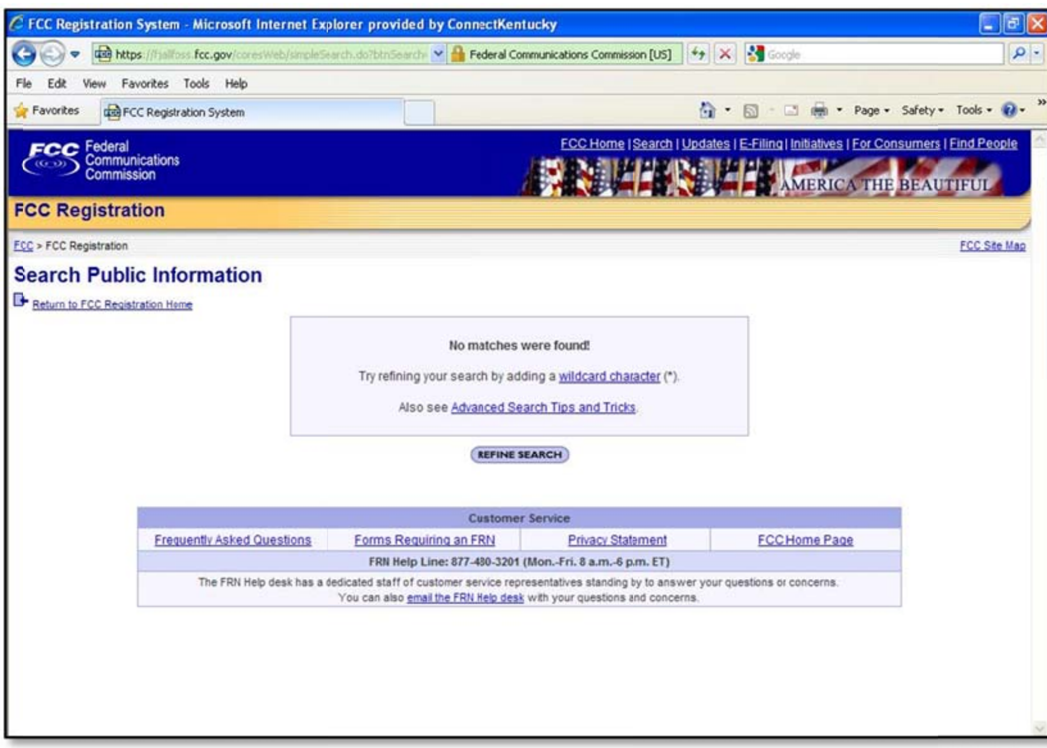

Preliminary Identification of Provider's Coverage Area

During the October 2011 mapping cycle, CN extracted the Avant service area polygons from the provider's website (Exhibit B) and submitted the polygons to NTIA. Information from that website was utilized to create a spectrum analysis testing route.

<u>Testing Techniques</u>

CN staff then developed a spectrum analysis data collection and site validation plan **(Exhibit D)**, based on information derived from Avant's coverage depiction from its website. Once in the field, the CN engineer measured signal strength at 33 different locations throughout South Reno, Washoe Valley, along Mt Rose Highway, parts of downtown Reno, Sparks, Spanish Springs, and Palomino Valley. The CN wireless engineer was equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900 MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands. Each validation point was scrutinized for frequency of operation to ascertain if multiple frequencies were being utilized by the provider. A screen image of the operating frequency (or frequencies) was captured and general notes were recorded for each location **(Exhibit E)**.

Exhibit D: Avant Spectrum Analysis Survey Locations

Exhibit E: Avant Field Verification Tests and Notes

Site #	Date	Provider	(N) Lat Decimal	(-)(W) Long Decimal	Peak Freq	Peak Sig Strength	Spectrum Analyzer	Time	Images

<u>Results and Submission for October 2012</u>
The publicly available data was transferred to the CN Provider Information file. A composite propagation study was completed **(Exhibit F)** based on the service area map polygons extracted from the provider's website and based on the field verification data established during the data collection exercise.

Count of Datasets by Status	**77**
Total Unique Providers Represented	**56**

Provider Name	Platform	Status	NDA Execution Date	Notes
Absolute Best Communications, LLC	Fixed Wireless	Data Added to Statewide Inventory		[AUG-27-12 Jess Cary] Correction: Initial submission of provider's coverage, but they were in service previously.
Air-Internet, Inc.	Fixed Wireless	Data Added to Statewide Inventory		[AUG-27-12 Jess Cary] Correction: Initial submission of provider's coverage, but they were in service previously.
Arizona Nevada Tower Corporation	Fixed Wireless	Data Added to Statewide Inventory	3/8/2010	[AUG-27-12 Jess Cary] Change: Provider added tower.
AT&T Inc.	DSL	Data Added to Statewide Inventory	12/16/2009	[AUG-27-12 Jess Cary] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
AT&T Inc.	Mobile Wireless	Data Added to Statewide Inventory	12/16/2009	[AUG-27-12 Jess Cary] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
CenturyLink	DSL	Data Added to Statewide Inventory	12/4/2009	[AUG-27-12 Jess Cary] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Charter Communications, Inc.	Cable	Data Added to Statewide Inventory	12/15/2009	[AUG-10-12 Jess Cary] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Citizens Telecommunications Company of Ne	DSL	Data Added to Statewide Inventory	1/22/2010	[AUG-12-12 Jess Cary] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; partially new dataset provided for October 2012 submission.
CoxCom, Inc.	Cable	Data Added to Statewide Inventory	2/3/2010	[AUG-27-12 Jess Cary]Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Great Basin Internet Services, Inc.	Fixed Wireless	Data Added to Statewide Inventory	4/6/2010	[AUG-27-12 Jess Cary] Change: Provider added additional tower.
Leap Wireless International, Inc.	Mobile Wireless	Data Added to Statewide Inventory	4/6/2010	[AUG-27-12 Jess Cary] Change: Provider expanded coverage area.
MegaPath Inc.	DSL	Data Added to Statewide Inventory	2/15/2010	[AUG-30-12 Jess Cary] Correction: Submitting data for the first time, but service was offered previously.
MetroPCS Wireless, Inc.	Mobile Wireless	Data Added to Statewide Inventory	2/10/2012	[AUG-27-12 Jess Cary] Change: Provider expanded coverage area.
Schatnet Internet LLC	Fixed Wireless	Data Added to Statewide Inventory		[AUG-27-12 Jess Cary] Change: Provider added additional tower.
Spacenet Inc.	Satellite	Data Added to Statewide Inventory		[SEP-6-12 Jess Cary] Correction: Initial submission of provider's coverage, but they were in service previously.
Sprint Nextel Corporation	Mobile Wireless	Data Added to Statewide Inventory	1/14/2010	[AUG-27-12 Jess Cary] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
T-Mobile USA, Inc.	Mobile Wireless	Data Added to Statewide Inventory	1/8/2010	[AUG-27-12 Jess Cary] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Vegas Wifi Communications LLC	Fixed Wireless	Data Added to Statewide Inventory	4/7/2010	[AUG-27-12 Jess Cary] Change/Correction: Provider added additional tower and decreased overall speed down to tier 5.
Verizon Communications, Inc.	Mobile Wireless	Data Added to Statewide Inventory	12/14/2009	[AUG-27-12 Jess Cary] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.

ViaSat, Inc.	Satellite	Data Added to Statewide Inventory	1/8/2010	[AUG-17-12 Jess Cary] Correction: Coverage area remained the same, but tier 5 download/3 upload was reduced while tier 4 download/2 upload was increased.
WaveDirect Telecommunications, LLC	Fixed Wireless	Data Added to Statewide Inventory		[AUG-20-12 Jess Cary] Correction: Initial coverage submission for provider that has previously been in service.
CoxCom, Inc.	Backhaul	Backhaul Provider Only Processing Complete	2/3/2010	
MegaPath Inc.	Backhaul	Backhaul Provider Only Processing Complete	2/15/2010	
Sprint Nextel Corporation	Backhaul	Backhaul Provider Only Processing Complete	1/14/2010	
T-Mobile USA, Inc.	Backhaul	Backhaul Provider Only Processing Complete	1/8/2010	
Hot Spot Broadband, Inc.	Fixed Wireless	Speed Only Update; Data Processing Complete		[AUG-27-12 Jess Cary] Change: Provider upgraded infrastructure and can now offer tier 9 download speeds and tier 8 upload speeds.

Mason Valley Quicknet, LLC	Fixed Wireless	Non-Responsive to Multiple Attempts		8 contact attempts were made this period between July 7, 2012 and August 14, 2012.

"White Paper" from *New York* describing Round 6 (Fall, 2012) Data Submission to the NTIA under the SBI

October 1, 2012

Executive Summary

The Broadband Mapping Team at the New York State Office of Cyber Security (OCS) is pleased to submit our Round 6 (Fall 2012) data for the State Broadband Initiative (SBI).

Our goals for Round 6 were to: 1) Gain new participants and maintain the very high level of participation from our current participants; 2) Add to and enhance our data verification methods and; 3) improve the completeness and quality of the data delivered. We believe we have met those goals.

We had 84 providers participate in the Spring 2012, Round 5 submission. That number has increased to 86 in Round 6. VSAT Systems LLC (dba Skycaster) and Stealth Communications were added this round. We still anticipate adding new participants in future rounds because we will be continuing dialog with some fixed wireless companies that we know about but have not yet begun participating; new start-ups are possible; and other regional or national providers new to NYS may be discovered.

Notable among the improvements made in data collection and verification this round is that:

- we realized the largest incremental increase in the amount of broadband service attributes we were able to collect from Community Anchor Institution;
- we noticed a significant increase in the quality of new and updated maximum advertised speed data we collected; and
- we implemented two new verification methods and are energized to continue to find innovative ways to validate and identify inconsistencies in provider reported availability data.

The remainder of this paper provides a summary of our data collection results and describes our methodology for performing data verification.

Provider Participation Summary Tables for Round 6:

0	**Potential Providers identified**
2	**Actual Providers identified**
86	**Total Participating Providers with data in the submission**
67	Wireline Providers
20	Wireless Providers (2 are both Wireless & Wireline)
1	Provider is middle-mile only
42	Providers submitted Middle Mile Data

Technology Type	Wireline Census Block Provider Count	Wireline Service Availability by Census Block	Wireline Street Segment Provider Count	Wireline Service Availability by Street Segment	Wireless Provider Count	Wireless Services by Shapefile	Middle Mile Provider Count	Middle Mile Points
Asymetric xDSL	38	300,214	34	25,063	0	0	26	1,497
Symetric xDSL	2	62,405	1	52	0	0	0	0
Other Copper Wireline	2	87,666	2	251	0	0	0	0
Cable Modem - DOCSIS 3.0	6	227,363	5	15,787	0	0	3	10
Cable Modem - Other	12	51,966	11	13,294	0	0	1	1
Optical Carrier/Fiber to the End User	24	128,338	18	2,447	0	0	8	674
Satellite	0	0	0	0	4	5	0	0
Terrestrial Fixed Wireless - Unlicensed	0	0	0	0	10	17	1	12
Terrestrial Fixed Wireless - Licensed	0	0	0	0	1	1	0	0
Terrestrial Mobile Wireless	0	0	0	0	6	17	2	15
Other (middle-mile only)	0	0	0	0	0	0	1	2

Verification List:

1. Automated verification
    a. Domain and topology rules in delivery geodatabase
    b. Submission scripts
    c. Feature dataset cross checks
2. Provider website research
3. Virtual Field Inspections (using Google Streetview)
4. Crowd-sourced data
    a. NYS Speed Test data points
    b. FCC Speed Test records
    c. NYS Broadband Map feedback
5. Use of government data sources
    a. DEC2011_AssessNY.gdb
    b. FCC Aggregated 477 Data
    c. NYS DMV data
    d. NYS Lottery terminal data

    e. NYS Streets and Address ranges
    f. NYS Address Points
    g. NYS Orthoimagery
    h. NYS Public Service Commission Cable Franchise Agreements data
6. Commercial data sources
    a. TomTom Data ILEC, CLEC and Rate Center Exchange Boundary data
    b. Online look up tools for middle mile & central office locations
    c. NAVTEQ address points
    d. Pictometry oblique aerial imagery/Google's Street View
    e. APNIC Whois database (publically available IP Address search engine)

7. Select Community Anchor Institution (CAI) locations
8. Provider verification maps
9. Clip wireless data to NTIA recommended NYS Boundary
10. Removal of 'uninhabited areas'
11. Other Grantee State Broadband Maps and National Broadband Map

Explanation of Verification Activities:

1. **Automated verification** was accomplished via the following methods:
    a. <u>Domain and topology rules in delivery geodatabase</u> automatically validate features and validate topology
    b. <u>Submission Scripts</u>: Repeatedly running the NTIA supplied Python script, the Massachusetts modified Python submission script and frequency statistics script, as well as a New York modified version of the NTIA submission script combining elements of the NTIA and Massachusetts scripts
    c. Feature dataset cross-checks: ESRI 'Frequency' tool used on Provider Name, DBA Name, FRN across feature datasets with cross comparisons to ensure consistency across all of these datasets

2. **Provider Website Research**: The team continues to use the providers' websites verify provider data submitted for the SBI mapping program. Data most frequently checked are maximum advertised speeds and whether the service offering is business or residential. That later classification is important to NY because our mapping team differentiates business only service on our state map and our Broadband Program Office has recently used that distinction in developing criteria for a capacity building grant.

3. **Virtual Field Inspections (using Google Streetview)**
Two members of the Broadband mapping Team were trained by members of our Public Utilities Commission staff on how to identify cable and fiber lines amongst the telephone and power lines on utility poles. There are certain distinctive wiring patterns and equipment boxes that identify where cable or fiber is present. After viewing representative schematics and photographs, the trainees spent time identify equipment and cables with Google Streetview. Afterwards, the PUC staff took the trainees into

the field to field verify the same equipment. This new knowledge and techniques were subsequently used to investigate areas where a provider's presence on a road was called into question via one of our other verification methods. This is a time intensive verification method but was found to be very effective when field verification was deemed to be the only other way to investigate a discrepancy.

4. **Crowd-sourced data**

   a. NYS Speed Test data points and attributes were used to verify provider reported availability. The NYS speed test website includes a data collection form which requests:

      i. Street address at which the test was taken
      ii. Service provider
      iii. Service technology

   After satellite provider records and sub-broadband speed records were removed, 6,822 records were successfully geocoded and used for verification. Four levels of verification were established for points that fell within areas of reported service availability. They are:

   Code 1 = Provider and technology matched
   Code 2 = Provider matched and technology unknown
   Code 3 = Provider matched but technology is mismatched
   Code 5 = Provider and technology unknown but Broadband is available at the location

   Each census block and street segment availability record involved with this verification activity was assigned one of the above codes.

   b. FCC speed test records were used to verify provider reported availability. FCC speed test records lack provider information but we were able to successfully establish the provider via a publically available IP Address search engine (the APNIC Whois Database). Those records were then used to verify provider reported availability in the same manner as was used with the NYS speed test points. Because the technology was not known, the highest verification code assigned was 2 (Provider Matched and Technology = 'Unknown'). Here is a statistical summary.

	Number	Percentage
Total Number of FCC Wireline Speed Test Points	69,922	N/A
Total Number / Percentage Successfully Geo-coded	39,946 / 69,922	57%
Total Number / Percentage Successfully IP Searched	21,766 / 39,946	54%

   c. NYS Broadband Map feedback:

   Our NYS Broadband map has been a tremendous asset for our program by engaging the public to communicate their personal knowledge and experiences of their local broadband scene. On February 15, 2012, our state mapping website was updated with more methods to gather public feedback. These included three new prominent buttons on the front page, including the *Report an Unserved Address* button. This function gathers the user's address and places a dot on the map at their location—and it is viewable in our "Public Feedback" layer. A red dot corresponds with an unserved wireline report, and a yellow dot corresponds with an unserved wireless report. Along with this new functionality, the public was given an additional chance to leave comments for the broadband team, as well as contact information so they can be responded to with a personal e-mail or phone call. During Round 6, investigative efforts to identifying and removing suspect census blocks and street segments continued. Using public feedback and the providers' own websites ("availability checkers"), specific census blocks were targeted and researched. If the Provider's availability checker corroborated an unserved wireline report, and additional checks done on a representative sample of address points within that same census block also indicated the block was unserved (by that provider), the block was removed from that provider's availability coverage. This specific type of verification and editing can only be done for providers who have a publically accessible availability checkers. Many providers do not have availability checkers on their websites. And for the ones that do have checkers, several have now added functionality to blocks users (IP addresses) who cross some threshold of checks in a single day or some other time period. This caused us to now use these checkers strategically, with less frequency.

Although our user enhancements for gathering public feedback made the process of reporting in easier for the general public, the volume of feedback initially did not edge upward that significantly. But, an August 14th broadband summit organized by a local county's department of economic development and the broadband-minded US Congressman from the region proved to be an impetus to triggering a burst of reports. A few newspaper articles after the broadband meeting instructing people to use the State broadband map also helped keep the public feedback continuing to flow. Lately, a sparsely populated town in the Catskills Mountains has been determined on making their broadband-challenged situation known on our public map. While about 22 response-necessary public e-mails were fielded from July 1st through August 13th, since then there have been no fewer than 180. Therefore, as of this writing, we have nearly doubled the public e-mail received in this one round compared with the total of the previous two. In addition, our mapping team fielded a number of phone calls from broadband lacking folks and their information was used to create additional unserved address reports. Despite the increased volume, it is still a priority for us to respond in a timely manner to each and every public feedback notification where a contact e-mail or phone number is provided.

5. **Use of government data sources:**

DEC2011_AssessNY.gdb: The NTIA Assessment Database from Round 5 can be used to verify provider reported availability, technology type, max advertised download and max advertised upload speeds in Census 2010 blocks. A field was added to the tables in the NTIA assessment database files to record a combined score of the matched records for census blocks, street segments, and wireless. Using a binary system, records were assigned a coded value from 0 to 6 as indicated in the table below.

PN	TT	MADS	MAUS	OCS	
x	x	x	x	**0**	Unscored
0	0	0	0	**1**	No Match
> 0	0	0	0	**2**	PN
> 0	> 0	0	0	**3**	PN and TT
> 0	> 0	> 0	0	**4**	PN, TT, MADS
> 0	> 0	0	> 0	**5**	PN, TT, MAUS
> 0	> 0	> 0	> 0	**6**	All Scored Elements

PN: Provider Name
TT: Transmission Technology
MADS: Maximum Average Download Speed
MAUS: Maximum Average Upload Speed
OCS: Office of Cyber Security Score

The first division was made of records that were either scored or un-scored. They were given a code of 0. Next, records that had no matches with the comparison data and scored 0 in all of the elements were coded 1. Thereafter, any element that scored > 0 in the NTIA assessment database was considered a match and records were assigned a coded value of 2 to 6 to indicate the combination of matched elements.

It should be noted that census blocks and street segments reported by New York State to the NTIA include blocks where a provider could serve in the "7 to 10 day" window and not just current subscribers. It is not revealed in the **DEC2011_AssessNY.gdb** documentation whether the comparison data used by the NTIA to compile the statistics differentiated between availability and subscribers.

Now that this methodology has been developed using the R5 verification data, we can apply it to R7. We plan to use the R6 verification data that is received from NTIA to guide our outreach to providers in R7. Any provider whose submission remains unchanged and who have blocks or street segments with OCS scores below 3 will be asked to verify that those blocks are correct.

a. **Aggregated FCC 477 data** were used in Round 5 to identify providers by tract, speeds above and below 3 mbps, and business vs. residential offerings. In Round 6 we used this previous data as a benchmark to review new data received. We will update our findings when new A477 data is made available to grantees.

b. The **NYS Department of Motor Vehicles** supplied three datasets for our independent verification activities. A list of 2,080 unique Satellite Offices, Dealer Locations and Inspection Station Locations were used to verify provider reported availability. *All of these facilities have broadband connections.*

The Dealer and Inspection Location datasets did not have provider or technology information associated with the locations. Therefore, the highest verification code assigned to any Census Blocks containing the points and Street Segments within 500 feet of the points was a 5 because we were only able to confirm that there was broadband at those locations. However, the DMV Satellite Offices dataset came with provider information, so any Census Blocks containing the points and Street Segments within 500 feet of the points that matched the provider name were assigned a verification code of 2.

c. **The NYS Lottery** supplied a dataset to add to our independent verification sources. The majority of the Lottery data we received did not have provider or technology information associated with it, so it could not be determined if many of the sites *actually* had access to a broadband connection. However, there were 276 Lottery terminal locations that had provider information associated with them. These locations were *confirmed* to have broadband connections and therefore any Census Blocks containing the points and Street Segments within 500 feet of the points that matched the provider name were given a verification code of 2.

d. **NYS Streets and Address Ranges** is a dataset we use to submit all of our provider data in census blocks > $2mi^2$. They are also used as part of our geocoding. Street address ranges are also used in verification of provider data by testing addresses along segments with online provider service look-up tools ("availability checkers").

e. **NYS Address Points** were used in the verification of provider data from public reports through investigation of in-block addresses and then testing those addresses with online provider service look-up tools.

f. **NYS Orthoimagery** was used as an aid during provider data processing.

g. **NYS Public Service Commission Cable Franchise Agreements data** were used in the verification of cable broadband availability. The dataset contains information about which cable providers are franchised by municipality and indicates if they provide cable broadband in the municipality or not. This dataset was used during data processing as a frame of reference for the cable broadband data we received and to flag and correct possible overstatement of provider data.

6. **Commercial data sources:**

a) **TomTom ILEC, CLEC and Rate Center Exchange Boundary data** were used to verify provider reported availability. The TomTom data included boundaries for many of the broadband providers we have received data from. During data processing, TomTom boundaries for each provider included in the dataset were overlaid onto the provider blocks and street segments footprint to ensure that the availability data sent to us by the providers fell reasonably within the respective boundary in the commercially available TomTom data. All of the provider footprints that had matching boundaries in the TomTom data fell within their respective boundary. In one case, Verizon New York, the ILEC boundary was used to remove outlier data. Discontinuous blocks and streets submitted that fell more than one mile outside Verizon's ILEC boundary was removed. The TomTom Exchange Boundary data was used to further improve broadband availability and middle mile data for Frontier Communications. Their DSLAM data is CLLI-coded which are tied to specific exchanges. By using the exchange boundary dataset we were able to improve the accuracy of many of Frontier's DLSAM and Central Office locations, and thereby improve the blocks and streets broadband data for Frontier overall.

b) **Online look up tools for middle mile & central office locations:** Additional publicly available CLLI code location lookups were used to supplement the refinement of Frontier's DSLAM locations: *Marigold Technologies* Central Office Lookup Tool (http://www.marigoldtech.com/lists/co.php) and *TelcoData.us* (http://www.telcodata.us/) online search tools. Further research into these or other publicly available datasets may help us add to, refine, and verify our middle mile and broadband availability data for all of our facilities-based broadband providers.

c) **NAVTEQ Address Points** were also used as an aid during provider data processing, for geocoding address data, and also in the verification of provider data by testing addresses with online provider service look-up tools

d) **Pictometry oblique aerial imagery/Google's Street View**: In the process of improving the CAI point location accuracy, we are using the CAI's website, Bing's Bird View (Pictometry Oblique Aerial Imagery) and Google's Street View function to provide us information to accurately put the points on the rooftop of the building. The CAI website can provide information about name, address, and exterior pictures of the CAI. With this information, we can use Google's Street View to identify the exact location of the building, either by matching the pictures or looking at signs. If Google's Street View failed to provide enough clues to be certain, we will use the Bing's Bird View to identify the exterior look of the building and try to match that with the pictures from the homepage. Additionally, we can look for adjoining clues such as a playground around the building if we are looking to improve a school CAI point.

e) **APNIC Whois database,** as mentioned above, was used add provider information to FCC speed test records.

7. **Select CAI locations** were used to verify provider reported availability. Through our continuing relationship with the University at Albany's Center for Technology in Government (CTG), we acquired new, complete broadband service details for 2,481 CAIs during the Round 6 data gathering process. Each of these records was used to verify the provider reported data. Where the information matched, the highest verification code was assigned (1 = Provider and technology matched). We also selected Colleges, Hospitals, Federal Correctional Facilities, State Prisons and State Police Stations from our total collection of previously identified CAIs to be used as an additional verification data source. While we do

not have complete service details for some of these facilities, we strongly believe all have broadband connections.

8. **Provider verification maps:** For providers with significant changes from the previous round, we created review maps showing Round 6 availability aggregated to census blocks and street segments. The providers were given at least five days to respond and initiate any changes or corrections. Changes were made based on provider feedback. Changes were documented for future reference. These OCS generated maps were later compared to the provider footprints in the geodatabase to ensure that the data loaded correctly. Many of the providers have multiple review maps, so each of these maps had to be examined and compared to the corresponding area in the data.

9. **Clipping all wireless data to the** NTIA recommended **NYS boundary file** to help ensure topological compliance for all wireless availability to be wholly within New York State.

10. **Removal of 'uninhabited areas':** These areas have been classified as land where development cannot occur, and where household wireline broadband will not be needed at any foreseeable time. If the center of a census block with no population or housing units falls within an uninhabitable area, the entire census block ≤ $2mi^2$ or all street segments within an identified block > $2mi^2$ are classified as uninhabited. We remove uninhabited blocks and streets from the provider submission data. The classifications of uninhabited lands include, but are not limited to: water, wilderness lands, reforestation areas, as well as portions of state parks, federal nuclear sites, and recreation areas.

11. **Other Grantee State Broadband Maps** and the **National Broadband Map were** used to compare and identify providers and coverage areas particularly along NYS boundaries

New York Methodology Outreach List:

As directed by the SBI Program Office in the March 26, 2012 delivery webinar, New York has included only providers who submitted data, or those who have been identified as true potential providers, in our Round 6 Data Package.xls.

The following "outreach list" is a summary of providers not included in Data Package.xls. This list represents the volume of companies that New York has researched, contacted and, in some cases, received data from in previous and current data cycles. The list includes:

- Companies found to be "not a provider"
- Providers who do not serve New York
- Broadband equipment companies
- Providers who chose to opt-out of the program
- Resellers

Providers are identified by DBA name, provider type, and status. Comments are included for additional details. **There are no changes to this table from last round.**

Filing Company DBA	Provider Type: Broadband=1 Reseller=2 Other=3 N/A=4	Provided Data Will provide data Will Not provide data Non-Responsive	Comments (Correspondence)
2nd Century Communication	4	Will Not Provide Data	Purchased by Covad
3M Telecom Systems Division	4	Will Not Provide Data	Supplier of equipment to broadband providers

Verizon Online	3	Will Not Provide Data	
Verizon Select Services, Inc.	3	Will Not Provide Data	formerly GTE Comm. Corp., focus on long-distance service.
Verizon Wireless	3	Will Not Provide Data	Provides data as Verizon Wireless
Verizon Wireless	4	Will Not Provide Data	Verizon Wireless services are now reported under Cellco Partnership dba Verizon Wireless.
Verizon Wireless	3	Will Not Provide Data	tower management company for Verizon Wireless
V-Global Communications	4	Will Not Provide Data	Voice and VoIP services.
VIA ONE TECHNOLOGIES INC.	4	Will Not Provide Data	Cannot identify this company or services they provide.

Vocal IP Networx Ltd	4	Will Not Provide Data	Voice and telephony services only.
Voda Networks, Inc.	2	Will Not Provide Data	Reseller. from website: Partnered with industry leading providers.
VoIPnet Technologies	4	Will Not Provide Data	Voice only.
VoIPStreet, Inc.	4	Will Not Provide Data	VoIP services only.
Vonage	4	Will Not Provide Data	Provides phone services only.
VPN Systems	3	Will Not Provide Data	Discovered on WISPA list. Does not provide BB service.
Warp Drive Products	3	Will Not Provide Data	Discovered on WISPA list. Does not provide BB service.
Wave2Wave Communications Inc	2	Will Not Provide Data	Company is a reseller, low priority, no outreach for R4
WavHost	3	Will Not Provide Data	Discovered on WISPA list. Webpage does not open, cannot get good search results on company.
WCS Wireless License Subsidiary, LLC	4	Will Not Provide Data	Cannot verify any information on company.
WDT	2	Will Not Provide Data	Reseller- unsure of service to NY.
White Fence	3	Will Not Provide Data	Company connects customers with broadband providers.
Wholesale Carrier Services, Inc.	2	Will Not Provide Data	Reseller- low priority for R4 outreach
WilTel Communications, LLC.	3	Will Not Provide Data	Acquired by Level 3.
Winstar	3	Will Not Provide Data	Company was reseller but since has gone bankrupt.
Worldlink USA Inc.	4	Will Not Provide Data	Unsure of actual company- best search turns up maritime communications company.
Worldwide Marketing Solutions	4	Will Not Provide Data	Research indicates website hosting, many pending lawsuits and scam reports.
Xand Corporation	3	Will Not Provide Data	Network systems- not BB provider
XCHANGE TELECOM CORP.	4	Will Not Provide Data	Voice services only.
Xcyncroj	4	Will Not Provide Data	Cannot identify company or services. Number is out of service
XO Communications Services, Inc. (Affiliated Entity)	2	Will Not Provide Data	
Zayo Group	3	Will Not Provide Data	Reseller, no NY customers
Zone Telecom, Inc.	4	Will Not Provide Data	Voice services, VoIP, etc.

OFFICIAL OCTOBER 2012 UPDATE SUBMISSION TO THE NATIONAL TELECOMMUNICATIONS AND INFORMATION ADMINISTRATION UNDER THE STATE BROADBAND INITIATIVE GRANT PROGRAM FOR THE STATE OF OHIO

CONNECT OHIO®

October 1, 2012

TABLE OF CONTENTS

October 1, 2012

Ms. Anne W. Neville
SBI Grant Program Director
National Telecommunications and Information Administration
U.S. Department of Commerce
Room 4716
1401 Constitution Avenue, NW
Washington, DC 20230

Dear Ms. Neville:

Please accept this submission from Connected Nation on behalf of the state of Ohio's State Broadband Initiative (SBI) Grant Program, known as Connect Ohio.

The Connect Ohio program and its collective stakeholder community continue to be faithful and energized contributors to the National Telecommunications and Information Administration's (NTIA) SBI program. Now more than ever, the significance of complete and validated data as compiled through the Federal Communications Commission's (FCC) National Broadband Map is instrumental in forging the innovation economy of the 21st century. As the Commission relies upon this unique resource to distribute monies under the Connect America Fund, through the Universal Service Fund reform, the Connect Ohio program equally values this data in informing meaningful program interventions relating to broadband access, adoption, and use initiatives. Truly, this coordination embodies the spirit of the SBI and demonstrates the joint effort of the NTIA, FCC, state governments, industry, and non-profits like Connected Nation as it continues to serve as a key tool for the American public and policymakers. We are proud of the role that Connect Ohio has played in creating and maintaining such a powerful tool that has benefitted and surely will continue to benefit broadband providers, consumers, and businesses nationwide.

The artifacts that comprise this submission should be found to be compliant with the October 1, 2012, deadline for the semi-annual data update and in accordance with the terms of the July 1, 2009, Notice of Funds Availability (NOFA) and all subsequent clarifications pertaining to delivery of state-level mapping of broadband service availability. This packet includes:

Inventory of Deliverables, Connect Ohio: October 1, 2012

NOFA Requirement	Data Transfer Model	Data Description
Appendix A: 1(a)(i)	BB_Service_CensusBlock	Broadband Service Availability of Facilities-Based Providers in

			Census Blocks of No Greater Than Two Square Miles in Area
Appendix A:	1(a)(ii)	BB_Service_RoadSegment	Broadband Service Availability of Facilities-Based Providers by Road Segment in Census Blocks Larger in Area Than Two Square Miles
Appendix A:	1(b)	BB_Service_Wireless	Broadband Service Availability of Wireless Services Not Provided to a Specific Address
Appendix A:	3(b)	BB_ConnectionPoint_MiddleMile	Broadband Service Infrastructure Middle-Mile and Backbone Interconnection Points
Appendix A:	4	BB_Service_CAInstitutions	Community Anchor Institutions-Listing
Appendix A:	4	n/a	Community Anchor Institutions-Narratives
VII.A.1(a)		n/a	Accuracy and Verification Report
n/a		DataPackage.xlsx	Worksheets of Contact Information, Record Count, and Provider Summary Table
n/a		n/a	List of Changes and Corrections to the Dataset
n/a		n/a	Non-Participating Provider (NPP) Narratives
n/a		n/a	Broadband Provider Roster and Participation Status

In addition, this data update submission should be found to be compliant with the additional program requirements instituted by the National Telecommunications and Information Administration since the time of the April 2012 SBI data submission for the Connect Ohio program. Specifically, these new requirements are:

SBI Data Transfer Model
The submission of the broadband dataset for October 1, 2012, is contained within the SBI Data Transfer Model as released on the Grantee Workspace on August 9, 2012. All efforts have been made to comply with formatting, domain, and metadata requirements to include as much information on each provider as possible.

Additional Submission Guidance
New to the semi-annual submission for October 2012 is a more robust version of the ReadMe text file. As per the template released on the Grantee Workspace on May 18, 2012, this file contains a high-level summary of the items contained within the submission, including the exact file deliverables, a description of the errors and warnings from the Check Submission report, and extraneous information of which the NTIA and other users of the dataset should be made aware.

> This submission continues to follow the speed technology guidance released by the Program Office on August 9, 2012, to review speed tier codes in correspondence with technology of transmission codes. In the April 2012 submission, descriptions were provided in the methodology paper that offered an explanation for any submitted technology of transmission and speed combinations that were outside of the expected value range. That practice continues in this submission as technology and speed combinations are reviewed and scrutinized; any questionable information supplied by providers is reviewed more in depth with the provider to ensure the information is accurately captured or a proper explanation is provided as to why the speed information should be submitted as supplied even if it falls outside the expected value range.
>
> Also in this submission are narratives describing the data and coverage estimation of non-participating providers. While Connect Ohio continues outreach to all providers prior to each submission period, the need to submit broadband service data for all providers regardless of their participation is evident as the SBI program continues into this sixth round of data submissions. The submission of this estimated broadband service area for providers that have not supplied data to Connect Ohio is essential in being able to portray a more accurate depiction of the current broadband landscape.

In addition to the requirements mentioned above, please find this methodology paper to be inclusive of the ongoing section pertaining to industry mergers and acquisitions – specifically this section details any and all mergers or acquisitions that have taken place in Ohio since the April 2012 submission. The intent of this updated section is to provide a better understanding of how the broadband provider landscape has changed since the last submission cycle.

This October 2012 semi-annual data update under the SBI Grant Program continues to demonstrate our dedication to implementing the joint purposes of the Recovery Act and the Broadband Data Improvement Act (BDIA) by gathering comprehensive and accurate state-level broadband mapping data, developing state-level broadband maps, aiding in the development and maintenance of the National Broadband Map, and undertaking statewide initiatives for broadband planning.

Broadband Service Availability — Provider Outreach and Verification

This data update submission under the SBI program includes datasets for approximately 92.19 percent of the Ohio provider community, or 118 of 128 total providers. There are 116 participating providers and 2 additional non-participating providers whose estimated coverage areas have been submitted. Of the 116 participating providers, 33 supplied an update to their network or coverage area(s), while 50 have reported no change. The remaining 33 represent providers who previously supplied data but were non-responsive in the October 2012 update effort; therefore their previous dataset is being put forward as part of this compilation. A complete roster by provider depicting participation status and contact record is contained herein. Of the 10 providers that are not represented in the attached datasets, 8 have refused to participate in the voluntary program or were non-responsive to multiple contact attempts, and 2 providers are currently in some form of progress toward data submission but were not able to submit coverage areas at the time of this submission.

As the aforementioned roster and attached methodology documentation will attest, it is the collective opinion of the Connect Ohio principals that all commercially reasonable efforts were made to account for 100 percent of the known Ohio broadband provider community, pursuant to this semi-annual data update submission.

Connect Ohio has also continued to perform broadband verification activities through several means. In addition to confirmation of service area(s) by each provider, Connect Ohio conducts field validation efforts. To date, 78(60.94 percent) providers have been validated through field verification activities. Additional details on verification activities are contained within the Field Validation Methodology.

The Connect Ohio website, (www.connectohio.org), continues to serve a prominent role in the outreach and data collection effort. This program asset provides a way for the general public to participate in the process by offering interactive tools for users to test their connection speed, submit broadband inquiries, or contact a program representative.

As an indicator of stakeholder penetration, the Connect Ohio website encountered 23,839 unique visits during this reporting period (148,849 total to date for the life of the grant awarded on December 20, 2009). Additionally, this pronounced Web activity netted 155 broadband inquiries over this same reporting period (1,666 grant inception to date). The website also provides access to the My ConnectView™ interactive mapping application, which allows consumers and broadband providers to confirm or dispute the coverage represented on the broadband inventory map. These consumer-initiated actions are facilitated through the Connect Ohio website and the Connect Ohio interactive mapping tool (My ConnectView™) that offer the stakeholders the vehicles to provide information regarding availability in their respective service area, either in affirmation or contest of the reported data represented in the Connect Ohio mapping artifacts. Since the initial data collection and release of corresponding maps, feedback in the form of broadband inquiries has allowed Connect Ohio to identify additional areas that are in need of field validation, which is scheduled as soon as possible.

Community Anchor Institutions

Connect Ohio has established an ongoing mechanism for gathering data on the location and broadband connectivity of Community Anchor Institutions (CAI), in accordance with the data requirements of the SBI NOFA Technical Appendix. Since the April 2012 data submission, the CAI outreach process method has been modified to improve data collection. Specifically, the outreach process is a more focused sector-specific and relationship-oriented approach that generates more responses than general contact.

Outreach was conducted during this data update reporting period by Connect Ohio to continue identification of existing, centralized sources for CAI connectivity data. Additionally, outreach was coordinated to distribute the CAI survey to institutions throughout the state through multiple methods including a customized online survey available on the Connect Ohio website. During this reporting period Connect Ohio has developed a number of new relationships with statewide associations such as Ohio Hospitals Association and Ohio Department of Education to promote the importance of broadband connectivity at anchor institutions and participation in this data collection process. It became apparent that these relationships are beneficial to the entire success of the Grant Program, and the CAI engagement is a logical extension of new and existing relationships. Connect Ohio will continue to build upon these new relationships over the coming months and utilize its contacts throughout the state to collect data and raise awareness of this project.

In addition to fostering and building relationships with state agencies, associations, and organizations, Connect Ohio has also developed a sector-specific calendar that supports CAI outreach as well as research and communications efforts. This focused approach allows a corporate commitment to capturing CAI data in addition to developing meaningful sector-specific content.

Connect Ohio is also working hard to clarify CAI information associated with wireless broadband. NTIA has requested in-depth questioning of CAI listing a wireless broadband service as their sole form of connectivity. This follow-up allows us to better understand the reason for adopting the wireless broadband service.

From our work in Ohio, as well as other states, we recognize the great value of this data to future collaboration efforts within the state as well as its value to the National Broadband Map. We plan to continue to bring best practices to the Connect Ohio efforts, along with an investment of both human and technical resources required to reach our goal of increasing the data that is secured and reported as part of this process.

The Connect Ohio program exists to improve data on the deployment and adoption of broadband services and to assist in the extension of broadband technology across all regions of the great state of Ohio, as well as the United States and its territories through contribution to the National Broadband Map. We look forward to the continuing work ahead and improving upon our data collection methods.

Respectfully submitted,

Thomas W. Ferree
President and Chief Operating Officer
Connected Nation, Inc.

Data Acquisition: Ohio Community Anchor Institutions Methodology

In this sixth reporting period of the SBI, Connect Ohio, working in close coordination with the state of Ohio, has established an ongoing mechanism for gathering data on the location and broadband connectivity of Community Anchor Institutions (CAI), in accordance with the data requirements of the SBI NOFA Technical Appendix. Since the April 2012 data submission, the CAI outreach process method has been modified to improve data collection. Specifically, the outreach process is a more focused sector-specific and relationship-oriented approach that generates more responses than general contact.

Connect Ohio has continued to identify and process CAI data obtained through an ongoing statewide outreach campaign. Physical address information continues to be augmented through manual sourcing and geocoded by Connect Ohio through Esri ArcGIS software.

Connect Ohio continues to utilize a customized online survey hosted through SurveyMonkey, with a landing page on the Connect Ohio website that was developed during the first reporting period. This survey, in combination with a customized data-gathering spreadsheet, was distributed on a regular basis to a targeted list of CAI throughout the state as well as organizations and agencies that work closely with the CAI. The distributions were completed with the support of the state client. Connect Ohio will continue to use these data-gathering tools for future targeted outreach efforts throughout the coming months leading up to the next reporting period. These materials are customized to fit the CAI categories as defined in the SBI NOFA.

The survey can be accessed at this link:
http://www.surveymonkey.com/s/R3RLVNG

In addition to the survey, Connect Ohio has developed a number of new relationships with statewide associations such as Ohio Hospitals Association and Ohio Department of Education to promote the importance of broadband connectivity at Community Anchor Institutions and participation in this data collection process. It is apparent that these relationships are beneficial to the entire success of the grant program, and the CAI engagement is a logical extension of new and existing relationships. Connect Ohio will continue to build upon these new relationships over the coming months and utilize its contacts throughout the state to collect data and raise awareness of this project.

In addition to fostering and building relationships with state agencies, associations, and organizations, Connect Ohio has also developed a sector-specific calendar that supports CAI outreach as well as research and communications efforts. This focused approach allows a corporate commitment to capturing CAI data in addition to developing meaningful sector-specific content.

Connect Ohio conducts significant research as part of an ongoing process to identify existing, centralized sources for CAI connectivity data. In tandem with these efforts to identify existing data, Connect Ohio continues to identify key CAI contacts in an effort to distribute and promote the online survey and raise awareness of the importance of CAI broadband connectivity. Also, when possible, Connect Ohio works with the Ohio Office for Information Technology to identify existing relationships that can support CAI outreach.

Connect Ohio has an ongoing mission to educate CAI throughout the state on the importance of participating in the project. Participation by these institutions will raise awareness about the importance of broadband connectivity and the need to report the requested data for inclusion on the National Broadband Map.

The greatest challenge with collecting CAI data continues to be educating the CAI about the Connect Ohio project as well as self-awareness of their own CAI connectivity (specifically upload and download speeds). Connect Ohio will continue to research key CAI organizations and agency contacts in an effort to raise awareness of this project among CAI. When applicable, the Ohio Office for Information Technology will continue to be briefed on the current CAI data and provided information so it can assist with outreach and promotion within the state.

A CAI summary of all processed and submitted data is provided below:

CAI Type	Total	Physical Address	Lat/Long	Technology of Transmission	Download Speed	Upload Speed
K-12 Schools	9,204	9,204	9,026	3,484	2,497	2,457
Libraries	808	808	807	684	586	333
Healthcare	1,950	1,950	1,950	5	5	5
Public Safety	3,817	3,817	3,815	5	4	4
Higher Ed Institutions	958	958	953	17	12	11
Other Government	590	590	589	13	7	7
Other Non-Government	3,660	3,660	3,660	29	20	15
Total	20,987	20,987	20,800	4,237	3,131	2,832

As part of Connect Ohio's efforts to ensure compliance with Ohio's Every Community Online (ECO) facilities, a member of the engineering and technical services team from Connect Ohio has visited a number of sites to perform speed tests to obtain information. In addition, technology types were reviewed, and it was determined that facilities with a T1 line have a synchronous connection of upload and download speeds. Therefore, the upload speed was able to be determined based on the download speed.

During the coming months, CAI data collection will be supported by regular reporting to the Connect Ohio team. The CAI data is proving an invaluable resource to all components of the Connect Ohio effort. The data identifies potential local champions, sector trends, and opportunities for improvement as well as opportunities to educate CAI not familiar with their current connectivity.

SBI Data Submission Methodology

The submission of the broadband dataset for October 1, 2012, is contained within the SBI Data Transfer Model and additional components as released on the Grantee Workspace on August 9, 2012. Connected Nation (CN) has reviewed all literature that relates to the release and use of this data transfer model and recognizes that it does not replace or dictate how data is stored, processed, or displayed for the state, as it is meant primarily as a means to transfer the broadband data from all states and territories and populate the National Broadband Map in a seamless fashion.

Connected Nation has complied with the following guidance documents published by NTIA:

- Technical Mapping Guide, as released on the Grantee Workspace on March 24, 2011, was followed to ensure the completeness and validity of the submission through completion steps and checklists, completing the DataPackage spreadsheet, uploading broadband datasets into the Data Transfer Model, and checking the dataset using the SBDD_CheckSubmission receipt process.
- Naming Conventions and Category of End User, as released on the Grantee Workspace on March 26, 2012, was followed to ensure the consistency of individual file and zip package naming.

In addition to the methodologies contained herein, the Changes and Corrections documentation, as well as the DataPackage.xls containing contact information, the data dictionary, and a provider summary table, the following feature classes are submitted within the SBI Data Transfer Model for the state of Ohio.

Inventory of Deliverables, Connect Ohio: October 1, 2012

NOFA Requirement	Data Transfer Model	Data Description
Appendix A: 1(a)(i)	BB_Service_CensusBlock	Broadband Service Availability of Facilities-Based Providers in Census Blocks of No Greater Than Two Square Miles in Area.
Appendix A: 1(a)(ii)	BB_Service_RoadSegment	Broadband Service Availability of Facilities-Based Providers by Road Segment in Census Blocks Larger in Area Than Two Square Miles.
Appendix A: 1(b)	BB_Service_Wireless	Broadband Service Availability of Wireless Services Not Provided to a Specific Address.
Appendix A: 3(b)	BB_ConnectionPoint_MiddleMile	Broadband Service Infrastructure Middle-Mile and Backbone Interconnection Points.
Appendix A: 4	BB_Service_CAInstitutions	Community Anchor Institutions-Listing.

The provider data collected by CN on behalf of the state of Ohio have been formatted per the given specifications and uploaded into the appropriate feature classes of the SBI Data Transfer Model. Wireline availability is contained within census blocks and road segments, wireless availability is contained as polygons of coverage areas, and middle-mile connections and Community Anchor Institutions are contained as point data. All speed data is contained at the census block, road segment, or wireless polygon level of availability. All efforts have been made to comply with formatting, domain, and metadata requirements to include as much information as possible.

Connected Nation has continued outreach to satellite providers on their availability, technology, and speed information, but granular coverage is not yet available. Submitted within the wireless feature class are the satellite companies providing service to Ohio as a polygon of the state boundary. Efforts will continue to collect, process, or otherwise create more granular satellite data based on availability analyses and guidance received from NTIA. Process development is underway at CN as well to be able to create more granular satellite coverage based on satellite equipment positioning and geographic inputs.

Ohio Field Validation Methodology

CN focused a portion of its time on specific validation processes such as:

- conducting random spectrum analysis studies throughout the state using an Avcom PSA-37-XP spectrum analyzer;
- conducting mobile speed tests throughout the state using an iPhone, Android (or other smart phone) as well as provider-specific aircards (Sprint 3G/4G, Clearwire et al);
- identifying pre-selected, provider-submitted wireless transmit tower sites and cross-referencing data about that tower against the Federal Communications Commission (FCC) databases such as Antenna Structure Registration and/or the Universal Licensing System;
- cross-referencing Federal Registration Number data against available FCC Form 477 data as well as the FCC **CO**mmission **RE**gistration **S**ystem (CORES);
- validating provider submitted data (for example: latitude/longitude) using a handheld Garmin eTrex Summit GPS unit or GPS enabled software such as Microsoft Streets and Trips;
- locating physical wire-line attributes (such as Central Offices, Remote Terminals, CATV plant, etc.) and comparing them against provider submitted data; and
- conducting on-net and off-net speed tests using the FCC portal at http://www.broadband.gov/qualitytest/about/ or using the Ookla Net Metrics enabled speed test utility located on each of CN's program specific websites.

Additionally, CN cross-referenced numerous public documents in order to ensure that all known broadband providers were located and contacted. This included searching membership logs from trade associations (WISPA, WCAI, PCIA, etc.), the Cable Television Fact Book, Public Utility Commission records, Public Service Commission records, Chamber of Commerce, etc.

To date, Connected Nation's staff conducted on-site validation tests in Ohio on the following providers: 1 Touch Technology; Access Ohio Valley; Amplex Internet; Armstrong Utilities; AT&T Inc.; Avolve; Bascom Mutual Telephone (d.b.a. BrightNet Bascom); Benton Ridge Telephone (d.b.a.

W.A.T.C.H. TV); Blue Sky Wireless; Buckeye Cablevision Inc.; Buckland Telephone; Celerity Networks; CenturyLink; Champaign Telephone Company (d.b.a. CTC); Cincinnati Bell Telephone Company LLC; Cincinnati Communications; CityNet Fiber; City of Wadsworth; Clearwire Corporation; Comcast; Computers4U; ConnectLink; Country Connections LLC; Coyote Wireless; Dark Horse Wireless; Databit Solutions; Doylestown Communications; DuplexCom of Ohio LLC; Eagle Communications (d.b.a. Safe-T.net); FairPoint Communications (d.b.a. Germantown Independent Telephone, Columbus Grove Telephone, and Orwell Telephone); Falcon 1; Fort Jennings Telephone Company; Frontier Communications (d.b.a. Citizen's Communications); GMN Wireless; Hometown Cable Company (also d.b.a. g Wireless); Horizon Telecom; Hometown Cable Company (d.b.a. g Wireless Inc.); Imagine Networks; Intelliwave LLC; J-B Nets LLC; Jenco Wireless; KeyOn Communications Inc. (being acquired by New Knoxville Telephone); King Office Supply; Leap; Level 3 Communications; LightSpeed Technologies; MegaPath Inc.; MetaLINK; Middle Point Home Telephone Company; Mikulski Communications LLC; Mobilecomm (d.b.a. Heavenwire); Nelsonville Cable Television; New Era Broadband LLC; New Knoxville Telephone; NexGen Access; NorthWest Net Inc.; nTelos (d.b.a. Ohio Fibernet); OmniCity; One Communications Corporation; R.A.A. Services; Redbird Internet Services; Southern Ohio Communication Services Inc. (also formerly Scioto Wireless); Sprint Nextel; StratusWave; Suddenlink; Sycamore Telephone; Telephone Service Company; Time Warner Cable Access (d.b.a. Insight Communications of Central Ohio LLC); T-Mobile; UData Net; Vaughnsville Telephone Company; Verizon Communications; Wavelinc Communications; Wilkshire Wireless; Wireless Intranet; Windstream (f.k.a. PAETEC Communications. Inc., Cavalier Telephone, and Talk America, Inc.); Wireless Intranet; XO Communications LLC; and Zayo Group LLC.

In addition to the field verification tests that have been conducted, Connect Ohio has also conducted work in the field to collect information for the Non-Participating Providers, Wireless Intranet and GLW Broadband which, by nature of the methodology required for this collection, are also included in the above list.

From program initiation through this reporting period, CN has completed in-the-field validation testing against 78 companies (out of a universe of 128 viable providers) totaling 60.94 percent within the state of Ohio. This percentage also considers the non-participating provider (NPP) records submitted to NTIA as may be contained herein (see "Data Submission and Coverage Estimation of Non-Participating Provider" below).

CN has also continued to review provider datasets for accurate speed information, platform listings, and other intricacies that may fall outside of the standard SBI Data Transfer Model parameters, as published on the NTIA Grantee Workspace on August 9, 2012. Any providers whose submitted coverage and attributes are anticipated to come into question have been further reviewed and confirmed; details on a case-by-case basis are presented below.

Amplex Internet
Issue: Fixed wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 10 Mbps service; screenshot below.

SPEED - Amplex Internet gives you reliable connections that surpass the competition. Our premium plans offer 3.5Mbps down with a 10MB Burst!*

AT&T Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 24 Mbps service; screenshot below.

Compare Internet Packages

	Pro	Elite	Max	Max Plus	Max Turbo
Standard Monthly Rate	$38*	$43*	$48*	$53*	$63*
Downstream Speed	Up to 3 Mbps	Up to 6 Mbps	Up to 12 Mbps	Up to 18 Mbps	Up to 24 Mbps

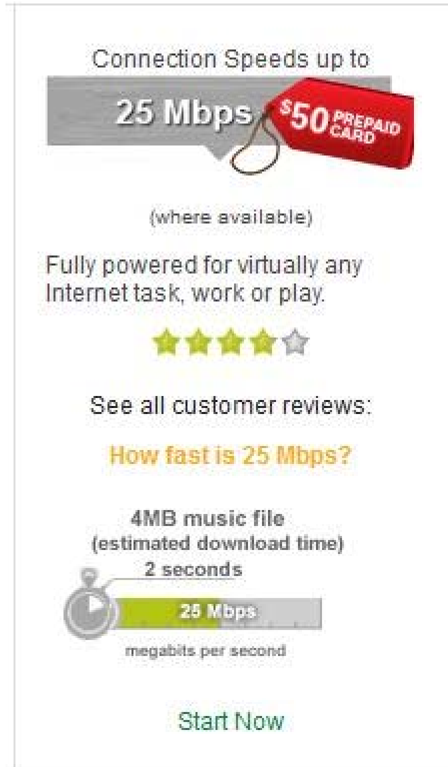
AT&T Inc.
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider confirmed tier 7 service is available.

Blu Sky Wireless
Issue: Fixed wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.

Residential

Basic: Up to 3Mbs Down / 128Kbs Up
Standard: Up to 5Mbs Down / 256Kbs
Turbo: Up to 8Mbs Down / 512Kbs
Turbo Plus: 12Mbs Down / 1Mbs

CenturyLink
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 25 Mbps service; screenshot below.



Cequel Communications (Suddenlink)
Issue: Technology of transmission code 40 with maximum advertised download speed in tiers 5, 7, and 8, lower than expected value range for the technology.
Resolution: Provider representative confirmed that DOCSIS 3.0 is indeed in use, but speeds have not been turned up higher yet.

Conneaut Telephone Co
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 24 Mbps service; screenshot below.

SERVICE	PRICE
2.0MB/512k	$29.95
8MB/768k	$44.95
12MB/768k	$59.95
24MB/1MB	$74.95

Massillon Cable TV, Inc.
Issue: Technology of transmission code 40 with maximum advertised download speed in tier 7, lower than expected value range for the technology.
Resolution: Provider website confirms use of DOCSIS 3.0 with the lower speeds.

- DOCSIS 3.0 High- Speed Data- Maximize your online experience with download speeds up to 10 Mbps, upload speeds up to 1.5 Mbps and 3 email addresses included for only $159.95/month.

MegaPath Inc.
Issue: DSL platform with maximum advertised download speed in tiers 7 and 8, higher than expected value range for the technology.
Resolution: Provider website advertises 20 Mbps and 45 Mbps service; screenshots below.

DSL service provides download speeds up to 20 Mbps over a nationwide, multi-redundant private network that optimizes performance and security. DSL is an ideal broadband solution for small and medium-sized businesses that download large files or use the Internet extensively.

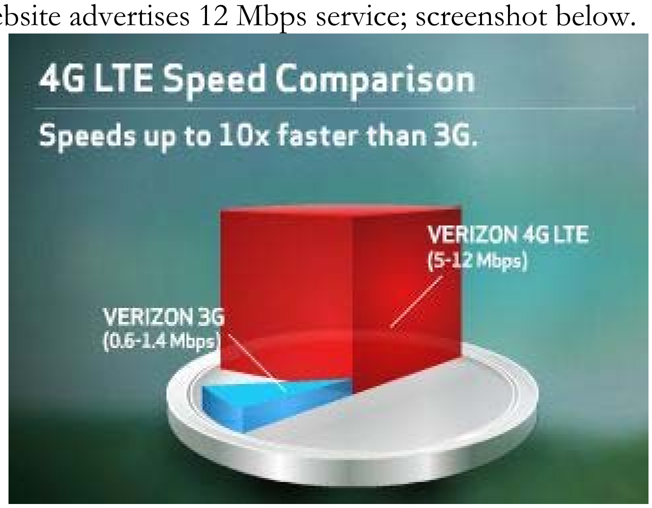
For maximum connectivity at a minimum cost, there's no greater value than MegaPath Business Ethernet. Choose the bandwidth—2 Mbps up to 45 Mbps—that best fits your business' needs.

T-Mobile USA, Inc.
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website confirms that speeds greater than tier 6 are available; screenshot below.

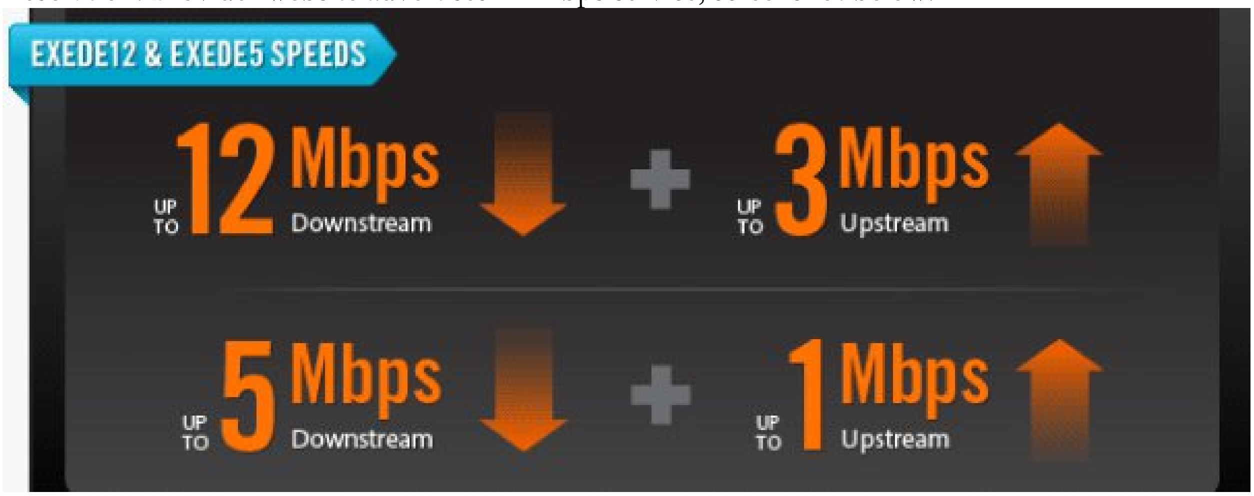
T-Mobile customers with 4G phones are already experiencing data speeds that are comparable to or faster than the speed of a home broadband network. And with recent improvements to our 4G network-doubling our theoretical download speeds-we're giving our customers enhanced 4G data speeds. We've seen average download speeds on our HSPA+ 42 Mbps-capable data stick approaching 10 Mbps with peak speeds of 27 Mbps, and download speeds approaching 8 Mbps with peak speeds of 20 Mbps on our upcoming HSPA+ 42 Mbps-capable smartphones.

TDS Telecommunications Corporation
Issue: DSL platform with maximum advertised download speed in tiers 7 and 8, higher than expected value range for the technology.
Resolution: Provider website advertises 15 and 25 Mbps service; screenshot below.

Verizon Communications, Inc.
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.



ViaSat, Inc.
Issue: Satellite platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.



Windstream Communications
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.

See which of our speeds matches your online activities. Choose the right Internet speed (WATCH VIDEO)	3 Mbps (Basic Use)	6 Mbps (Most Popular)	12 Mbps (Fastest Option)

Data Submission and Coverage Estimation of Non-Participating Providers

As part of its ongoing broadband mapping efforts, CN has developed a series of processes with the goal of submitting coverage estimation mapping data to NTIA for every known and qualifying last-mile broadband provider, regardless of platform type (cable modem, DSL, fixed wireless, etc.). This state specific collection of coverage estimation methodology papers (see Appendix A) demonstrates the estimated broadband service territory for the providers in this state that have either been non-responsive or that have refused to participate in the SBI mapping initiative.

Accuracy and Verification: Provider Validation Methodology

Broadband providers maintain their service area data in many different formats, all in varying levels of complexity and granularity. In order to ensure that the data required by the NTIA is standardized across all providers and that it is as accurate as possible, CN translates and formats the data that providers are able to supply into a GIS shapefile and produces maps for the provider to review. The resulting map(s) and review process allow for providers to see their service area in a geographic format – for some providers, this is the first time they have seen maps of their broadband service area. Having the mapped service area allows providers to quickly identify any issues that appear in the data representation, whether the issue is in the data translation into a GIS format or from the original data collection and submission. Often data is provided from various sources and through the review and revision process, local engineers who operate the networks and work in the field are able to ensure that the tabular data that has been submitted is accurate and represents the real-world network extent. Any issues in how the service area is represented on the map(s) are remedied by CN, whether they are additions, removal of service, or any other revisions. Revised maps of service area representations are sent to the provider for review and approval; CN will revise data and return maps as many times as necessary until the provider is in agreement that the map represents their service area as accurately as possible. Once the review process has been completed and final approval of the data is provided, the data is deemed ready for NTIA submission.

Once the data collection has been aggregated at a statewide level, static maps of statewide and county-level availability are produced and made publicly available. In addition, consumers can visit the interactive online tool, My ConnectView, to create customized views of broadband service areas and analyze corresponding demographic information. Leveraging broadband service data on various platforms allows for public users, providers, and other stakeholders to review, scrutinize, and provide feedback on the represented data. This feedback becomes a validation method in itself as consumers submit inquiries to CN either affirming where service is not available or identifying areas where broadband service is shown on the map, but in actuality is not available. This allows for a follow-up to providers regarding revisions to the data as it is represented; it also allows for CN to identify locations where on-site visits may be necessary to complete field validation of available services. Public feedback on all forms of mapping products serves as a localized validation method for provider-supplied information and allows CN to resolve inaccuracies as they are identified to ensure that only the highest quality information is provided to stakeholders.

Additionally, non-participating provider narratives that were submitted in previous mapping cycles are subjected to the same level of scrutiny. Occasionally, a provider may elect to voluntarily participate (thus eliminating the need for future data estimation activities in the field). However, more often than not, the NPP narrative is updated with a combination of data gleaned from the provider's website, data obtained through FCC research and/or data collected/verified in the field by a CN staff engineer.

Estimates derived from provider-validated data indicate that approximately 1.41 percent of Ohio households do not have terrestrial fixed broadband service available, and approximately 0.27 percent of Ohio households have neither mobile nor fixed broadband service available.

Within rural areas of the state, results derived from provider-validated data indicate that approximately 2.81 percent of rural Ohio households do not have terrestrial fixed broadband service available, and approximately 0.53 percent of rural Ohio households have neither mobile nor fixed broadband service available. Please note that the availability estimates presented are based on Census 2010 household information.

The estimates above, in accordance with NTIA's definition of available broadband service as specified in the SBI NOFA, include broadband service with download speeds of at least 768 Kbps and upload speeds greater than 200 Kbps.

In addition, due to the nature of the SBI data collection methodology as defined by the NTIA and based on both census block geographic units and street segment data, the estimates of broadband availability derived from provider-validated data may include an overstatement of the actual number of households with broadband availability. Under the census block-based data collection method, a provider will typically report broadband availability for an entire census block whether its network is present across the whole or only a subset of that census block. This potential overestimation at the census block level can be amplified as the data is aggregated across the entire state.

WIRELESS METHODOLOGY

Broadband Service Availability in Provider's Service Area
Wireless Services Not Provided to a Specific Address

Data solicited from a fixed wireless provider to create propagation models include, but are not limited to:

1. The name of the structure.
2. Whether the transmitting device is operational or proposed.
3. The maximum advertised downstream speed, the maximum advertised upstream speed.
4. The typical downstream speed, the typical upstream speed (peak periods for both).
5. The frequency range of spectrum being used (as prescribed by NTIA). This may include (but is not limited to) spectrum authorizations identified within the Federal Communications Commission (FCC) Universal Licensing System (ULS) database or located on the FCC's Spectrum Dashboard. This research often proves to be exceptionally effective when estimating the coverage area of an NPP.
6. The primary population center(s) being served (for geopolitical boundary reference).
7. The physical address of the transmit site (in the event latitude/longitude is unavailable from the provider this allows a quick reference point for geocoding).
8. Latitude in either Degrees, Minutes, and Seconds and/or in Decimal Degrees (typically received as NAD 27 or NAD 83).
9. Longitude in either Degrees, Minutes and Seconds and/or in Decimal Degrees (typically received as NAD 27 or NAD 83).
10. Antenna pattern (e.g. omni-directional, 180°, 120°, 90°, etc.).
11. Azimuth of antenna (e.g. 360° with magnetic declination if known).
12. Approximate transmit radius (in feet, miles, or kilometers).
13. Polarity of transmit antenna (Vertical or Horizontal).
14. Transmit antenna gain (in dBi).

15. Line loss (applicable only to providers using coax, heliax, waveguide or other forms of cabling – excludes power-over-Ethernet devices).
16. Mechanical and/or Electrical beam tilt (if applicable).
17. Equipment Manufacturer (allows easy cross-reference against manufacturer's specification sheet).
18. Power output of the transmitting device (if unknown, FCC standards or manufacturer specifications are applied).
19. AMSL at base of tower site.
20. Antenna centerline AGL (height of antenna above ground level measured at the centerline of the actual antenna).
21. Foliage factors (Evergreens/Deciduous and percent of ground cover).
22. Ground Clutter (primarily used in rural areas to account for foliage and in metropolitan areas to account for types and heights of buildings if known).
23. Average gain of receive antenna.
24. Receive antenna is estimated at height above average terrain (HAAT) of 6.2 meters/20 feet.
25. Federal Registration Numbers (if applicable) which may allow opportunities to cross-reference and/or obtain additional data from the FCC's ULS and the **CO**mmission **RE**gistration **S**ystem.

Propagation modeling combines scientific data and empirical mathematical formulation for the characterization of radio wave propagation as a function of frequency, distance, and other conditions. Propagation software(s) typically use the Irregular Terrain Model (also known as Longley-Rice) of radio propagation for frequencies between 20 MHz and 20 GHz. This model is based on electromagnetic theory and statistical analyses of the combination of terrain features and radio measurements, then predicting the median attenuation of a radio signal as a function of distance and the variability of the signal in time and in space. For metropolitan areas, the software can typically be adjusted to use the Okumura-Hata model which accounts for predicting the behavior of cellular transmissions in areas where buildings are the primary obstructions. The resulting product from either model depicts a graphical illustration of the theoretical propagation characteristics of a selected frequency range based on defined variables (receiver sensitivity of the home/mobile device, foliage factor, and digital elevation terrain input).

After converting propagation models into a geospatial format, additional processing is completed to remove the small pixels representing service present in the resulting dataset. These areas are initially created based on the parameters entered in the software from the provider equipment information, the underlying data parameters of elevation, hillshade, etc., and the limitations of the software itself to display a broadband service area as accurately as possible. Generally, these random pixel striations appear as a result of signal levels reaching the highest elevated points within the prescribed radius. Typically, while this pixilation anomaly shows legitimate areas where signals can be received, these highly elevated points may have exceedingly sparse populations or are entirely void of population. As a result, and congruent to the *Wireless Technology Methodologies and Business Logic* white paper submitted to NTIA on January 20, 2011, all independent pixels representing service that are less than 0.125 square miles in area have been removed from the geospatial representation of each wireless provider.

BROADBAND INQUIRIES METHODOLOGY

CN collects consumer feedback in the form of broadband inquiries (BBIs). These inquiries represent any type of communication received from the public regarding broadband service. Once BBIs are received across the state, this information is overlaid with the broadband availability information which was collected through the SBI program. This allows for a real-world comparison of the broadband landscape to the information received from broadband inquiries. Consumers submitting these inbound comments and/or inquiries are able to provide information regarding five categories: 1) residents who do not have broadband but want it; 2) residents who have broadband but want a different provider; 3) residents who do not have broadband, but the broadband inventory maps indicate that they do; 4) residents who have broadband but want a faster connection speed; and 5) residents who have broadband but want a less expensive service option.

BBIs are submitted frequently by consumers via the Connect Ohio website. Inquiries often seek help to identify local broadband provider options, or to learn when a specific provider may be able to provide service to that consumer. Consumer comments also provide information which may help modify maps with actual service area information. The primary objectives of CN regarding these inquiries are 1) to improve the accuracy of the state maps with submitted consumer information and follow-up field research; 2) to provide broadband options to consumers through cooperation with mapped providers and by facilitating new broadband service options; and 3) to map and analyze information from consumers about areas of unmet broadband demand and alternatives to currently mapped services. A prime example of the second option is the utilization of the Rural Utility Service satellite eligibility tool. By simply entering the consumer's address, the CN engineer can quickly determine if the consumer meets the initial qualification status for BIP satellite subsidies.

New BBIs are assigned to either the GIS department or the Engineering & Technical Services (ETS) team depending on the category entered by the consumer on the website submission form. The GIS or ETS team members respond to each inquiry according to the information requested by the consumer. Many BBIs can be resolved through desktop research; however, if a BBI requires research in the field, the assigned ETS team member conducts such research when performing field validations in the area of the inquiry, or at other such time as is practical and appropriate. GIS and ETS team members respond to and conclude BBIs via telephone contact and/or e-mail communication.

The broadband inquiry process has been implemented in each of the CN state programs with successful results. Altogether CN has received over 18,600 broadband inquiries since 2007, allowing the state programs to evaluate each inquiry for broadband demand and data verification. These inquiries are continuously examined against current broadband availability, updated every six months, to determine if previously unserved households have been expanded to and can now receive broadband at their residence. This database of broadband inquiries has also allowed the CN state programs to aggregate demand in concentrated areas to show providers the exact locations where the population has made it clear that they would purchase broadband if it was made available to them. Providers in the states have responded to this process and have expanded to areas knowing that their investment will be worthwhile. Data verification methods have also proven successful, as the state programs have been able to show those inquiries that indicate the broadband service areas are misrepresented on the map to providers, who then verify where service cannot reach in regard to that residence(s). The broadband coverage in these states has been altered to create a more accurate map based on the inquiries submitted by the public.

During this reporting period, the Connect Ohio project has received a total of 155 inquiries (1,666 grant inception to date). As more inquiries are submitted to Connect Ohio, a more thorough validation of the broadband landscape can be performed, while also allowing providers to see which areas have a high demand for broadband adoption.

MY CONNECTVIEW METHODOLOGY

My ConnectView is an online, interactive mapping tool for viewing, analyzing, and validating broadband data. Developed using Esri's ArcGIS for Server and Adobe's Flex Framework and hosted and maintained by Connected Nation, My ConnectView is a multi-functional, user-friendly way for local leaders, policymakers, consumers, and technology providers to devise a plan for the expansion and adoption of broadband.

First and foremost, My ConnectView allows consumers to locate their residence and identify providers that offer broadband Internet service to that location. The interactive platform allows for users to build and evaluate broadband expansion scenarios using a wealth of data, including several coverage analysis layers, speed analyses, Community Anchor Institutions, and tools to search and export household demographic information, as well as extract data in GIS, spreadsheet, and/or PDF formats.

My ConnectView also features more interactive data layers and additional tools than ever before to allow the consumer to explore the broadband data. My ConnectView provides consumers with the ability to print, e-mail, and provide feedback on the broadband data displayed on the interactive map. Through the collection of this feedback, a visual demand for broadband is presented. This visualization allows the CN state programs the ability to validate the broadband availability for accuracy. If residents within a region state they are without broadband, but the interactive map shows otherwise, this allows CN to approach the providers within that area in an effort to trim down their coverage to more accurately represent real-world availability on the ground.

The Connect Ohio project launched My ConnectView on April 2, 2012, and received 2,788 visits this reporting period; to date the interactive mapping applications have received 13,193 visits.

Speed Test Methodology

The 1,945 speed tests that are represented in the Connect Ohio Speed Test Report during this reporting period (13,381 grant inception to date) are the result of a partnership between CN and Ookla Net Metrics. Utilizing this relationship increases the level of confidence in the data being collected and provides for a far greater sample size than could be collected by a single testing site.

Ookla owns and operates Speedtest.net, as well as develops and deploys speed tests, such as the Connect Ohio speed test website, for partners around the world. This network of sites that is developed and run on its testing technology provides Ookla with a vast dataset that, due to the variability of geographic information collected across the varying speed test sites, is geocoded utilizing Geo-IP technology. This technology allows for tests to be geocoded to points of aggregation, typically larger nodes across provider networks. While there are hundreds of thousands of tests that have been conducted, the level of aggregation is only sufficient for county-level detail due to the test results being located at these larger nodes and not at an absolute location for each speed test.

In an effort to validate broadband data from the Connect Ohio project, speed test information is collected throughout the state. Speed tests provide speed information on the path taken through all networks (a provider's network as well as additional networks) a local machine must connect to in order to reach the host test. The benefit of this collection of speed information is two-tiered. First, it allows for a comprehensive dataset of speeds, while also providing Connect Ohio with the information on where broadband services are available. Second, unlike theoretical speed information which was received through the data collection process, the use of speed tests provide real-world information on the speeds that currently exist within the state of Ohio.

Providers Deemed Non-Viable

The following list of companies represents the remainder of the broadband provider universe that was originally identified as complete for outreach to begin for the State Broadband Initiative. These providers are not included in the Data Package for the October 2012 submission because they have been deemed non-eligible under the parameters and guidance of the SBI grant program. This list of companies includes, but is not limited to: providers offering service but below the current definition of broadband, those that have gone out of business, technology consulting firms, infrastructure or network construction companies, non-facilities based general resellers, etc.

	Company Name	URL	Comments
1	21Globe, Inc.	www.21globe.com/is/access/	General reseller of DSL and backhaul.
2	650Net	www.650net.net/	Dial-up only.

3	A 007 Access	www.a007.com/	General reseller of Quest DSL and mobile wireless; DSL does not qualify as the max advertised speed is 768 kbps x 128 kbps.
4	AAA Internet Service	n/a	URL no longer in service.
5	Aaccess Network Communications	www.aaccess.net/	Not a broadband provider; installs and maintains WiFi systems.
6	ACC-NET	www.acc-net.com/	This company is no longer an active provider or in business.
7	ACERX.NET	http://acerx.net/	General reseller but no contact information listed on website; requests for information were never returned.
8	Adelphia	n/a	No longer in business; assets liquidated.
9	Airespring, Inc.	www.airespring.com	General reseller of VOIP, long distance and data circuits (non-residential).
10	Airewaves Broadband, LLC	www.airewaves.com	URL no longer in service.
11	Airmail247.com	www.airmail247.com	Business mailing list search site; not a broadband provider.
12	Alphalink Technologies	www.alink.com/index.htm	This company is a nonfacilities-based reseller.
13	American Broadband & Telecommunications	www.ambt.net	This company is a nonfacilities-based reseller.
14	Antioch Wireless Broadband	www.antiochwirelessbroadband.com/	Resells DSL and cellular service in Antioch, IL only.
15	Arrowheadnet.com	www.arrowheadnet.com/	Domain registration and web hosting company.
16	bargainisp.net	www.bargainisp.net/	Generic web directory site; company does not offer broadband.
17	Beonline	www.beol.net	This company is a nonfacilities-based reseller.
18	Bonzai Pipeline, Inc.	www.bonzaipipeline.net	This company is no longer in business.
19	BreezeWave Broadband	www.breezewave.com	This company is no longer in business.
20	Bright Choice	www.brightchoice.com	Bright Choice was acquired by Omnicity.

21	Broadband National	www.broadbandnational.com	Nonfacilities-based general reseller of DSL and satellite for 36 companies (e.g., ACC Business, HughesNet, et al.).
22	Broadview Networks Holdings, Inc.	www.broadviewnet.com	Wholesale reseller of partners' communication products and services; company is nonfacilities-based.
23	BullsEye Telecom, Inc.	www.bullseyetelecom.com	Integrated suite of telecommunications services for businesses and general reseller of backhaul.
24	Byesville.Net	www.byesville.net	This company is no longer in business.
25	Cable One	n/a	Inactive; non-state provider.
26	CAC MediaNet, Inc.	n/a	No longer in business; acquired by First Step (Michigan general reseller of DSL).
27	Camino-Net Internet Services	www.camino-net.com	No longer in business; was dial-up only.
28	CanNet Internet Services	www.cannet.com	Offers dial-up and B2B services, webhosting, etc.
29	Canton Cable	n/a	Acquired by Comcast.
30	CCIS.net	www.ccis.net	Now owned by Beacon Technologies; offers dial-up and is general reseller of DSL in Pennsylvania.
31	Celito Communications	www.celito.net/	Offers dial-up and wireless in North Carolina.
32	CIMCO Communications, Inc.	www.cimco.net	This company is a nonfacilities-based reseller.
33	Clear Sky Communications	www.clearskycommunications.com/	This company is a general reseller of and an installation company for satellite services.
34	Cleartouch.Com	n/a	This company is no longer in business.
35	CloverNet	n/a	Script coding application company.
36	Coax-Net	www.coax.net	This company is a nonfacilities-based reseller.
37	Cobridge Communications, LLC	www.cobridge.net/communications	This company was acquired in Ohio by Time Warner.

38	Cognisurf	www.calling-plans.com	Dial-up internet provider.
39	Columbus Cable	n/a	Possibly acquired by Comcast; OSS service branch.
40	Combined Technologies Inc.	www.ctipack.com	This company is no longer in business.
41	Communication Options Inc.	www.coi.net	Provides B2B and residential dial-up.
42	config.com Internet	www.config.com	Nonfacilities-based reseller; provided limited data but not enough for creation of coverage area or identification of services.
43	CoreComm Wireless	n/a	This company is no longer in business.
44	Dacor Internet Services	www.dacor.net/	This company is a nonfacilities-based reseller.
45	Data-Tel of Illinois, Inc.	www.data-telinc.net/	This company is a nonfacilities-based reseller.
46	Davis Voice and Data	n/a	Cellular reseller only; does not operate a broadband network.
47	Dayton Digital Networks	www.daytondigital.net	No longer offers broadband services.
48	Deltaforce	www.deltaforce.net	Dial-up and webhosting services only.
49	deluxehost.com	deluxe-host.com	Offers web hosting only.
50	Devlin Express	www.devlinex.com	This company is a nonfacilities-based reseller.
51	DGUI	www.dgui.com/	No longer in business; domain name for sale.
52	DHB Networks, Ltd.	www.dhbnetworks.com	This company is no longer in business.
53	Dial National	www.dialnational.com/	Inactive URL; out of business.
54	Dialer.net	www.dialer.net/internet_access/United_States.html	Offers international dial-up services.
55	DigitalBridge Communications Corp.	n/a	Non-state provider; serves Idaho, Indiana, Montana, South Dakota, Virginia, and Wyoming.
56	DSL @ Interlync	www.interlync.com	General reseller of Covad and for this mapping cycle they have been non-responsive.

57	DTS-NET.COM	www.dts-net.com/	Provider of wholesale and retail telecommunications services.
58	Duvall Wireless	www.duvallwireless.net	This company is no longer in business.
59	East Allen High Speed Internet, LLC	n/a	Non-state provider; serves Allen County, Indiana.
60	East Palestine Internet, Inc.	www.epiinternet.com/	Company appears to have gone out of business; phone is disconnected and Inactive URL.
61	Enventis Telecom Inc.	n/a	Non-state general reseller.
62	Erielink LLC	www.erielink.com	No longer in business.
63	ETI - Connecting Your World	www.cyberenet.net/	General reseller of DSL services from infrastructure owned by Verizon, AT&T, and Covad.
64	EZnet Ohio	www.2.ezo.net/iserv.htm	Provides dial-up service.
65	FairPoint Broadband	www.fairpoint.com	Non-state provider.
66	Fast Dependable Access	www.fda.net	Inactive URL; company appears to have gone out of business.
67	g wireless, Inc.	http://www.g-wireless.net	Acquired by another company.
68	Galaxywave Internet	www.galaxywave.net/	Phone number was disconnected.
69	Global Crossing Telecommunications, Inc.	n/a	Acquired by another company.
70	GO Concepts	n/a	This company is a nonfacilities-based reseller.
71	Great American Broadband, Inc.	www.oibw.net	Non-state provider; serves Indiana.
72	Hubwest Protected Networks LLC	www.hubwest.com	Dial-up and web hosting only.
73	iDigi Wireless	www.digi.com	Inactive URL; no longer in business.
74	Imbris, Inc.	www.imbris.com	Provides fixed wireless in Idaho only.
75	IMGISP.NET	www.imgisp.net/	Search engine.
76	Incredible Networks	n/a	Inactive URL; out of business.
77	Inercom Communications Inc.	www.inercom.com	Inactive URL; out of business.

78	Interactiveinfo.com Inc.	www.rocketbroadband.com	Offers cable television services in NY only.
79	In-Touch Software	www.intouchsoftware.co.uk	Software development company.
80	iRadical	n/a	Inactive URL; out of business.
81	ISPartner.net	n/a	Inactive URL; out of business.
82	KAS Cable TV	www.kascable.com	This company is a nonfacilities-based reseller.
83	KeyOn Communications, Inc.	www.keyon.com	This company was acquired by New Knoxville Telephone Company.
84	LARIAT.NET	www.lariat.net/	Offers fixed wireless services in Wyoming only.
85	LCSisp.com	www.lcsisp.com/index.cfm	Offers national dial-up services only.
86	Lek.net Internet Services, Inc.	www.lek.net	General reseller of AT&T DLS and offers dial-up and computer repair.
87	LightEdge Solutions, Inc.	www.lightedge.com	IT consulting; LightEdge does not provide residential service in any state.
88	Lightyear Network Solutions, LLC	www.lightyear.net	Nonfacilities-based general reseller.
89	LinkAmerica.Net	www.linkamerica.net/	Inactive URL; out of business.
90	Magnum Cable	n/a	Inactive URL; out of business.
91	MainBoard	www.mainboard.cc/internet.htm	General reseller in Virginia.
92	Maine Cable and Wireless	www.mainecableandwireless.com	Inactive URL; out of business.
93	Marcin Company	n/a	Inactive URL; out of business.
94	Metropolitan Telecommunications Holding Company	n/a	MetTel provides facilities-based and resold services (certified CLEC in some states); the company provides a variety of voice, including wireless, and data services to commercial customers.
95	Millenicom Inc.	www.millenicom.com	General reseller of dial-up and mobile broadband (Sprint network).
96	Nanomega.Com	www.nanomega.com	Inactive URL; out of business.
97	NCO Wireless	www.ncowifi.com	Acquired by NexGen Access.
98	NetAccess, Inc.	www.nas.net/	Offers wireless B2B services only.
99	NetSpeed Online	www.netspeed-online.net	Inactive URL; out of business.

100	New Edge Network, Inc.	www.newedgenetworks.com	Acquired by EarthLink.
101	Northwest ISP	www.northwestisp.com/	Inactive URL; out of business.
102	nTelos, Inc.	n/a	Non-state provider; offers mobile wireless cards in West Virginia.
103	NuVox, Inc.	www.nuvox.com	Acquired by Windstream.
104	OffWorld1	n/a	Inactive URL; no longer in business.
105	ONEcom Wireless	n/a	Inactive URL; no longer in business.
106	Open Range Communications, Inc.	http://www.openrangecomm.com/	No longer in business.
107	Overarch Broadband	n/a	Offers services in Idaho only.
108	Pacific Internet Exchange	www.pie.us/	Inactive URL; company appears to have gone out of business.
109	PAETEC Communications, Inc.	http://www.paetec.com/	Acquired by another company.
110	Paknet Limited	n/a	Subsidiary of Pakistan Telephone Company; no services offered in the U.S.
111	Pattersonville Telephone Company	n/a	Does not offer broadband service.
112	Planet Online	www.planetonline.net/	Offers website hosting services.
113	Practical Support, Ltd.	http://www.practicalsupport.com/	Offers service, but below broadband threshold.
114	PremoWeb	www.premoweb.com/about_us/contact_us.html	Offers national dial-up services only.
115	Reliance Globalcom Services, Inc.	www.relianceglobalcom.com	California-based company; non-state provider.
116	Renaissance Networks	www.renaissancenetworks.com/	IT support company based in New Mexico.
117	Simply Dialup A Metrogeek Company	www.simplydialup.com/	Offers dial-up only.
118	Siscom Internet Service	www.siscom.net/index.html	This company is a nonfacilities-based reseller.
119	SkyLAN	n/a	This company is not a broadband provider.

120	Skymax Broadband, Inc.	http://www.skymaxbroadband.com/	No longer in business.
121	Sling Broadband	n/a	Non-state provider; WISP in Florida.
122	Supernova Systems, Inc.	home.onlyinternet.net/	Company acquired by Great American Broadband.
123	Surferz.Net	www.surferz.net/	Offers dial-up in upstate NY only.
124	T1 Shopper	www.t1shopper.com/	Search engine for general reseller.
125	TelNet Worldwide, Inc.	n/a	Does not offer broadband service.
126	The Iserv Company, LLC	www.iserv.net	This company is a nonfacilities-based reseller.
127	The T1 Company	www.t1company.com	Offers B2B services.
128	Total Access Networks, Inc	n/a	Does not offer broadband service.
129	TSISP.NET	www.tsisp.net	Inactive URL; out of business.
130	U.S. Wireless Online, Inc.	n/a	Non-state provider; acquired by Caviair and offers service in Florida only.
131	University Corporation for Advanced Internet Development	n/a	Currently ineligible under the parameters and guidance of the SBI grant program.
132	Untangled Technology, LLC	n/a	Company Acquired by Lightspeed Technologies.
133	UNUM Telecommunications, Inc.	www.utinet.net/	Inactive URL; out of business.
134	WCNet	www.wcnet.org/rates/hispeed/	This company is a nonfacilities-based reseller.
135	Wcoil	www.wcoil.com	Despite numerous outreach efforts, this company remains nonresponsive; accordingly, we are uncertain of the types of services offered.
136	WilTel Communications, LLC	www.level3.com	Acquired by Level 3.
137	WireFire Internet	www.wirefire.com	Acquired by FiberNet.
138	Wireless Roanoke, Inc.	www.wirelessroanoke.com/	Inactive URL; out of business.
139	wisbin	www.wisbin.com/	No longer in business.
140	www.AmericanAngel.us	www.americanangel.us/	Inactive URL; out of business.

141	YEYZOO.NET	www.yeyzoo.net/	Inactive URL; out of business.
142	YLISP (Your Local ISP)	www.itsyournet.com	Resells DSL and dial-up.
143	YourT1Wifi.com	yourt1wifi.com/	Offers wireless service in Idaho only.
144	Zito Media Communications, II, LLC	n/a	Zito Media does not yet offer broadband service in Ohio.
145	ZOOM Internet Services, LLC	n/a	Michigan-based dial-up provider and web hosting company.

APPENDIX A: ESTIMATION OF NON-PARTICIPATING PROVIDERS

GLW Broadband

Wireless Intranet

GLW BROADBAND

As part of its ongoing broadband mapping efforts, Connected Nation has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying last-mile broadband provider, regardless of whether the provider has chosen to support and participate in the SBI mapping initiative.

The following narrative provides detail regarding the recent, and ongoing, data collection and coverage estimation activities related to GLW Broadband (GLW) a cable television and cable modem Internet service provider, located in Grafton, Ohio with a service area around Grafton, LaGrange and Wellington, Ohio (and certain unincorporated of Lorain County). The narrative will include information regarding how and where CN obtained publicly available data and utilized on-the-ground validation and infrastructure verification techniques that support the underlying data.

Background

From March 1, 2010, through February 8, 2012, CN made 43 attempts to contact the provider (either by phone, e-mail, or in person). On two occasions (e-mail response from April 23, 2010 and conversation with a CSR on February 18, 2011) the provider refused to participate. On July 19, 2012, (after attempting to contact and persuade the provider 4 more times during this mapping cycle) a CN staff member decided that a field audit and coverage estimation document would be the only way that this provider would be represented on the National Broadband Map. On August 7, 2012, two CN staff members were dispatched into the field to gather data necessary for the creation of a coverage estimation document and map.

The Issue

GLW has predicated its refusal to participate in the Connect Ohio broadband mapping initiative.

Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing

CN has built a file based on research information and, as time progressed, enriched the file with information obtained through the public domain or through on-the-ground research and site verification. For example, CN reviewed the provider's website (www.glwb.net) to determine the residential service plans **(Exhibit A)** and reviewed the Ohio Department of Commerce, Video Service Authorization to determine the approximate service area **(Exhibit B)**.

A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) the system FRN #0004982286 **(Exhibit C)**. Also, to support field validation of access points, the FRN was referenced against the FCC Universal Licensing System (ULS) to identify any FCC authorizations that the provider may hold. This process yielded no license results.

Internet Service

Tired of dialing up and being disconnected? With GLW Broadband Internet, you get the lightning fast download speeds up to 150 times faster than 56k dialup. Our Broadband Internet is up to 10.5 times faster than 768k DSL.

GLW Broadband Internet access is a high speed, online service that provides lightning fast access to the internet as well as to the ever increasing unique broadband content and services provided across the internet. Broadband Internet is delivered to your computer over the same upgraded cable systems that currently bring cable television in your home. Cutting-edge technology advancements implemented over comprehensive regional and national bandwidth networks get you to your internet destinations in seconds.

GLW Broadband Internet is an "always-on" technology meaning there are no connection times. When you open your browser, you are instantly on the internet. No longer will you tie your phone line up or pay for a phone line dedicated to your computer.

As a Broadband Internet subscriber, you will be able to watch a movie trailer on line, call a friend and check movie times and locations, ALL AT THE SAME TIME!

<u>Preliminary Identification of Provider's Coverage Area</u>

Connected Nation determined the approximate parameters of the service area from the provider's website and from review of the Ohio Department of Commerce, Video Service Authorization for GLW. CN staff members travelled to Grafton, Ohio on August 7, 2012, to begin driving through the service territory and to begin their data collection process. The first stop along the way was in the Village of Grafton where the CN staff members requested a copy of the local franchise agreement (see excerpts in **Exhibit H)**; in this instance the franchise agreement specifies (Section 2.3 A, B & C) where and how the cable system's plant can be constructed on poles, easements, etc.

Next, the CN staff members drove throughout Lorain County systematically working towards LaGrange and then to Wellington **(Exhibit D)** as they confirmed the presence of cable plant. The CN staff members stopped and visited with representative from City Hall in both LaGrange (Village Administrator) and Wellington (Village Manager) and discussed the franchise agreements for those villages. While representatives from each location confirmed that the franchise agreement was substantially the same as Grafton, neither person had immediate access to the franchise agreement in time to make copies.

In all, the trip consisted of approximately 150 miles of "line driving" and/or visually confirming the location of offices, drop box locations, and aerial and underground plant **(Exhibit E)**. The concept being simple: where there is no cable, there can be no cable modem Internet service. While the coverage estimation submitted herein does not account for 100% of the service area of GLW, it does provide a robust general representation of their coverage area. This "line driving" allowed the CN engineers to create a GPS trail as illustrated in Exhibit D, use the data to create a Google Earth Image **(Exhibit F)** and then convert the image into a Connect Ohio coverage map for GLW **(Exhibit G).**

Q. "Standard Installation" means any residential installation that can be completed using a drop on one hundred fifty (150) feet or less.

R. "Street" means the surface of, and the space above and below, any public or private street, road, highway, freeway, lane, alley, path, court, sidewalk, parkway or drive, or any easement or right-of-way now or hereafter held by the Village.

S. "Subscriber" means any Person who lawfully receives Cable Television Service. In the case of multiple office buildings or multiple dwelling units, the "Subscriber" means the lessee, tenant or occupant.

T. "Unlawful" shall mean an act initiated by any person and will be considered a misdemeanor.

SECTION 2.

GRANT OF AUTHORITY AND GENERAL PROVISIONS

2.1) Franchise Required. It shall be unlawful for any person to construct, operate or maintain a Cable Communications System in the Village unless such person or the person for whom such action is being taken shall have first obtained and shall currently hold a valid Franchise granted pursuant to this Ordinance. It shall also be unlawful for any person to provide Cable Television Service in the Village unless such person shall have first obtained shall currently hold a valid Franchise granted pursuant to the provisions of this Ordinance. All Franchises granted by the Village pursuant to this Ordinance shall contain the same substantive terms and conditions.

2.2) Grant of Franchise. This Franchise is granted pursuant to the terms and conditions contained herein. Such terms and conditions shall be subordinate to all applicable provisions of state and federal laws, rules and regulations.

2.3) Grant of Nonexclusive Authority. The Grantee shall have the right and privilege to construct, erect, operate and maintain, in, upon, along, across, above, over and under the Streets, alleys, public ways and public places now laid out or dedicated and all extensions thereof, and additions thereto in the Village, poles, wires, cables, underground conduits, manholes and other television conductors and fixtures necessary for the maintenance and operation in the Village of a Cable Communications System as herein defined. The Cable Communications System constructed and maintained by Grantee or its agents shall not interfere with other uses of streets. Grantee shall make use of existing poles and other facilities available to Grantee to the extent it is technically and economically feasible to do so.

A. Notwithstanding the above grant to use Streets, no Street shall be used by Grantee if the Village in its sole opinion determines that such use is inconsistent with the terms, conditions or provisions by which such Street was created or dedicated, or with the present use of the Street. The Village shall be notified by the grantee of any proposed and or scheduled underground additions to Grantee's system.

B. This Franchise shall be nonexclusive, and the Village reserves the right to grant a similar use of said Streets, alleys, public ways and places, to any Person at any time during the period of this Franchise, provided, however, that any additional Franchise grants shall be under the same substantive terms and conditions as this Franchise.

C. Grantee shall have the authority to use the Village easements, public rights-of-way, Streets and other conduits for the distribution of Grantee's System. The Village may require all developers of future subdivisions to allow and accommodate the construction of the System as part of any provisions for utilities to serve such subdivisions.

2.4) Franchise Term. This Franchise shall be in effect for a period twelve (12) years from the date of acceptance by Grantee, unless renewed, revoked or terminated sooner as herein provided.

2.5) Previous Franchises. Upon acceptance by Grantee as required by Section 13 herein, this Franchise shall supersede and replace any previous Ordinance or Agreement granting a Franchise to Grantee to own, operate and maintain a Cable Television System within the Village. The Ordinance 80-995 is hereby expressly repealed.

2.6) Compliance with Applicable Laws, Resolutions and Ordinances. The Grantee shall at all times during the life of this Franchise be subject to all lawful exercise of the police power and the right of eminent domain by the Village. This Franchise shall comply with the Ohio franchise standards contained in the Ohio Revised Code.

2.7) Rules of Grantee. The Grantee shall have the authority to promulgate such rules, regulations, terms and conditions governing the conduct of its businesses as shall be reasonably necessary to enable said Grantee to exercise its rights and perform its obligation under this Franchise and to assure uninterrupted service to each and all of its Subscribers; provided that such rules, regulations, terms and conditions shall not be in conflict with provisions hereto, the rules of the FCC, the laws of the State of Ohio, the Village or any other body having lawful jurisdiction thereof and except upon occurrence of acts beyond the reasonable control of Grantee or acts of God.

2.8) Territorial Area Involved. This Franchise is granted for the corporate boundaries of the Village, as it exists from time to time. In the event of annexation by the Village, or as development occurs, any new territory shall become part of the area covered, provided, however, that Grantee shall not be required to extend service beyond its present System boundaries unless there is a minimum of thirty (30) homes

WIRELESS INTRANET INC.

As part of its ongoing broadband mapping efforts, Connected Nation (CN) has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying broadband provider, regardless of whether the provider has chosen to support and participate in the State Broadband Initiative (SBI) program.

The following narrative provides detail regarding the recent data collection and coverage estimation activities related to Wireless Intranet, Inc., an Ohio wireless Internet service provider (WISP), with service areas in and around Delaware, Morrow, Marion and Union counties. The narrative will include information regarding how and where CN obtained publicly available data and the on-the-ground validation and site verification techniques that support the underlying data.

Background

From March 10, 2010, through the April 2012 NTIA mapping submission, CN staff members conducted multiple outreach sessions to attempt to obtain the participation of the provider with 19 instances of communication (telephone and e-mail). However, since the requests were never acknowledged, the provider record was flagged for an on-the-ground data collection exercise at the end of the April 2012 submission cycle. Two additional attempts were made during this mapping cycle (May 4, 2012 and June 8, 2012) prior to dispatching CN staff members into the field. On June 13, 2012 two members of the CN engineering and technical services team drove through the provider's coverage area to independently gather the data.

The Issue

Wireless Intranet, Inc., by its lack of responsiveness since March 10, 2010, has predicated its unwillingness to participate in the Connect Ohio broadband mapping initiative.

Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing

CN began building a file based on research information and, as time progressed, enriched the file with information obtained through the public domain, prior to conducting in-field spectrum testing. Despite the fact that Wireless Intranet, Inc. displays its coverage area on its website **(Exhibit A)**, the provider refused to offer any data that could be used for the construction of a complete dataset for submission to NTIA. All publically available, such as maximum advertised speeds, **(Exhibit B)** or searches for federal registration numbers **(Exhibit C)** were combined with the data gathered in the field in order to develop and present this coverage estimation document to the NTIA.

A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) system yielded a "no match" (Exhibit C) response. Additionally, the FCC Universal Licensing System (ULS) was searched to determine if the provider was the authorization holder of any spectrum, including but not limited to FCC Radio Service "NN" for 3650 MHz authorizations; this search also yielded "no match" **(Exhibit D)**.

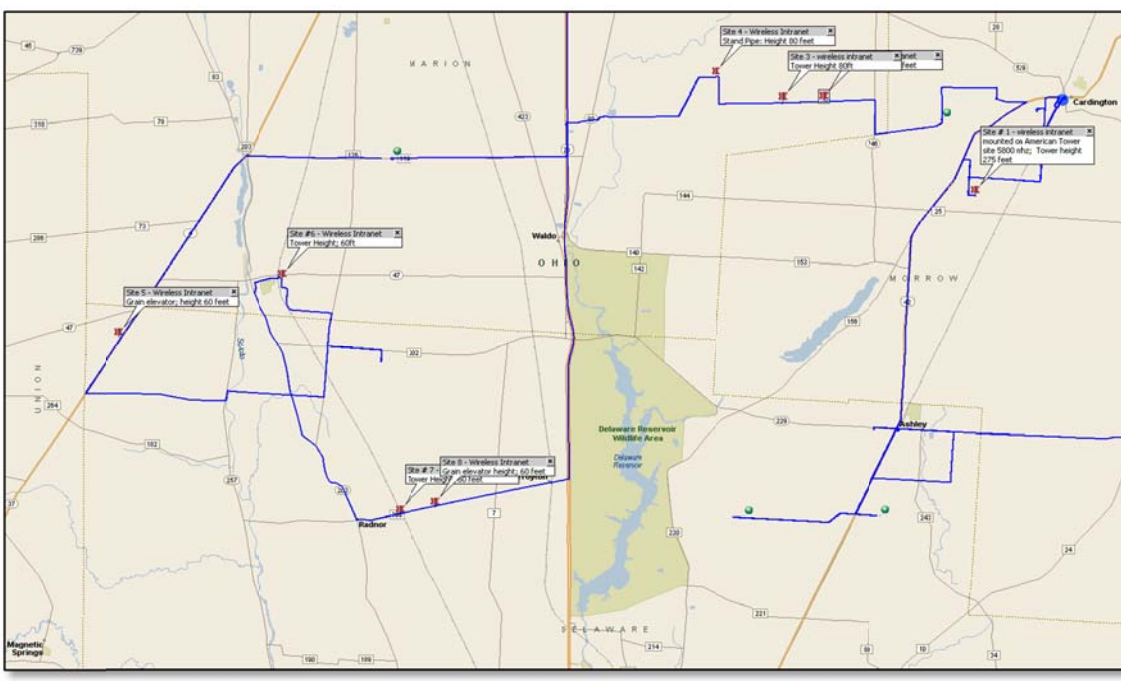
Preliminary Identification of Provider's Coverage Area

Eight transmit site locations were identified during the course of the field research and these locations were captured in a GPS route using Microsoft *Streets & Trips* **(Exhibit E).**

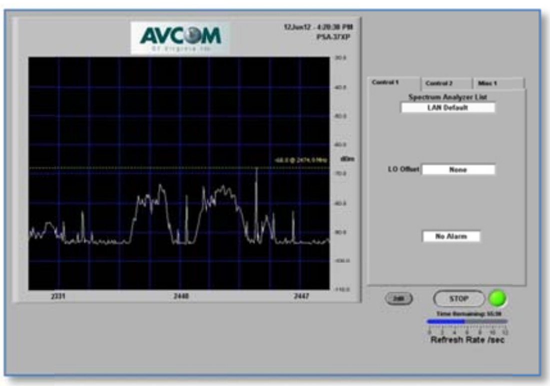
Exhibit E: Validation Points for AP Structures

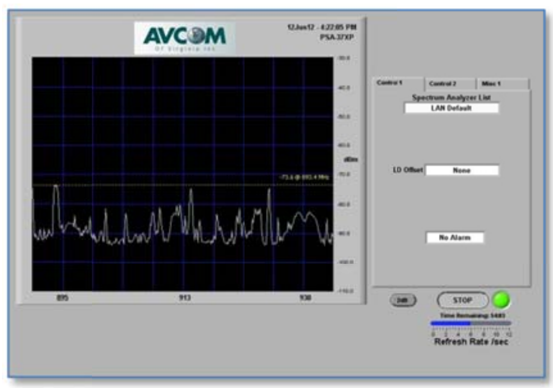


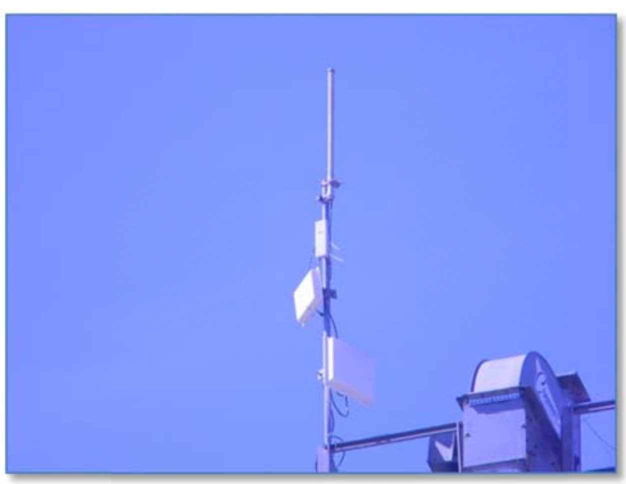
Testing Techniques

CN staff developed a data collection and site validation route based on information as outlined above primarily using the provider's coverage area (as depicted on the website) and attempting to identify centerline coordinates for each transmit location. CN staff members then used the "estimated" centerline coordinates to review satellite images from Google Earth in an attempt to isolate vertical structure that could be the transmit locations (water tanks, grain elevators, rooftops and/or towers). To ensure accuracy of the coverage estimates, the CN engineer also included wireless transmit sites of neighboring WISPs to eliminate confusion when a transmit site was located. For example, known transmit sites, from WISPs that have voluntarily submitted data, were also geocoded and "eliminated" during the on-the-ground search to ensure that erroneous signal testing was mitigated. The CN wireless engineer was equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900 MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands **(Exhibit F)**. Each validation point was scrutinized for frequency of operation. A screen image of the operating frequency (or frequencies) was captured; general notes were recorded for each location-approximate antenna height, frequency of operation, antenna type (omnidirectional or sectored) and photographs were taken of the access points.

Exhibit F: Field Data Samples for Wireless Intranet Tower Locations







<u>Results and Submission for October 2012</u>

Through the analysis of the combined 8 estimated locations, 8 access points were ultimately identified and relative information was logged into the Wireless Intranet field validation notes file **(Exhibit G)**. The CN engineer then used the datum for each tower site to create a composite propagation study **(Exhibit H)**.

Provider Name	Platform	Status	NDA Execution Date	Notes
JB-Nets, LLC	Fixed Wireless	Approval for Update Not Received - Data Still Submitted	4/5/2010	[AUG-30-12 Jess Cary] Change: Provider added new towers and expanded coverage area.
MetaLINK Technologies, Inc.	Fixed Wireless	Approval for Update Not Received - Data Still Submitted	3/22/2010	[SEP-10-12 Jess Cary] Change: Provider subtracted and added towers.
Amplex Internet	Fixed Wireless	Data Added to Statewide Inventory	3/26/2010	[AUG-21-12 Amanda Bentley] Change: Provider expanded service area; new towers sites were added.
AT&T Inc.	DSL	Data Added to Statewide Inventory	12/16/2009	[AUG-24-12 Amanda Bentley] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
AT&T Inc.	Mobile Wireless	Data Added to Statewide Inventory	12/16/2009	[AUG-20-12 Amanda Bentley] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Bascom Mutual Telephone Company	Fiber	Data Added to Statewide Inventory	3/22/2010	[JUL-13-12 Amanda Bentley] Change: Provider expanded service area; upgrading cable broadband network over to fiber.
Bascom Mutual Telephone Company	Cable	Data Added to Statewide Inventory	3/22/2010	[JUL-13-12 Amanda Bentley] Change: Provider reduced cable broadband service area due to upgrading network to fiber.
Blu Sky Wireless	Fixed Wireless	Data Added to Statewide Inventory	2/24/2010	[AUG-20-12 Amanda Bentley] Change: Provider expanded service area; new towers sites were added.
CenturyLink	DSL	Data Added to Statewide Inventory	12/4/2009	[AUG-10-12 Amanda Bentley] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Clearwire Corporation	Mobile Wireless	Data Added to Statewide Inventory	3/3/2010	[JUL-09-12 Amanda Bentley] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Comcast Cable Communications, LLC	Cable	Data Added to Statewide Inventory	12/7/2009	[AUG-10-12 Amanda Bentley] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Country Connections LLC	Fixed Wireless	Data Added to Statewide Inventory	2/15/2010	[AUG-02-12 Amanda Bentley] Change: Provider decommissioned some previous towers but added additional tower sites and expanded coverage.
CoxCom Inc.	Cable	Data Added to Statewide Inventory	1/29/2010	[AUG-03-12 Amanda Bentley] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Frontier Communications Corporation	DSL	Data Added to Statewide Inventory	1/22/2010	[AUG-08-12 Amanda Bentley] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Imagine Networks, LLC	Fixed Wireless	Data Added to Statewide Inventory	7/13/2011	[JUL-13-12 Amanda Bentley] Change: Provider expanded service area; new tower site and 2 new sectors to existing towers were added.
Intelliwave, LLC	Fixed Wireless	Data Added to Statewide Inventory		[AUG-10-12 Amanda Bentley] Change: New tower sites were added and others decommissioned. Intelliwave no longer operates networks in Vinton, Jackson, Gallia, and Lawrence Counties.
Jefferson County Cable TV, Inc.	Cable	Data Added to Statewide Inventory	2/1/2010	[JUL-10-12 Amanda Bentley] Change: Provider expanded service area.
Leap Wireless International, Inc.	Mobile Wireless	Data Added to Statewide Inventory	4/6/2010	[AUG-03-12 Amanda Bentley] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.

Massillon Cable TV, Inc.	Cable	Data Added to Statewide Inventory	2/9/2010	[JUL-16-12 Amanda Bentley] Change and Correction: Provider expanded coverage area; also removed incorrect coverage from one road.
MegaPath Inc.	DSL	Data Added to Statewide Inventory	2/15/2010	[AUG-30-12 Jess Cary] Correction: Submitting data for the first time, but service was offered previously.
Mobilcomm	Fixed Wireless	Data Added to Statewide Inventory	2/16/2012	[SEP-5-12 Jess Cary] Change: Provider added new towers and expanded coverage area.
New Era Broadband, LLC	Fixed Wireless	Data Added to Statewide Inventory	7/12/2010	[JUL-10-12 Amanda Bentley] Change: Provider expanded service area; new towers sites were added.
New Knoxville Telephone Company	Fixed Wireless	Data Added to Statewide Inventory	3/12/2010	[SEP-5 Jess Cary] Change: Provider added new towers and expanded coverage area.
Spacenet Inc.	Satellite	Data Added to Statewide Inventory		[SEP-6-12 Jess Cary] Correction: Initial submission of provider's coverage, but they were in service previously.
Sprint Nextel Corporation	Mobile Wireless	Data Added to Statewide Inventory	1/14/2010	[JUL-13-12 Amanda Bentley] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
T-Mobile USA, Inc.	Mobile Wireless	Data Added to Statewide Inventory	1/8/2010	[AUG-08-12 Amanda Bentley] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
TDS Telecommunications Corporation	DSL	Data Added to Statewide Inventory	1/27/2010	[AUG-10-12 Amanda Bentley] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Time Warner Cable LLC	Cable	Data Added to Statewide Inventory	12/21/2009	[AUG-16-12 Amanda Bentley] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Verizon Communications, Inc.	Mobile Wireless	Data Added to Statewide Inventory	12/14/2009	[AUG-03-12 Amanda Bentley] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
ViaSat, Inc.	Satellite	Data Added to Statewide Inventory	1/8/2010	[AUG-08-12 Amanda Bentley] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Wavelinc Communications	Fixed Wireless	Data Added to Statewide Inventory		[SEP-6-12 Jess Cary] Change: Provider added additional towers.
Your Digital Partner	Fixed Wireless	Data Added to Statewide Inventory	6/28/2010	[SEP-5-12 Jess Cary] Change: Provider's initial submission; service now meets broadband speeds.
Bascom Mutual Telephone Company	Backhaul	Backhaul Provider Only Processing Complete	3/22/2010	
Com Net, Inc.	Backhaul	Backhaul Provider Only Processing Complete		
First Communications, LLC	Backhaul	Backhaul Provider Only Processing Complete	8/13/2012	
Sprint Nextel Corporation	Backhaul	Backhaul Provider Only Processing Complete	1/14/2010	
T-Mobile USA, Inc.	Backhaul	Backhaul Provider Only Processing Complete	1/8/2010	
TDS Telecommunications Corporation	Backhaul	Backhaul Provider Only Processing Complete	1/27/2010	
Arthur Mutual Telephone Company	DSL	Speed Only Update; Data Processing Complete	12/22/2009	[AUG-16-12 Amanda Bentley] Change: Provider upgraded infrastructure and can now offer tier 3 upload speeds previously reported as tier 2; download speeds remain tier 5.
GLW Broadband	Cable	Estimated Coverage Submitted for Non-Participating Provider		[AUG-7-12 Jess Cary] Correction: Coverage estimated and submitted for non-participating provider.
Wireless Intranet	Fixed Wireless	Estimated Coverage Submitted for Non-Participating Provider		[AUG-28-12 Jess Cary] Correction: Coverage estimated and submitted for non-participating provider.

Oklahoma Broadband Mapping

Data Submission Methodology Report

October 1, 2012

Sanborn
1935 Jamboree Drive
Suite 100
Colorado Springs, CO 80920

Data Submission Report (October 1, 2012)

Table of Contents

1 Introduction

This report is submitted along with the sixth data submission for the Oklahoma Broadband Mapping Project. This submission includes all data collected so far per the requirements of the National Telecommunications and Information Administration (NTIA) State Broadband Data and Development Grant Program (Docket No. 0660-ZA29) Notice of Funds Availability (NOFA) and formal and informal clarifications to it. Specifically, it includes broadband data collected from broadband providers and community anchor institutions data compiled from various sources for the State of OK. The State of OK has retained a mapping contractor, The Sanborn Map Company to perform the work related to the Mapping Grant for this project. Data from the previous submission is now publicly accessible via the OK Broadband Program (http://broadbandmapping.ok.gov/).

This document is a supplement to the five previous reports submitted with previous data submissions on May 1, 2010, October 1, 2010, April 1, 2011, October 1, 2011, and April 1, 2012 respectively. Therefore, it builds on the documents provided with those submissions. Rather than repeat the contents of the previous report, this document makes incremental updates on various topics where changes have been made in the methodology or reiterates the methodology used. Please refer to the previous documents for further details.

2 Overall Project Status

2.1 DATA COLLECTION

This section details data collection related to NTIA deliverables which include broadband data and community anchor institution data.

2.1.1 Broadband Data

For this submission, Sanborn started data collection efforts on July 5th, 2012 by sending out data update requests and technical data specifications. These were sent to a large list of companies which were compiled from multiple lists (FCC 477 list (dated June 30, 2011), Wireless Internet Service Providers Association (WISPA)) and from any providers that were identified through other sources such as web research, planning meetings, State outreach, etc. Sanborn also uploaded the final data for each provider in NTIA format from the previous submission on the Sanborn Provider Portal. The providers were encouraged to use the provider portal and update their information on it.

We followed the same contact and follow-up protocols as the previous submissions. In brief, this involved following up with already participating providers after sending them a letter requesting data updates. For newly identified providers, we contacted them three additional times and offered any/all support to make this as easy as possible. We provided a due date for submission but worked with providers who needed more time. If providers did not submit updated data and did not respond to our efforts to contact them, we reused their existing data.

The following are some of the important changes or no changes:

1. We continued to request all providers to provide us their speed information in mbps rather than as a speed tier. We did this in order to better validate the data, analyze served/underserved, and identify the breakdowns in speeds within a given tier. For this submission, 47% of the participating providers in OK have given us their speed in mbps rather than speed tier.

2. Like the previous submission, we also requested fixed wireless providers to provide us appropriate information to do propagation analysis. We had more success with this in the current submission. For those WISP providers that provided us the data to accomplish propagation, we used Radio Mobile to do propagation analysis and iterated with the providers until the parameters were suitably selected to get appropriate output. Propagation analysis results were provided to the providers for review through our provider portal and google kmz file formats to ensure validation. In OK, we were able conduct propagation analysis for six providers (AirLink, Cowboy.net, Omega 1 Wireless, PTCI, Plainsnet, and ProValue.Net) and collect propagation results from Link Technology for

one provider (HTS Wireless). Two providers submitted propagation results conduct themselves (Ruralinet, and Valnet).

3. We continue to not collect data from resellers.

4. Due to our NDA restrictions, last mile infrastructure points, if submitted by providers, are not being submitted to NTIA.

5. We continue to submit data for satellites in this submission based on NTIA clarifications. Four satellite providers have been identified in Oklahoma which are; Hughes, Starband, Wildblue, and Stratos. We have received data from all the companies listed above except for Stratos. We also were able to add an additional satellite provider, identified by NTIA (Skycaster) in this submission as well.

6. Due to NDA restrictions, address points are not included in this submission to NTIA for any commercial provider.

7. Some providers did not submit middle mile elevation or backhaul capacity, particularly when they asked us to reuse previous submission data. Wherever possible, we went back to providers to obtain that information, but it is not available for every record. In this submission, we also improved the elevation of middle mile data substantially. Some providers were providing elevation above sea level – we were able to work with the largest of these providers to resolve the issues and will continue to work on improving this over the next submission.

8. If a cable based wireline provider provides both DOCSIS 2.0 and DOCSIS 3.0 service to the same area, the block or road was listed only once with a technology code of 40.

9. Providers were only willing to indicate on a general level if they served business, residential or both, so we did not get any providers that broke down the type of service by block. Only if the provider stated they only serve business to business customers did we fill in the "category of end user" with a code of 2, otherwise this field was left blank. There are three providers in OK who are identified as serving business customers only. These are:

    1) Cogent Communications, Inc.
    2) TW Telecom of Oklahoma LLC
    3) XO Communications, LLC

10. This submission is being made based on the NTIA data model as of 08/09/12 provided by NTIA on the SBDD site.

    We have added nine new providers in this submission:

1) Cowboy.Net (fixed wireless)
2) Cross Valliant Cellular (mobile wireless)
3) Cross Wireless (mobile wireless)
4) Diamond Net (fiber)
5) HTS Wireless (fixed wireless)
6) Omega 1 Wireless (fixed wireless)
7) ProValue (fixed wireless)
8) Skycasters (satellite)
9) Wavelinx (fixed wireless)

In this submission:

1) We have contacted a total of 193 providers in OK, of which 55 providers were contacted for the first time.
2) We have identified 104 potential providers, of which 90 are participating in this map to date and 14 have refused to participate. In addition, 24 providers have not responded to our efforts to contact them and we are not sure whether any of these providers are actual providers or not. A list of the non-responders, resellers and non-providers is provided at the end of the document and all of these potential broadband providers were contacted. Even if some providers were identified as non-providers or resellers in previous submissions, we continue sending out data request letters to these providers in case their status has changed in any way.
3) 44% of the providers submitted new or updated data whereas for the remaining providers, we reused data from their previous submissions. This is in contrast to 49% providers submitting new or updated data during the previous submission.
4) We do not report areas of service for providers that have refused to participate or have not responded to our requests for data. In some cases program office staff are aware of approximate service areas for non-participating providers, but to date we have reported only areas that meet our validation criteria. If estimated service areas are desired we would collaborate with other states and NTIA to develop and disclose a workable methodology.

During this submission period, we had the following changes in providers:

1) Oklahoma Telephone and Telegraph changed its name to Oklatel Communications, Inc.
2) Wildblue changed its name to Viasat
3) Community Cablevision Company changed its name to Community Cable & Broadband

2.1.2 Community Anchor Institutions Data

The community anchor institutions data continues to be crowd-sourced through the online data gathering application created by the Sanborn Team. Following discussions with NTIA on ways to improve the CAI IDs via email and guidance on what datasets to use for IDs, we have incorporated IDs for libraries and schools where possible. The numbers of community anchor institutions that have responded so far is provided below:

Category	Name	Total in Submission 6	Total with Broadband Information in Submission 6
1	School - K through 12	1966	375
2	Library	211	175
3	Medical/healthcare	459	162
4	Public Safety	1794	316
5	University, college, other post-secondary	79	22
6	Other community support - government	507	91
7	Other community support - nongovernmental	16	2

2.2 DATA PROCESSING

We started with the following base data:

Census Blocks:

For this submission, Census 2010 data was utilized. The data was set up as follows:

- Block size (AREA) is calculated combining the 2010 land area (ALAND) and water area (AWATER)
- AREA is converted from square meters to square miles to calculate square mileage (SMI).
- If the SMI of a block is less than or equal to 2, then the less than or equal to 2 square mile indicator (LE2SMI) is set to true.

Road Segments:

2010 Tiger Line IDs (TLID) were used for data processing for this submission. The data was set up as follows:

- The GT2SMI (Greater Than 2 Square Mile) indicator is set to True when:
  - The 2010 road segment <u>is completely within</u> a block that is NOT less than 2 square miles
- Only minimum and maximum address ranges and a single zip code for each road segment is maintained.

All data received went through the following processing steps:

1. **Triage:** All new data were quickly reviewed to understand what was received, and in what format. We also made sure we had all the required components for NTIA's data model, such as their FRN and advertised speed information. We also screened for any known issues that we might have seen before (such as Excel 2003 spreadsheets that cut off at 32k row).
2. **Ingest:** At this time the data is actually brought into our systems. Each provider is set up with a unique file geodatabase to store their information. Record counts of what was received are logged so that we can validate that we did not drop anything in processing.
3. **Data Processing:** In this step, the data goes through a number of ETL routines to convert the raw proprietary information into a format similar to the NTIA format. The exact routine utilized depends on how the data is received.
   1) When a wireline provider submits a service boundary, we select all the blocks and roads inside that shape.

2) If a wireline provider submits a customer address list, the points are geocoded, and then the appropriate block or road segment is selected.
3) If a wireline provider submits block and road information using Census data, we just make sure everything is formatted to the appropriate specifications.
4) If the wireline provider submits any type of road or line data that does not directly correlate to the TIGER data set, we convert the lines to TIGER by selecting the road centroid and spatially selecting the closest segment in our data set. If the road is in a block less than 2 square miles, then the block is selected. Some manual cleanup is also applied to make sure we do not accidentally drop any road segments that should have been processed.
5) Wireless provider data is formatted to ensure that there are no overlapping polygons with the technology type and spectrum. In addition the data is cropped to the state boundary.
6) After each round of processing, we make sure that we only keep unique records. A unique record is defined as having a unique combination of FRN, Block/Road ID, and technology type. If there are multiple records with different speeds, but all else is equal, than we select the maximum of the advertised speeds.

4. **QC Review:** All data are then sent to a different analyst to perform a thorough quality control review on the processed data set. Record counts are compared to what was submitted. The QC staff also makes sure the ETL scripts and routines populated all of the right fields.
5. **QA Review:** Data is then sent to another team for Quality Assurance Review. In this step the data is not only double checked against what was originally submitted, but it is also brought up inside standardized ArcMap templates that allow us to make sure our results make sense. This often involves comparing the new data set with prior submissions, as well as looking for any possible technology or speed anomalies and verifying against third-party datasets (as discussed in more details in the next section).
6. **Provider Review:** Processed data is all posted to a customized web-mapping tool we commonly refer to as the Provider Portal. All providers were notified once their data was available on the site, and were given five business days to review the data and respond. In this site, providers can log on and visually see their processed data in a map format. It also allows them to overlay their raw data to help them validate that we did indeed process things correctly. The provider portal also has a suite of markup tools that will allow the providers to edit their data, including adding or removing service areas, and making changes to the data attributes.
7. **Comment Processing:** All comments and feedback received from the provider portal is then reviewed and applied to the processed data set. This updated data set goes back through our QA and QC processes, and if time allows, back out to the Provider Portal, for the provider to review and sign off.

8. **Data Append:** After all of the individual data sets are processed and approved, we run an append process which merges all of the individual provider data sets into one geodatabase. This is also the point where our team will do any final transformations to get our working data model into the latest NTIA publishing format.

9. **Submission Comparison Check:** Starting with this submission an additional check was added to our quality review process. An application was written that compares the individual provider's unique data that is stored in their unique file to that which is stored in our final appended file and the NTIA submission data. Any variation in each of these data files in thoroughly investigated and resolved. This was done to assure no data loss or data transformation issues. We also compare the submission 5 dataset to the submission 6 dataset, review any variations and assure that the changes found can be documented as being requested by the provider.
10. **Final QA/QC:** A series of quality checks are run on the final appended data sets to ensure it is ready for submission to NTIA. We also run the latest version of the NTIA receipt tool at this time. If any issues are flagged as failing they are reviewed and corrected. All warnings are also reviewed and either corrected or documented in the attached document which explains that we have validated this data and any last issues are corrected.
11. **Submission to NTIA.**

2.2.1 Submission 6: NTIA Submission Data Model Schema Changes

The latest data model released was released on August 8, 2012 was very similar to the previous data model. No substantive changes were noted and changes related to allowable speed and technology of transmission combinations. Most of these combinations have exceptions to them and hence were not being completely disallowed by NTIA.

2.3 DATA VALIDATION

Sanborn has continued to perform the same validation on the data as the previous four submissions (details in previous reports and a summarized version provided below). Some minor updates to the validation process are discussed below.

1) QC of the data at various steps – this includes when data is received (triage), when it is processed through the various processing steps discussed above, etc.

2) Spatial checks against public and commercial datasets
    a. For OK, we continued to use the following datasets for validation:
        i. Exchange Boundaries: for DSL boundaries
        ii. MediaPrints: for Cable and Fiber boundaries
    b. We did not use speedtest.net speed data that we used previously for validation as we had our own speed test data that was more current and pertinent.
3) Speedtest data and other data collection for verification
    a. We continue to use speedtest data collected through our interactive map and community anchor data crowd-sourced for validation purposes.
    b. For this submission, we added an additional dataset to check against – FCC speed test data. We geocoded the data, used the IP to reverse engineer the provider name and used it to check speeds where possible.
    c. We also incorporated any feedback we received through the interactive map – this included feedback such as incorrect speeds, incorrect boundaries, missing provider or areas of no service, etc.
4) Verification by providers – processed data are uploaded on our Provider Portal for providers to review both the outcome of data processing and any issues that we found in the third-party and crowd-sourced validation. Issues pertaining to a particular provider are highlighted and shown in the portal for those providers only. Issues that are global and cannot be assigned to a particular provider are shown to all providers (e.g. there are no providers in this area, or we tried to get service here and heard x from A provider, y from B provider, etc.). Previously, we were highlighting these issues through a letter but in this submission, we have integrated the feedback through the Provided Portal. We make additional calls to providers who have issues.
5) Planning workshops and local validation –
    a. During this submission, local validation was undertaken by an independent group, the Center for Spatial Analysis at the University of Oklahoma (OU). OU performed an independent survey gathering data points from CAI's and the GIS community for the State of Oklahoma. Within Sanborn's validation process, OU's points were compared against provider's data. Those data points found in question were taken back to the providers for correction. Also, during this submission, Sanborn created an efficient way to make sure the CAI data that OU had gathered from phone calls or public gatherings was entered straight into the database without duplicating efforts for either team by designing a CAI data entry interface. This allows OU to increase their efforts to gather more data points by streamlining the process and provides current data to Sanborn to use for each submission and report to NTIA.

b. We have reviewed any issues that the State Planning team has identified and brought to our attention.

2.4 UNIVERSE OF CONTACTED PROVIDERS/NON-PROVIDERS

We have identified 104 potential providers, of which 90 are participating in this map to date and 14 have refused to participate. In addition, 24 providers have not responded to our efforts to contact them and we are not sure whether any of these providers are actual providers or not. A list of the non-responders, resellers and non-providers is provided at the end of the document and all of these potential broadband providers were contacted. Even if some providers were identified as non-providers or resellers in previous submissions, we continue sending out data request letters to these providers in case their status has changed in any way.

2.4.1 Non-providers

4D Networks Corp.
Atlas Telephone Company
Charter Communications
Comcast Cable Communications, Inc.
Cyber Rover
Fulltel
IO-2 Services
KoehlerPro Wireless
LightEdge Solutions Inc.

Contents

OVERVIEW

This white paper highlights the **Submission Summary** for this deliverable, as well as describes the **Data Gathering**, **Data Integration**, **Data Validation and Verification** and **Quality Control** processes used to create the Oregon Broadband Mapping Project's October 1, 2012 data submission. To support varying levels of technical and program knowledge, both a **process summary** and a **process review** are supplied.

SUBMISSION SUMMARY

PROVIDER DETAILS

PROVIDER PARTICIPATION

- Provider Participation Statistics Summary

Summary	Count
Total Providers Researched/Contacted	449
Total Valid Broadband Providers	108
Non-Responsive Providers	13
Non-Cooperative Providers	08
Number of Providers - Supplied Updates for this Submission	55
Number of Providers - Confirmed No Updates	31
Will Provide Data	1

- New Providers since Last Data Submission (5)
  - Blue Mountain Cable
  - PrineTIME Internet Solutions
  - Safelink Internet Services
  - Silver Star
  - Wallowa Valley Networks

- Existing Providers – No Updates (31)
    - Ashland Fiber Network
    - BendBroadband
    - Cableone
    - Cal – Ore Communications Inc.
    - Cascade Networks, Inc.
    - Coltontel
    - Helixtel.com
    - Integra Telecom
    - J & N Cable Systems, Inc.
    - Molalla Communications Company
    - Monitor Cooperative Telephone Company
    - Nehalem Telecommunications Inc.
    - North-State Telephone Co.
    - Oregon-Idaho Utilities, Inc.
    - PEAK Internet
    - Molalla Communications Company
    - Webformix Company
    - St Paul Telephone
    - PocketiNet Communications Inc
    - QualityLife Intergovernmental Agency
    - Reliance Connects
    - Skycasters
    - St Paul Telephone.
    - Stephouse Networks
    - U.S. Cellular
    - UnwiredWest LLC
    - Upward Access
    - Wave Broadband
    - Webformix Company
    - Whiz To Coho, Inc.
    - XO Communications Services, Inc

- Providers Included (listed by Provider and Holding Company name) by DBA

Air Speed LLC	Gervais Telephone Company	Quantum Communications
Alyrica	Gorge Networks	Reliance Connects
Ashland Fiber Network	Helixtel.com	Rio Networks
AT&T Corp, Inc.	HughesNet	Roome Telecommunications Inc.
AT&T Mobility LLC	Hunter Communications, INC	Rural Technology Group
Axxis Communications	Integra Telecom	Safelink Internet Services
Beaver Creek Telephone Company	J & N Cable Systems, Inc.	SandyNet
BendBroadband	Level 3 Communications, LLC	SawNet
BendTel	LS Networks	SCIO Mutual Telephone
Blue Mountain Cable	MegaPath Corporation	SCS Communications
Cableone	Meritel Group, Inc	Silver Star Telecom
Cal-Ore Communications Inc.	MINet	Skycasters
Canby Telcom	Molalla Communications Company	Sprint
Cascade Networks, Inc.	Monitor Cooperative Telephone Company	St Paul Telephone
CenturyLink	Monroe Telephone	StarBand Communications
CHARTER COMMUNICATIONS INC.	Mount Angel Telephone Company	Stayton Cooperative Telephone Company
City of Cascade-Locks	Rural Network services Inc.	Stephouse Networks
Clear Creek Mutual Telephone Company	Nehalem Telecommunications Inc.	TDS Telecom
Clearwire	NextGen Internet Systems, Inc.	T-Mobile
CoastCom, Inc	Nextnet Ventures, LLC	Tnet Broadband
Cogent Communications Group	North-State Telephone Co.	TW Telecom of Oregon LLC
Coinet	OnlineNW	U.S. Cellular
Coltontel	ORBITCOM	UnwiredWest LLC
Comcast	ORCA Communications	Upward Access
Communications Access Cooperative Holding Enterprise	Oregon Telephone Corporation	Verizon Wireless
Comspan Communications, Inc.	OregonFAST.net	Vertex SSX Corporation
Country Vision Cable	Oregon-Idaho Utilities, Inc.	ViaSat, Inc.
Crestview Cable Communications	PEAK Internet	Wallowa Valley Networks
Cricket Communications, Inc.	Pendleton Fiber Company	WarmSprings Telecommunications Co.
Douglas Fast Net	People's Telephone Company	Wave Broadband
Eagle Telephone System, INC	Pine Telephone Systems, Inc.	Webformix Company
EarthLink Business	Pioneer Telephone Cooperative	Whiz To Coho, Inc.
Eastern Oregon Telecom	PocketiNet Communications Inc	WTech Link
EONI.com	Preferred Connections Inc. NW	X5 PDX, LLC
Freewire Broadband LLC	PrineTIME Internet Solutions	XO Communications Services, Inc. (Affiliated Entity)
Frontier Communications Northwest Inc.	Qnect.net	Yellowknife Wireless Company, LLC
Frontier Communications of Oregon	QualityLife Intergovernmental Agency	Zayo Group LLC

- Non-Responsive Providers (13)
  - Air Speed LLC
  - City of Cascade - Locks
  - Crestview Cable Communications
  - EarthLink Buisness
  - Freewire Broadband LLC
  - HughesNet
  - Level 3 Communications, LLC
  - OregonFAST.net
  - Qnect.net
  - Quantum Communications
  - Rio Networks
  - SawNet
  - Yellowknife Wireless Company, LLC

- Non-Cooperative Providers (8)
  - BendTel
  - Cogent Communications Group
  - Meritel Group, Inc.
  - NextGen Internet Systems, Inc
  - X5 PDX, LLC
  - Next Ventures, LLC
  - Vertex Ventures
  - StarBand Communications

- Other Provider Changes

Name Changes

Covad Communications Company - now identified as MegaPath Corporation
New Edge Networks - now identified as EarthLink Business
WildBlue Communications, Inc. - now identified as ViaSat Communications

Acquisitions and merges

AboveNet Communications Inc. acquired by Zayo Group LLC
Chambers Cable acquired by BendBroadband

Additional providers identified as non-broadband this round

Orbitcom
Coinet
Preferred Connections Inc. NW

- Providers researched and identified as non-broadband providers can be viewed within the table at the end of this document.

COVERAGE AREA CHANGES

- Coverage Footprint Reductions/Map Refinement –
    - Alyrica (TT-10)
    - Canby Telcom (TT-50)
    - Charter Communications Inc. (TT-41)
    - Cricket Communications, Inc. (TT-80)
    - Eastern Oregon Telecom (TT-10)
    - Eastern Oregon Telecom (TT-70)
    - New Edge (TT-30)
    - TDS Telecom (TT-10)
    - T-Mobile (TT-80)
    - Verizon Wireless (TT-80)

- Technology Changes/Additions –
    - BendBroadband. – New TT-41 coverage
    - Eagle Telephone Systems, INC. – New TT - 50 coverage
    - Eagle Telephone Systems, INC. – New TT - 10 coverage
    - EONI – New TT-70 coverage
    - EONI – New TT-71 coverage
    - ORCA – New TT-10 coverage
    - WarmSprings Telecommunications Co. – New TT-70 coverage

- Coverage Footprint Expansion –
    - Charter Communications, Inc (TT-40)
    - CoastCom, Inc (TT-50)
    - Douglas Fast Net (TT-10)
    - Douglas Fast Net (TT-50)
    - Eastern Oregon Telecom (TT-50)
    - Frontier Communications Northwest Inc. (TT-10)
    - George Networks (TT-70)
    - Gervais Telephone Company (TT-50)
    - LS Network (TT-30)
    - LS Network (TT-50)
    - OnlineNW (TT-71)
    - ORCA Communications (TT-50)
    - Pendleton Fiber Company (TT-50)
    - Rural Technology Group (TT-70)
    - TW Telecom of Oregon LLC (TT-30)

COMMUNITY ANCHOR INSTITUTION (CAI) DETIALS

OVERALL STATISTICS

Community Anchor Institution - Categories	Overall Count	Broadband Subscriber (1 or 2)	Trans Tech	Advertised Speed Down	Advertised Speed Up
Category 1 - School K through 12	1615	361	351	317	317
Category 2 - Library	189	185	185	177	177
Category 3 - Medical/Healthcare	323	22	10	10	9
Category 4 - Public Safety	1136	239	115	66	66
Category 5 - Universities/Colleges	69	38	37	34	34
Category 6 - Other: Government	227	37	219	28	28
Category 7 - Other: Non-Government	19	3	2	1	1
Total	**3578**	**885**	**919**	**633**	**632**

Total CAI records: 3,578

Broadband Service - Yes	885	24%
Broadband Service - Unknown	2,693	75%

Broadband Service - Yes

Unknown Technology Type	154	17%
Unknown Speed	225	8%
Download Speed = Upload Speed	630	71%

Public Wi-Fi Unknown	97%
CAI with CAIID	31%
Libraries with No CAIID	3%

CAI CHANGES

- Library CAI IDs have been updated with Oregon specific identifiers.
- Medical and Health Care facilities have been cleaned up. Removing duplicate data and adding new facilities.

PROCESS REVIEW

1. **Provider Outreach and Data Collection**

   Data is collected from identified broadband ISPs via a process of e-mail notifications and telephone interactions designed to achieve the maximum number of positive responses. ISPs can supply data and/or updates in a number formats via the following communication channels: mail, e-mail, and web applications (provider portal and file upload tool).

2. **Data Ingestion and Processing**

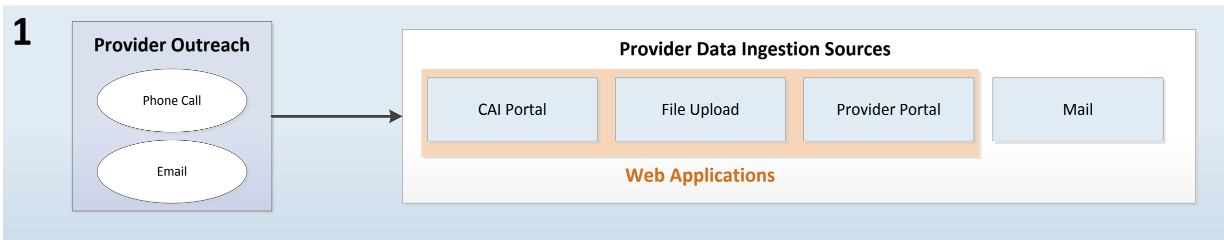
   Acquired data enter a recursive multi-stage editing, validation and verification process until all parties are satisfied that the data is a good representation of both the ISP service area and level of service. Automated scripts run nightly that capture updates posted by an ISP and publish completed updates to the provider portal web application for further provider review.

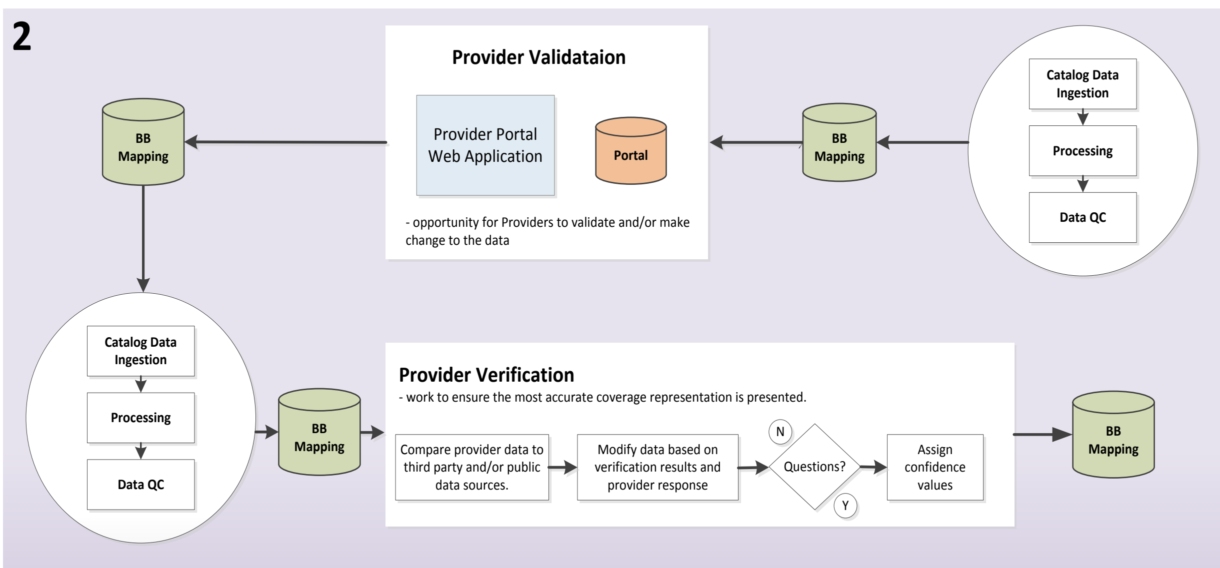
3. **Reporting**

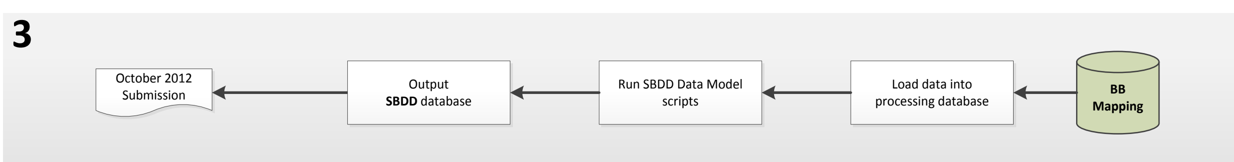
   At the close of each data collection period all ISP and CAI data is passed through a set of automated processes that parse the geospatial data into the format required for NTIA submission, flag potential data errors and generate associate tabular reports. The final outputs are combined into a single archive file for submission via the Broadband State Data Management Tool hosted by the FCC.

* Process Review Diagram, sections reference below numbered diagram (pg.10)

* Process Review Diagram, sections reference above numbered paragraphs (pg.9):







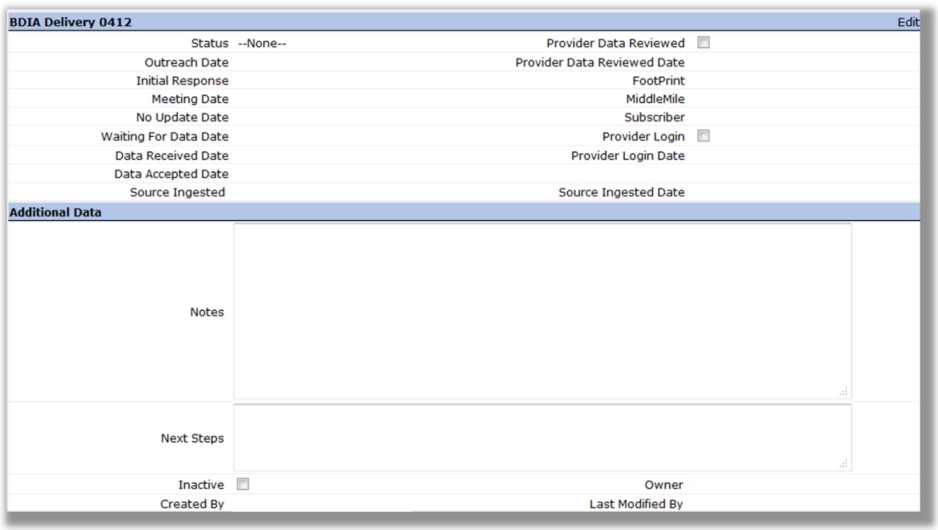
PROCESS SUMMARY

DATA GATHERING

BROADBAND SERVICE AREAS, MIDDLE MILE AGGREGATION POINTS AND BROADBAND SERVICE OVERVIEW

The collection of Broadband Service Areas, Middle Mile Aggregation Points and Broadband Service Overview information is handled through the following Provider Outreach Process:

- Build and maintain an inventory of Broadband providers through currently known providers and research.
- The inventory and everyday interaction with providers is tracked using the Provider Catalog (PCat). Below are some examples of the web application.



BDIA Delivery 0412 Edit

- Update provider material that describes the data requirements and logistics for data transfer.
- Update Non-Disclosure Agreement (NDA) for use in the project, where applicable.
- Maintain multiple protocols for the provider to submit data, including Secure File Upload Protocol when desired.
- Conduct one-on-one informational discussions with each provider to communicate the following:
  - Requirements of this project;
  - Broadband data required to support the product data model;
  - Submission protocols available;
  - Capability to validate how the supplied data is aggregated.
- Download/receive provider data.
- Establish a repeatable process with provider. Maintain provider communication, transaction and data handling records throughout the project (dates contacted, data received, etc.).

COMMUNITY ANCHOR INSTITUTION (CAI)

The collection of CAI information is handled through the following CAI Collection Process:

- Collect and maintain inventory of CAIs through currently known CAIs, data mining, and research.
- Maintain web-based CAI portal for institutions to add or confirm attribution, location and enter broadband-specific information.
- Upload web-based data to Core Database for standardization.
- Perform internal cleansing, such as removing duplicate records, identifying gaps in broadband attribution and verifying category.
- Geocode CAI locations.
- Translate Core Database data to deliverable-ready format.
- Continue engagement with non-responsive institutions.
- Communicate with Oregon State departments to acquire CAI data.

DATA INTEGRATION PROCESS

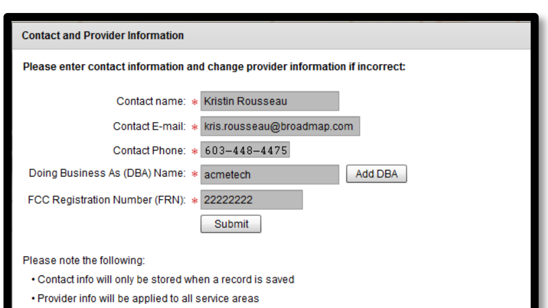
The data integration and processing mechanisms currently used allow for multiple types of inputs and result in a standardized output that meets the NTIA deliverable requirements. This flexible process supports data model changes and project-requested enhancements.

- Receive inputs from providers via submission protocols; upload into Sourcing Database and catalog with provider information.
- Review provider-supplied data for completeness and for potential discrepancies that require resolution prior to processing and flag as necessary.
- Categorize input into data-type category (addresses, block lists, paper maps, etc.).
- Standardize input based on data type within BB Mapping Database.
- Create Compact Polygons (CP)—(internal methodology for generating area-based feature for coverage in BB Mapping Database).
- Apply broadband attribution to CP; apply metadata to CP.
- Perform quality analysis of the CP against the source supplied to identify any completeness or accuracy issues.
- Post data to the provider portal web application for provider review and validation.
- Request additional information from the provider if elements of coverage are missing or contain discrepancies. This is a second manual quality check to ensure data is complete.
    - Process coverage area to build the required NTIA data model layers.

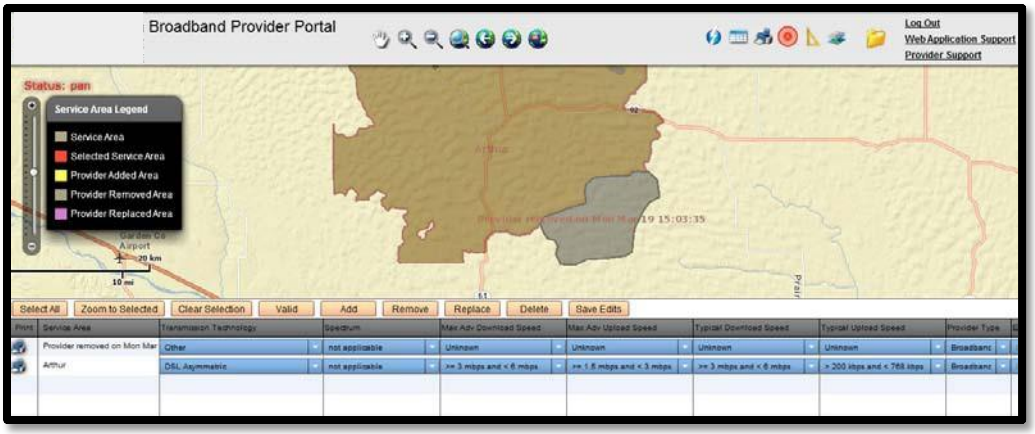
With the deployment of the Provider Portal, the data collection and later validation process was streamlined allowing both activities to occur within a secure web application. The majority of the providers used this methodology as it supplies them with more visibility into how their data is being represented and gives them knowledge and ownership of their coverage representation. Below are some bullet points and supporting screen shots on how the portal is used.

- Each provider is assigned credentials with a strong password to ensure security measures are taken into consideration

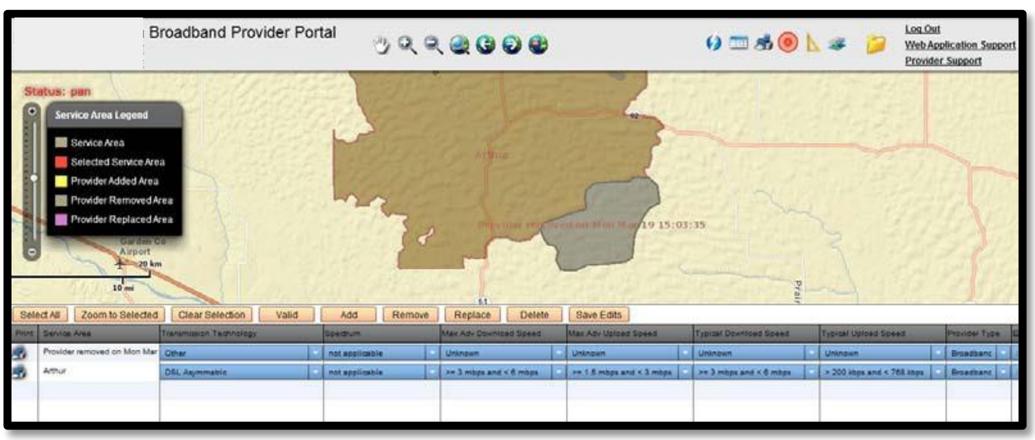
- Collection and confirmation of contact, as well as the company's DBA Name and FRN accuracy



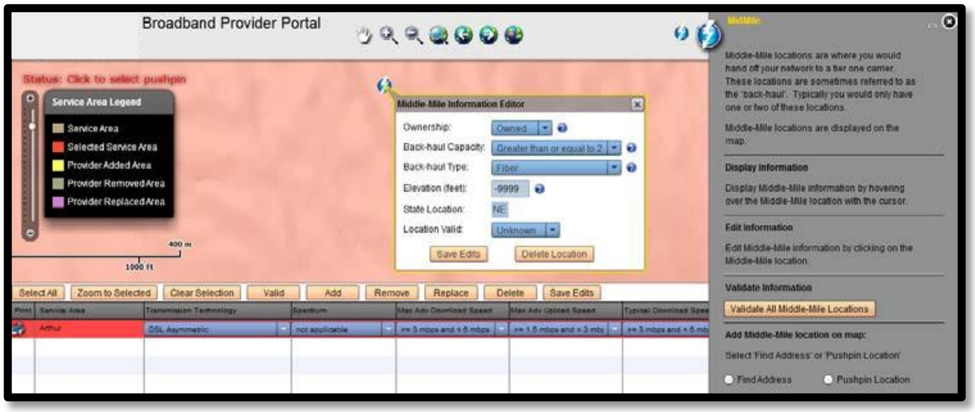
- Capability to review and request changes to the coverage footprint

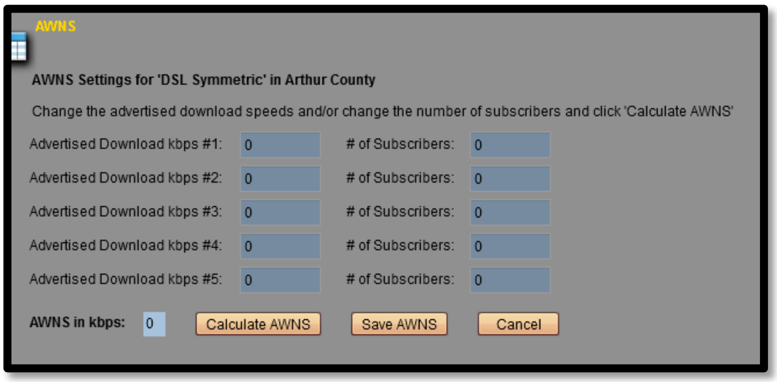


- The provider can Add/Remove portions, or all, of the footprint requesting that their footprint be increased or refined.

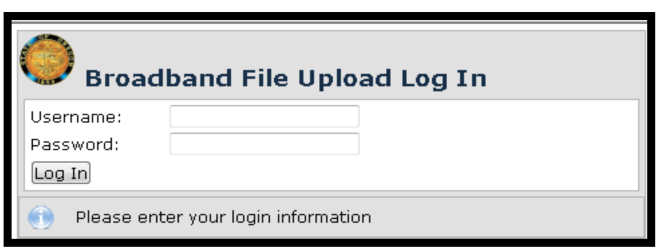


- Middle Mile and Average Weight Nominal Speed (AWNS) collection and validation





- File upload functionality to support providers that would prefer a shape file, spreadsheet, PDF, KMZ/KML file be used to reflect changes for the data round



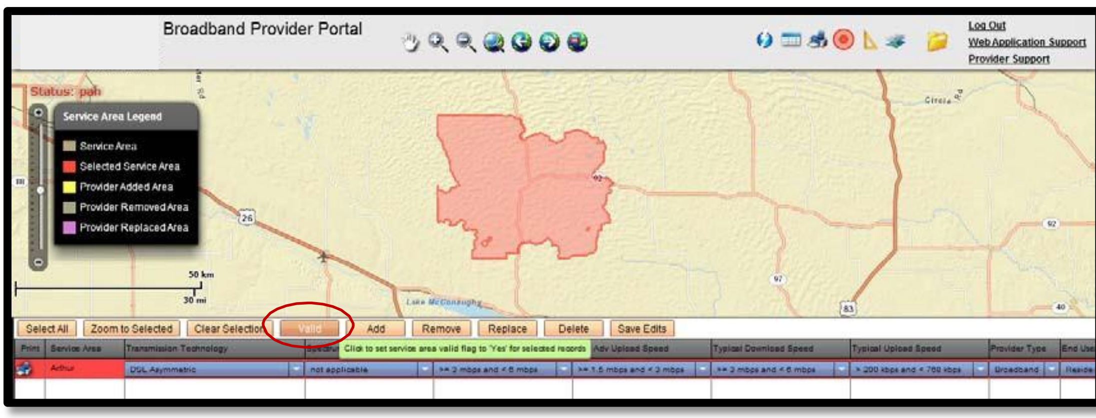
- Once the provider has reviewed and/or completed changes to their coverage, middle mile and AWNS, they may validate by selecting the validate field for each feature.

DATA VALIDATION AND VERIFICATION

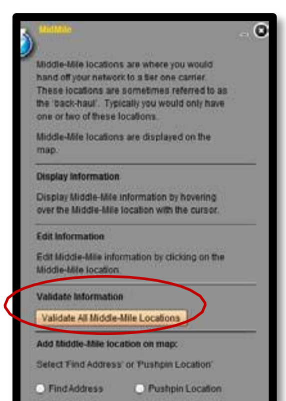
Following the creation of the product, process steps within Data Validation and Verification occur. To ensure the data collected and processed is as accurate and comprehensive as possible, provider validation and internal verification activities are employed. After the initial mapping of providers' coverage areas and serviceability claims, additional reviews are performed using the methods described in the subsections below in order of action (**Broadband Provider Validation**, **Third-Party Data Verification**, **Public Verification, and Confidence Values**).

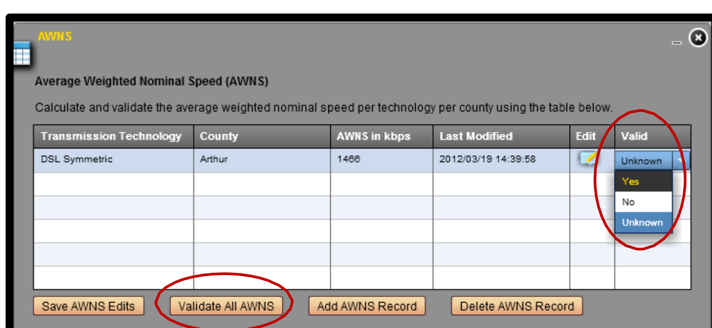
Validation examples are as follows:

- Coverage validation can be done on one record/footprint at a time or by selecting multiple footprints and selecting the 'Valid' button.



- Middle Mile & AWNS Validation





All validation results are tracked internally through the Validation Table, which is used to improve the overall **Confidence Value** of each provider.

THIRD-PARTY DATA VERIFICATION

The coverage is visually and programmatically compared against third-party data as new or updated coverage area information is received and ingested from providers. All anomalies identified during this analysis are reviewed with the providers.

3rd Party Source Name	Source Type	Verification Type
Pitney Bowes (PBBI)	Exchange Info Plus (Central Office Locations)	Exchange datasets are used to verify the following Transmission Technologies (TT): Asymmetric xDSL (10), Symmetric xDSL (20), Other Copper Wireline (30), and Optical Carrier/Fiber to the End User (50).
Media Prints	Cable Boundaries	Used to verify the following TT: Cable Modem—DOCSIS 3.0 (40) and Cable Modem—Other (41)
American Roamer	Wireless Coverage Patterns (EVDO, GPRS, WISP, HSPA)	Used to verify the following TT: Terrestrial Fixed Wireless—Unlicensed (70), Terrestrial Fixed Wireless—Licensed (71) and Terrestrial Mobile Wireless (80)
Comsearch	Wireless Spectrum Holdings and Tower Data	Used to verify the following TT: Terrestrial Fixed Wireless—Unlicensed (70), Terrestrial Fixed Wireless—Licensed (71) and Terrestrial Mobile Wireless (80)

PUBLIC VERIFICATION – CROWD SOURCING

Oregon Broadband Map

Public Feedback and speed test data

Since last data submission, we have improved the public website - interactive map to collect more detailed feedback on the represented broadband coverage areas. The feedback is also displayed on the map itself, which we're currently using as discussion points with providers during the outreach phases of each data submission. The data collected can be seen at the following path:

Hyperlink: **http://broadband.oregon.gov/StateMap/index.html**

FCC Speed test data:

Speed test results for Oregon submitted by individuals via the FCC browser and mobile based tools have been included in the verification process for this submission for supporting provider service area claims and bandwidth benchmarking.

CONFIDENCE VALUES

All verification, validation and manual quality review results are tracked by provider/technology type and stored and maintained within a **Validation table**. A confidence value is assigned, based on internal assessments of the collected information, to highlight the provider coverage areas and/or attributions that would benefit from further investigation and/or enhancements.

With the continued efforts on provider validation, 3rd party verification and the release of the public interactive map with feedback collection functionality, the confidence values will be utilized further to identify specific areas in need of attention. This is an ongoing initiative, we are working to improve and gain acceptance for from providers included in the program.

QUALITY CONTROL

Following collection, processing and analysis of the provider and CAI data, the product is checked manually and algorithmically against the NTIA data model. Some of the items included within these checks are:

- Format correctness;
- Table and field structure;
- Valid values, including default values, where applicable;
- Geographic extent and topology errors.

Prior to data submission, another quality control script supplied by NTIA is run. This script, SBDD_CheckSubmission.py, creates a text output form that is required to be submitted along with the final deliverable. All data must pass submission check unless otherwise specified by NTIA.

DATA DEVELOPMENT & VALIDATION METHODOLOGIES WHITE PAPER

Commonwealth of Pennsylvania
State Broadband Initiative (SBI)
Broadband Mapping Project

NTIA Data Submittal
September 28, 2012

Table of Contents

Introduction

The following sections of this document provide an overview of the process used for the SBI Broadband Mapping data development for the Commonwealth of Pennsylvania. The following narrative is depicted in Appendix A, Commonwealth of Pennsylvania SBI Process Workflow, and Appendix B, State Broadband Data Validation Workflow, included at the end of this document.

Broadband Provider Outreach Results

As a result of the outreach to broadband providers and investigating whether a internet service provider (ISP) fits the definition of a broadband provider as per the NOFA, the following is a summary of our findings:

- 294 Total Investigated ISPs
- 121 Total Confirmed Broadband Service Providers (unique Provider/DBAs combinations)
- 96 Broadband Service Providers who Supplied Data (unique Provider/DBAs combinations)
- 37 Total Confirmed Broadband Service Resellers
- 2 Broadband Service Resellers who Supplied Data

Attachment C, Master Outreach List, contains additional provider information.

Broadband Provider Outreach Procedure

The following outreach procedure provides the framework for communicating with Broadband Service Providers (providers). The primary goals of the outreach approach documented herein are to:

- Promote provider understanding and acceptance of the Broadband Mapping process, results, and benefits
- Clarify NTIA Broadband Mapping requirements
- Facilitate data confidentiality agreements as required
- Minimize the submittal of invalid data
- Enhance provider understanding of the semi-annual update process
- Work with providers to evaluate submittal options to facilitate data submittals

Data Submission Guidelines

Guidelines for the providers' submission of Broadband Mapping Data are documented in the "Data Submission Guidelines". These Guidelines define technical requirements, submission specifications, and coordination and documentation activities.

Pennsylvania Broadband Providers Website

A URL was deployed (http://www.bakergis.com/PABroadbandProvider/) to communicate and distribute NTIA NOFA requirements to providers along with outreach and data submittal materials including:

- NTIA NOFA and subsequent clarification
- Outreach letters to providers
- Draft Non-Disclosure/Data Sharing Agreement

- Quick Start Guides
- Data Submission Guidelines
- Data Transmittal Letter
- Broadband Data Submittal Templates
- Census TIGER Data
- Data Submittal Assistance Contact Information

Outreach Delivery Vehicles

- A State Broadband Mapping Initiative Call for Data letter from the Commonwealth of Pennsylvania Department of Community and Economic Development (DCED) was emailed to all providers in the Commonwealth. This initial provider contact letter described the program and the role of Michael Baker Jr., Inc. (Baker) acting on behalf of the DCED for Broadband Data Collection and Mapping.
- Baker distributed a follow-up letter to all providers describing the data submittal requirements and material and help available to aid with the data submittals.
- Submittal assistance was provided to providers that needed help with data submittals.
- Presentations were conducted with various broadband provider associations to present the data submittal requirements and answer questions.
- Email communication and electronic transfer of data was encouraged to facilitate a faster delivery of data and information.
- A URL was deployed and promoted to distribute outreach material and information concerning the Broadband Mapping Project.
- A secure FTP URL was provided for submittal of broadband data by providers.
- A secure Broadband Provider Data Update Webportal was deployed for providers to redline/update their service coverage, rather than supply their updated coverage for the semi-annual data updates.

Inclusion of Resellers

With the request for data current as of December 31, 2011, resellers are being included in all of the outreach, data collection, data aggregation, and verification tasks. The following reseller outreach form has been developed to secure the proper information and to minimize the resource commitment required by the reseller.

Reseller Information

R4-07/25

Reseller Name:
D/B/A Name (If applicable) :
FCC Registration Number ("FRN") (If applicable) :
Web Site Address:
Reselling Broadband Service for the following Organization(s): (List all carriers you represent)
Do you resell services for the entire area of each carrier above? ☐ Yes ☐ No
If no, indicate what area(s) you resell broadband services (List counties or Cities):
Technology of Transmission (Check all that apply):
☐ Assymmetric xDSL (ADSL) ☐ Symmetric xDSL (SDSL)
☐ Cable Modem – DOCSIS 3.0 ☐ Other Copper Wire
☐ Cable Modem - Other ☐ Optical Carrier/Fiber to End User
☐ Terrestrial Fixed Wireless – Unlicensed ☐ Satellite
☐ Terrestrial Fixed Wireless - Licensed ☐ Terrestrial Mobile Wireless
☐ Electric Power Line ☐ Other
Speed Tiers (See info on next page) : What is the fastest Broadband service plan ("Max") you offer, and what service plan ("Typical") do customers normally buy each month. To see the speed categories, turn to page 2 of this form.
Max Adv Down: ☐3 ☐4 ☐5 ☐6 ☐7 ☐8 ☐9 ☐10 ☐11
Max Adv Up: ☐2 ☐3 ☐4 ☐5 ☐6 ☐7 ☐8 ☐9 ☐10 ☐11
Typical Adv Down: ☐3 ☐4 ☐5 ☐6 ☐7 ☐8 ☐9 ☐10 ☐11
Typical Adv Up: ☐2 ☐3 ☐4 ☐5 ☐6 ☐7 ☐8 ☐9 ☐10 ☐11
Middle Mile Equipment (for each Carrier): ☐ Owned ☐ Leased Does your company own or lease any equipment related to the Broadband service for the Carriers you sell?
Latitude/Longitude or Location Address:
Facility Type: ☐Fiber ☐Copper ☐Hybrid Fiber Coax ☐ Wireless
Facility Capacity (see page 2 of this form): ☐1 ☐2 ☐3 ☐4 ☐5 ☐6
Elevation: ____ Feet above or below grade (nearest foot)

Speed Tier Codes:

Upload Speed Tier Code	Download Speed Tier Code	Description
1	--	Less than or equal to 200 kbps
2	--	Greater than 200 kbps and less than 768 kbps
3	3	Greater than 768 kbps and less than 1.5 mbps

6	Greater than or equal to 10 gbps

Figure 1 Reseller Outreach/Interview Form

Secure Broadband Provider Data Update Webportal

A secure web-based application for broadband service providers has been deployed to simplify and automate the semi-annual process for collecting and verifying data. The webportal provides an easy-to-use map redlining tool for updating a provider broadband service area and attributes. It is expected that the simplification and automation of the data collection process will increase participation and improve the timeliness of provider response, data accuracy and consistency. Providers are being encouraged to utilize this tool but data is still being accepted through other means and formats.

Figure 2 Provider Data Update Webportal Entry Page

The View/Edit Coverage Map functions via secure login/password and secured map services limit broadband providers to see and edit only their own data. Picklists of valid database attributes eliminates entry errors and create consistency. It also contains a workflow from initial provider input, saving of a provider's work-in-progress, provider formally submitting edits, aggregation into the master geodatabase, soliciting provider approval of aggregated data, and final approval of the edit.

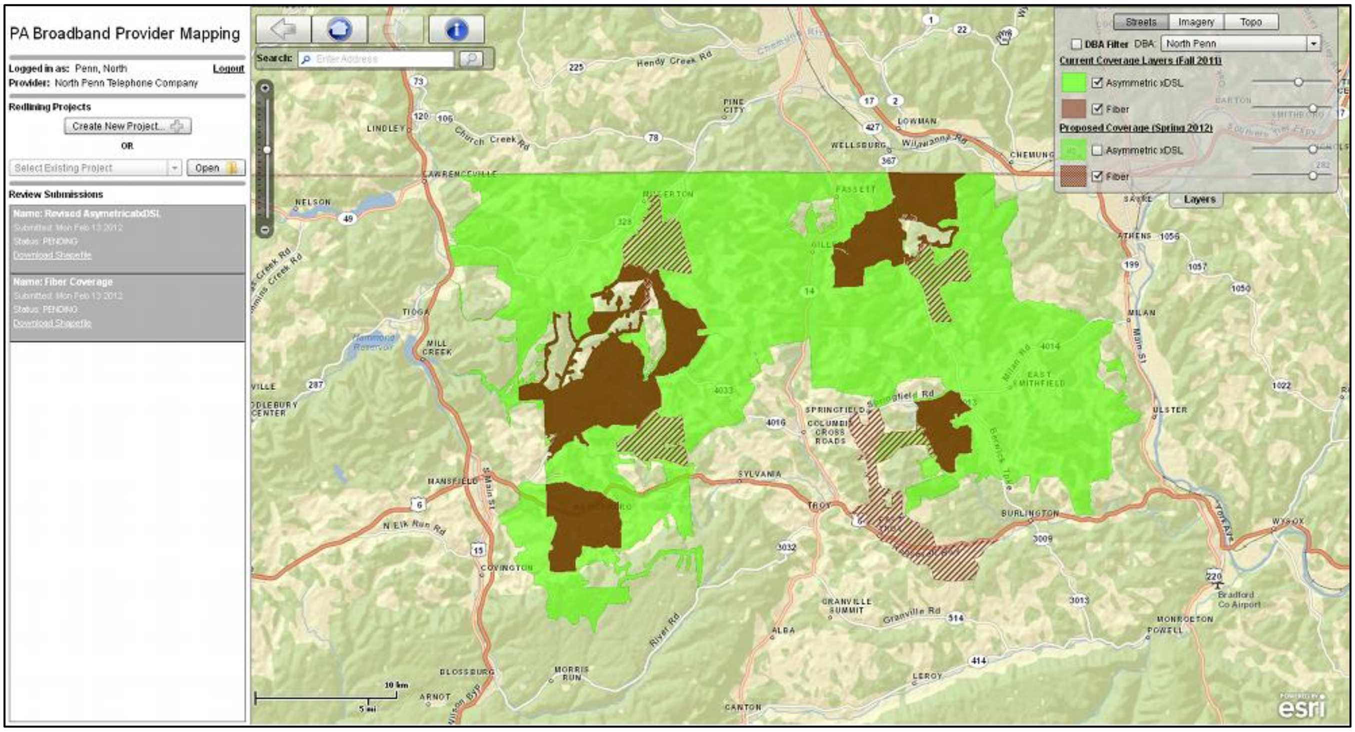

Figure 3 Provider Data Update Webportal –View/Edit Coverage Map Environment

Broadband Outreach Tracker Application

The Tracker application is utilized to collect all correspondence with providers and feedback on the effectiveness of the outreach activities by tracking items such as:

- The number and content of incoming e-mails and letters submitted from the providers
- The number and source of comments, questions, and suggestions made by providers
- The number and source of comments, questions, and suggestions made by attendees at provider meetings and conference calls
- Provider contact information and data submittal status.

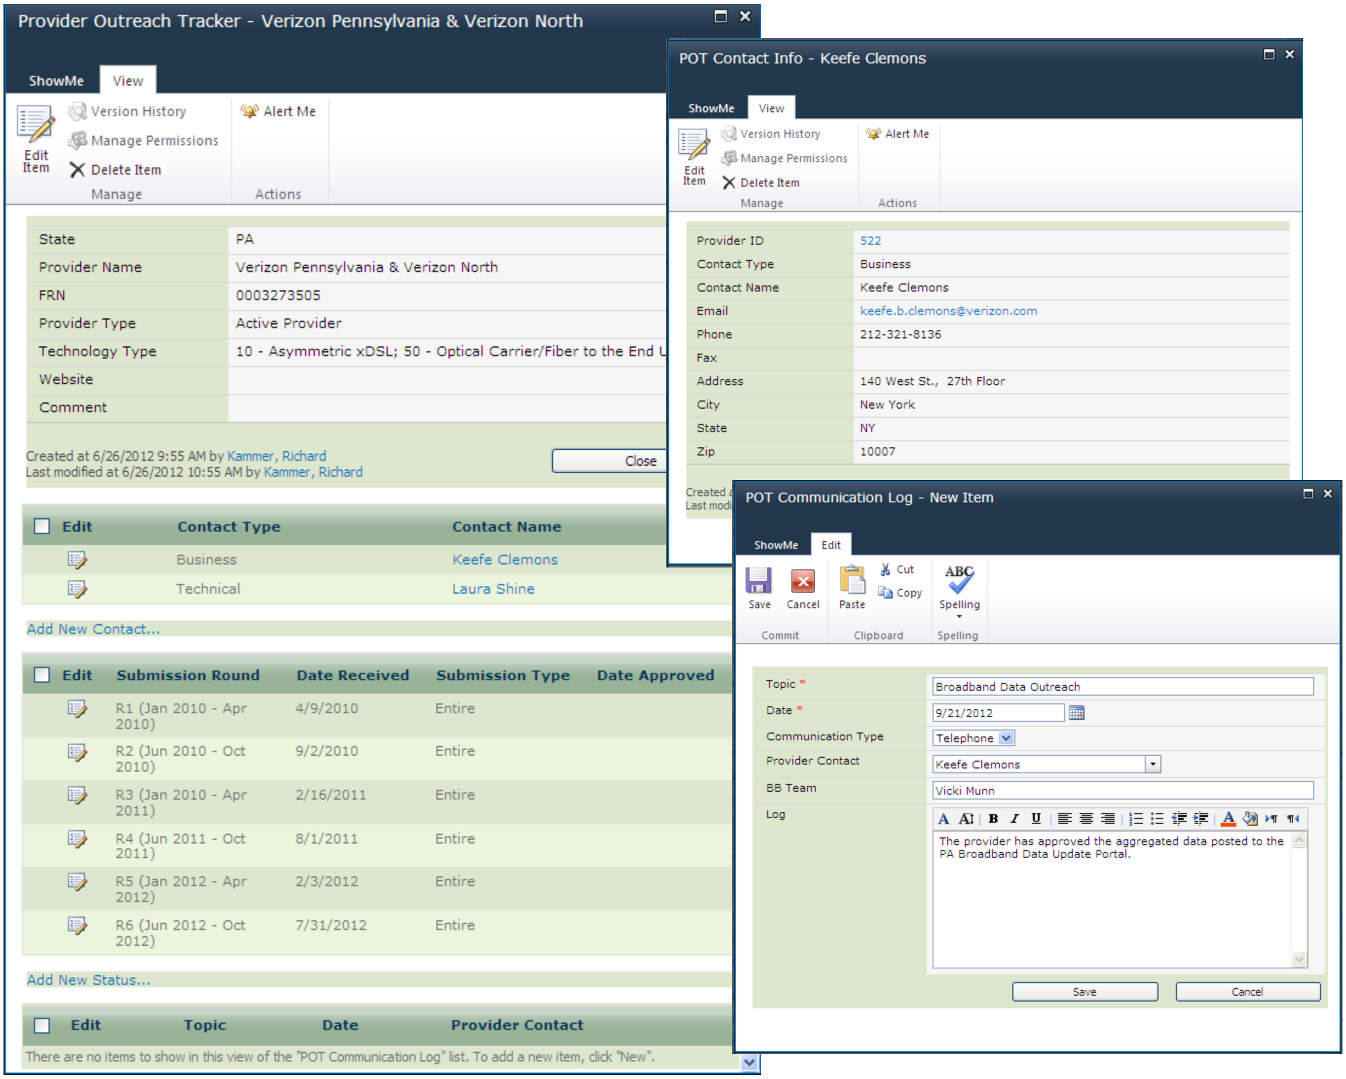

Figure 4 Broadband Outreach Tracker

Provider Submittal Validation

When a data submittal is received from a broadband service provider, it is updated in the Broadband Outreach Tracker and run through an initial validation process to assure that it meets the submittal guidelines.

Validation Checklist

The following items are part of this initial data validation process:

- Verify provider's transmittal letter requested in Data Submission Guideline with is complete and matches submitted data
- Verify the file naming conventions
- Verify each file is machine readable
- Verify data is in the correct GIS or Tabular format/file type
- Verify each field is populated and no empty or NULL values are present for mandatory fields
- Verify all ID (record number points) are unique within the submittal

- Verify all attribute data is formatted according to the submittal guidelines
- Verify topology for all geospatial submissions
- Verify Metadata for all submissions
- Verify the required contact information is included
- Verify adherence to Data Submittal Guidelines (see http://www.bakergis.com/PABroadbandProvider/ to access Data Submittal Guidelines)

  Broadband Service Availability (at least one)
  - Individual Street Addresses (Sec 3.1 & 4.1)
  - Census Blocks < 2 sq mi (Sec 3.3 & 4.3)
  - Street Segments for Census Blocks > 2 sq mi (Sec 3.2 & 4.2)
  - Service Overview (Sec 3.4 & 4.4)
  - Polygonal Boundary Area(s) (Sec 3.8 & 4.8)

  Middle-mile Points (Sec 3.5 & 4.5)
  Community Anchor Institutions (Sec 3.7 & 4.7)
  Last Mile Connection Points (Sec 3.6 & 4.6)
  WISP Antennas (Sec 4.9)

Data Usability Determination

The validation results are evaluated by the outreach and aggregation persons to determine the usability of the data. If the data meets the submission specifications, it is forwarded on for data aggregation. If it is determined to be unusable, it is returned to the provider for resolution. If the data can be manipulated to get it into a usable format, it is manipulated as required, and then forwarded on for data aggregation.

SBI Data Development

Data from the providers may be submitted in various formats as defined in the Data Submittal Guidelines, or in some cases unspecified formats may be accepted to help facilitate provider participation. Depending on the format of the submitted data, it is processed through one of the following processes to upgrade it to the NTIA SBI data standards.

Spatial Data

After validation and any required manipulation of any spatial data submitted by the providers, it is georeferenced and simply loaded into the appropriate NTIA geodatabase feature class.

Address Data Geocoding

If not already in the standard address point template, the provider tabular address data is first loaded into that template. The data is then exported to a geodatabase table using the ArcGIS Conversion Tools. ArcGIS geocoding tools are then utilized geospatially locate the address points for the tabular records. Interactive address rematching is performed against two additional street centerline datasets as needed to increase geocoding matching results. The NTIA deliverable is the geocoded address point geodatabase table. The geocoded address points are also subsequently aggregated to the census block or road segment feature class for public web map display.

Census Block Aggregation

If not already in the standard census block template, the provider tabular census block data is first loaded into that template. The data is then exported to a geodatabase table using the ArcGIS Conversion Tools. The provider tabular census block records are then joined to the geodatabase 2010 U.S. Census Block. This join is performed as many times as necessary for multiple Trans Tech values for each Provider/Census Block combination. The NTIA deliverable is the census block geodatabase table.

If the list of census blocks contains blocks > 2 sq. miles then these blocks are used to select all the 2010 U.S. Census TIGER centerlines that intersect those blocks. The Census Block record data is aggregated to each Road Segment within the Census Block. This process is performed as many times as necessary for multiple Trans Tech values for each Provider/Census Block combination.

Road Segment Aggregation

If not already in the standard road segment template, the provider road segment data is first loaded into that template. The data is then exported to a geodatabase table using the ArcGIS Conversion Tools. If the provider submittal included graphic centerline segments, these are migrated into the delivery geodatabase along with the linked attribute records. If the provider submittal was tabular road segment records only, they are then joined to the geodatabase 2010 U.S. Census TIGER centerline feature class. This join is performed as many times as necessary for multiple Trans Tech values for each Provider/Road Segment combination. The NTIA deliverable is the road segment geodatabase table.

If the provider road segment data lie within census blocks <= 2 sq. miles then the road segment data is aggregated to the census block. This process is performed as many times as necessary for multiple Trans Tech values for each Provider/Road Segment combination. The NTIA deliverable is the road segment geodatabase table.

Overview Data Aggregation

Provider Service Availability Areas submitted for entire county areas are loaded into the NTIA geodatabase Overview table. If not already in the standard template, the provider data is first loaded into that template. The data is then exported to a geodatabase table using the ArcGIS Conversion Tools. The provider overview records are then joined to the geodatabase 2010 U.S. Census County feature class. This join is performed as many times as necessary for multiple Trans Tech values for each Provider/County Area combination.

Polygonal Boundary Aggregation/Integration

Providers submitting polygonal service area data are handled in two ways. Wireline Provider data is aggregated to the census block feature class for areas where census blocks <= 2 sq. mi., or road segment feature class for areas where census blocks > 2 sq. mi. Wireless Provider Service Availability Areas submitted by polygonal area are simply loaded into the NTIA geodatabase Poly_Bndry feature class.

Wireline Provider

The polygonal data is georeferenced and loaded into the Poly_Bndry feature class. The polygon is then attributed, manually if necessary. Depending on the area, census blocks < or => 2 sq. mi., a selection set of either census blocks or road segments that intersect the polygon boundary is created. The attributed polygon boundary is then joined with census blocks or road segments table to attribute accordingly. This join is performed as many times as necessary for multiple Trans Tech values for each Provider/County Area combination. The NTIA deliverable is the census block or road segment geodatabase table.

Wireless Provider

The polygonal data is georeferenced and loaded into the Poly_Bndry feature class. The polygon is then attributed, manually if necessary. Multiple Poly_Bndry records are created for multiple Trans Tech values for each provider. The NTIA deliverable is the polygon boundary geodatabase table.

Middle/Last Mile Data Integration

If not already in the standard template, the data is first loaded into that template. The data is then exported to a geodatabase table using the ArcGIS Conversion Tools. The point features are geo-located utilizing the lat/long information provided. The NTIA deliverable is the middle or last mile geodatabase table.

Community Anchor Institution Integration

Providers supplied some Community Anchor Institution (CAI) data with the data submittals. But the majority of the data was collected from existing GIS Layers maintained by the Commonwealth of Pennsylvania, outreaching to CAIs through state agencies and their contacts, and having CAIs complete an online survey at http://www.bakerbb.com/pa_institution_survey/.

Provider CAIs

If not already in the standard template, the data is first loaded into that template. The data is then exported to a geodatabase table using the ArcGIS Conversion Tools. The point features are geo-located utilizing the lat/long information provided. Address data is used to geocode locations only when lat/long data is not provided.

Commonwealth CAIs

CAI shapefiles were provided through the Commonwealth's other geospatial efforts. The shapefiles were then exported to the NTIA geodatabase CAI feature class. Various sources for obtaining broadband information for the CAIs were utilized. Various state agencies provided some of the information, i.e. Pennsylvania Department of Education (PDE) provided tabular broadband information for schools, PDE provided tabular broadband information for libraries, and Pennsylvania State Police provided tabular broadband information for their facilities. A CAI data survey website was also deployed and the URL distributed by various state agencies to the CAI contacts. Data from all of these sources were then aggregated into the CAI geodatabase table for the NTIA deliverable.

Typical Speeds from Other Sources

Because not all providers are submitting the typical speed attribution with their data, a method to fill in the missing information has been developed using other sources. The method utilizes speed test data supplied through the FCC speed test information as well as from other speed test data that we are independently collecting. Business rules have been established so quality and realistic typical speeds are produced. In addition, the calculated typical speeds are compared against the Centris average speed verification data to be certain that the calculated typical speeds are within reason. The end result is a more complete data submittal to NTIA.

Propagation Modeling

Fixed wireless broadband transmission is a diverse technology. Service may be transmitted over licensed and unlicensed spectrum, and delivered by larger corporate or smaller LLC business entities, many of which serve rural areas of the State. This diversity has resulted in varying levels of SBI participation including Providers that have:

- participated,
- refused to participate,
- wished to participate but lack adequate capabilities and/or tools, or
- supplied data of marginal accuracy

The NTIA's supplemental grant funding has provided the means to generate propagation models to supplement and validate the above scenarios. In addition, the NTIA has identified fixed wireless service coverages with unusual shapes for state grantee analysis.

To facilitate development of propagation mapping, additional tower/antenna information is being requested from fixed wireless broadband providers. For those providers not responding to requests for required tower/antenna information, an attempt is made to gather the information through 3rd party sources and field investigation. The Provider, 3rd party and/or field data is processed using Terrain Analysis Package (TAP) software to develop propagation models. Maps of the resultant propagation study are sent to the fixed wireless providers for their feedback on the propagation model produced for their company.

Data Verification Summary

Pennsylvania's broadband mapping project employs a multi-prong approach to ensure the provider data is accurate and complete.

In summary, the project employs the following validation methodologies and resources:

- Provider Validation
- Data Validation via Market Intelligence Sources
- Data Validation Using State Supplied Data Points
- Field Validation
- Wireless Coverage Analysis
- Topology Validation
- Automated Validation Processing
- Confidence Level/Statistical Modeling
- SBDD Check Submission
- Stakeholder Validation

The remainder of this verification section describes the various methods in greater detail.

Provider Validation

After data development, service availability maps are generated and submitted to the providers to validate their mapping results. This provides a "sign off" on the interpretation of the submitted data and extends the outreach efforts by providing a visual representation of the data to be delivered to the State and the NTIA.

Types of Provider Maps

Provider maps generally consist of the following types.

Outreach Maps

Often, providers will send data which does not contain all the information needed for a NTIA compliant dataset. In such cases, as an aid to the outreach communication, it may be necessary to produce a map to help the provider locate their service area or verify data they have provided. These maps may take many forms, but generally are of two types:

- General Location Maps – these maps are often produced when the provider does not have a list of address or other standard submittal data and needs help defining their service area. A typical map will show counties, major roads, and towns of the general area the provider has stated as their service area. The intent of the map is to give the provider a way to markup or delineate their service area. If a provider has not provided required attribute information such as Technology of Transmission, Speed Data, etc. then it may be necessary to add a visual clue to this data like an information stamp on the map that they can easily fill out. If the provider sends the map back with a service area boundary, this can then be digitized and sent back to the provider for verification.
- Verification of Provider Supplied Boundaries – these maps are produced when the provider has sent service area boundary information which is confusing or otherwise unclear. Often these are produced when providers send CAD maps, hand drawn maps that need digitization, or lists of zip codes or counties served. A typical map will place the interpreted boundary over a location map so the provider can verify the service area. As with the General Location Map, information stamps or other visual clues may be placed on the map.

Initial Verification Maps

Once the provider data has been processed and the census block and road segment feature classes created, an Initial Verification Map (Figure 5) is produced to give the provider a visual representation of their service area by census block. These maps enable the provider to verify their service area and make changes if necessary. Initial Verification Maps are produced using a set of standards and produced at the highest resolution necessary to convey the map information to the provider. Initial Verification Maps are also produced for Wireless Polygon areas.

Detailed Verification Maps

Providers who have questions about their service areas may request additional information to help clarify issues. In these cases, it may be necessary to create a Detailed Verification Map to highlight the areas in question.

Detailed Verification Maps provide the same information as Initial Verification Maps only at a higher resolution. Several maps may be needed to accurately portray an area in question.

Revised Maps

Revised maps take two forms:

Initial or Detailed Verification Maps which have been annotated or marked-up by the provider
Outreach produced Initial or Detailed Verification Maps incorporating provider changes

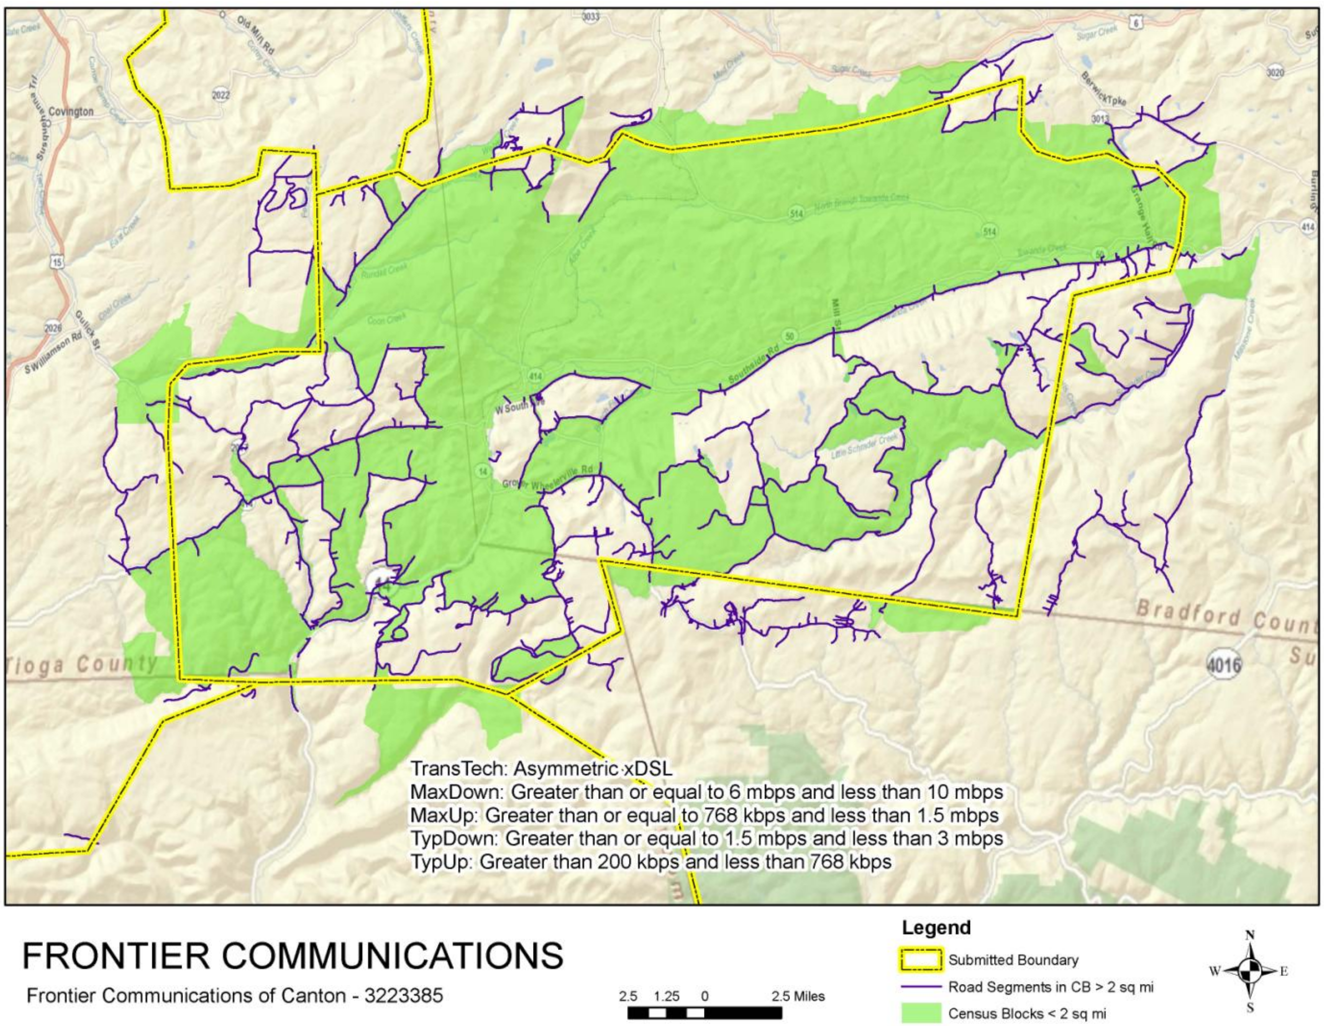

Figure 5 Provider Map

Data Validation

A critical component of the project is the validation of the data submitted by the broadband service providers. Data from various sources, as described in more detail in the following sections, is utilized to develop a level of confidence in the data received from the broadband providers.

Validation Data Set Collection and Development

This validation process employs data sets developed or acquired from different sources as described in the following sections.

Provider Feedback Loop: Maps of completed provider service areas and data are furnished back to the providers for confirmation of the processed/aggregated information. Feedback is integrated into the each provider's dataset.

Telogical Systems Wireline Market Intelligence Data: This commercially available dataset was developed using a methodology that incorporates deep web crawling and additional means, including direct mail harvesting and advertising collaterals (including door to door) to gather cable and telecommunication provider information. This dataset is used as a validation source for wireline provider service area coverage, Technology of Transmission, and Speed.

American Roamer Wireless Market Intelligence Data: This commercially available dataset is used as an independent source to verify information submitted by providers of wireless broadband service. This dataset is used as a validation source for wireless provider service area coverage.

Prior Commonwealth Broadband Mapping Dataset: Under the requirements of the Commonwealth's Act 183 of 2004 legislation, broadband coverage data was previously collected by the Commonwealth. These datasets are used as a validation source for provider service area coverage and Technology of Transmission.

FCC Speed Test: The FCC speed test data includes the IP addresses for each specific speed test conducted. This IP address is queried against a web search engine to determine the provider assigned to that address and is used as a validation source for the provider service coverage and typical speeds.

Fixed Wireless Line of Sight Analysis: Utilizing the existing PAMAP LiDAR for topography generation and determining tower/antennae heights, line of sight analysis is performed to determine areas of reported fixed wireless broadband coverage that is questionable.

Field Data Acquisition: Broadband technicians visited a sampling of census block locations to gather broadband data to be used for validation. The following criteria were taken into account when developing the census block sampling dataset:

urban vs. rural census block characteristic
censes block grouping
land vs. water census block characteristic

The overarching mission of the Federal broadband stimulus program is to expand Broadband service to areas that are currently unserved and underserved. Also, the market intelligence validation sources typically represent some rural, but more urban areas. Thus, our field data collection efforts were targeted more towards the rural areas; split 90% rural, 10% urban.

Additionally, a study by Penn State University (Glasmeier 2002) notes that a large number of census block groups typically fit within any given cable or telephone company service areas. Therefore, our field sample was also based on selection of one census block per block group and a land mass greater than 50% to avoid field visiting areas covered mostly by water. There are a total of 10,387 block groups in PA. Using a statistical sample size calculator based upon the number of block groups in the state and +/- 4% margin of error at a 95% confidence level, the sample size is 568 census block locations statewide. The procedure for selecting the calculated field verification census blocks is provided below.

Select one census block per census block group
Convert the census block groups polygon to label points.
Select the census block polygon by doing a spatial selection using census block groups label points.
Select from the current selection where the census block land mass is 50% or greater and the block is rural.
Export the selected blocks to a new shapefile. This reset the FID for the next step.
Select every 2nd, 3rd, 4th, or so on to get the desired number of blocks. Query used to select: MOD("FID",2) = 0. This will select every other record.

The planned census block field locations are shown in Figure 6.

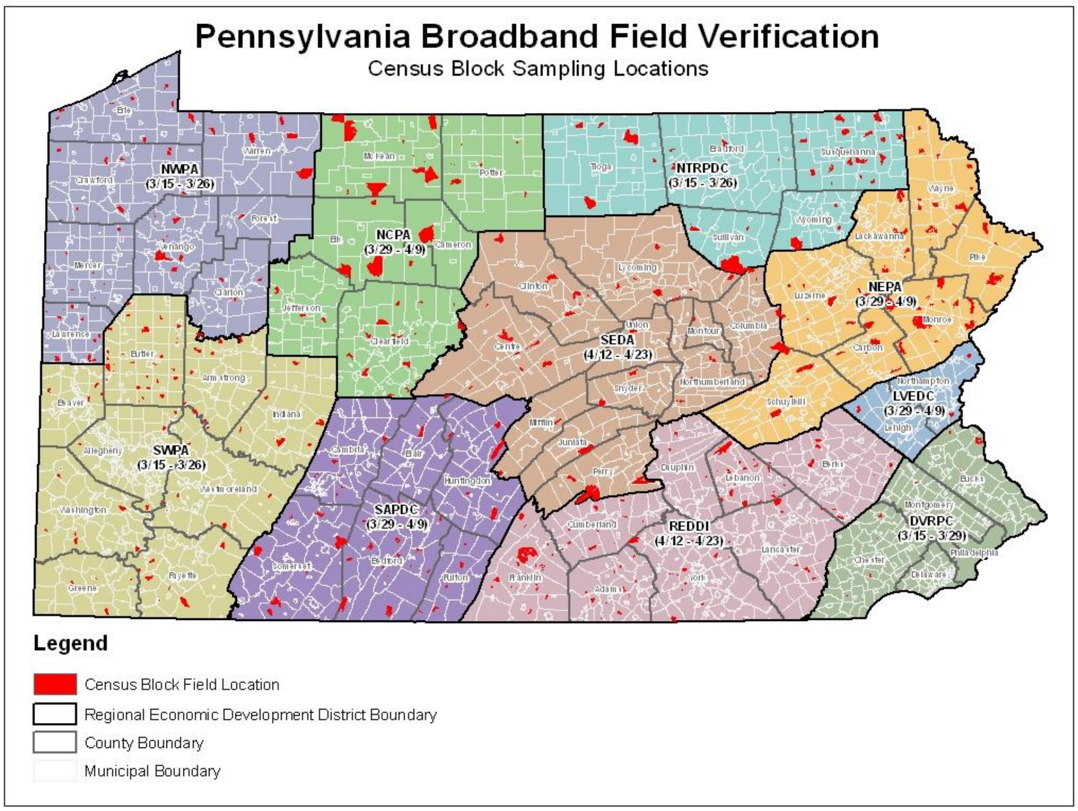

Figure 6 Planned Field Verification Census Block Locations

For each census block in the sample set, broadband technicians collected data using Panasonic Toughbook computers, loaded with MapPoint mapping software, and a customized Microsoft Access data collection form with the ability to automatically import GPS coordinates. The sample census blocks were pre-loaded and directly accessible from MapPoint. Two types of data collection were conducted (infrastructure observation and wireless speed testing) and the results were recorded and linked to the corresponding field location coordinates within the designated sample census block. The information collected by the field broadband technicians includes:

Wireline:

GPS coordinates
circuit infrastructure feeding the area (copper, fiber, cable)
local distribution hut equipment inspection, where allowed/possible
witness access circuit speed tests, where allowed/possible
facility elevation (measurement relative to grade), where allowed/possible
distance from DSLAM measurement where applicable and determine access speed capability with an accuracy within 500ft using mapping software
collect site pictures

Wireless:

GPS coordinates
internet speed test

The map in Figure 7 shows the locations (blue points) of the census block field surveys that were performed.

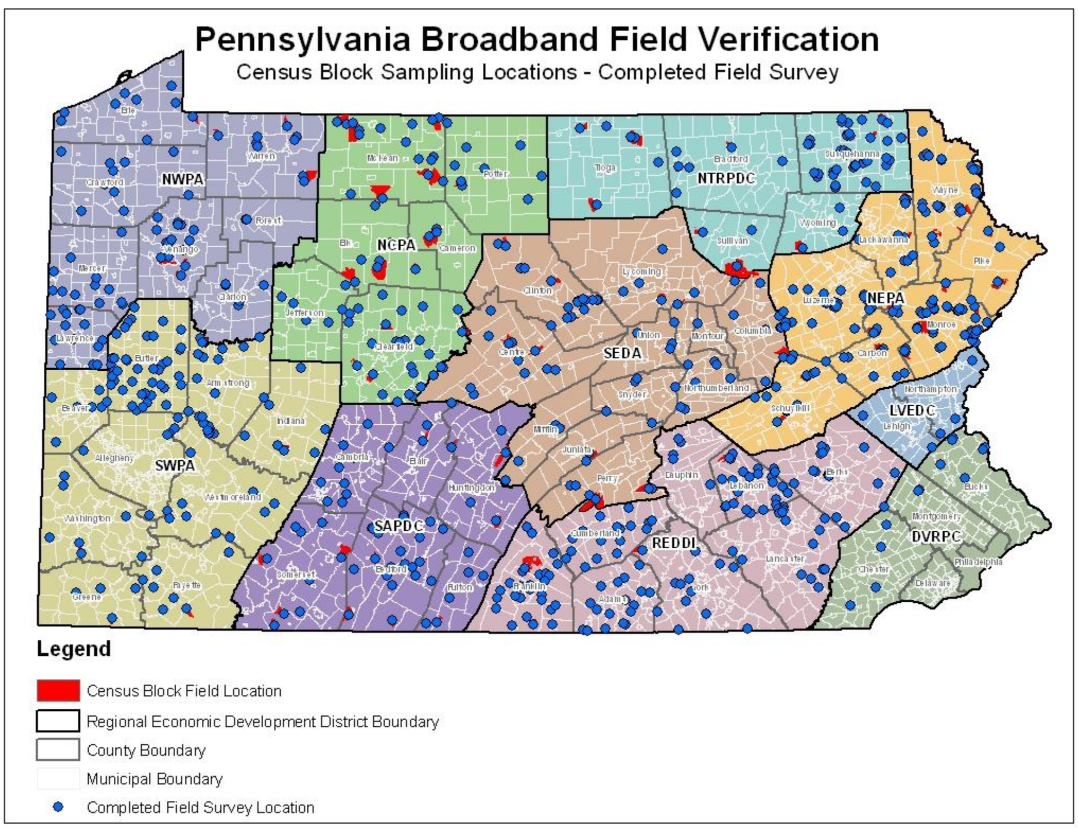

Figure 7 Completed Field Verification Locations

For the 568 census blocks that were visited, 2821 individual wired/wireless data elements were recorded and 3666 pictures were taken at those locations. This field collected dataset is used as a validation source primarily for wireline and wireless technology of transmission, middle mile, and wireless speed.

Provider Data Validation Process

Provider Feedback Loop: Feedback received from the providers is visually inspected and integrated directly in the mapping GIS database.

Service Area Validation Data: The Telogical wireline service area data is tabular and contains a separate record for each provider/technology of transmission combination with an associated census block or TIGER road segment, depending on the whether the size of the census block area (=/< or > 2 sq. mi.). This data is exported into an ArcGIS data format. The American Roamer wireless service area data is already in and ArcGIS data format. The validation data is then joined to the provider service area data by census block or TIGER road segment ID. Any database records in the provider or validation tables that cannot be joined are output to a separate layer that indicates the areas of discrepancy between the two datasets. The joined tables are then queried to detect any speed discrepancies which are also output to a separate discrepancy layer.

Field Validation Data: The field data are also collected in tabular database format, and represent a specific lat/long spatial location for each record. This data is also exported into an ArcGIS data format, joined to the provider data, queried to validate pertinent attribution. Again, records not joined and/or with detected attribution discrepancies are output to separate GIS layers.

Topology: The ArcGIS Validate Topology Tool is used to flag any topology issues in the broadband data. Flagged issues are reviewed to identify false positives and update true errors as required.

SBI Check Submission: The NTIA-provided SBI Check Submission tool is utilized to validate that the deliverable broadband data is consistent with the business logic rules set forth by the NTIA and a passing receipt is provided with the data submittal to NTIA.

Stakeholder Feedback: The state broadband mapping website includes a feedback function. Comments received from stakeholders such as the regional Economic Development Districts and the public are reviewed and used to validate the provider data submissions.

Validation and Confidence Level Reporting

To facilitate validation and confidence level reporting, Baker deployed a validation application called Statistical Evaluation and Assessment System (SEAS) which automatically compares the multiple independent validation datasets against the broadband service providers' supplied information. The SEAS application uses statistical methodologies to report the confidence level in the spatial and attribute accuracy of the information. Appendix B shows the validation workflow.

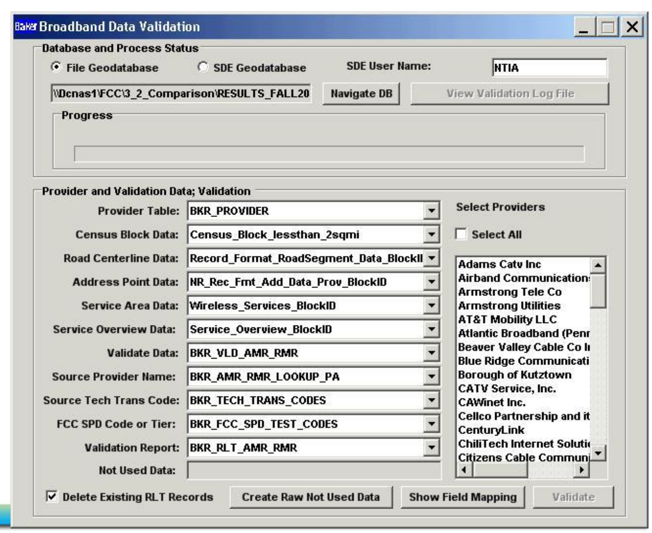

Figure 8 SEAS

The SEAS comparison is a three-part validation process:

Comparison of the collected validation source against the aggregated broadband provider data.
Match percentage calculation for each provider reported in the DataPackage.xls, “Provider Table” tab, “Comments” column.
Confidence score calculation displayed on the state broadband website.

After completing all validation data source collections, SEAS is used to automatically compare the multiple validation datasets against the aggregated broadband data which came from the providers. Through the SEAS accumulation table, it produces a match percentage per broadband service record based upon the number of matches that record has against each validation source. The matched percentage for each record is the result of the total count of the matched validations for the record divided by the total validation source being compared against the record. Validation confidence rating/score is assigned on a scale of 1 to 5 based upon the percentage of validation source matches as per the following score results:

1 Star   = 0% - 19% Match
2 Stars = 20% - 39% Match
3 Stars = 40% - 59% Match
4 Stars = 60% = 79% Match
5 Stars = 80% - 100% Match
“No Analytics” = No validation source available for that provider

The Commonwealth’s public broadband mapping website (www.broadbandinpa.com) is updated with the confidence level results at the record level based upon the queried geographic location and the following shows an example of this representation.

Provider Name	Transmission Technology	Max Download Speed	Max Upload Speed	Confidence Score
AT&T Mobility	Mobile Wireless	Greater than or e…	Greater than or e…	
Verizon	Asymmetric xDSL	Greater than or e…	Greater than or e…	NO ANALYTICS
Comcast	Cable Modem – Other	Greater than or e…	Greater than or e…	

The matched percentage for the records for each provider are summarized and then divided by the total count of the records to create the final matched percentage for the specific provider. These percentages are included in DataPackage.xls on the Provider Table tab in the Comments column.

Low Confidence Provider Feedback

Provider data which is assigned a low confidence (1 or 2 stars) through the SEAS process is communicated back to the provider through a feedback loop. Generally, the low confidence feedback and reconciliation is a continuous refinement process and usually occurs between update cycles. The goal is to provide this feedback through the Provider Data Update Webportal via a web connection that is available and rolled out to providers in January 2012.

Changes and Corrections Documentation

With each semi-annual NTIA data submittal, changes and corrections documentation is provided. Significant changes in a provider's status or data, corrections to previously supplied data, providers supplying data for the first time, etc. are specified by Provider name in the Changes and Corrections document.

OFFICIAL OCTOBER 2012 UPDATE SUBMISSION TO THE NATIONAL TELECOMMUNICATIONS AND INFORMATION ADMINISTRATION UNDER THE STATE BROADBAND INITIATIVE GRANT PROGRAM FOR THE COMMONWEALTH OF PUERTO RICO

CONNECT PUERTO RICO®

October 1, 2012

TABLE OF CONTENTS

October 1, 2012

Ms. Anne W. Neville
SBI Grant Program Director
National Telecommunications and Information Administration
U.S. Department of Commerce
Room 4716
1401 Constitution Avenue, NW
Washington, DC 20230

Dear Ms. Neville:

Connected Nation is pleased to present this submission on behalf of the Designated Entity, the Puerto Rico Office of the Chief Information Officer, and the Commonwealth of Puerto Rico's State Broadband Initiative (SBI) Grant Program, known as Connect Puerto Rico.

The Connect Puerto Rico program and its collective stakeholder community continue to be faithful and energized contributors to the National Telecommunications and Information Administration's (NTIA) SBI program. Now more than ever, the significance of complete and validated data as compiled through the Federal Communications Commission's (FCC) National Broadband Map is instrumental in forging the innovation economy of the 21st century. As the Commission relies upon this unique resource to distribute monies under the Connect America Fund, through the Universal Service Fund reform, the Connect Puerto Rico program equally values this data in informing meaningful program interventions relating to broadband access, adoption, and use initiatives. Truly, this coordination embodies the spirit of the SBI and demonstrates the joint effort of the NTIA, FCC, state governments, industry, and non-profits like Connected Nation as it continues to serve as a key tool for the American public and policymakers. We are proud of the role that Connect Puerto Rico has played in creating and maintaining such a powerful tool that has benefitted and surely will continue to benefit broadband providers, consumers, and businesses nationwide.

The artifacts that comprise this submission should be found to be compliant with the October 1, 2012, deadline for the semi-annual data update and in accordance with the terms of the July 1, 2009, Notice of Funds Availability (NOFA) and all subsequent clarifications pertaining to delivery of state-level mapping of broadband service availability. This packet includes:

Inventory of Deliverables, Connect Puerto Rico: October 1, 2012

NOFA Requirement	Data Transfer Model	Data Description
Appendix A: 1(a)(i)	BB_Service_CensusBlock	Broadband Service Availability of Facilities-Based Providers in

			Census Blocks of No Greater Than Two Square Miles in Area
Appendix A:	1(a)(ii)	BB_Service_RoadSegment	Broadband Service Availability of Facilities-Based Providers by Road Segment in Census Blocks Larger in Area Than Two Square Miles
Appendix A:	1(b)	BB_Service_Wireless	Broadband Service Availability of Wireless Services Not Provided to a Specific Address
Appendix A:	3(b)	BB_ConnectionPoint_MiddleMile	Broadband Service Infrastructure Middle-Mile and Backbone Interconnection Points
Appendix A:	4	BB_Service_CAInstitutions	Community Anchor Institutions-Listing
Appendix A:	4	n/a	Community Anchor Institutions-Narratives
VII.A.1(a)		n/a	Accuracy and Verification Report
n/a		DataPackage.xlsx	Worksheets of Contact Information, Record Count, and Provider Summary Table
n/a		n/a	List of Changes and Corrections to the Dataset
n/a		n/a	Non-Participating Provider (NPP) Narratives
n/a		n/a	Broadband Provider Roster and Participation Status

In addition, this data update submission should be found to be compliant with the additional program requirements instituted by the National Telecommunications and Information Administration since the time of the April 2012 SBI data submission for the Connect Puerto Rico program. Specifically, these new requirements are:

SBI Data Transfer Model
The submission of the broadband dataset for October 1, 2012, is contained within the SBI Data Transfer Model as released on the Grantee Workspace on August 9, 2012. All efforts have been made to comply with formatting, domain, and metadata requirements to include as much information on each provider as possible.

Additional Submission Guidance
New to the semi-annual submission for October 2012 is a more robust version of the ReadMe text file. As per the template released on the Grantee Workspace on May 18, 2012, this file contains a high-level summary of the items contained within the submission, including the exact file deliverables, a description of the errors and warnings from the Check

Submission report, and extraneous information of which the NTIA and other users of the dataset should be made aware.

This submission continues to follow the speed technology guidance released by the Program Office on August 9, 2012, to review speed tier codes in correspondence with technology of transmission codes. In the April 2012 submission, descriptions were provided in the methodology paper that offered an explanation for any submitted technology of transmission and speed combinations that were outside of the expected value range. That practice continues in this submission as technology and speed combinations are reviewed and scrutinized; any questionable information supplied by providers is reviewed more in depth with the provider to ensure the information is accurately captured or a proper explanation is provided as to why the speed information should be submitted as supplied even if it falls outside the expected value range.

Also in this submission is a narrative describing the data and coverage estimation of non-participating providers. While Connect Puerto Rico continues outreach to all providers prior to each submission period, the need to submit broadband service data for all providers regardless of their participation is evident as the SBI program continues into this sixth round of data submissions. The submission of this estimated broadband service area for providers that have not supplied data to Connect Puerto Rico is essential in being able to portray a more accurate depiction of the current broadband landscape.

In addition to the requirements mentioned above, please find this methodology paper to be inclusive of the ongoing section pertaining to industry mergers and acquisitions – specifically this section details any and all mergers or acquisitions that have taken place in Puerto Rico since the April 2012 submission. The intent of this updated section is to provide a better understanding of how the broadband provider landscape has changed since the last submission cycle.

This October 2012 semi-annual data update under the SBI Grant Program continues to demonstrate our dedication to implementing the joint purposes of the Recovery Act and the Broadband Data Improvement Act (BDIA) by gathering comprehensive and accurate state-level broadband mapping data, developing state-level broadband maps, aiding in the development and maintenance of the National Broadband Map, and undertaking statewide initiatives for broadband planning.

Broadband Service Availability — Provider Outreach and Verification

This data update submission under the SBI program includes datasets for 95 percent of the Puerto Rico provider community, or 19 of 20 total providers. There are 18 participating providers and one additional non-participating provider whose estimated coverage areas have been submitted. Of the 18 participating providers, 9 supplied an update to their network or coverage area(s), while 9 have reported no change. A complete roster by provider depicting participation status and contact record is contained herein. The provider that is not represented in the attached datasets is currently in some form of progress toward data submission but was not able to submit coverage areas at the time of this submission.

As the aforementioned roster and attached methodology documentation will attest, it is the collective opinion of the Connect Puerto Rico principals that all commercially reasonable efforts were made to account for 100 percent of the known Puerto Rico broadband provider community, pursuant to this semi-annual data update submission.

Connect Puerto Rico has also continued to perform broadband verification activities through several means. In addition to confirmation of service area(s) by each provider, Connect Puerto Rico conducts field validation efforts. To date, 13(65 percent) providers have been validated through field verification activities. Additional details on verification activities are contained within the Field Validation Methodology.

The Connect Puerto Rico website, (www.connectpr.org), continues to serve a prominent role in the outreach and data collection effort. This program asset provides a way for the general public to participate in the process by offering interactive tools for users to test their connection speed, submit broadband inquiries, or contact a program representative.

As an indicator of stakeholder penetration, the Connect Puerto Rico website encountered 3,210 unique visits during this reporting period (16,144 total to date for the life of the grant awarded on December 20, 2009). Additionally, this pronounced Web activity netted 6 broadband inquiries over this same reporting period (77 grant inception to date). The website also provides access to the My ConnectView™ interactive mapping application, which allows consumers and broadband providers to confirm or dispute the coverage represented on the broadband inventory map. These consumer-initiated actions are facilitated through the Connect Puerto Rico website and the Connect Puerto Rico interactive mapping tool (My ConnectView™) that offer the stakeholders the vehicles to provide information regarding availability in their respective service area, either in affirmation or contest of the reported data represented in the Connect Puerto Rico mapping artifacts. Since the initial data collection and release of corresponding maps, feedback in the form of broadband inquiries has allowed Connect Puerto Rico to identify additional areas that are in need of field validation, which is scheduled as soon as possible.

Community Anchor Institutions

Connect Puerto Rico has established an ongoing mechanism for gathering data on the location and broadband connectivity of Community Anchor Institutions (CAI), in accordance with the data requirements of the SBI NOFA Technical Appendix. Since the April 2012 data submission, the CAI outreach process method has been modified to improve data collection. Specifically, the outreach process is a more focused sector-specific and relationship-oriented approach that generates more responses than general contact.

In conjunction with the Office of the Chief Information Officer, outreach was conducted during this data update reporting period by Connect Puerto Rico to continue identification of existing, centralized sources for CAI connectivity data. Additionally, outreach was coordinated to distribute the CAI survey to institutions throughout the commonwealth through multiple methods including a customized online survey available on the Connect Puerto Rico website. During this reporting period Connect Puerto Rico continued to promote the importance of broadband connectivity at anchor institutions and participation in this data collection process. It became apparent that these relationships are beneficial to the entire success of the Grant Program, and the CAI engagement is a logical extension of new and existing relationships. Connect Puerto Rico will continue to build upon these existing relationships over the coming months and utilize its contacts throughout the commonwealth to collect data and raise awareness of this project.

In addition to fostering and building relationships with commonwealth agencies, associations, and organizations, Connect Puerto Rico has also developed a sector-specific calendar that supports CAI outreach as well as research and communications efforts. This focused approach allows a corporate commitment to capturing CAI data in addition to developing meaningful sector-specific content.

Connect Puerto Rico is also working hard to clarify CAI information associated with wireless broadband. NTIA has requested in-depth questioning of CAI listing a wireless broadband service as their sole form of connectivity. This follow-up allows us to better understand the reason for adopting the wireless broadband service.

From our work in Puerto Rico, as well as other states, we recognize the great value of this data to future collaboration efforts within the commonwealth as well as its value to the National Broadband Map. We plan to continue to bring best practices to the Connect Puerto Rico efforts, along with an investment of both human and technical resources required to reach our goal of increasing the data that is secured and reported as part of this process.

The Connect Puerto Rico program exists to improve data on the deployment and adoption of broadband services and to assist in the extension of broadband technology across all regions of the great Commonwealth of Puerto Rico, as well as the United States and its territories through contribution to the National Broadband Map. We look forward to the continuing work ahead and improving upon our data collection methods.

Respectfully submitted,

Thomas W. Ferree
President and Chief Operating Officer
Connected Nation, Inc.

DATA ACQUISITION: PUERTO RICO COMMUNITY ANCHOR INSTITUTIONS METHODOLOGY

In this sixth reporting period of the SBI, Connect Puerto Rico, working in close coordination with the Commonwealth of Puerto Rico, has established an ongoing mechanism for gathering data on the location and broadband connectivity of Community Anchor Institutions (CAI), in accordance with the data requirements of the SBI NOFA Technical Appendix. Since the April 2012 data submission, the CAI outreach process method has been modified to improve data collection. Specifically, the outreach process is a more focused sector-specific and relationship-oriented approach that generates more responses than general contact.

Connect Puerto Rico has continued to identify and process CAI data obtained through an ongoing island-wide outreach campaign. Physical address information continues to be augmented through manual sourcing and geocoded by Connect Puerto Rico through Esri ArcGIS software.

Connect Puerto Rico continues to utilize a customized online survey hosted through SurveyMonkey, with a landing page on the Connect Puerto Rico website that was developed during the first reporting period. This survey, in combination with a customized data-gathering spreadsheet, was distributed on a regular basis to a targeted list of CAI throughout the commonwealth as well as organizations and agencies that work closely with the CAI. The distributions were completed with the support of the client. Connect Puerto Rico will continue to use these data-gathering tools for future targeted outreach efforts throughout the coming months leading up to the next reporting period. These materials are customized to fit the CAI categories as defined in the SBI NOFA.

The survey can be accessed at this link:
http://www.surveymonkey.com/s/RGLRB9D

In addition to the survey, Connect Puerto Rico continued to promote the importance of broadband connectivity at Community Anchor Institutions and participation in this data collection process. It is apparent that these relationships are beneficial to the entire success of the grant program, and the CAI engagement is a logical extension of new and existing relationships. Connect Puerto Rico will continue to build upon these new relationships over the coming months and utilize its contacts throughout the commonwealth to collect data and raise awareness of this project.

In addition to fostering and building relationships with territory agencies, associations, and organizations, Connect Puerto Rico has also developed a sector-specific calendar that supports CAI outreach as well as research and communications efforts. This focused approach allows a corporate commitment to capturing CAI data in addition to developing meaningful sector-specific content.

Connect Puerto Rico conducts significant research as part of an ongoing process to identify existing, centralized sources for CAI connectivity data. In tandem with these efforts to identify existing data, Connect Puerto Rico continues to identify key CAI contacts in an effort to distribute and promote the online survey and raise awareness of the importance of CAI broadband connectivity. Also, when possible, Connect Puerto Rico works with the Office of the Chief Information Officer to identify existing relationships that can support CAI outreach.

Connect Puerto Rico has an ongoing mission to educate CAI throughout the island on the importance of participating in the project. Participation by these institutions will raise awareness about the importance of broadband connectivity and the need to report the requested data for inclusion on the National Broadband Map.

The greatest challenge with collecting CAI data continues to be educating the CAI about the Connect Puerto Rico project as well as self-awareness of their own CAI connectivity (specifically upload and download speeds). Connect Puerto Rico will continue to research key CAI organizations and agency contacts in an effort to raise awareness of this project among CAI. When applicable, the Office of the Chief Information Officer will continue to be briefed on the current CAI data and provided information so it can assist with outreach and promotion within the commonwealth.

A CAI summary of all processed and submitted data is provided below:

CAI Type	Total	Physical Address	Lat/Long	Technology of Transmission	Download Speed	Upload Speed
K-12 Schools	2,024	2,021	1,724	1,544	1,506	1,505
Libraries	157	156	153	2	1	1
Healthcare	624	623	139	4	4	4
Public Safety	302	301	274	21	15	11
Higher Ed Institutions	601	601	143	25	19	19
Other Government	129	129	122	0	59	45
Other Non-Government	1,591	1,530	979	8	5	5
Total	5,428	5,361	3,534	1,604	1,609	1,590

During the coming months, CAI data collection will be supported by regular reporting to the Connect Puerto Rico team. The CAI data is proving an invaluable resource to all components of the Connect Puerto Rico effort. The data identifies potential local champions, sector trends, and opportunities for improvement as well as opportunities to educate CAI not familiar with their current connectivity.

SBI Data Submission Methodology

The submission of the broadband dataset for October 1, 2012, is contained within the SBI Data Transfer Model and additional components as released on the Grantee Workspace on August 9, 2012. Connected Nation (CN) has reviewed all literature that relates to the release and use of this data transfer model and recognizes that it does not replace or dictate how data is stored, processed, or displayed for the commonwealth, as it is meant primarily as a means to transfer the broadband data from all states and territories and populate the National Broadband Map in a seamless fashion.

Connected Nation has complied with the following guidance documents published by NTIA:

- Technical Mapping Guide, as released on the Grantee Workspace on March 24, 2011, was followed to ensure the completeness and validity of the submission through completion steps and checklists, completing the DataPackage spreadsheet, uploading broadband datasets into the Data Transfer Model, and checking the dataset using the SBDD_CheckSubmission receipt process.
- Naming Conventions and Category of End User, as released on the Grantee Workspace on March 26, 2012, was followed to ensure the consistency of individual file and zip package naming.

In addition to the methodologies contained herein, the Changes and Corrections documentation, as well as the DataPackage.xls containing contact information, the data dictionary, and a provider summary table, the following feature classes are submitted within the SBI Data Transfer Model for the Commonwealth of Puerto Rico.

Inventory of Deliverables, Connect Puerto Rico: October 1, 2012

NOFA Requirement	Data Transfer Model	Data Description
Appendix A: 1(a)(i)	BB_Service_CensusBlock	Broadband Service Availability of Facilities-Based Providers in Census Blocks of No Greater Than Two Square Miles in Area.
Appendix A: 1(a)(ii)	BB_Service_RoadSegment	Broadband Service Availability of Facilities-Based Providers by Road Segment in Census Blocks Larger in Area Than Two Square Miles.
Appendix A: 1(b)	BB_Service_Wireless	Broadband Service Availability of Wireless Services Not Provided to a Specific Address.
Appendix A: 3(b)	BB_ConnectionPoint_MiddleMile	Broadband Service Infrastructure Middle-Mile and Backbone Interconnection Points.
Appendix A: 4	BB_Service_CAInstitutions	Community Anchor Institutions-Listing.

The provider data collected by CN on behalf of the Commonwealth of Puerto Rico have been formatted per the given specifications and uploaded into the appropriate feature classes of the SBI Data Transfer Model. Wireline availability is contained within census blocks and road segments, wireless availability is contained as polygons of coverage areas, and middle-mile connections and Community Anchor Institutions are contained as point data. All speed data is contained at the census block, road segment, or wireless polygon level of availability. All efforts have been made to comply with formatting, domain, and metadata requirements to include as much information as possible.

Connected Nation has continued outreach to satellite providers on their availability, technology, and speed information, but granular coverage is not yet available. Submitted within the wireless feature class are the satellite companies providing service to Puerto Rico as a polygon of the island boundary. Efforts will continue to collect, process, or otherwise create more granular satellite data based on availability analyses and guidance received from NTIA. Process development is underway at CN as well to be able to create more granular satellite coverage based on satellite equipment positioning and geographic inputs.

PUERTO RICO FIELD VALIDATION METHODOLOGY

CN focused a portion of its time on specific validation processes such as:

- conducting random spectrum analysis studies throughout the territory using an Avcom PSA-37-XP spectrum analyzer;
- conducting mobile speed tests throughout the territory using an iPhone, Android (or other smart phone) as well as provider-specific aircards (Sprint 3G/4G, Clearwire et al);
- identifying pre-selected, provider-submitted wireless transmit tower sites and cross-referencing data about that tower against the Federal Communications Commission (FCC) databases such as Antenna Structure Registration and/or the Universal Licensing System;
- cross-referencing Federal Registration Number data against available FCC Form 477 data as well as the FCC **CO**mmission **RE**gistration **S**ystem (CORES);
- validating provider submitted data (for example: latitude/longitude) using a handheld Garmin eTrex Summit GPS unit or GPS enabled software such as Microsoft Streets and Trips;
- locating physical wire-line attributes (such as Central Offices, Remote Terminals, CATV plant, etc.) and comparing them against provider submitted data; and
- conducting on-net and off-net speed tests using the FCC portal at http://www.broadband.gov/qualitytest/about/ or using the Ookla Net Metrics enabled speed test utility located on each of CN's program specific websites.

Additionally, CN cross-referenced numerous public documents in order to ensure that all known broadband providers were located and contacted. This included searching membership logs from trade associations (WISPA, WCAI, PCIA, etc.), the Cable Television Fact Book, Public Utility Commission records, Public Service Commission records, Chamber of Commerce, etc.

To date, Connected Nation's staff conducted on-site validation tests in Puerto Rico on the following providers: Aeronet Wireless; AT&T; Critical Hub Networks; Choice Communications; Data@ccess; Liberty Cablevision of Puerto Rico; Neptuno Media; PR Wireless Inc.; San Juan Cable LLC (d.b.a. OneLink); Puerto Rico Telephone Company; Sprint; T-Mobile; and Worldnet.

In addition to the field verification tests that have been conducted, Connected Nation had previously conducted work in the field to collect information for the non-participating provider, San

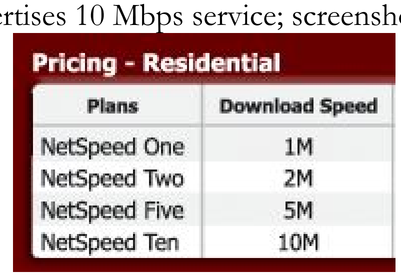
Juan Cable LLC (d.b.a. OneLink) which, by nature of the methodology required for this collection, is also included in the above list. On June 26, 2012, the Denver Business Journal reported that Liberty Global will be "acquiring the parent San Juan Cable LLC (d.b.a. OneLink)." As such, the number of viable providers should result in a net of -1 prior to year end.

From program initiation through this reporting period, CN has completed in-the-field validation testing against 13 companies (out of a universe of 20 viable providers) totaling 65 percent within the Commonwealth of Puerto Rico. This percentage also considers the non-participating provider (NPP) records submitted to NTIA as may be contained herein (see "Data Submission and Coverage Estimation of Non-Participating Provider" below).

CN has also continued to review provider datasets for accurate speed information, platform listings, and other intricacies that may fall outside of the standard SBI Data Transfer Model parameters, as published on the NTIA Grantee Workspace on August 9, 2012. Any providers whose submitted coverage and attributes are anticipated to come into question have been further reviewed and confirmed; details on a case-by-case basis are presented below.

AT&T Mobility LLC
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider confirmed that tier 7 service is available.

Critical Hub Networks
Issue: Fixed wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 10 Mbps service; screenshot below.



Pricing - Residential

Plans	Download Speed
NetSpeed One	1M
NetSpeed Two	2M
NetSpeed Five	5M
NetSpeed Ten	10M

Liberty Global, Inc.
Issue: Technology of transmission code 40 with maximum advertised download speed in tier 8, lower than expected value range for the technology.
Resolution: Provider website advertises 30 Mbps service; screenshot below.

Our Internet service sets the bar for high speed web access in Puerto Rico. If you're looking for speed and reliability, you got it. We offer you the highest speeds at the lowest prices, guaranteed. The stats prove it! You don't need to install a phone line you don't use. The equipment cost is included. Plus, if you bundle it up with our TV and phone services, it costs even less!

3 Mbps	Triple Pack Individual $29.99 - $39.99 Monthly	Up to 5 times faster than most, plus, you get aditional features for FREE!	Show me more Details
5 Mbps	Triple Pack Individual $34.99 - $44.99 Monthly	Increase your speed and save an average of $40 compared to the competition.	Show me more Details
10 Mbps	Triple Pack Individual $44.99 - $64.99 Monthly	Rev it up! The only place where you can get this much speed without breaking the bank.	Show me more Details
20 Mbps	Triple Pack Individual $54.99 - $74.99 Monthly	Do evething you love to do online all at once and faster than ever.	Show me more Details
30 Mbps	Triple Pack Individual $64.99 - $84.99 Monthly	All your household divices connected and at full speed.	Show me more Details

PR Wireless Inc.
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.

• Internet móvil hasta **12 Mbps** de velocidad

Puerto Rico Telephone Company, Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 16 Mbps service; screenshot below.

Planes de Internet 16 Mega

T-Mobile USA, Inc.
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website indicates speeds greater than tier 6 are available; screenshot below.

T-Mobile customers with 4G phones are already experiencing data speeds that are comparable to or faster than the speed of a home broadband network. And with recent improvements to our 4G network-doubling our theoretical download speeds-we're giving our customers enhanced 4G data speeds. We've seen average download speeds on our HSPA+ 42 Mbps-capable data stick approaching 10 Mbps with peak speeds of 27 Mbps, and download speeds approaching 8 Mbps with peak speeds of 20 Mbps on our upcoming HSPA+ 42 Mbps-capable smartphones.

Data Submission and Coverage Estimation of Non-Participating Provider

As part of its ongoing broadband mapping efforts, CN has developed a series of processes with the goal of submitting coverage estimation mapping data to NTIA for every known and qualifying last-mile broadband provider, regardless of platform type (cable modem, DSL, fixed wireless, etc.). This specific collection of coverage estimation methodology papers (see Appendix A) demonstrates the estimated broadband service territory for the providers in Puerto Rico that have either been non-responsive or that have refused to participate in the SBI mapping initiative.

Accuracy and Verification: Provider Validation Methodology

Broadband providers maintain their service area data in many different formats, all in varying levels of complexity and granularity. In order to ensure that the data required by the NTIA is standardized across all providers and that it is as accurate as possible, CN translates and formats the data that providers are able to supply into a GIS shapefile and produces maps for the provider to review. The resulting map(s) and review process allow for providers to see their service area in a geographic format – for some providers, this is the first time they have seen maps of their broadband service area. Having the mapped service area allows providers to quickly identify any issues that appear in the data representation, whether the issue is in the data translation into a GIS format or from the original data collection and submission. Often data is provided from various sources and through the review and revision process, local engineers who operate the networks and work in the field are able to ensure that the tabular data that has been submitted is accurate and represents the real-world network extent. Any issues in how the service area is represented on the map(s) are remedied by CN, whether they are additions, removal of service, or any other revisions. Revised maps of service area representations are sent to the provider for review and approval; CN will revise data and return maps as many times as necessary until the provider is in agreement that the map represents their service area as accurately as possible. Once the review process has been completed and final approval of the data is provided, the data is deemed ready for NTIA submission.

Once the data collection has been aggregated at an island-wide level, static maps of island-wide and municipality-level availability are produced and made publicly available. In addition, consumers can visit the interactive online tool, My ConnectView, to create customized views of broadband service areas and analyze corresponding demographic information. Leveraging broadband service data on various platforms allows for public users, providers, and other stakeholders to review, scrutinize, and provide feedback on the represented data. This feedback becomes a validation method in itself as consumers submit inquiries to CN either affirming where service is not available or identifying areas where broadband service is shown on the map, but in actuality is not available. This allows for a follow-up to providers regarding revisions to the data as it is represented; it also allows for CN to identify locations where on-site visits may be necessary to complete field validation of available services. Public feedback on all forms of mapping products serves as a localized validation method for provider-supplied information and allows CN to resolve inaccuracies as they are identified to ensure that only the highest quality information is provided to stakeholders.

Additionally, non-participating provider narratives that were submitted in previous mapping cycles are subjected to the same level of scrutiny. Occasionally, a provider may elect to voluntarily participate (thus eliminating the need for future data estimation activities in the field). However, more often than not, the NPP narrative is updated with a combination of data gleaned from the provider's website, data obtained through FCC research and/or data collected/verified in the field by a CN staff engineer.

Estimates derived from provider-validated data indicate that approximately 14.25 percent of Puerto Rico households do not have terrestrial fixed broadband service available, and approximately 0.17 percent of Puerto Rico households have neither mobile nor fixed broadband service available.

Within rural areas of the island, results derived from provider-validated data indicate that approximately 22.91 percent of rural Puerto Rico households do not have terrestrial fixed broadband service available, and approximately 0.20 percent of rural Puerto Rico households have neither mobile nor fixed broadband service available. Please note that the availability estimates presented are based on Census 2010 household information.

The estimates above, in accordance with NTIA's definition of available broadband service as specified in the SBI NOFA, include broadband service with download speeds of at least 768 Kbps and upload speeds greater than 200 Kbps.

In addition, due to the nature of the SBI data collection methodology as defined by the NTIA and based on both census block geographic units and street segment data, the estimates of broadband availability derived from provider-validated data may include an overstatement of the actual number of households with broadband availability. Under the census block-based data collection method, a provider will typically report broadband availability for an entire census block whether its network is present across the whole or only a subset of that census block. This potential overestimation at the census block level can be amplified as the data is aggregated across the entire state.

WIRELESS METHODOLOGY

Broadband Service Availability in Provider's Service Area
Wireless Services Not Provided to a Specific Address

Data solicited from a fixed wireless provider to create propagation models include, but are not limited to:

1. The name of the structure.
2. Whether the transmitting device is operational or proposed.
3. The maximum advertised downstream speed, the maximum advertised upstream speed.
4. The typical downstream speed, the typical upstream speed (peak periods for both).
5. The frequency range of spectrum being used (as prescribed by NTIA). This may include (but is not limited to) spectrum authorizations identified within the Federal Communications Commission (FCC) Universal Licensing System (ULS) database or located on the FCC's Spectrum Dashboard. This research often proves to be exceptionally effective when estimating the coverage area of an NPP.
6. The primary population center(s) being served (for geopolitical boundary reference).
7. The physical address of the transmit site (in the event latitude/longitude is unavailable from the provider this allows a quick reference point for geocoding).
8. Latitude in either Degrees, Minutes, and Seconds and/or in Decimal Degrees (typically received as NAD 27 or NAD 83).
9. Longitude in either Degrees, Minutes and Seconds and/or in Decimal Degrees (typically received as NAD 27 or NAD 83).
10. Antenna pattern (e.g. omni-directional, 180°, 120°, 90°, etc.).
11. Azimuth of antenna (e.g. 360° with magnetic declination if known).
12. Approximate transmit radius (in feet, miles, or kilometers).
13. Polarity of transmit antenna (Vertical or Horizontal).
14. Transmit antenna gain (in dBi).

15. Line loss (applicable only to providers using coax, heliax, waveguide or other forms of cabling – excludes power-over-Ethernet devices).
16. Mechanical and/or Electrical beam tilt (if applicable).
17. Equipment Manufacturer (allows easy cross-reference against manufacturer's specification sheet).
18. Power output of the transmitting device (if unknown, FCC standards or manufacturer specifications are applied).
19. AMSL at base of tower site.
20. Antenna centerline AGL (height of antenna above ground level measured at the centerline of the actual antenna).
21. Foliage factors (Evergreens/Deciduous and percent of ground cover).
22. Ground Clutter (primarily used in rural areas to account for foliage and in metropolitan areas to account for types and heights of buildings if known).
23. Average gain of receive antenna.
24. Receive antenna is estimated at height above average terrain (HAAT) of 6.2 meters/20 feet.
25. Federal Registration Numbers (if applicable) which may allow opportunities to cross-reference and/or obtain additional data from the FCC's ULS and the **CO**mmission **RE**gistration **S**ystem.

Propagation modeling combines scientific data and empirical mathematical formulation for the characterization of radio wave propagation as a function of frequency, distance, and other conditions. Propagation software(s) typically use the Irregular Terrain Model (also known as Longley-Rice) of radio propagation for frequencies between 20 MHz and 20 GHz. This model is based on electromagnetic theory and statistical analyses of the combination of terrain features and radio measurements, then predicting the median attenuation of a radio signal as a function of distance and the variability of the signal in time and in space. For metropolitan areas, the software can typically be adjusted to use the Okumura-Hata model which accounts for predicting the behavior of cellular transmissions in areas where buildings are the primary obstructions. The resulting product from either model depicts a graphical illustration of the theoretical propagation characteristics of a selected frequency range based on defined variables (receiver sensitivity of the home/mobile device, foliage factor, and digital elevation terrain input).

After converting propagation models into a geospatial format, additional processing is completed to remove the small pixels representing service present in the resulting dataset. These areas are initially created based on the parameters entered in the software from the provider equipment information, the underlying data parameters of elevation, hillshade, etc., and the limitations of the software itself to display a broadband service area as accurately as possible. Generally, these random pixel striations appear as a result of signal levels reaching the highest elevated points within the prescribed radius. Typically, while this pixilation anomaly shows legitimate areas where signals can be received, these highly elevated points may have exceedingly sparse populations or are entirely void of population. As a result, and congruent to the *Wireless Technology Methodologies and Business Logic* white paper submitted to NTIA on January 20, 2011, all independent pixels representing service that are less than 0.125 square miles in area have been removed from the geospatial representation of each wireless provider.

BROADBAND INQUIRIES METHODOLOGY

CN collects consumer feedback in the form of broadband inquiries (BBIs). These inquiries represent any type of communication received from the public regarding broadband service. Once BBIs are received across the island, this information is overlaid with the broadband availability information which was collected through the SBI program. This allows for a real-world comparison of the broadband landscape to the information received from broadband inquiries. Consumers submitting these inbound comments and/or inquiries are able to provide information regarding five categories: 1) residents who do not have broadband but want it; 2) residents who have broadband but want a different provider; 3) residents who do not have broadband, but the broadband inventory maps indicate that they do; 4) residents who have broadband but want a faster connection speed; and 5) residents who have broadband but want a less expensive service option.

BBIs are submitted frequently by consumers via the Connect Puerto Rico website. Inquiries often seek help to identify local broadband provider options, or to learn when a specific provider may be able to provide service to that consumer. Consumer comments also provide information which may help modify maps with actual service area information. The primary objectives of CN regarding these inquiries are 1) to improve the accuracy of the territory maps with submitted consumer information and follow-up field research; 2) to provide broadband options to consumers through cooperation with mapped providers and by facilitating new broadband service options; and 3) to map and analyze information from consumers about areas of unmet broadband demand and alternatives to currently mapped services. A prime example of the second option is the utilization of the Rural Utility Service satellite eligibility tool. By simply entering the consumer's address, the CN engineer can quickly determine if the consumer meets the initial qualification status for BIP satellite subsidies.

New BBIs are assigned to either the GIS department or the Engineering & Technical Services (ETS) team depending on the category entered by the consumer on the website submission form. The GIS or ETS team members respond to each inquiry according to the information requested by the consumer. Many BBIs can be resolved through desktop research; however, if a BBI requires research in the field, the assigned ETS team member conducts such research when performing field validations in the area of the inquiry, or at other such time as is practical and appropriate. GIS and ETS team members respond to and conclude BBIs via telephone contact and/or e-mail communication.

The broadband inquiry process has been implemented in each of the CN state programs with successful results. Altogether CN has received over 18,600 broadband inquiries since 2007, allowing the state programs to evaluate each inquiry for broadband demand and data verification. These inquiries are continuously examined against current broadband availability, updated every six months, to determine if previously unserved households have been expanded to and can now receive broadband at their residence. This database of broadband inquiries has also allowed the CN state programs to aggregate demand in concentrated areas to show providers the exact locations where the population has made it clear that they would purchase broadband if it was made available to them. Providers in the states have responded to this process and have expanded to areas knowing that their investment will be worthwhile. Data verification methods have also proven successful, as the state programs have been able to show those inquiries that indicate the broadband service areas are misrepresented on the map to providers, who then verify where service cannot reach in regard to that residence(s). The broadband coverage in these states has been altered to create a more accurate map based on the inquiries submitted by the public.

During this reporting period, the Connect Puerto Rico project has received a total of 6 inquiries (77 grant inception to date). As more inquiries are submitted to Connect Puerto Rico, a more thorough validation of the broadband landscape can be performed, while also allowing providers to see which areas have a high demand for broadband adoption.

MY CONNECTVIEW METHODOLOGY

My ConnectView is an online, interactive mapping tool for viewing, analyzing, and validating broadband data. Developed using Esri's ArcGIS for Server and Adobe's Flex Framework and hosted and maintained by Connected Nation, My ConnectView is a multi-functional, user-friendly way for local leaders, policymakers, consumers, and technology providers to devise a plan for the expansion and adoption of broadband.

First and foremost, My ConnectView allows consumers to locate their residence and identify providers that offer broadband Internet service to that location. The interactive platform allows for users to build and evaluate broadband expansion scenarios using a wealth of data, including several coverage analysis layers, speed analyses, Community Anchor Institutions, and tools to search and export household demographic information, as well as extract data in GIS, spreadsheet, and/or PDF formats.

My ConnectView also features more interactive data layers and additional tools than ever before to allow the consumer to explore the broadband data. My ConnectView provides consumers with the ability to print, e-mail, and provide feedback on the broadband data displayed on the interactive map. Through the collection of this feedback, a visual demand for broadband is presented. This visualization allows the CN state programs the ability to validate the broadband availability for accuracy. If residents within a region state they are without broadband, but the interactive map shows otherwise, this allows CN to approach the providers within that area in an effort to trim down their coverage to more accurately represent real-world availability on the ground.

The Connect Puerto Rico project launched My ConnectView on April 2, 2012, and received 878 visits this reporting period; to date the interactive mapping applications have received 2,811 visits.

SPEED TEST METHODOLOGY

The 238 speed tests that are represented in the Connect Puerto Rico Speed Test Report during this reporting period (1,428 grant inception to date) are the result of a partnership between CN and Ookla Net Metrics. Utilizing this relationship increases the level of confidence in the data being collected and provides for a far greater sample size than could be collected by a single testing site.

Ookla owns and operates Speedtest.net, as well as develops and deploys speed tests, such as the Connect Puerto Rico speed test website, for partners around the world. This network of sites that is developed and run on its testing technology provides Ookla with a vast dataset that, due to the variability of geographic information collected across the varying speed test sites, is geocoded utilizing Geo-IP technology. This technology allows for tests to be geocoded to points of aggregation, typically larger nodes across provider networks. While there are hundreds of thousands of tests that have been conducted, the level of aggregation is only sufficient for municipality-level detail due to the test results being located at these larger nodes and not at an absolute location for each speed test.

In an effort to validate broadband data from the Connect Puerto Rico project, speed test information is collected throughout the commonwealth. Speed tests provide speed information on the path taken through all networks (a provider's network as well as additional networks) a local machine must connect to in order to reach the host test. The benefit of this collection of speed information is two-tiered. First, it allows for a comprehensive dataset of speeds, while also providing Connect Puerto Rico with the information on where broadband services are available. Second, unlike theoretical speed information which was received through the data collection process, the use of speed tests provide real-world information on the speeds that currently exist within the Commonwealth of Puerto Rico.

PROVIDERS DEEMED NON-VIABLE

The following list of companies represents the remainder of the broadband provider universe that was originally identified as complete for outreach to begin for the State Broadband Initiative. These providers are not included in the Data Package for the October 2012 submission because they have been deemed non-eligible under the parameters and guidance of the SBI grant program. This list of companies includes, but is not limited to: providers offering service but below the current definition of broadband, those that have gone out of business, technology consulting firms, infrastructure or network construction companies, non-facilities based general resellers, etc.

	Company Name	URL	Comments
1	Adelphia	n/a	Acquired by another company; no longer in business.
2	Advance IP Applications, Inc.	www.advanceipapplications.com/	Data integrator and management company.
3	Advance Wireless Communications, Inc.	www.advancedwireless.com/	General distributor of radio equipment.
4	Affinity Mobile, LLC	www.affinitymobile.com	Inactive URL; out of business.
5	American Telephone Communication	www.americantel.com	General distributor of telephones and equipment.
6	Arroyo Calling Services	n/a	Prepaid phone services and pay phone distributor.
7	Atenas Internet	www.atenas.com/	General reseller of backhaul and dial-up; also offers B2B wireless services.
8	Broadband Internet Via Air	www.bivapr.net	BIVA assets acquired by Sprint and Clearwire; Inactive URL; no longer in business.
9	Centennial Communications Corporation	n/a	General reseller; acquired by AT&T.
10	Centennial de Puerto Rico	n/a	Acquired by AT&T.
11	Centennial Puerto Rico License Corp.	n/a	Acquired by AT&T.
12	Centro Beeper	n/a	Paging company.
13	Comunicaciones Tony Plaza, Inc.	n/a	Pay phone and prepaid services.
14	Cortelco Systems Puerto Rico, Inc.	n/a	Distributor of communications and billing systems.
15	Custom Teleconnect, Inc.	www.customteleconnect.com	US provider of operator support, domestic and international direct dial service, international callback and debit card services; also an independent pay phone provider (IPP) for the hospitality and tourism industries.

16	Datavos Corporation	www.datavos.com	Inactive URL; out of business.
17	DG-TEC Puerto Rico, LLC	n/a	Dominican-based VOIP and GSM provider; may now be out of business.
18	Ernesto L. González Morales	n/a	Not a provider of broadband services.
19	Empire Payphones, Inc.	n/a	Prepaid phone services and pay phone distributor.
20	Fibercrossing Corp.	www.fibercrossing.net	Went out of business in December of 2009.
21	Globalstar Caribbean, Ltd.	www.globalstarusa.com	Provider of satellite phones and SMS service.
22	Hibridos Telecommunications, Inc. (HIB)	n/a	Puerto Rico-based CLEC; refused to participate.
23	Humacao Payphone	n/a	Prepaid phone services and pay phone distributor.
24	IDT Puerto Rico Co.	www.idt.net	Resells local and long distance phone services.
25	Intellicall Operator Services, Inc.	www.intellicalloperatorservices.com	Outsourced service solutions and U.S. call center facilities.
26	Level 3 Communications, LLC	http://www.level3.com/	No broadband services offered on the island.
27	Lightyear Alliance of Puerto Rico, LLC	www.lightyear.net	Nonfacilities-based general reseller.
28	MCI Communications Services, Inc.	n/a	Acquired by Verizon.
29	MCI International, Inc.	n/a	Acquired by Verizon.
30	MEG COMMUNICATION	n/a	No longer in business.
31	Metro Beeper, Inc.	www.metrobeeper.com	Paging company.
32	MG Communications	n/a	Prepaid phone services and pay phone distributor.
33	Moises Sierra Fernandez	n/a	Not a provider of broadband services.
34	Network Communications International Corp.	www.ncic.com	Inmate telephone services, pay phone services, and directory assistance and reseller of prepaid

			minutes.
35	Network Operator Services, Inc.	www.centrisinfo.com	U.S. provider of operator support, domestic and international direct dial service, international callback and debit card services; also an independent pay phone provider (IPP) for the hospitality and tourism industries.
36	Neutral Tandem-Puerto Rico, LLC	www.neutraltandem.com	Provides tandem services for wholesale long distance, local transit, and international long distance.
37	Next G Network of NY, Inc.	n/a	System integrator.
38	North Sight Communications, Inc.	www.northsite.com	Was an iDEN provider in Puerto Rico; URL no longer works; may have been acquired by Proxtel Wireless.
39	Optivon Telecommunications Services, Inc.	www.optivonpr.com	Nonfacilities-based general reseller.
40	Orizon Wireless Corp.	n/a	No longer in business, contacts and website decommissioned, all licensed point-to-point authorizations now terminated by the FCC.
41	Pan American Telephone Co., PR, LLC	n/a	Hispanic-owned political consulting, public affairs, communications and business development firm on Long Island.
42	Payphone Telecom	n/a	Prepaid phone services and pay phone distributor.
43	Phoneworks, Inc.	n/a	Pay phone services and distributor.
44	PR Pronto Telecommunications Corp.	n/a	An international word-of-mouth marketing agency.
45	PR Wireless, Inc.	www.openmobilepr.com	General reseller of prepaid mobile (long distance and broadband).

46	Primus Telecommunications Group, Inc.	www.ptgi.com//docs/factscaribbean.html	Nonfacilities-based general reseller and CLEC.
47	Qwest Communications Company, LLC	n/a	Acquired by CenturyLink.
48	San Juan Gas Acquisition Corporation, (SAC)	n/a	Gas and propane company with offshore communications.
49	STSJ Overseas Telephone Company, Inc.	n/a	Facilities-based long distance carrier; offers direct dial, toll-free long distance, calling and debit cards, international toll-free service and 24-hour bilingual operator services; does not offer broadband.
50	Tatiana C. Velázquez Roza	n/a	Not a provider of broadband services.
51	T-Mobile Puerto Rico, LLC	n/a	Holding company for T-Mobile; registered with JRT.
52	Tricom USA, Inc.	www.tricomusa.net	Specializes in the installation of any voice, data, and fiber cabling, from new construction to additions.
53	Value Added Communications, Inc.	n/a	Inmate telephone services, pay phone services and directory assistance.
54	Verizon Wireless	n/a	Out-of-state provider.
55	VoiceLan Group, Corp.	www.voicelangroup.com	Inactive URL; out of business.
56	VPNet, Inc.	www.vox-tel.com	Inactive URL; out of business.
57	WorldNet Telecommunications	n/a	CLEC and holding company for Worldnet.

APPENDIX A: ESTIMATION OF NON-PARTICIPATING PROVIDER: SAN JUAN CABLE, LLC (D.B.A ONELINK)

SAN JUAN CABLE, LLC (D.B.A. ONELINK)

As part of its ongoing broadband mapping efforts, Connected Nation has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying broadband provider, regardless of whether the provider has chosen to support and participate in the SBI mapping initiative.

The following narrative will discuss the recent data collection activities related to San Juan Cable, LLC (d.b.a. OneLink), a cable television and cable modem provider in the San Juan, Puerto Rico area, explaining how and where CN obtained publicly available data and the on-the-ground validation techniques that support the underlying data.

Background

Since the April 2012 mapping submission, CN staff members have attempted to contact OneLink with 6 additional telephonic or e-mail outreach efforts. Prior to the April 2012 mapping submission, CN staff members attended meetings in Puerto Rico from September 21-25, 2009, for a series of one-on-one provider meetings, which had been scheduled by Maria Pou, Special Assistant to the OCIO, to discuss the SBI grant program. OneLink was scheduled to attend a meeting on September 24 at 10 a.m.; however, no one from the organization arrived (nor did they notify Maria of their intent to cancel). Outreach efforts conducted from September 2009 through July 2011 have failed to motivate OneLink into either responding or participating in the mapping initiative. On June 26, 2012, the Wall Street Journal reported that "Liberty Global Inc. (LBTYA, LBTYB), along with investment funds tied to Searchlight Capital Partners LP, Tuesday agreed to acquire OneLink Communications, in a roughly $585 million deal expected to form Puerto Rico's largest cable operator." (see Exhibit M). Subsequently, on August 1, 2012, newsisnybusiness.com reported that the local telephone company (Puerto Rico Telephone) filed additional comments on the proposed transaction (see Exhibit N).

CN staff members have continued to monitor the OneLink website for additional information but have not discovered any changes to either the coverage area of OneLink or the maximum advertised speeds offered by this company. Accordingly, the coverage polygon for OneLink is hereby being submitted with a "No Update" status to NTIA in regards to coverage and/or maximum advertised speeds.

The Issue

OneLink, by its lack of actions, indicated its unwillingness to participate in the island-wide mapping initiative. This surfaced as a problem during the first two stages of mapping; the lack of data for this provider will continue to threaten to skew future research and planning activities under the direction of the OCIO.

Identification of Provider's Legal Name, d.b.a., and FRN

CN began building a file based on anecdotal information and, as time progressed, enriched the file with information obtained through the public domain. For example, CN received information from the Junta Reglamentadora de Telecomunicaciones de Puerto Rico (JRT) indicating that territory once operated by Adelphia was the same territory now operated by OneLink. A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) system did not yield results. It was later discovered that the entity of record with the JRT was, in fact, San Juan Cable, LLC. A new search on the FCC CORES site yielded an FRN of 0013778857**(Exhibit A)** and additional contact data. This was later confirmed when NTIA provided CN with a submission summary comparison against FCC Form 477 filers **(Exhibit B)**.

Identification of Provider's Coverage Area

Connected Nation extracted the municipality boundaries from OneLink's publicly available website **(Exhibit C)** and used the company's published boundaries to create a GIS shapefile **(Exhibit D)** of the greatest advertised extent of OneLink's service area.

Exhibit C: Municipal Boundaries

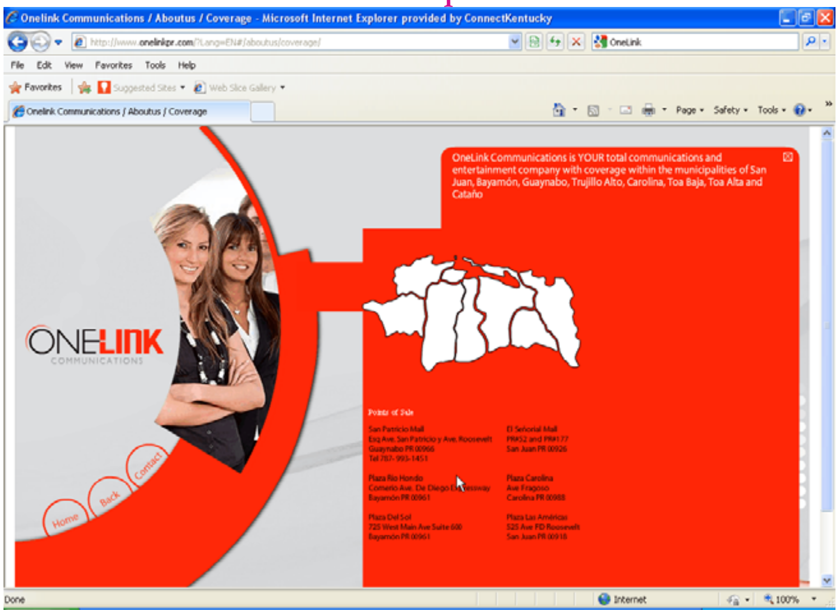

Exhibit D: GIS Shapefile

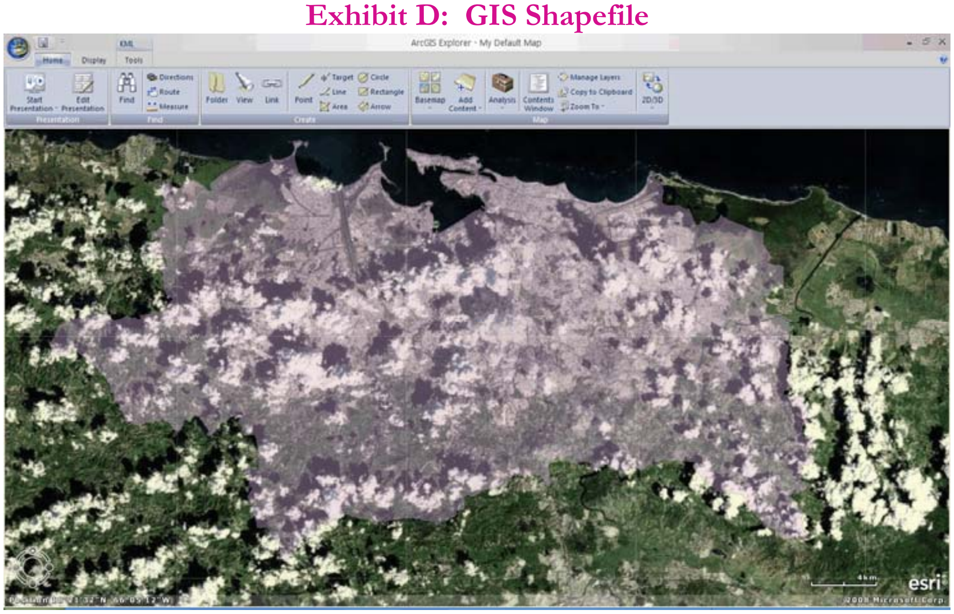
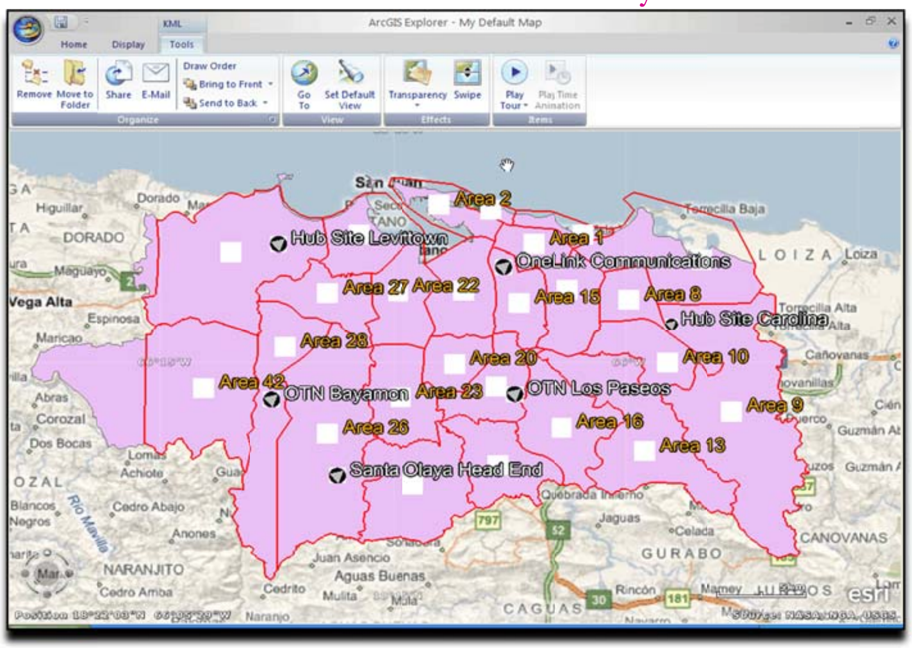


These polygons were then compared against *the only* data supplied by OneLink during the course of attempted communication **(Exhibit E)**. The purple-shaded area was the CN coverage polygon extracted from OneLink's website, and the red outlines illustrate the franchisee boundaries submitted by OneLink.

Exhibit E: OneLink Franchise Boundary Submission

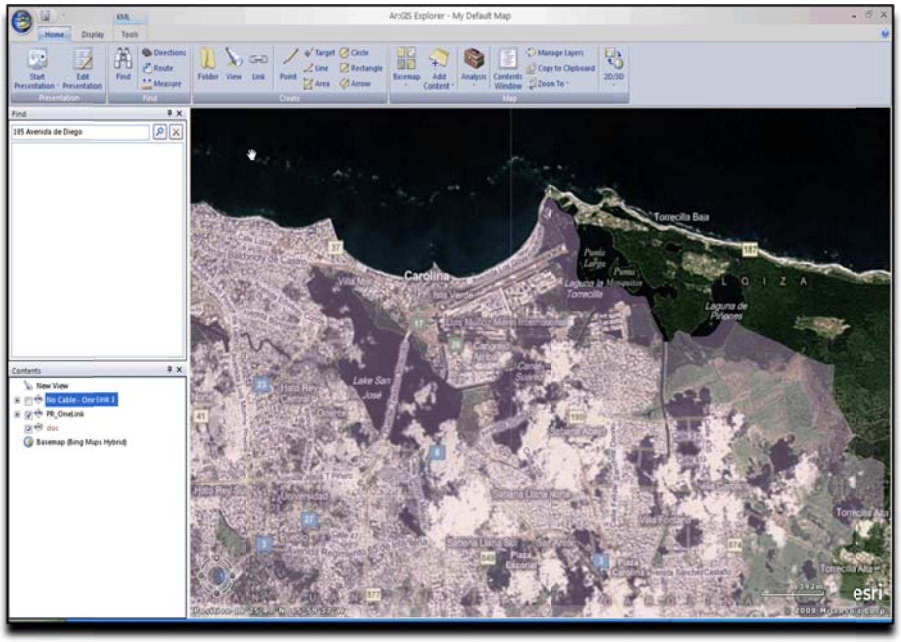


Using this combined coverage polygon as the basis for further investigation, Connected Nation set out on an exploratory "drive test" to determine where cable plant existed and estimate where cable modem likely existed in the greater San Juan area. During the period of February 7-11, 2011, Connected Nation deployed five staff members (all highly trained, former telecommunications operators) to conduct a thorough analysis of OneLink's alleged coverage area.

Testing Techniques

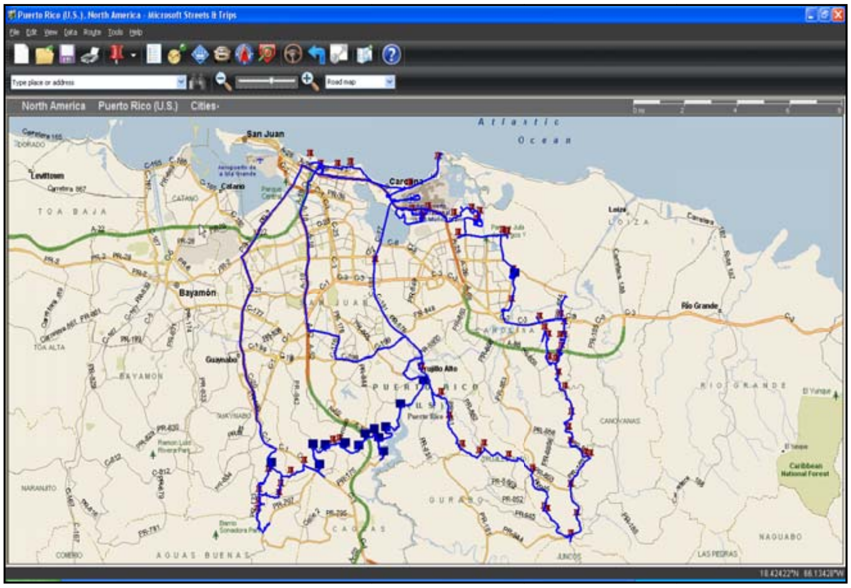
Specific quadrants **(Exhibit F)** were assigned to each of the validation teams on a daily basis. The goal was to drive through each of the areas and determine the existence (or lack thereof) of CATV plant – whether fiber or coaxial.

Exhibit F: Sample Quadrant



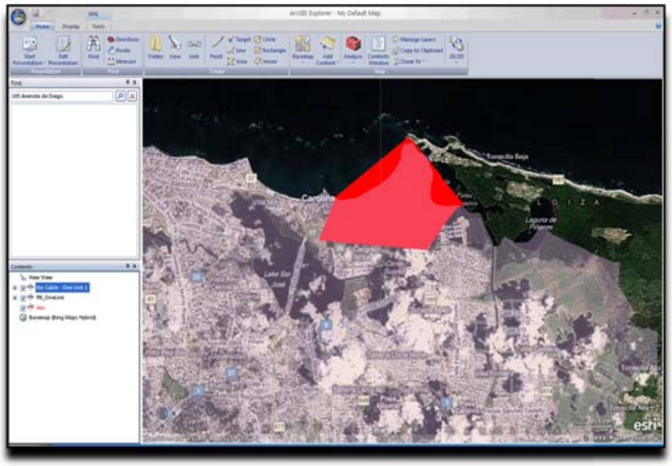
Test points were pre-selected and entered into Microsoft *Streets & Trips* software **(Exhibit G)**, which also created a GPS-enabled "trace route" of each day's drive testing activities. As cable plant was identified, markers were placed within *Streets & Trips*, pinpointing the areas where service was likely to exist. Connected Nation staff members then proceeded to stop at points along the way and conducted random interviews with residents within the area querying the actual availability of cable modem service.

Exhibit G: Test Point Locations



Based on the lack of visible or traceable cable plant, polygons were created in ArcGIS Explorer to specify the population areas where the Connected Nation staff believed coverage gaps existed. The illustration below **(Exhibit H)** represents one such gap area identified during the drive test.

Exhibit H: Coverage Gap Polygon



Visual identification of physical CATV plant **(Exhibit I)** was relatively easy and straightforward. The Connected Nation team members, many of whom were former CATV operators, found very little difficulty in identifying aerial (above ground) CATV plant or in locating plant that traveled below the earth's surface (underground plant) based simply on looking for specific cable routes.

Exhibit I: OneLink Service Truck

The images below demonstrates that the Connected Nation team could, in fact, locate aerial plant **(Exhibit J)** and identify CATV plant moving from a pole to an area where underground vaults or above-ground pedestals **(Exhibit K)** were easily traced and identified.

Exhibit J: Aerial Plant

Exhibit K: Above Ground Pedestal

At the conclusion of this week-long exercise, Connected Nation had driven through several hundred miles of the OneLink franchise area, located above-ground and underground plant, visited with and surveyed numerous local residents, obtained collateral material from OneLink's local offices (to determine maximum advertised connection speeds), and created a polygon that illustrates the identified and likely coverage area of OneLink.

Results and Submission for April 2012

As a result of the collection of publicly available information and the on-the-ground validation efforts, Connected Nation is submitting on behalf of the Commonwealth of Puerto Rico, the cable modem broadband service area of OneLink. Without provider participation and support of the SBI mapping initiative, CN has proceeded with developing a relevant and feasible methodology for collecting and validating the service area of a currently non-participating broadband provider. The image below **(Exhibit L**) shows the exact results of the validation efforts in terms of the revisions made to the advertised cable broadband availability in the San Juan area. Polygons in red demonstrate areas where the CN staff reasonably believes "gaps" exist in the franchise area. The remaining purple-shaded areas are included, along with full attributes, in the Puerto Rico broadband data submission for the October 1, 2011, deliverable to NTIA for the SBI grant program.

June 26, 2012

Liberty Global Inc. (LBTYA, LBTYB), along with investment funds tied to Searchlight Capital Partners LP, Tuesday agreed to acquire OneLink Communications, in a roughly $585 million deal expected to form Puerto Rico's largest cable operator.

Liberty Global, which is controlled by media entrepreneur John Malone, has in recent years sought out growth opportunities primarily in Europe, where it has purchased two of Germany's largest cable operators. In the Americas, Liberty already owns other businesses in Puerto Rico and in Chile.
OneLink, the parent of San Juan Cable LLC, will be merged with Liberty's existing operations in Puerto Rico.

As of the end of March, OneLink Communications served around 262,500 revenue-generating units in Puerto Rico. Combined, the companies have around 480,000 revenue-generating units, generating nearly $300 million in 2011 adjusted revenue, said Liberty Global Chief Executive Mike Fries.

Claro has filed a motion expressing its concerns about the Liberty-OneLink merger. (Credit: © Mauricio Pascual)

Puerto Rico Telephone, which does business as Claro Puerto Rico, has drawn the line in the sand with regards to Liberty Puerto Rico's proposed acquisition of OneLink Communications, asking the Telecommunications Regulatory Board for transparency in the process.

In a motion filed at the agency, Claro Puerto Rico asked the board to give it and the general public access to the application Liberty filed last week requesting the approval of the $585 million transaction announced about a month ago.

"As of today, the Board has not made the document public, even when that's essential to understanding, evaluating and making comments about the transaction," the company said in a statement sent to reporters Tuesday.

The carrier also asked the agency to address the fact that, "contrary to what Liberty has presented to the media" if the transaction is approved OneLink would be the surviving entity and would continue providing cable service in Puerto Rico.

"Although both the Board and Liberty have sold this transaction as one that would result in Liberty controlling OneLink's operations in Puerto Rico, OneLink and Liberty filed several documents with the FCC stating that as a result of the transaction Liberty will cease to exist as a corporate entity and OneLink would survive the transaction and would continue providing cable service in Puerto Rico in Liberty's and OneLink's territories," PRT said in its statement.

"That fact that OneLink would survive as a result of the transaction raises serious issues that the Board must address and require public and binding commitments by OneLink and Liberty before any application is approved," the carrier further stated.

When the transaction was announced, Liberty Global — the local company's parent — explained that upon completion it would own 60 percent of the company and investment fund company Searchlight Capital Partners L.P would own the remaining 40 percent. The company would continue doing business in Puerto Rico as Liberty, it said.

"Today, PRT/Claro sent a press statement in which they claim that the entity that would survive the purchase transaction between Liberty Cablevision of Puerto Rico and OneLink Communications would be OneLink and that the latter would be the one that would continue providing cable TV services," said Naji Khoury, General Manager of Liberty Cablevision of Puerto Rico. "This statement is completely false."

"Regardless of which corporate entity registered in Puerto Rico survives the transaction, be it San Juan Cable, LLC [OneLink], or Liberty Cablevision of Puerto Rico, the resulting company's assets will be managed by Liberty as the majority partner and Searchlight Capital Partners, L.P. as the minority partner, and myself as general manager of the newly formed company; just as it was reported from the beginning in press releases disseminated in Puerto Rico and the United States," he said. "In addition, the resulting brand will also be Liberty's."

Section A: The Broadband Rhode Island Mapping Team Overview

In support of the national broadband initiatives undertaken by President Obama and the Federal Government through the American Recovery & Reinvestment Act of 2009 (Recovery Act), Public Law No. 111-5, and the Broadband Data Improvement Act (BDIA), title I of Public Law No. 110-385, 122 Stat. 4096, the Rhode Island Economic Development Corporation (RIEDC), as the entity assigned by former Governor Donald Carcieri, has been awarded grant funds from the United States Department of Commerce – National Telecommunications and Information Administration (NTIA) State Broadband Data and Development Grant Program.

Project Description

EA Engineering, Science, and Technology, Inc. (EA), has been selected by RIEDC, through their Broadband Initiative for Rhode Island (BBRI) to provide a data management and retrieval system for RIEDC. RIEDC and EA entered into a contractual agreement on January 15, 2010 for a base period of 2 (two) years with 3 (three) optional years. The work assignment consists of negotiating non disclosure agreements (NDA) with the State's broadband providers, collecting provider broadband data, verifying data submitted, combining and updating data collected, developing and implementing a broadband website with mapping application, and reporting findings to RIEDC and the NTIA.

This program has created a statewide broadband map which will be maintained for five (5) years, that assesses broadband infrastructure in Rhode Island and distinguishes between served, underserved, and un-served communities as per the definition specified by NTIA. The data has been made available to the public, with certain restrictions to account for confidentiality of supplier information, through a state website and is linked to a Federal Department of Commerce webpage. The goal of this project is to meet the RIEDC's broadband mapping needs and in doing so provide maps and information that will be used to lend guidance and assistance in the planning of future broadband infrastructure development, as well as provide numerous broadband options to the end users.

The BBRI is a comprehensive effort aimed at producing a high level of detailed inventory of broadband services provided to residential, government and business consumers within the State of Rhode Island. The project is not only a Geographical Information Systems (GIS) mission but a project that needs expertise in GIS, contracting and legal issues, Quality Assurance/Quality Control (QAQC), and project management. In order to acquire, collect, process, analyze and display the data that represents these services it was necessary to combine the resources of several professional firms. Each team member provides unique set of strengths and capabilities needed to create the system that is in place. The team is made up of Rhode Island Economic Development Corporation (RIEDC), EA Engineering (EA), University of Rhode Island (URI), Adler Pollock & Sheehan P.C. (AP&S), Eastern Shore Regional GIS Cooperative (ESRGC), and Mapping

& Planning Services (M&PS). The following paragraphs provide information on each team member and their role the project.

The RIEDC is leading the project efforts for the State of Rhode Island (RI). Led by Mr. Stuart Freiman, they oversee all facets of the project and teams involved. The RIEDC coordinates schedules, communicates directly with the National Telecommunications Information Agency (NTIA), reviews and approves all project deliverables, and ensure all project deadlines are met. With their high visibility in the RI business community they are instrumental in arranging meetings between broadband providers and BBRI Team members. The relationship and communication RIEDC has with the State's providers was and continues to be instrumental in making the process of collecting and verifying information from the providers as effortless as possible.

EA is the prime contractor selected to lead the State's data collection, verification, reporting, and mapping efforts. EA has been providing scientific and engineering technical solutions to a wide range of government and industrial clients since 1973. Serving IT and GIS solutions via the web has become a standard business solution for EA's clients. As the prime contractor EA works closely with the RIEDC on all phase of the BBRI project. Included in the work EA has done to date, is the creation of the State's broadband website and mapping application (Digital Atlas). The website provides information on the project, links to related sites, custom mapping capabilities, and user speed test and feedback forms. The site can be viewed at the following address; http://broadband.ri.gov/.

M&PS has been providing GIS consulting services in RI for over 20 years. For the RI Broadband Mapping project, M&PS assisted in the development of a verification and analysis process which is used to perform the QA/QC of the data prior to submitting to the NTIA. Prior to each bi-annual NTIA submittal M&PS uses this process to review and check the data. During this process MP&S checks for positional and attribute accuracy of the data by using a random sampling methodology. The service MP&S provides insures data going to the NTIA is of the highest accuracy and precision. Additional M&PS provides data analysis and static maps displaying the data status at each delivery date.

The GIS laboratory in the URI's Department of Natural Resources is the center of technical expertise in the GIS field for the State of RI. On this project URI manages all GIS data report by EA to the RIEDC. They also serve as an additional tier of QA/QC on the data that is collected and submitted to the NTIA. URI provides technical input to the data processes and the types of maps and data to be displayed on the website. Additionally, several data layers including Community Anchor Institute locations and base map layers being used on the Digital Atlas are provided by URI.

The Eastern Shore Regional GIS Cooperative (ESRGC) is an organization that provides technical support, training, and GIS services to local governments on the Eastern Shore of Maryland. In addition to supporting the BBRI project, ESRGC is leading the broadband mapping efforts for the state of Maryland. For the BBRI project, the ESRGC's provides the project team technical advisor support. They provide guidance on the project's technical approach and peer review support based on knowledge gained from their work in Maryland. ESRGC provided assistance in defining requirements for the QA/QC process, database design, and data verification tasks. The ESRGC provides the Team with a "lessons learned" from the Maryland Broadband project which guided the BBRI Team around common mistakes made on broadband mapping projects.

AP&S is a local RI law firm providing legal advice and representation and has been servicing RI residents and firms for 50 years. The role AP&S plays on this project is providing the necessary legal advice and contracting that is necessary between the RIEDC and the broadband providers. To date, AP&S has brokered the Non-Disclosure Agreements (NDA's) between the RIEDC and 16 broadband providers. These agreements were imperative and had to be in place before any data was submitted by the broadband providers. All provider broadband information that is made public is based on what the NDAs state. AP&S became the State's expert as to what information was legal for the team to make available to the public and modeled the NDAs off of the guidance provided in the NOFA.

BROADBAND PROVIDER DATA VERIFICATION REPORT
RHODE ISLAND DATA SUBMITTAL #5
SEPTEMBER 28, 2012

General Findings:

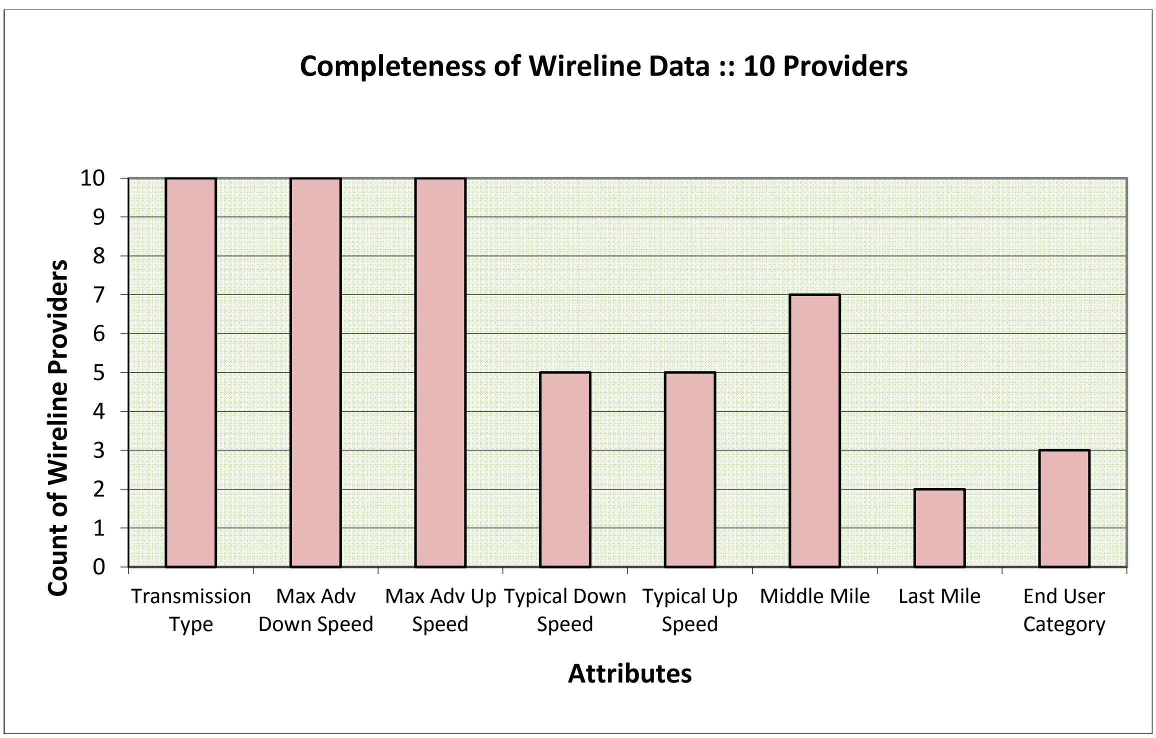
- Rhode Island has extensive broadband coverage from 18 providers. These 18 providers combine to offer broadband coverage for the entire state of Rhode Island.

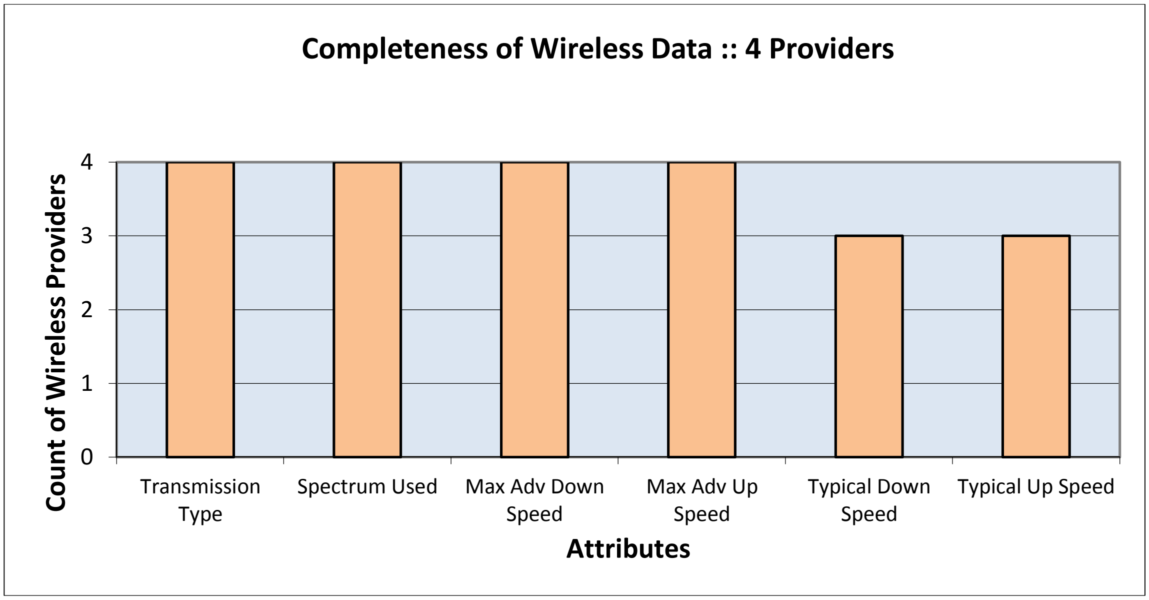
- Broadband availability on a census block basis is summarized in the Figure below:

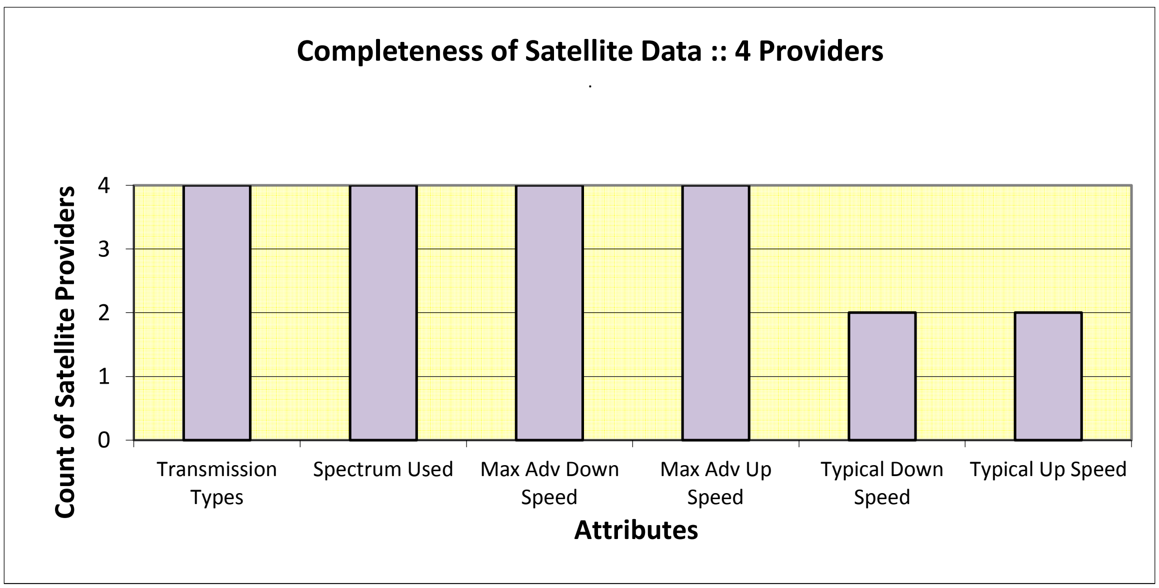
Broadband Availability	Census Blocks	% of Total
Unserved: Census block no access to broadband	0	0
Underserved: One to four broadband providers	0	0
Competitive: Five to Eight broadband providers	1,044	4
Nine to Twelve broadband providers	24,124	96
Thirteen to Fifteen broadband providers	13	<1
Total	**25,181**	**100**

Note: Broadband is defined as being wireline, wireless and satellite service for this table.

- A total of 18 providers submitted data; 10 wireline, 4 wireless, and 4 satellite. The completeness of the attributes in the 18 providers' datasets is summarized in the Figures below.







- Middle Mile data was provided by 7 broadband providers. There were a total of 23 facilities (13 owned and 10 leased).

- Last Mile data was provided by 2 broadband providers, Cogent Communication and AboveNet Communications. Both of the last mile facilities reported are owned by the provider that submitted the data.

- A total of 983 Community Anchor Institutions (CAIs) are identified. These were verified with available Rhode Island Geographic Information System (RIGIS) datasets and 204 RIEDC and FCC speed tests.

- The RIEDC collected 1,183 speed tests in 378 (1.5%) of the census blocks within the State. These tests are for the period 7/15/2011 to 8/1/2012.

- A total of 2,341 wireline speed tests from FCC were used for the verification. These tests are for the period 3/11/2010 to 5/31/2012 and cover 1,096 (4.4%) of the census blocks within the State. Tests were collected by OOKLA and MLAB.

- FCC tests for Mobile Applications (accessing Cellular, WiFi, Edge & UTMS) are also used for the verification. These 6,478 speed tests are recorded for the period 3/11/2010 to 5/31/2012 and cover 1,362 (5.4%) of the census blocks within the State. These tests were collected by OOKLA.

- A total of 10,002 speed tests (RIEDC, FCC, and FCC Mobile Applications) were used for verification purposes. These were distributed within 2,548 (10%) of the 2010 US Census Bureau's 25,181 census blocks in the state. The distribution of each of these sources/types of tests is similar and follows population and household patterns across the State. The distribution of the speed tests are shown in the Figures on the following page.

- A total of 56 census blocks are greater than 2 sq. miles, with 28 over land and 28 over open water areas. Road Segment data was provided by 1 provider. Service Address data was provided by 1 provider. All land-based census blocks greater than 2 sq. miles had road segment or service address data.

The Figures below show the distribution of speed tests used for verification purposes.

Provided Subscribe Upstream Speed: YES, INCOMPLETE (810 of 983)
Provided Street Address: YES, COMPLETE
Provide Public Wifi: YES, INCOMPLETE (767 of 983)
Provided URL: YES, INCOMPLETE (637 of 983)
Provided CAIID: YES, INCOMPLETE (579 of 983)

Count of Community Anchor Institutions by category:

CAI Category	Count of Features
1 – School K through Grade 12	518
2 - Library	91
3 – Medical/healthcare	56
4 – Public safety	242
5 – Univ., college, other post-secondary	24
6 – Other govt support - govt	48
7 – Other govt support - non-govt	4

Maximum Subscribe down/upstream speeds reported by institutions:

CAI Category	Max Downstream Category	Max Upstream Category	Count
1	10	10	1
2	10	10	1
3	11	11	3
4	10	10	3
5	11	11	2
6	11	11	1
7	7	6	1

Number of technology of transmission types reported by provider: 9

Data Verification:
Greatest down/upload speed from RIEDC [1] speed test: 10, 8
Greatest down/upload speed from FCC [2] speed test: 9, 6
Greatest down/upload speed from FCC Mobile Applications [3] speed tests: 7, 7

Count of RIEDC speed tests: 115
Count of FCC speed tests: 66
Count of FCC Mobile Applications speed tests: 92

Footnotes:

1 RIEDC Date Range: 7/15/2011 to 8/1/2012
2 FCC Date Range: 3/11/2010 to 5/31/2012
3 FCC Mobile Application Date Range: 3/11/2010 to 5/31/2012

Section C: Data Processes and Submission Overview

Submission Summary

The Broadband Rhode Island Mapping (BBRI) Team, led by EA Engineering, Science & Technology, Inc. (EA), in its role as primary technical lead for the BBRI project, contacted 24 potential facilities-based broadband service providers (BSPs) and received data from 18 providers for this round of data collection. An overall summary of the data submission is described below:

- 24 potential facilities-based broadband service providers were contacted for this round of data collection
- 2 BSPs responded but did not provide data
- 4 BSPs were identified as resellers of data
- 18 BSPs responded and provided data

Of those that provided data:

- 8 provided only census block information
- 1 provided census blocks and addresses
- 1 provided census blocks and road segments
- 8 provided wireless coverage areas

In addition, 7 of the 18 responsive BSPs provided middle mile infrastructure points and 2 of 18 responsive BSPs provided last mile infrastructure points.

Besides the 24 providers contacted during the current round of broadband data collection, the BBRI team has previously reached out to an additional 122 potential broadband providers. These 122 broadband providers did not provide data because they were either broadband resellers, their data was being collected under a different provider's dataset, they were non-responsive, they chose not to participate, or they did not offer service in Rhode Island. The 122 providers previously researched and contacted are listed below:

1. 360 networks (USA) Inc.
2. A.R.C. Networks, Inc. / ATX Licensing, Inc. /
3. Access Point, Inc.
4. ACN Communication Services, Inc.
5. Ad-Base Systems Inc. (DBA GlobalPOPS)
6. Airespring, Inc.
7. AmeriVision Communications d/b/a Affinity 4
8. Apogee Telecom
9. ATC Outdoor DAS, LLC
10. Bandwidth.com CLEC, LLC
11. BBN Communications

12. BCN Telecom, Inc.
13. Bell South Long Distance, Inc.
14. Bellsouth.Net
15. BLC Management, LLC d/b/a Angles Communications Solutions
16. Broadview Networks, Inc.
17. Broadvox-CLEC, LLC
18. Budget PrePay, Inc. d/b/a Budget Phone
19. BullsEye Telecom, Inc.
20. CCG Communications, LLC d/b/a Veroxity Technical Partners, Inc.
21. CERFnet
22. Charter Communications
23. Cleartel Telecommunications, Inc. (acquired by Birch)
24. CloseCall America, Inc.
25. Comcast Business Communications
26. Comcast Cable
27. CommPartners, LLC
28. Commrail (Access Northeast)
29. Computer Sciences Corporation
30. ComTech21, LLC
31. Comtel Telcom Assets LP d/b/a Clear Choice Communication
32. Conversent Communications (d/b/a Earthlink Business III)
33. Covista, Inc.
34. Cricket Communications
35. CTC Communications (d/b/a One Communications)
36. DSCI Corporation
37. DSL.net
38. EasyNet
39. Entelegent Solutions, Inc.
40. Ernest Communications, Inc.
41. Evercom Systems, Inc.
42. ExteNet Systems, Inc.
43. FAIRPOINT COMMUNICATIONS
44. Global Capacity Group, Inc.
45. Global Crossing Telecommunications, Inc.
46. Global NAPS, Inc.
47. Granite Telecommunications, LLC
48. Hickory Tech. Corp. / Enventis Telecom, Inc.
49. Hosttech Communications, LLC
50. IDT America, Corp.
51. inContact, Inc. (f/k/a UCN, Inc.)
52. Intap, LLC (dba Big Dog Technologies, Inc.)
53. Internap Network Services
54. International Telecom, Ltd.

55. Internet & Telephone, LLC
56. Intrado Communications, Inc.
57. ISP Alliance (ZCorum)
58. Key3Media Events (Media Live International)
59. LexMark International
60. Lightyear Network Solutions, LLC
61. Link Technologies
62. Macross Information Systems
63. Magellan Hill Technologies, LLC
64. Masergy Communications
65. Matrix Telecom, Inc.
66. Meganet Communications
67. Melita PLC (fka Melita Cable Cable plc)
68. MetroCast Cablevision
69. Metropolitan Telecommunications of Rhode Island

113. United Systems Access Telecom, Inc. d/b/a/ USA Telephone
114. Virgin Media
115. Wayport
116. Wholesale Carrier Services, Inc.
117. WilTel Communications Group, LLC
118. Wireless Data Service Provider
119. XO Communications Services, Inc.
120. Ymax Communications Corp.
121. Zone Four
122. Zone Telecom, Inc.

Rhode Island Broadband Mapping Data Processes

Data Received From Providers – The process begins by receiving data from each provider that offers service in the State of Rhode Island (RI). Broadband data is currently received from 18 broadband facility based service providers within the State who have signed Non-Disclosure Agreements with RIEDC. Once all of the available data is received from a provider it is reviewed and archived in its native format. While the same data is requested from each provider the information often comes in different formats and with missing attribute and or spatial data. If attributes are missing from the dataset the provider is contacted to see if the missing information is available.

Data Evaluated & Processed – The EA project team gives the data spatial attributes through geocoding to the RI E911 data or by joining the data to the 2010 census block data. The attribute data is then formatted so that the database can easily be entered in the Broadband Rhode Island geodatabase. Speeds reported below broadband levels are removed from the dataset and archived. Data that is located in census blocks great than 2 square miles are loaded into either the address or street segment feature classes. All remaining data is loaded into the census block feature class. The data is loaded using Esri tools and software. The Broadband

Rhode Island, or our data analysis geodatabase, stores the most recent broadband information. Data is extracted from this geodatabase and formatted as needed to be used for the State's web map and our biannual NTIA submittals. Data is pulled from this analysis database, formatted to meet the web and NTIA formatting requirements, and loaded into either the NTIA transfer database or the web mapping database using custom built data extraction and loading tools.

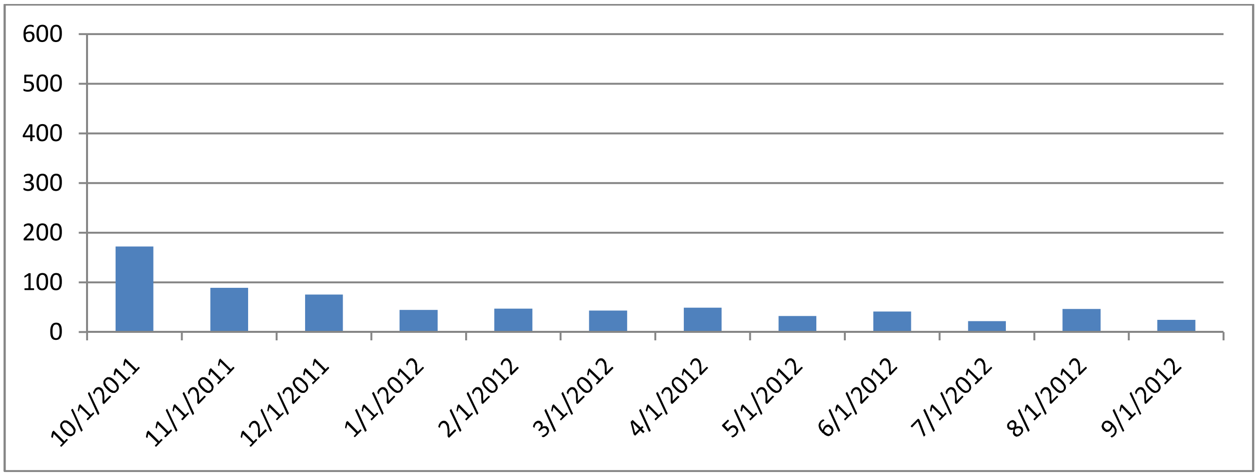
- Community Anchor Institute (CAI) Data: The initial list of CAIs were received from the University of Rhode Island and populated into the BBRI database. This data was then compared to and updated using 3rd party datasets in order to create the most comprehensive CAI list available for RI. In order to collect the broadband data for the CAIs, the BBRI Team utilized a top down approach. The agencies that oversaw a large number of CAIs such as RINET and OSHEAN were contacted regarding the data collection. CAIs that still had missing attribute data after contacting these agencies were contact directly via phone and email. Once contacted, the CAIs were directed to an online survey. The online survey walked the user through a short questionnaire that collected the required CAI broadband data. At the end of the survey the user was directed to take a speed test in order to help with the data collection and verification process.

Data Verification – Once the data is loaded into the geodatabase the verification process can begin. This process is comprised of several steps to ensure that the actual facilities and services provided to the public match the provider's data being reported. The steps are listed below, followed by a detailed description of each step.

1. Compared to Available Datasets
   a. Speed test
   b. User feedback
   c. 3rd party dataset analysis
2. Spatial Analysis of Coverage Area
3. Physical Infrastructure Survey
4. Provider Meetings
5. 3rd Party Verification

- Compared to Available Datasets -
  - Speed test – Using Ookla's speed test application, EA has been collecting speed test data for RI since March 2010. A breakdown of speed tests collected over the past year by EA, displayed by month, can be found in the table below. EA uses both the FCC speed tests collected for RI and the speed tests collected on the RI broadband website to get a better view of the actual speeds and coverage area providers are offering the public. The speed tests are geocoded and mapped by provider. (FCC speed test providers are identified by the speed test's IP address) Each provider's speed test data is compared to their stated coverage area.

Discrepancies are noted and reported back to the provider. The provider either gives a reason for the discrepancy or instructs us to modify their coverage area to match the speed test data.



- User feedback - user feedback information is captured by both the FCC and RI's broadband mapping website. This information is reviewed on a case by case basis. Changes are made as needed to the data and reported to the provider, similar to the speed test data update process.

- Best practices for final data quality checks include the review and comparison to 3rd party datasets (such as the FCC's 477 data) with the information received from the providers. The FCC's data is used to check for previously unknown providers, perform spatial analysis and comparisons on the data, and to give a better understanding of our confidence in the data. Since FCC data is broken out by census tract the provider's data must be converted to the tract level in order to perform a full data comparison.

- Spatial Analysis of Coverage Area– Spatial Analysis is performed on each provider's data set. The analysis checks for small areas in populated sections of the state that are surrounded by coverage areas but do not show coverage. These "donut holes" in the data are reviewed and reported to the provider if we feel they have a high probability of actually being covered by the providers' broadband services.

- Physical Infrastructure Survey - As part of the expanding need to verify broadband coverage within RI, a physical infrastructure survey pilot project was performed for the Town of Foster. The physical infrastructure survey verified the physical broadband facilities present within the Town. EA performed the survey utilizing GPS equipment and industry knowledge to capture the actual location of strategic infrastructure facilities throughout Foster. The data was then mapped and analyzed to determine where wireline broadband service is theoretically available within the town. Structures outside of the identified theoretical service area were mailed surveys to determine if broadband was actually available at their location as well as collect additional broadband usage information from the residents.

- Provider Meetings - The BBRI Team held conference calls with broadband providers that had significant changes in their current data submittals or had identified issues that required a review. These conference calls were used as working sessions to review reasoning behind changes being made, discuss findings, address questions, and review edits being made to the provider's submitted dataset. Following the meetings, edits to the data were made final based on the information agreed upon. The reason for making each edit to the data was documented in case issues or questions arose in the future.

- 3rd Party Verification – A 3rd party, Mapping & Planning Services (M&PS), is used to do provide an independent review and a report on the status of each provider's data. These reports summarize the data collected and provide a second review of the verification steps listed above.

Data Analysis – In addition to the data verification steps, a complete summary of each provider's data and static broadband coverage maps are created for RIEDC. These maps are used to analyze existing data availability and plan for future broadband development and outreach projects.

Geodatabase Checks– Once the data is processed and verified the database is checked prior to submittal to the NTIA. This process is comprised of several steps to ensure that the information in the geodatabase is as accurate and complete and possible.

- Visual Checks - These visual checks inspect the data to ensure completeness, accuracy, and engineering logic. The visual inspection process employs random sampling techniques to validate feature placement and attribution. The random sampling is performed in accordance with ANSI standards for attribute inspection.

- Automated Checks – These checks are performed on 100% of the data. ESRI's Production Line Tool Set (PLTS) and the NTIA's QC toolbox are utilized for the automated check of the data. PLTS check for both schema and logical errors in the data. The following checks are performed on the data.

  - Geodatabase Format - Verify that the geodatabase's name and feature classes are correct per the corresponding RIEDC data model and NOFA requirements.
  - Coordinate System Errors - Check for proper projection definition.
  - Validity Checks - Verify the attribution fields in the tables and field values fall within the domain specified in the geodatabase.
  - Duplicate Item Values - Verify the uniqueness of attribute values within a user-specified item (such as Feature IDs).

- Invalid Item Values - Checks for invalid codes using discrete values and ranges defined in the appropriate domain tables.
- Spatial Logic Checks - Checks the geodatabase to validate minimum size polygons, minimum length lines, and dangles in line feature classes.

- If the geodatabase has passed all tests listed above, and has met the acceptance criteria, the dataset is considered passed and can be processed for delivery to RIEDC and the NTIA. If the geodatabase fails any test and does not meet acceptance criteria, the data is considered failed and will be returned with error reports to the data processing team for correction. Additional follow-up with the providers may be necessary to correct the issue(s). Once edits are completed or exceptions are documented, the geodatabase will be returned to the QC team for an additional sequence of all QC procedures. This process will be repeated until all tests have received a passing status or exceptions have been documented.

OFFICIAL OCTOBER 2012 UPDATE SUBMISSION TO THE NATIONAL TELECOMMUNICATIONS AND INFORMATION ADMINISTRATION UNDER THE STATE BROADBAND INITIATIVE GRANT PROGRAM FOR THE STATE OF SOUTH CAROLINA

CONNECT south carolina®

October 1, 2012

TABLE OF CONTENTS

October 1, 2012

Ms. Anne W. Neville
SBI Grant Program Director
National Telecommunications and Information Administration
U.S. Department of Commerce
Room 4716
1401 Constitution Avenue, NW
Washington, DC 20230

Dear Ms. Neville:

As the State Broadband Designated Entity, Connected Nation, in cooperation with South Carolina's broadband provider community and state-based partners, is pleased to present this submittal of the state of South Carolina's State Broadband Initiative (SBI) Grant Program, known as Connect South Carolina.

The Connect South Carolina program and its collective stakeholder community continue to be faithful and energized contributors to the National Telecommunications and Information Administration's (NTIA) SBI program. Now more than ever, the significance of complete and validated data as compiled through the Federal Communications Commission's (FCC) National Broadband Map is instrumental in forging the innovation economy of the 21st century. As the Commission relies upon this unique resource to distribute monies under the Connect America Fund, through the Universal Service Fund reform, the Connect South Carolina program equally values this data in informing meaningful program interventions relating to broadband access, adoption, and use initiatives. Truly, this coordination embodies the spirit of the SBI and demonstrates the joint effort of the NTIA, FCC, state governments, industry, and non-profits like Connected Nation as it continues to serve as a key tool for the American public and policymakers. We are proud of the role that Connect South Carolina has played in creating and maintaining such a powerful tool that has benefitted and surely will continue to benefit broadband providers, consumers, and businesses nationwide.

The artifacts that comprise this submission should be found to be compliant with the October 1, 2012, deadline for the semi-annual data update and in accordance with the terms of the July 1, 2009, Notice of Funds Availability (NOFA) and all subsequent clarifications pertaining to delivery of state-level mapping of broadband service availability. This packet includes:

Inventory of Deliverables, Connect South Carolina: October 1, 2012

NOFA Requirement	Data Transfer Model	Data Description
Appendix A: 1(a)(i)	BB_Service_CensusBlock	Broadband Service Availability of Facilities-Based Providers in

			Census Blocks of No Greater Than Two Square Miles in Area
Appendix A:	1(a)(ii)	BB_Service_RoadSegment	Broadband Service Availability of Facilities-Based Providers by Road Segment in Census Blocks Larger in Area Than Two Square Miles
Appendix A:	1(b)	BB_Service_Wireless	Broadband Service Availability of Wireless Services Not Provided to a Specific Address
Appendix A:	3(b)	BB_ConnectionPoint_MiddleMile	Broadband Service Infrastructure Middle-Mile and Backbone Interconnection Points
Appendix A:	4	BB_Service_CAInstitutions	Community Anchor Institutions-Listing
Appendix A:	4	n/a	Community Anchor Institutions-Narratives
VII.A.1(a)		n/a	Accuracy and Verification Report
n/a		DataPackage.xlsx	Worksheets of Contact Information, Record Count, and Provider Summary Table
n/a		n/a	List of Changes and Corrections to the Dataset
n/a		n/a	Broadband Provider Roster and Participation Status

In addition, this data update submission should be found to be compliant with the additional program requirements instituted by the National Telecommunications and Information Administration since the time of the April 2012 SBI data submission for the Connect South Carolina program. Specifically, these new requirements are:

SBI Data Transfer Model
The submission of the broadband dataset for October 1, 2012, is contained within the SBI Data Transfer Model as released on the Grantee Workspace on August 9, 2012. All efforts have been made to comply with formatting, domain, and metadata requirements to include as much information on each provider as possible.

Additional Submission Guidance
New to the semi-annual submission for October 2012 is a more robust version of the ReadMe text file. As per the template released on the Grantee Workspace on May 18, 2012, this file contains a high-level summary of the items contained within the submission, including the exact file deliverables, a description of the errors and warnings from the Check Submission report, and extraneous information of which the NTIA and other users of the dataset should be made aware.

This submission continues to follow the speed technology guidance released by the Program Office on August 9, 2012, to review speed tier codes in correspondence with technology of transmission codes. In the April 2012 submission, descriptions were provided in the methodology paper that offered an explanation for any submitted technology of transmission and speed combinations that were outside of the expected value range. That practice continues in this submission as technology and speed combinations are reviewed and scrutinized; any questionable information supplied by providers is reviewed more in depth with the provider to ensure the information is accurately captured or a proper explanation is provided as to why the speed information should be submitted as supplied even if it falls outside the expected value range.

In addition to the requirements mentioned above, please find this methodology paper to be inclusive of the ongoing section pertaining to industry mergers and acquisitions – specifically this section details any and all mergers or acquisitions that have taken place in South Carolina since the April 2012 submission. The intent of this updated section is to provide a better understanding of how the broadband provider landscape has changed since the last submission cycle.

This October 2012 semi-annual data update under the SBI Grant Program continues to demonstrate our dedication to implementing the joint purposes of the Recovery Act and the Broadband Data Improvement Act (BDIA) by gathering comprehensive and accurate state-level broadband mapping data, developing state-level broadband maps, aiding in the development and maintenance of the National Broadband Map, and undertaking statewide initiatives for broadband planning.

Broadband Service Availability — Provider Outreach and Verification

This data update submission under the SBI program includes datasets for approximately 95.74 percent of the South Carolina provider community, or 45 of 47 total providers. Of the 45 participating providers, 24 supplied an update to their network or coverage area(s), while 14 have reported no change. The remaining 7 represent providers who previously supplied data but were non-responsive in the October 2012 update effort; therefore, their previous dataset is being put forward as part of this compilation. A complete roster by provider depicting participation status and contact record is contained herein. The 2 providers that are not represented in the attached datasets have refused to participate in the voluntary program or were non-responsive to multiple contact attempts.

As the aforementioned roster and attached methodology documentation will attest, it is the collective opinion of the Connect South Carolina principals that all commercially reasonable efforts were made to account for 100 percent of the known South Carolina broadband provider community, pursuant to this semi-annual data update submission.

Connect South Carolina has also continued to perform broadband verification activities through several means. In addition to confirmation of service area(s) by each provider, Connect South Carolina conducts field validation efforts. To date, 33 (70.21percent) providers have been validated through field verification activities. Additional details on verification activities are contained within the Field Validation Methodology.

The Connect South Carolina website, (www.connectsc.org), continues to serve a prominent role in the outreach and data collection effort. This program asset provides a way for the general public to participate in the process by offering interactive tools for users to test their connection speed, submit broadband inquiries, or contact a program representative.

As an indicator of stakeholder penetration, the Connect South Carolina website encountered 3,222 unique visits during this reporting period (16,590 total to date for the life of the grant awarded on December 20, 2009). Additionally, this pronounced Web activity netted 25 broadband inquiries over this same reporting period (138 grant inception to date). The website also provides access to the My ConnectView™ interactive mapping application, which allows consumers and broadband providers to confirm or dispute the coverage represented on the broadband inventory map. These consumer-initiated actions are facilitated through the Connect South Carolina website and the Connect South Carolina interactive mapping tool (My ConnectView™) that offer the stakeholders the vehicles to provide information regarding availability in their respective service area, either in affirmation or contest of the reported data represented in the Connect South Carolina mapping artifacts. Since the initial data collection and release of corresponding maps, feedback in the form of broadband inquiries has allowed Connect South Carolina to identify additional areas that are in need of field validation, which is scheduled as soon as possible.

Community Anchor Institutions

Connect South Carolina has established an ongoing mechanism for gathering data on the location and broadband connectivity of Community Anchor Institutions (CAI), in accordance with the data requirements of the SBI NOFA Technical Appendix. Since the April 2012 data submission, the CAI outreach process method has been modified to improve data collection. Specifically, the outreach process is a more focused sector-specific and relationship-oriented approach that generates more responses than general contact.

In conjunction with the state of South Carolina outreach was conducted during this data update reporting period by Connect South Carolina to continue identification of existing, centralized sources for CAI connectivity data. Additionally, outreach was coordinated to distribute the CAI survey to institutions throughout the state through multiple methods including a customized online survey available on the Connect South Carolina website. During this reporting period Connect South Carolina has developed a number of new relationships with statewide associations such the South Carolina State Firefighters Association and the Office of State Fire Marshal to promote the importance of broadband connectivity at anchor institutions and participation in this data collection process. It became apparent that these relationships are beneficial to the entire success of the Grant Program, and the CAI engagement is a logical extension of new and existing relationships. Connect South Carolina will continue to build upon these new relationships over the coming months and utilize its contacts throughout the state to collect data and raise awareness of this project.

In addition to fostering and building relationships with state agencies, associations, and organizations, Connect South Carolina has also developed a sector-specific calendar that supports CAI outreach as well as research and communications efforts. This focused approach allows a corporate commitment to capturing CAI data in addition to developing meaningful sector-specific content.

Connect South Carolina is also working hard to clarify CAI information associated with wireless broadband. NTIA has requested in-depth questioning of CAI listing a wireless broadband service as their sole form of connectivity. This follow-up allows us to better understand the reason for adopting the wireless broadband service.

From our work in South Carolina, as well as other states, we recognize the great value of this data to future collaboration efforts within the state as well as its value to the National Broadband Map. We plan to continue to bring best practices to the Connect South Carolina efforts, along with an investment of both human and technical resources required to reach our goal of increasing the data that is secured and reported as part of this process.

The Connect South Carolina program exists to improve data on the deployment and adoption of broadband services and to assist in the extension of broadband technology across all regions of the great state of South Carolina, as well as the United States and its territories through contribution to the National Broadband Map. We look forward to the continuing work ahead and improving upon our data collection methods.

Respectfully submitted,

Thomas W. Ferree
President and Chief Operating Officer
Connected Nation, Inc.

DATA ACQUISITION: SOUTH CAROLINA COMMUNITY ANCHOR INSTITUTIONS METHODOLOGY

In this sixth reporting period of the SBI, Connect South Carolina, working in close coordination with the state of South Carolina, has established an ongoing mechanism for gathering data on the location and broadband connectivity of Community Anchor Institutions (CAI), in accordance with the data requirements of the SBI NOFA Technical Appendix. Since the April 2012 data submission, the CAI outreach process method has been modified to improve data collection. Specifically, the outreach process is a more focused sector-specific and relationship-oriented approach that generates more responses than general contact.

Connect South Carolina has continued to identify and process CAI data obtained through an ongoing statewide outreach campaign. Physical address information continues to be augmented through manual sourcing and geocoded by Connect South Carolina through Esri ArcGIS software.

Connect South Carolina continues to utilize a customized online survey hosted through SurveyMonkey, with a landing page on the Connect South Carolina website that was developed during the first reporting period. This survey, in combination with a customized data-gathering spreadsheet, was distributed on a regular basis to a targeted list of CAI throughout the state as well as organizations and agencies that work closely with the CAI. The distributions were completed with the support of the state client. Connect South Carolina will continue to use these data-gathering tools for future targeted outreach efforts throughout the coming months leading up to the next reporting period. These materials are customized to fit the CAI categories as defined in the SBI NOFA.

The survey can be accessed at this link:
http://www.surveymonkey.com/s/RJH5DMW

In addition to the survey, Connect South Carolina has developed a number of new relationships with statewide associations such as South Carolina State Firefighters Association and the Office of the State Fire Marshal to promote the importance of broadband connectivity at Community Anchor Institutions and participation in this data collection process. It is apparent that these relationships are beneficial to the entire success of the grant program, and the CAI engagement is a logical extension of new and existing relationships. Connect South Carolina will continue to build upon these new relationships over the coming months and utilize its contacts throughout the state to collect data and raise awareness of this project.

In addition to fostering and building relationships with state agencies, associations, and organizations, Connect South Carolina has also developed a sector-specific calendar that supports CAI outreach as well as research and communications efforts. This focused approach allows a corporate commitment to capturing CAI data in addition to developing meaningful sector-specific content.

Connect South Carolina conducts significant research as part of an ongoing process to identify existing, centralized sources for CAI connectivity data. In tandem with these efforts to identify existing data, Connect South Carolina continues to identify key CAI contacts in an effort to distribute and promote the online survey and raise awareness of the importance of CAI broadband connectivity. Also, when possible, Connect South Carolina works with the state of South Carolina to identify existing relationships that can support CAI outreach.

Connect South Carolina has an ongoing mission to educate CAI throughout the state on the importance of participating in the project. Participation by these institutions will raise awareness about the importance of broadband connectivity and the need to report the requested data for inclusion on the National Broadband Map.

The greatest challenge with collecting CAI data continues to be educating the CAI about the Connect South Carolina project as well as self-awareness of their own CAI connectivity (specifically upload and download speeds). Connect South Carolina will continue to research key CAI organizations and agency contacts in an effort to raise awareness of this project among CAI. When applicable, the state of South Carolina will continue to be briefed on the current CAI data and provided information so it can assist with outreach and promotion within the state.

A CAI summary of all processed and submitted data is provided below:

CAI Type	Total	Physical Address	Lat/Long	Technology of Transmission	Download Speed	Upload Speed
K-12 Schools	1,764	1,764	1,764	1,099	1,098	1,098
Libraries	284	284	284	184	183	183
Healthcare	295	295	295	198	199	199
Public Safety	821	821	821	320	317	316
Higher Ed Institutions	226	226	226	138	136	136
Other Government	903	903	903	825	825	825
Other Non-Government	94	94	94	83	83	83
Total	4,387	4,387	4,387	2,847	2,841	2,840

During the coming months, CAI data collection will be supported by regular reporting to the Connect South Carolina team. The CAI data is proving an invaluable resource to all components of the Connect South Carolina effort. The data identifies potential local champions, sector trends, and opportunities for improvement as well as opportunities to educate CAI not familiar with their current connectivity.

SBI Data Submission Methodology

The submission of the broadband dataset for October 1, 2012, is contained within the SBI Data Transfer Model and additional components as released on the Grantee Workspace on August 9, 2012. Connected Nation (CN) has reviewed all literature that relates to the release and use of this data transfer model and recognizes that it does not replace or dictate how data is stored, processed, or displayed for the state, as it is meant primarily as a means to transfer the broadband data from all states and territories and populate the National Broadband Map in a seamless fashion.

Connected Nation has complied with the following guidance documents published by NTIA:

- Technical Mapping Guide, as released on the Grantee Workspace on March 24, 2011, was followed to ensure the completeness and validity of the submission through completion steps and checklists, completing the DataPackage spreadsheet, uploading broadband datasets into the Data Transfer Model, and checking the dataset using the SBDD_CheckSubmission receipt process.
- Naming Conventions and Category of End User, as released on the Grantee Workspace on March 26, 2012, was followed to ensure the consistency of individual file and zip package naming.

In addition to the methodologies contained herein, the Changes and Corrections documentation, as well as the DataPackage.xls containing contact information, the data dictionary, and a provider summary table, the following feature classes are submitted within the SBI Data Transfer Model for the state of South Carolina.

Inventory of Deliverables, Connect South Carolina: October 1, 2012

NOFA Requirement	Data Transfer Model	Data Description
Appendix A: 1(a)(i)	BB_Service_CensusBlock	Broadband Service Availability of Facilities-Based Providers in Census Blocks of No Greater Than Two Square Miles in Area.
Appendix A: 1(a)(ii)	BB_Service_RoadSegment	Broadband Service Availability of Facilities-Based Providers by Road Segment in Census Blocks Larger in Area Than Two Square Miles.
Appendix A: 1(b)	BB_Service_Wireless	Broadband Service Availability of Wireless Services Not Provided to a Specific Address.
Appendix A: 3(b)	BB_ConnectionPoint_MiddleMile	Broadband Service Infrastructure Middle-Mile and Backbone Interconnection Points.
Appendix A: 4	BB_Service_CAInstitutions	Community Anchor Institutions-Listing.

The provider data collected by CN on behalf of the state of South Carolina have been formatted per the given specifications and uploaded into the appropriate feature classes of the SBI Data Transfer Model. Wireline availability is contained within census blocks and road segments, wireless availability is contained as polygons of coverage areas, and middle-mile connections and Community Anchor Institutions are contained as point data. All speed data is contained at the census block, road segment, or wireless polygon level of availability. All efforts have been made to comply with formatting, domain, and metadata requirements to include as much information as possible.

Connected Nation has continued outreach to satellite providers on their availability, technology, and speed information, but granular coverage is not yet available. Submitted within the wireless feature class are the satellite companies providing service to South Carolina as a polygon of the state boundary. Efforts will continue to collect, process, or otherwise create more granular satellite data based on availability analyses and guidance received from NTIA. Process development is underway at CN as well to be able to create more granular satellite coverage based on satellite equipment positioning and geographic inputs.

DATASETS FOR IN-KIND MATCH

Connect South Carolina received an in-kind match contribution to assist with SBI mapping goals which has been beneficial to the program in the following ways:

Connect South Carolina received a Community Anchor Institution (CAI) connectivity information dataset for a variety of institution types including higher education, state and local governments, public safety, and more from the South Carolina Budget and Control Board - Department of State Information Technology as part of an in-kind match contribution to Connect South Carolina - $107,548.

Connect South Carolina received a CAI dataset for schools and libraries from the South Carolina Budget and Control Board - Department of State Information Technology as part of an in-kind match contribution to Connect South Carolina - $71,232.

SOUTH CAROLINA FIELD VALIDATION METHODOLOGY

CN focused a portion of its time on specific validation processes such as:

- conducting random spectrum analysis studies throughout the state using an Avcom PSA-37-XP spectrum analyzer;
- conducting mobile speed tests throughout the state using an iPhone, Android (or other smart phone) as well as provider-specific aircards (Sprint 3G/4G, Clearwire et al);
- identifying pre-selected, provider-submitted wireless transmit tower sites and cross-referencing data about that tower against the Federal Communications Commission (FCC) databases such as Antenna Structure Registration and/or the Universal Licensing System;
- cross-referencing Federal Registration Number data against available FCC Form 477 data as well as the FCC **CO**mmission **RE**gistration **S**ystem (CORES);
- validating provider submitted data (for example: latitude/longitude) using a handheld Garmin eTrex Summit GPS unit or GPS enabled software such as Microsoft Streets and Trips;
- locating physical wire-line attributes (such as Central Offices, Remote Terminals, CATV plant, etc.) and comparing them against provider submitted data; and

- conducting on-net and off-net speed tests using the FCC portal at http://www.broadband.gov/qualitytest/about/ or using the Ookla Net Metrics enabled speed test utility located on each of CN's program specific websites.

Additionally, CN cross-referenced numerous public documents in order to ensure that all known broadband providers were located and contacted. This included searching membership logs from trade associations (WISPA, WCAI, PCIA, etc.), the Cable Television Fact Book, Public Utility Commission records, Public Service Commission records, Chamber of Commerce, etc.

To date, Connected Nation's staff conducted on-site validation tests in South Carolina on the following providers: AT&T; Atlantic Broadband; CenturyLink; Charter Communications; Chester Telephone Company (d.b.a. Fairfield Communications); Clearwire Corporation; Comcast; Countrywide Wireless; Electronics Service Company of Hamlet LLC; Family View Cable; Farmers Telephone Cooperative Inc. (d.b.a. FTC Communications); Frontier Communications of the Carolinas; Harron Communications; Home Telephone Company Inc.; NTInet Inc.; Palmetto Rural Telephone (d.b.a. Low Country); Pee Dee Net; Pee Dee Online; PRT Communications; Rock Hill Telephone Company (d.b.a. Comporium Communications, PBT Communications, and Fort Mill Telephone Company); Sandhill Telephone Cooperative; SkyRunner; Southern Coastal Cable; Sprint; TDS Telecom; Time Warner Cable Inc.; T-Mobile; tw telecom; US Cellular; Verizon South Inc.; Wide Open West (formerly d.b.a. Knology); Windstream; and XO Communications.

From program initiation through this reporting period, CN has completed in-the-field validation testing against 33 companies (out of a universe of 47 viable providers) totaling 70.21 percent within the state of South Carolina.

CN has also continued to review provider datasets for accurate speed information, platform listings, and other intricacies that may fall outside of the standard SBI Data Transfer Model parameters, as published on the NTIA Grantee Workspace on August 9, 2012. Any providers whose submitted coverage and attributes are anticipated to come into question have been further reviewed and confirmed; details on a case-by-case basis are presented below.

AT&T Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 24 Mbps service; screenshot below.

Compare Internet Packages

	Pro	Elite	Max	Max Plus	Max Turbo
Standard Monthly Rate	$38*	$43*	$48*	$53*	$63*

Pee Dee Online Consulting
Issue: Fixed wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider representative confirmed that 10 Mbps service is available and advertised locally, but not advertised on the website.

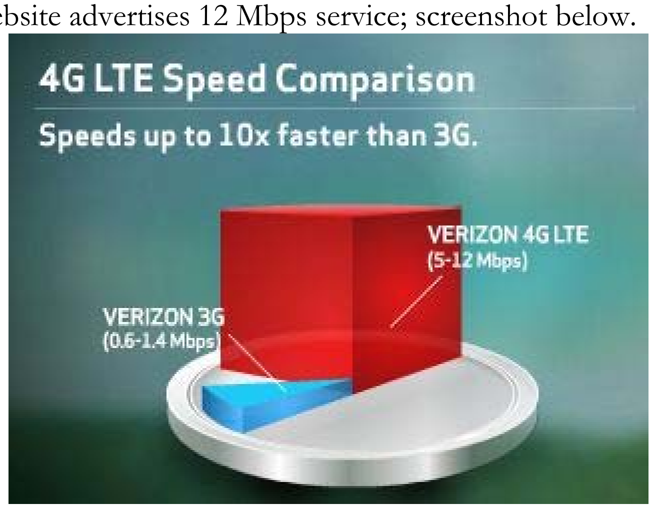
Piedmont Rural Telephone Cooperative, Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 10 Mbps service; screenshot below.

T-Mobile USA, Inc.
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises that download speeds greater than tier 6 are available; screenshot below.

T-Mobile customers with 4G phones are already experiencing data speeds that are comparable to or faster than the speed of a home broadband network. And with recent improvements to our 4G network-doubling our theoretical download speeds-we're giving our customers enhanced 4G data speeds. We've seen average download speeds on our HSPA+ 42 Mbps-capable data stick approaching 10 Mbps with peak speeds of 27 Mbps, and download speeds approaching 8 Mbps with peak speeds of 20 Mbps on our upcoming HSPA+ 42 Mbps-capable smartphones.

TDS Telecommunications Corporation
Issue: DSL platform with maximum advertised download speed in tiers 7 and 8, higher than expected value range for the technology.
Resolution: Provider website advertises 15 and 25 Mbps service; screenshot below.

Verizon South Inc.
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.



West Carolina Rural Telephone Cooperative, Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.

DSL Only

12 MB*	$31.62 Per Month
6 MB*	$24.65 Per Month

Windstream Communications
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.

ACCURACY AND VERIFICATION: PROVIDER VALIDATION METHODOLOGY

Broadband providers maintain their service area data in many different formats, all in varying levels of complexity and granularity. In order to ensure that the data required by the NTIA is standardized across all providers and that it is as accurate as possible, CN translates and formats the data that providers are able to supply into a GIS shapefile and produces maps for the provider to review. The resulting map(s) and review process allow for providers to see their service area in a geographic format – for some providers, this is the first time they have seen maps of their broadband service area. Having the mapped service area allows providers to quickly identify any issues that appear in the data representation, whether the issue is in the data translation into a GIS format or from the original data collection and submission. Often data is provided from various sources and through the review and revision process, local engineers who operate the networks and work in the field are able to ensure that the tabular data that has been submitted is accurate and represents the real-world network extent. Any issues in how the service area is represented on the map(s) are remedied by CN, whether they are additions, removal of service, or any other revisions. Revised maps of service area representations are sent to the provider for review and approval; CN will revise data and return maps as many times as necessary until the provider is in agreement that the map represents their service area as accurately as possible. Once the review process has been completed and final approval of the data is provided, the data is deemed ready for NTIA submission.

Once the data collection has been aggregated at a statewide level, static maps of statewide and county-level availability are produced and made publicly available. In addition, consumers can visit the interactive online tool, My ConnectView, to create customized views of broadband service areas and analyze corresponding demographic information. Leveraging broadband service data on various platforms allows for public users, providers, and other stakeholders to review, scrutinize, and provide feedback on the represented data. This feedback becomes a validation method in itself as consumers submit inquiries to CN either affirming where service is not available or identifying areas where broadband service is shown on the map, but in actuality is not available. This allows for a follow-up to providers regarding revisions to the data as it is represented; it also allows for CN to identify locations where on-site visits may be necessary to complete field validation of available services. Public feedback on all forms of mapping products serves as a localized validation method for provider-supplied information and allows CN to resolve inaccuracies as they are identified to ensure that only the highest quality information is provided to stakeholders.

Estimates derived from provider-validated data indicate that approximately 3.18 percent of South Carolina households do not have terrestrial fixed broadband service available, and approximately 0.16 percent of South Carolina households have neither mobile nor fixed broadband service available.

Within rural areas of the state, results derived from provider-validated data indicate that approximately 4.04 percent of rural South Carolina households do not have terrestrial fixed broadband service available, and approximately 0.21 percent of rural South Carolina households have neither mobile nor fixed broadband service available. Please note that the availability estimates presented are based on Census 2010 household information.

The estimates above, in accordance with NTIA's definition of available broadband service as specified in the SBI NOFA, include broadband service with download speeds of at least 768 Kbps and upload speeds greater than 200 Kbps.

In addition, due to the nature of the SBI data collection methodology as defined by the NTIA and based on both census block geographic units and street segment data, the estimates of broadband availability derived from provider-validated data may include an overstatement of the actual number of households with broadband availability. Under the census block-based data collection method, a provider will typically report broadband availability for an entire census block whether its network is present across the whole or only a subset of that census block. This potential overestimation at the census block level can be amplified as the data is aggregated across the entire state.

WIRELESS METHODOLOGY

Broadband Service Availability in Provider's Service Area
Wireless Services Not Provided to a Specific Address

Data solicited from a fixed wireless provider to create propagation models include, but are not limited to:

1. The name of the structure.
2. Whether the transmitting device is operational or proposed.
3. The maximum advertised downstream speed, the maximum advertised upstream speed.
4. The typical downstream speed, the typical upstream speed (peak periods for both).
5. The frequency range of spectrum being used (as prescribed by NTIA). This may include (but is not limited to) spectrum authorizations identified within the Federal

Communications Commission (FCC) Universal Licensing System (ULS) database or located on the FCC's Spectrum Dashboard.

6. The primary population center(s) being served (for geopolitical boundary reference).
7. The physical address of the transmit site (in the event latitude/longitude is unavailable from the provider this allows a quick reference point for geocoding).
8. Latitude in either Degrees, Minutes, and Seconds and/or in Decimal Degrees (typically received as NAD 27 or NAD 83).
9. Longitude in either Degrees, Minutes and Seconds and/or in Decimal Degrees (typically received as NAD 27 or NAD 83).
10. Antenna pattern (e.g. omni-directional, 180°, 120°, 90°, etc.).
11. Azimuth of antenna (e.g. 360° with magnetic declination if known).
12. Approximate transmit radius (in feet, miles, or kilometers).
13. Polarity of transmit antenna (Vertical or Horizontal).
14. Transmit antenna gain (in dBi).
15. Line loss (applicable only to providers using coax, heliax, waveguide or other forms of cabling – excludes power-over-Ethernet devices).
16. Mechanical and/or Electrical beam tilt (if applicable).
17. Equipment Manufacturer (allows easy cross-reference against manufacturer's specification sheet).
18. Power output of the transmitting device (if unknown, FCC standards or manufacturer specifications are applied).
19. AMSL at base of tower site.
20. Antenna centerline AGL (height of antenna above ground level measured at the centerline of the actual antenna).
21. Foliage factors (Evergreens/Deciduous and percent of ground cover).
22. Ground Clutter (primarily used in rural areas to account for foliage and in metropolitan areas to account for types and heights of buildings if known).
23. Average gain of receive antenna.
24. Receive antenna is estimated at height above average terrain (HAAT) of 6.2 meters/20 feet.
25. Federal Registration Numbers (if applicable) which may allow opportunities to cross-reference and/or obtain additional data from the FCC's ULS and the **CO**mmission **RE**gistration **S**ystem.

Propagation modeling combines scientific data and empirical mathematical formulation for the characterization of radio wave propagation as a function of frequency, distance, and other conditions. Propagation software(s) typically use the Irregular Terrain Model (also known as Longley-Rice) of radio propagation for frequencies between 20 MHz and 20 GHz. This model is based on electromagnetic theory and statistical analyses of the combination of terrain features and radio measurements, then predicting the median attenuation of a radio signal as a function of distance and the variability of the signal in time and in space. For metropolitan areas, the software can typically be adjusted to use the Okumura-Hata model which accounts for predicting the behavior of cellular transmissions in areas where buildings are the primary obstructions. The resulting product from either model depicts a graphical illustration of the theoretical propagation characteristics of a selected frequency range based on defined variables (receiver sensitivity of the home/mobile device, foliage factor, and digital elevation terrain input).

After converting propagation models into a geospatial format, additional processing is completed to remove the small pixels representing service present in the resulting dataset. These areas are initially created based on the parameters entered in the software from the provider equipment information, the underlying data parameters of elevation, hillshade, etc., and the limitations of the software itself to display a broadband service area as accurately as possible. Generally, these random pixel striations appear as a result of signal levels reaching the highest elevated points within the prescribed radius. Typically, while this pixilation anomaly shows legitimate areas where signals can be received, these highly elevated points may have exceedingly sparse populations or are entirely void of population. As a result, and congruent to the *Wireless Technology Methodologies and Business Logic* white paper submitted to NTIA on January 20, 2011, all independent pixels representing service that are less than 0.125 square miles in area have been removed from the geospatial representation of each wireless provider.

Broadband Inquiries Methodology

CN collects consumer feedback in the form of broadband inquiries (BBIs). These inquiries represent any type of communication received from the public regarding broadband service. Once BBIs are received across the state, this information is overlaid with the broadband availability information which was collected through the SBI program. This allows for a real-world comparison of the broadband landscape to the information received from broadband inquiries. Consumers submitting these inbound comments and/or inquiries are able to provide information regarding five categories: 1) residents who do not have broadband but want it; 2) residents who have broadband but want a different provider; 3) residents who do not have broadband, but the broadband inventory maps indicate that they do; 4) residents who have broadband but want a faster connection speed; and 5) residents who have broadband but want a less expensive service option.

BBIs are submitted frequently by consumers via the Connect South Carolina website. Inquiries often seek help to identify local broadband provider options, or to learn when a specific provider may be able to provide service to that consumer. Consumer comments also provide information which may help modify maps with actual service area information. The primary objectives of CN regarding these inquiries are 1) to improve the accuracy of the state maps with submitted consumer information and follow-up field research; 2) to provide broadband options to consumers through cooperation with mapped providers and by facilitating new broadband service options; and 3) to map and analyze information from consumers about areas of unmet broadband demand and alternatives to currently mapped services. A prime example of the second option is the utilization of the Rural Utility Service satellite eligibility tool. By simply entering the consumer's address, the CN engineer can quickly determine if the consumer meets the initial qualification status for BIP satellite subsidies.

New BBIs are assigned to either the GIS department or the Engineering & Technical Services (ETS) team depending on the category entered by the consumer on the website submission form. The GIS or ETS team members respond to each inquiry according to the information requested by the consumer. Many BBIs can be resolved through desktop research; however, if a BBI requires research in the field, the assigned ETS team member conducts such research when performing field validations in the area of the inquiry, or at other such time as is practical and appropriate. GIS and ETS team members respond to and conclude BBIs via telephone contact and/or e-mail communication.

The broadband inquiry process has been implemented in each of the CN state programs with successful results. Altogether CN has received over 18,600 broadband inquiries since 2007, allowing the state programs to evaluate each inquiry for broadband demand and data verification. These inquiries are continuously examined against current broadband availability, updated every six months, to determine if previously unserved households have been expanded to and can now receive broadband at their residence. This database of broadband inquiries has also allowed the CN state programs to aggregate demand in concentrated areas to show providers the exact locations where the population has made it clear that they would purchase broadband if it was made available to them. Providers in the states have responded to this process and have expanded to areas knowing that their investment will be worthwhile. Data verification methods have also proven successful, as the state programs have been able to show those inquiries that indicate the broadband service areas are misrepresented on the map to providers, who then verify where service cannot reach in regard to that residence(s). The broadband coverage in these states has been altered to create a more accurate map based on the inquiries submitted by the public.

During this reporting period, the Connect South Carolina project has received a total of 25 inquiries (138 grant inception to date). As more inquiries are submitted to Connect South Carolina, a more thorough validation of the broadband landscape can be performed, while also allowing providers to see which areas have a high demand for broadband adoption.

My ConnectView Methodology

My ConnectView is an online, interactive mapping tool for viewing, analyzing, and validating broadband data. Developed using Esri's ArcGIS for Server and Adobe's Flex Framework and hosted and maintained by Connected Nation, My ConnectView is a multi-functional, user-friendly way for local leaders, policymakers, consumers, and technology providers to devise a plan for the expansion and adoption of broadband.

First and foremost, My ConnectView allows consumers to locate their residence and identify providers that offer broadband Internet service to that location. The interactive platform allows for users to build and evaluate broadband expansion scenarios using a wealth of data, including several coverage analysis layers, speed analyses, Community Anchor Institutions, and tools to search and export household demographic information, as well as extract data in GIS, spreadsheet, and/or PDF formats.

My ConnectView also features more interactive data layers and additional tools than ever before to allow the consumer to explore the broadband data. My ConnectView provides consumers with the ability to print, e-mail, and provide feedback on the broadband data displayed on the interactive map. Through the collection of this feedback, a visual demand for broadband is presented. This visualization allows the CN state programs the ability to validate the broadband availability for accuracy. If residents within a region state they are without broadband, but the interactive map shows otherwise, this allows CN to approach the providers within that area in an effort to trim down their coverage to more accurately represent real-world availability on the ground.

The Connect South Carolina project launched My ConnectView on April 2, 2012, and received 881 visits this reporting period; to date the interactive mapping applications have received 7,262 visits.

SPEED TEST METHODOLOGY

The 90 speed tests that are represented in the Connect South Carolina Speed Test Report during this reporting period (505 grant inception to date) are the result of a partnership between CN and Ookla Net Metrics. Utilizing this relationship increases the level of confidence in the data being collected and provides for a far greater sample size than could be collected by a single testing site.

Ookla owns and operates Speedtest.net, as well as develops and deploys speed tests, such as the Connect South Carolina speed test website, for partners around the world. This network of sites that is developed and run on its testing technology provides Ookla with a vast dataset that, due to the variability of geographic information collected across the varying speed test sites, is geocoded utilizing Geo-IP technology. This technology allows for tests to be geocoded to points of aggregation, typically larger nodes across provider networks. While there are hundreds of thousands of tests that have been conducted, the level of aggregation is only sufficient for county-level detail due to the test results being located at these larger nodes and not at an absolute location for each speed test.

In an effort to validate broadband data from the Connect South Carolina project, speed test information is collected throughout the state. Speed tests provide speed information on the path taken through all networks (a provider's network as well as additional networks) a local machine must connect to in order to reach the host test. The benefit of this collection of speed information is two-tiered. First, it allows for a comprehensive dataset of speeds, while also providing Connect South Carolina with the information on where broadband services are available. Second, unlike theoretical speed information which was received through the data collection process, the use of speed tests provide real-world information on the speeds that currently exist within the state of South Carolina.

Providers Deemed Non-Viable

The following list of companies represents the remainder of the broadband provider universe that was originally identified as complete for outreach to begin for the State Broadband Initiative. These providers are not included in the Data Package for the October 2012 submission because they have been deemed non-eligible under the parameters and guidance of the SBI grant program. This list of companies includes, but is not limited to: providers offering service but below the current definition of broadband, those that have gone out of business, technology consulting firms, infrastructure or network construction companies, non-facilities based general resellers, etc.

	Company Name	URL	Comments
1	ACSinc.net	www.acsinc.net	This company does not provide residential Internet service.
2	Aerolina Wireless Networks	www.aerolina.com	This company provides commercial services only.
3	Airespring, Inc.	www.airespring.com	This company is a non-facilities-based reseller.
4	Beyond Communications	www.discoverbeyond.com	This provider offers service to select MDUs and HOAs, but not to public communities; non-responsive to multiple attempts.
5	Broadview Networks Holdings, Inc.	www.broadviewnet.com	Non-facilities-based reseller to businesses.
6	County of Oconee	www.oconeefocus.com	BIP recipient promotes the construction of a fiber optic broadband network in the county.
7	Genesis Telecommunications	www.genesistelcom.com	Dial-up services in Greenwood only.
8	Global Crossing Telecommunications, Inc.	http://www.globalcrossing.com	Acquired by another company.
9	Hickory Tech Corporation	www.enventis.com	B2B services.
10	Hotwire Communications	www.gethotwired.com	Offers residential service to one multi-dwelling unit.
11	LightEdge Solutions, Inc.	www.lightedge.com	Illinois provider; no service in SC.

12	Lightyear Network Solutions, LLC	www.lightyear.net	Non-facilities-based reseller.
13	Main Street Wireless	http://www.mainstreetsc.com	Provider may no longer be in business.
14	MegaPath Inc.	www.megapath.com	This company does not provide Internet services in the state.
15	Metropolitan Telecommunications Holding Company	www.mettel.net	Non-facilities-based reseller of business services.
16	Navacore.net	www.navacore.net	Dial-up only.
17	Net Doctors	www.netmds.com	This company does not offer high-speed Internet; dial-up only.
18	New Edge Network, Inc.	www.newedgenetworks.com	Acquired by Earthlink. Company does not offer residential service; resells backhaul.
19	NuVox, Inc.	n/a	Acquired by another company.
20	Open Range Communications, Inc.	http://www.openrangecomm.com	No longer in business.
21	PAETEC Communications, Inc.	http://www.paetec.com/	Acquired by another company.
22	Personally Complete	www.personallycomplete.com	This company does not provide Internet access.
23	Pine Tree Cablevision	www.ptc-me.net	This company is out of business.
24	PM Broadband	www.pmcol.com	This company is out of business.
25	Qwest Communications Company, LLC	www.qwest.net	Acquired by CenturyLink.
26	Shentel Converged Services, Inc.	www.shentel.com	This company is a private cable provider serving a few campuses and related MDUs, but not public residences.
27	Techcore Consultants II	www.almega.com	This company is no longer in business in South Carolina.
28	TeleSouth Wireless	www.telesouth1.com	The company appears to be out of business.
29	Telovations, Inc.	www.telovations.com	This company does not provide residential Internet services.

30	University Corporation for Advanced Internet Development	www.internet2.edu	This consortium is a BIP/BTOP recipient with no Internet network.
31	WilTel Communications, LLC.	n/a	Acquired by Level 3.
32	WP Media	www.wpmedia.com	This company is a consulting firm.

Total Unique Providers Represented	**47**

Provider Name	Platform	Status	NDA Execution Date	Notes
AT&T Inc.	DSL	Data Added to Statewide Inventory	12/16/2009	[AUG-28-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
AT&T Inc.	Mobile Wireless	Data Added to Statewide Inventory	12/16/2009	[AUG-20-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
CenturyLink	DSL	Data Added to Statewide Inventory	12/4/2009	[AUG-08-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Charter Communications, Inc.	Cable	Data Added to Statewide Inventory	12/15/2009	[AUG-20-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Clearwire Corporation	Mobile Wireless	Data Added to Statewide Inventory	3/17/2011	[JUL-19-12 Matthew Brunt] Change: Provider expanded mobile wireless coverage.
Comcast Cable Communications, LLC	Cable	Data Added to Statewide Inventory	12/7/2009	[AUG-28-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Countrywide Wireless	Fixed Wireless	Data Added to Statewide Inventory		[AUG-17-12 Matthew Brunt] Correction: Initial submission of provider's coverage, but they were in service previously.
Electronics Service Company of Hamlet, LLC	Fixed Wireless	Data Added to Statewide Inventory	3/24/2010	[AUG-17-12 Matthew Brunt] Change: Provider expanded fixed wireless coverage area.
Farmers Telephone Cooperative, Inc.	Fiber	Data Added to Statewide Inventory	1/22/2010	[AUG-15-12 Matthew Brunt] Change: Provider expanded fiber coverage area.
Farmers Telephone Cooperative, Inc.	Mobile Wireless	Data Added to Statewide Inventory	1/22/2010	[AUG-15-12 Matthew Brunt] Change: Provider expanded mobile coverage area.
Frontier Communications Corporation	DSL	Data Added to Statewide Inventory	1/22/2010	[AUG-10-12 Matthew Brunt] Change: Provider added DSLAM locations.
Hargray Communications Group, Inc.	Cable	Data Added to Statewide Inventory	1/25/2010	[AUG-20-12 Matthew Brunt] Change: Provider expanded cable coverage area.
Hargray Communications Group, Inc.	Cable	Data Added to Statewide Inventory	1/25/2010	[AUG-20-12 Matthew Brunt] Change: Provider expanded cable coverage area.
Home Telephone Company, Inc.	DSL	Data Added to Statewide Inventory	1/22/2010	[AUG-03-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Home Telephone Company, Inc.	Fiber	Data Added to Statewide Inventory	1/22/2010	[AUG-03-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Home Telephone Company, Inc.	Fiber	Data Added to Statewide Inventory	1/22/2010	[AUG-03-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Home Telephone Company, Inc.	Cable	Data Added to Statewide Inventory	1/22/2010	[AUG-03-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Home Telephone Company, Inc.	Cable	Data Added to Statewide Inventory	1/22/2010	[AUG-03-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.

Horry Telephone Cooperative, Inc.	DSL	Data Added to Statewide Inventory	1/22/2010	[AUG-27-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Horry Telephone Cooperative, Inc.	Fiber	Data Added to Statewide Inventory	1/22/2010	[AUG-27-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Horry Telephone Cooperative, Inc.	Mobile Wireless	Data Added to Statewide Inventory	1/22/2010	[AUG-27-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Horry Telephone Cooperative, Inc.	Cable	Data Added to Statewide Inventory	1/22/2010	[AUG-27-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Leap Wireless International, Inc.	Mobile Wireless	Data Added to Statewide Inventory	4/6/2010	[JUL-18-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Rock Hill Telephone Company	Mobile Wireless	Data Added to Statewide Inventory	1/25/2010	[AUG-15-12 Matthew Brunt] Change: Provider expanded mobile coverage area.
Spacenet Inc.	Satellite	Data Added to Statewide Inventory		[SEP-12-12 Matthew Brunt] Correction: Initial submission of provider's coverage, but they were in service previously.
Sprint Nextel Corporation	Mobile Wireless	Data Added to Statewide Inventory	1/14/2010	[JUL-18-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
T-Mobile USA, Inc.	Mobile Wireless	Data Added to Statewide Inventory	1/8/2010	[AUG-09-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
TDS Telecommunications Corporation	DSL	Data Added to Statewide Inventory	1/27/2010	[AUG-24-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Time Warner Cable LLC	Cable	Data Added to Statewide Inventory	12/21/2009	[AUG-20-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Verizon South Inc.	Mobile Wireless	Data Added to Statewide Inventory	12/14/2009	[JUL-18-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
ViaSat, Inc.	Satellite	Data Added to Statewide Inventory	1/8/2010	[AUG-30-12 Matthew Brunt] Changes: Provider can now offer tier 7 download and tier 5 upload speeds to portions of their service area.
West Carolina Rural Telephone Cooperative, Inc.	Fiber	Data Added to Statewide Inventory	1/22/2010	[AUG-15-12 Matthew Brunt] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Conterra Ultra Broadband Holdings	Backhaul	Backhaul Provider Only Processing Complete	11/8/2011	
Palmetto Rural Telephone Cooperative, Inc.	DSL	Speed Only Update; Data Processing Complete	1/22/2010	[AUG-03-12 Matthew Brunt] Change: Provider upgraded infrastructure and can now offer tier 7 download speeds and tier 5 upload speeds.
Palmetto Rural Telephone Cooperative, Inc.	DSL	Speed Only Update; Data Processing Complete	1/22/2010	[AUG-03-12 Matthew Brunt] Change: Provider upgraded infrastructure and can now offer tier 7 download speeds and tier 5 upload speeds.
Rock Hill Telephone Company	Cable	Speed Only Update; Data Processing Complete	1/25/2010	[AUG-15-12 Matthew Brunt] Change: Provider upgraded infrastructure and can now offer tier 9 download speeds.
Rock Hill Telephone Company	Cable	Speed Only Update; Data Processing Complete	1/25/2010	[AUG-15-12 Matthew Brunt] Change: Provider upgraded infrastructure and can now offer tier 9 download speeds and tier 4 upload speeds.
Rock Hill Telephone Company	Cable	Speed Only Update; Data Processing Complete	1/25/2010	[AUG-15-12 Matthew Brunt] Change: Provider upgraded infrastructure and can now offer tier 9 download speeds and tier 4 upload speeds.
Rock Hill Telephone Company	Fiber	Speed Only Update; Data Processing Complete	1/25/2010	[AUG-15-12 Matthew Brunt] Change: Provider upgraded infrastructure and can now offer tier 9 download speeds.
Rock Hill Telephone Company	Fiber	Speed Only Update; Data Processing Complete	1/25/2010	[AUG-15-12 Matthew Brunt] Change: Provider upgraded infrastructure and can now offer tier 9 download speeds.

Rock Hill Telephone Company	Fiber	Speed Only Update; Data Processing Complete	1/25/2010	[AUG-15-12 Matthew Brunt] Change: Provider upgraded infrastructure and can now offer tier 9 download speeds.
West Carolina Rural Telephone Cooperative, Inc.	DSL	Speed Only Update; Data Processing Complete	1/22/2010	[AUG-15-12 Matthew Brunt] Change: Provider upgraded infrastructure and can now offer tier 7 download speeds and tier 5 upload speeds.
AT&T Inc.	Backhaul	No Update to Provide	12/16/2009	
CenturyLink	Backhaul	No Update to Provide	12/4/2009	
Chesnee Telephone Company, Inc.	Cable	No Update to Provide	1/25/2010	
Chesnee Telephone Company, Inc.	DSL	No Update to Provide	1/25/2010	
Chester Telephone Company	Backhaul	No Update to Provide	1/25/2010	
Chester Telephone Company	Cable	No Update to Provide	1/25/2010	
Chester Telephone Company	DSL	No Update to Provide	1/25/2010	
Chester Telephone Company	Fiber	No Update to Provide	1/25/2010	
DeltaCom, Inc.	Backhaul	No Update to Provide	2/16/2010	
Family View CableVision	Cable	No Update to Provide		
Farmers Telephone Cooperative, Inc.	Backhaul	No Update to Provide	1/22/2010	
Farmers Telephone Cooperative, Inc.	Backhaul	No Update to Provide	1/22/2010	
Farmers Telephone Cooperative, Inc.	DSL	No Update to Provide	1/22/2010	
Farmers Telephone Cooperative, Inc.	DSL	No Update to Provide	1/22/2010	
Farmers Telephone Cooperative, Inc.	Fiber	No Update to Provide	1/22/2010	
Frontier Communications Corporation	Fiber	No Update to Provide	1/22/2010	
Hargray Communications Group, Inc.	Backhaul	No Update to Provide	1/25/2010	
Hargray Communications Group, Inc.	Backhaul	No Update to Provide	1/25/2010	
Hargray Communications Group, Inc.	Backhaul	No Update to Provide	1/25/2010	
Hargray Communications Group, Inc.	DSL	No Update to Provide	1/25/2010

Southern Coastal Cable, LLC	Cable	No Update to Provide	6/30/2010	
Sprint Nextel Corporation	Backhaul	No Update to Provide	1/14/2010	
TDS Telecommunications Corporation	Backhaul	No Update to Provide	1/27/2010	
tw telecom of south carolina, llc	Backhaul	No Update to Provide	4/26/2010	
United States Cellular Corporation	Mobile Wireless	No Update to Provide	2/15/2011	
West Carolina Rural Telephone Cooperative, Inc.	Backhaul	No Update to Provide	1/22/2010	
ATG Communications, LLC	Backhaul	No Update Provided - Use Last Submission Data	1/14/2010	
Atlantic Broadband, LLC	Cable	No Update Provided - Use Last Submission Data	2/3/2010	
Charter Communications, Inc.	Backhaul	No Update Provided - Use Last Submission Data	12/15/2009	
Knology of South Carolina, Inc.	Cable	No Update Provided - Use Last Submission Data	7/13/2011	
Level 3 Communications, LLC	Backhaul	No Update Provided - Use Last Submission Data	12/14/2009	
Northland Communications Corp.	Cable	No Update Provided - Use Last Submission Data		
Pee Dee Net	Fixed Wireless	No Update Provided - Use Last Submission Data	2/23/2010	
Windstream Communications	Backhaul	No Update Provided - Use Last Submission Data	1/20/2010	
Windstream Communications	DSL	No Update Provided - Use Last Submission Data	1/20/2010	
Windstream Communications	Backhaul	Solicited Initial Data	1/20/2010	
Birch Communications, Inc.	Backhaul	Refused to Participate		[MAY-04-12 Daryl Coffey] A company representative sent an e-mail stating that the company declines to participate.
Atlantic Tele-Network, Inc.	Mobile Wireless	Non-Responsive to Multiple Attempts		In addition to numerous contact attempts made during the last mapping submission period, 4 contact attempts were made this period.
Knology of South Carolina, Inc.	Backhaul	Non-Responsive to Multiple Attempts	7/13/2011	In addition to numerous contact attempts made during past mapping submission periods, 5 contact attempts were made this period.

South Dakota Broadband Mapping Project: Product Release White Paper

Contact Name Manager: Jim Edman
Contact Phone Number: 603-773-4861
Contact E-mail: Jim.Edman@state.sd.us

Submitted By: Kristin Rousseau
Contact E-mail: kristin.rousseau@broadmap.com

Product Specification: Fall 2012 NTIA Data Model
Product/Process: NTIA— October 1, 2012 Data Deliverable
Dataset Submission QC: NTIA—SBDD_CheckSubmission.py

Table of Contents

OVERVIEW

This white paper highlights the **Submission Summary** for this deliverable, as well as describes the **Data Gathering**, **Data Integration**, **Data Validation and Verification** and **Quality Control** processes used to create the Broadband Mapping Project's October 1st, 2012 data submission. To support varying levels of technical and program knowledge, both a **high-level summary** and a **detailed process review** are supplied.

SUBMISSION SUMMARY

PROVIDER DETAILS

PROVIDER PARTICIPATION

- Provider Participation Statistics Summary

Summary	Count
Total Providers Researched/Contacted	98
Total Valid Broadband Providers	51
Non-Responsive Providers	4
Non-Cooperative Providers	1
Number of Providers - Supplied Updates for this Submission	38
Number of Providers - Confirmed No Updates	8

- New Providers Since Last Data Submission
    - No new providers added to the dataset for this submission.
    - Additional providers are currently under review to identify if they are valid broadband providers.

- Existing Providers – Confirmed No Updates
    - Cable One, Inc.
    - Hughes Network Systems
    - Knology, Inc.
    - MNW Wireless
    - Skycasters
    - StarBand Communications Inc.
    - Valley Telephone
    - Venture Communications

- Providers Included (listed by Provider and Holding Company name)

Alliance Communications Cooperative	MNW Wireless
AT&T Mobility	New Edge Network, Inc.
Beresford Municipal Telephone	Northern Valley Communications
Cable One, Inc.	Northern Wireless
CenturyLink (SD)	RC Communications
Cheyenne River Sioux Tribe	RC Technologies, Inc.
Consolidated Telecom	Roberts County Telephone Cooperative
Data Truck	Santel Communications
DigitalBridge Communications (BridgeMaxx)	SDN Communications
Faith	Sioux Valley Wireless
Fibercomm L.C.	Skycasters
Fort Randall	Sprint
Frontier Communications	StarBand Communications Inc.
Golden West Communications	Swiftel Communications
Hughes Network Systems	Triotel / McCook Cooperative
Interstate Telecommunications Cooperative	Valley Telecommunications Cooperative
Kennebec Telephone Company	Valley Telephone
KeyOn Communications Inc.	Venture Communications
Knology, Inc.	Verizon Wireless
Long Lines	West River Cooperative
Mediacom Communications Corporation	West River Telecommunications Cooperative
Midcontinent Communications	Western Telephone Company
Midstate Communications	WildBlue Communications Inc. (ViaSat)
Mitchell Telecom (Sancom, Inc. dba Mitchell Telecom)	Zayo

- Non-Responsive Providers/Non-Cooperative Providers
    - KeyOn Communications Inc.
    - New Edge Network, Inc.
    - Western Communications
    - Wirefree USA
    - Nate’s Net

- Providers researched and identified as non-broadband providers can be viewed within the table at the end of this document.

COVERAGE AREA CHANGES

- Coverage Footprint Reductions/Map Refinement –
  - CenturyLink (TT-10)
  - AT&T Mobility LLC (TT-80)
  - Cheyenne River Sioux Tribe Telephone Authority (TT-10)
  - Fort Randall Telephone Company (TT-10)
  - Golden West Cablevision Inc (TT-10)
  - Golden West Telecommunications (TT-10)
  - Interstate Telecommunications Cooperative, Inc. (TT-10)
  - James Valley Telecommunications (TT-10)
  - Mediacom LLC (TT-40)
  - Midcontinent Communications (TT-40)
  - NVC (TT-10)
  - Santel Communications Cooperative (TT-10)
  - SDN Communications (TT-50, TLIDS)
  - Splitrock (Middle Mile)
  - Swiftel Communications (TT-50)
  - TrioTel Communications, Inc. (TT-10)
  - Venture Communications Coop. (TT-10, FRN-0004338463)
  - West River Telecommunications (Middle Mile / Rename)
  - Zayo Group LLC (Middle Mile)

- Coverage Footprint Expansion –
  - Beresford Municipal Telephone (TT-10)
  - Cheyenne River Sioux Tribe Telephone Authority (TT-50)
  - Frontier Citizens Communications of Minnesota (TT-10)
  - Golden West Telecommunications (TT-50)
  - Interstate Telecommunications Cooperative, Inc. (TT-50)
  - Midcontinent Communications (TT-50)
  - Midstate Communications (TT-50)
  - RC Technologies, Inc. (TT-71)
  - Santel Communications Cooperative (TT-50)
  - SDN Communications (TT-50, Blocks)
  - SpeedConnect (TT-71)
  - SpeedConnect (TT-80)
  - Splitrock Properties (Middle Mile)
  - Swiftel Communications (TT-10)
  - TrioTel Communications, Inc. (TT-50)
  - Venture Communications Coop. (TT-50, Both FRNs)
  - ViaSat (TT-60)
  - West River Cooperative Telephone Company (TT-10)
  - West River Cooperative Telephone Company (TT-50)

- Provider Attribution or Name Changes –
  - West River Telecommunications Cooperative (Middle Mile Rename)
  - WildBlue Communications, Inc. (TT-60, Changed Name ViaSat)
  - New Edge Networks, Inc. (TT-20/TT-30 Removed / Non-Coop)
  - Venture Communications Coop. (TT-10 / FRN 0004338463 / Removed)

DATA CORRECTIONS

- Beresford Municipal Telephone
  - Beresford has a pipeline that supports a restricted amount of bandwidth. They offer their business customers a better overall package/level of service but since they have a limitation in their infrastructure, they are unable to support the same level of service for their residential customers.
    They were originally represented as two different footprints, one for residential with lower speeds and the other for business with higher speeds, to support the difference in services they support.

    NTIA requested that the residential footprint be removed and the remaining footprint updated to support both residential and business services for now. They stated that they will look into this mapping for a potential update to the data model in future data submissions, because there are many providers offering both services with different speeds.

COMMUNITY ANCHOR INSTITUTION (CAI) DETAILS

OVERALL STATISTICS

Community Anchor Institution - Categories	Overall Count	CAIID Counts	Broadband Subscriber (Yes)	Trans Tech	Advertised Speed Down	Advertised Speed Up
Category 1 - School K through 12	447	208	386	252	230	231
Category 2 - Library	96	80	27	22	16	15
Category 3 - Medical/Healthcare	180	0	104	32	25	24
Category 4 - Public Safety	373	0	70	51	27	27
Category 5 - Universities/Colleges	36	24	35	22	23	22
Category 6 - Other: Government	353	0	353	353	353	353
Category 7 - Other: Non-Government	16	0	6	5	4	4
Total	**1501**	**312**	**981**	**737**	**678**	**676**

CAI CHANGES

- The State Information Technology Bureau, the Bureau of Information and Telecommunications, extracted broadband service details from their circuit inventory system regarding the broadband capabilities of the k-12 schools, universities, and state/county/local government offices to which it provides services.

- The CAI inventory was review again against the database mentioned below for the following categories: Category 1: K-12 Schools, Category 2: Libraries and Category 5: Colleges
These databases are as follows:

  - For K-12 institutions (CAI type 1) please add the NCES ID CCD ID value found here: **http://nces.ed.gov/ccd/bat/**

  - For Higher Education (CAI type 5) please add the NCES IPEDS ID value found here: **http://nces.ed.gov/ipeds/datacenter/**

  - For Libraries (CAI type 2) please. Combine (do not add) “FSCSKey” and “FSCs_SEQ” from the “puout08av2000” file and place them here: **http://harvester.census.gov/imls/data/pls/index.asp** (FYI the LIBID is your state’s unique ID for libraries)

SUBMISSION RECEIPT

SUBMISSION RECEIPT RESULTS

- Attached are the results from the NTIA data submission receipt quality script.

SD_2012_9_26.txt

- Error Report
  - The main items flagged within the submission receipt were the technology and speed matches, which were validated by the provider and/or are within the ranges communicated in the NTIA data model.

  - All items are included within the accompanying ReadMe file.

HIGH-LEVEL SUMMARY

DATA GATHERING

BROADBAND SERVICE AREAS, MIDDLE MILE AGGREGATION POINTS AND BROADBAND SERVICE OVERVIEW

The collection of Broadband Service Areas, Middle Mile Aggregation Points and Broadband Service Overview information is handled through the following Provider Outreach Process:

- Build and maintain an inventory of Broadband providers through currently known providers and research.
- The inventory and everyday interaction with providers is tracked using the Provider Catalog (PCat). Below are some examples of the web application, which has a shared access between our team and mapping partner (BroadMap).

Company Information			Edit Clone History AAD

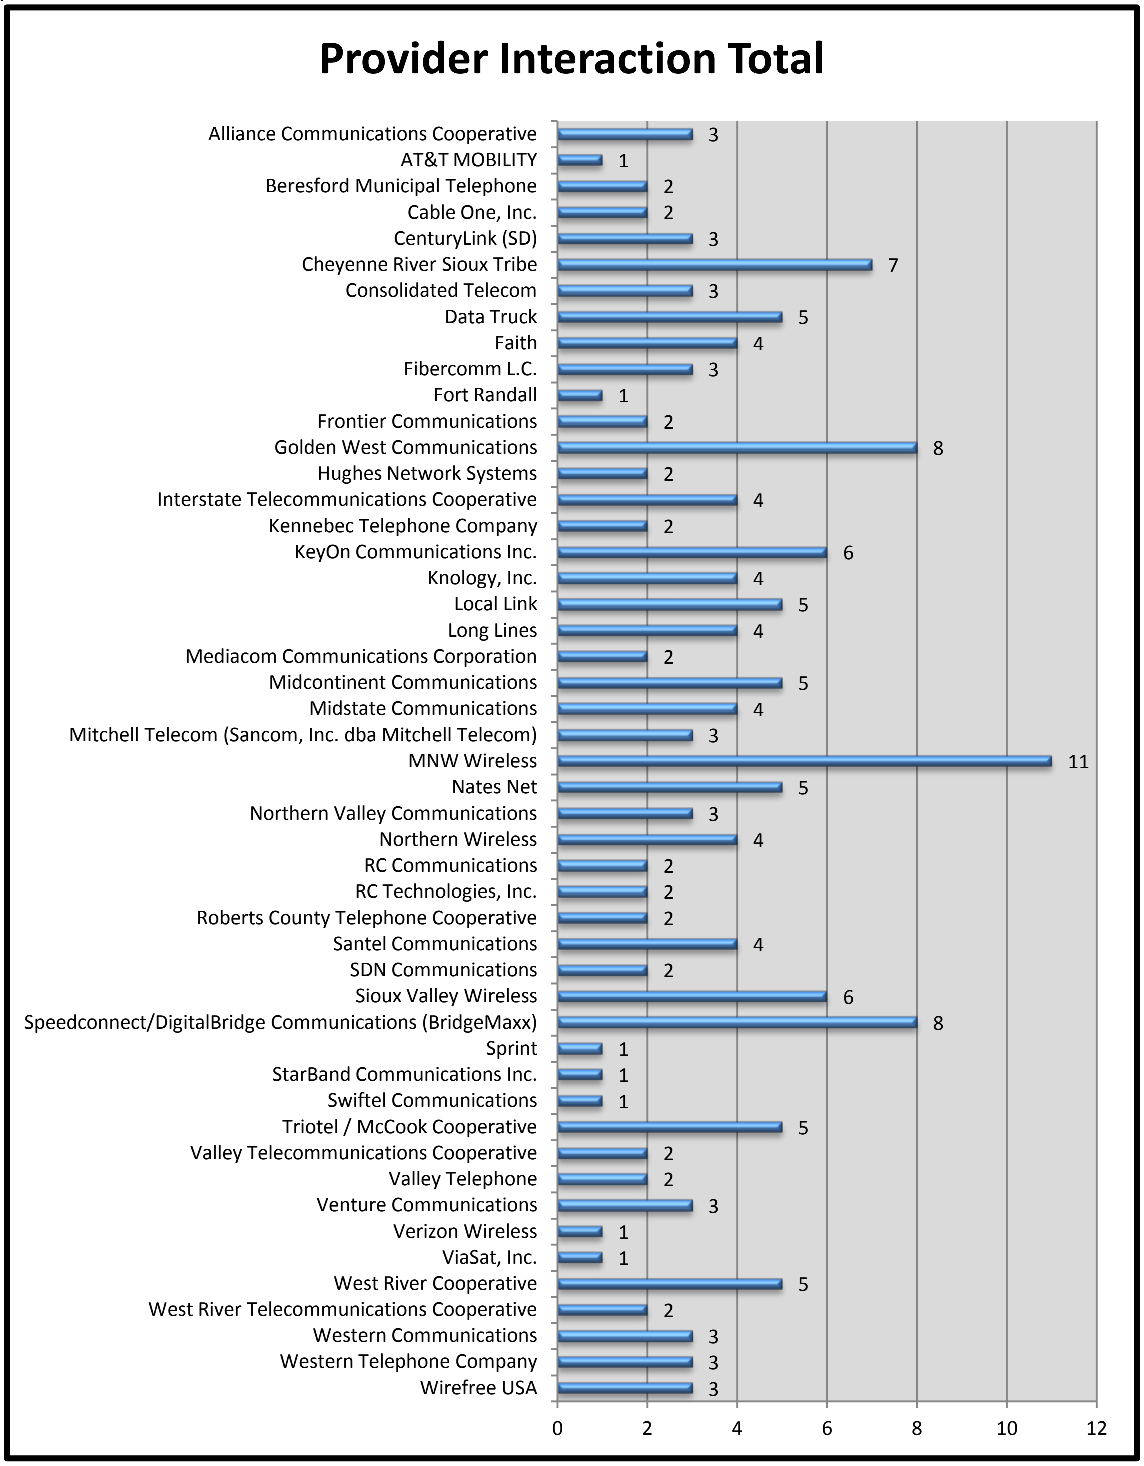
- In order to encourage participation throughout the life of the program, we feel it's important to foster relationships with the providers and encourage a collaborative team effort between all parties for each data submission. The chart below represents that interaction count with each provider.



- Update provider material that describes the data requirements and logistics for data transfer.
- Update Non-Disclosure Agreement (NDA) for use in the project, where applicable.
- Maintain multiple protocols for the provider to submit data, including Secure File Transfer Protocol (SFTP) technology when desired.
- Conduct one-on-one informational discussions with each provider to communicate the following:
  - Requirements of this project;
  - Broadband data required to support the product data model;
  - Submission protocols available;
  - Capability to validate how the supplied data is aggregated.
- Download/receive provider data.
- Establish a repeatable process with provider. Maintain provider communication, transaction and data handling records throughout the project (dates contacted, data received, etc.).

COMMUNITY ANCHOR INSTITUTION (CAI)

The collection of CAI information is handled through the following CAI Collection Process:

- Collect and maintain inventory of CAIs through currently known CAIs, data mining, and research.
- Maintain web-based CAI portal for institutions to add or confirm attribution, location and enter broadband-specific information.
- Upload web-based data to Core Database for standardization.
- Perform internal cleansing, such as removing duplicate records, identifying gaps in broadband attribution and verifying category.
- Geocode CAI locations.
- Translate Core Database data to deliverable-ready format.
- Continue engagement with non-responsive institutions.

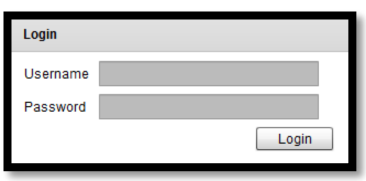
DATA INTEGRATION PROCESS

The data integration and processing mechanisms currently used allows for multiple types of inputs and result in a standardized output that meets the NTIA deliverable requirements. This flexible process supports data model changes and project-requested enhancements.

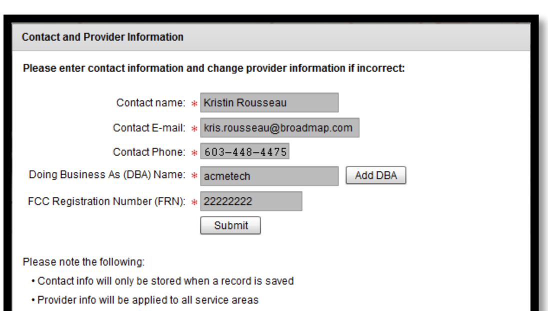
- Receive inputs from providers via submission protocols; upload into Sourcing Database and catalog with provider information.
- Review provider-supplied data for completeness and for potential discrepancies that require resolution prior to processing and flag as necessary.
- Categorize input into data-type category (addresses, block lists, paper maps, etc.).
- Standardize input based on data type within Staging Database.
- Create Compact Polygons (CP)—(internal methodology for generating area-based feature for coverage in Staging Database).
- Apply broadband attribution to CP; apply metadata to CP.
- Perform quality analysis of the CP against the source supplied to identify any completeness or accuracy issues.
- Request additional information from the provider if elements of coverage are missing or contain discrepancies. This is a second manual quality check to ensure data is complete.
    - Process coverage area to build the required NTIA data model layers.

With the deployment of the Provider Portal this round, the data collection and later validation process was streamlined allowing both activities to occur within a secure web application. The majority of the providers used this methodology as it supplies them with more visibility into how their data is being represented and gives them knowledge and ownership of their coverage representation. Below are some bullet points and supporting screen shots on how the portal is used.

- Each provider is assigned credentials with a strong password to ensure security measures are taken into consideration



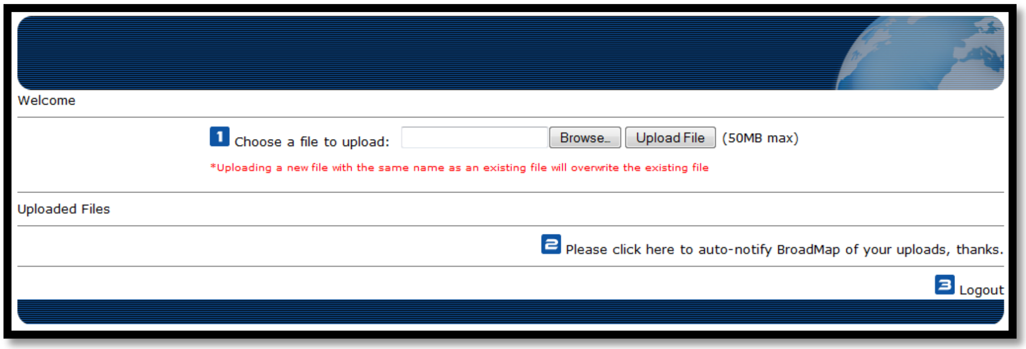
- Collection and confirmation our contact, as well as the company's DBA Name and FRN accuracy



- Capability to review and request changes to the coverage footprint

  - The provider can Add/Remove portions, or all, of the footprint requesting that their footprint be increased or refined.

- File upload functionality to support providers that would prefer a shapefile, spreadsheet, PDF, KMZ/KML file be used to reflect changes for the data round



- Once the provider has reviewed completed changes to their coverage, they can then validate them by signing off that everything is accurate.

DATA VALIDATION AND VERIFICATION

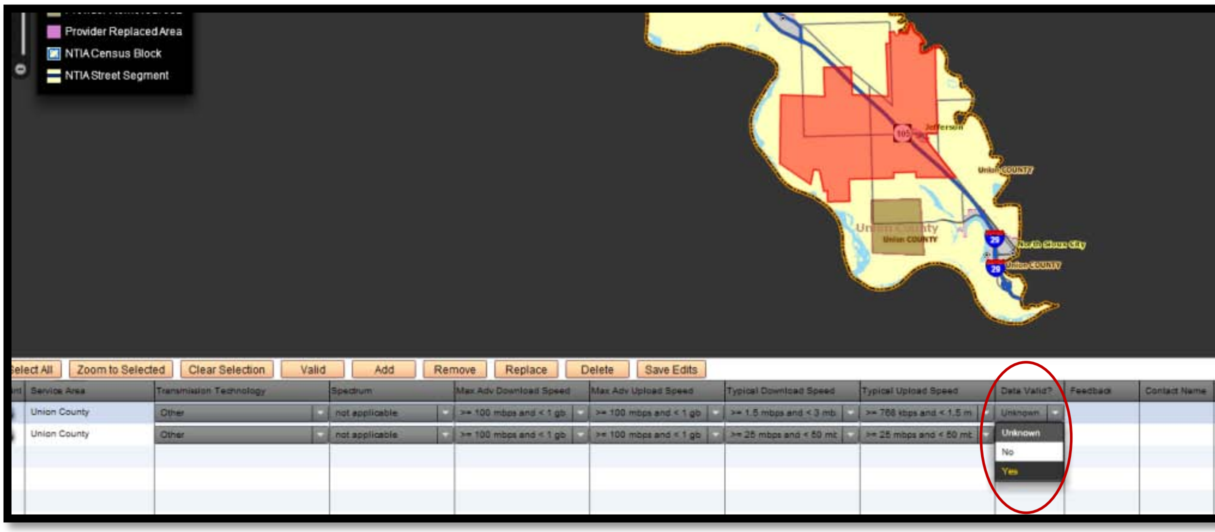
To ensure the data collected and processed is as accurate and as comprehensive as possible, South Dakota broadband verification encompasses many efforts. The methodologies employed are documented below:

BROADBAND PROVIDER VALIDATION—PROVIDER PORTAL APPLICATION

First and foremost, all providers are given access to, and are trained in the use of, a web application we call the "provider portal". After each data collection and ingestion of provider data, representatives from the provider are able to review the polygons, segments, speeds, technologies, and other attribution that our GIS teams have developed based on the submitted data. Providers are given the opportunity to make changes to the data's attributes (speeds, technology, spectrum, etc…) as well as add/change/move/delete coverage areas. The requested changes are delivered to the GIS teams for full ingestion in our broadband database. This process is repeated until the provider representatives confirm that all aspects of the coverage areas are accurate and complete.

This portal is available 24/7/365 for providers to utilize, allowing those companies without GIS or mapping staff access to those technologies and benefits for review, presentations, and other business opportunities. This process has proven both successful and popular in the provider community.

- Coverage validation can be done on one record/footprint at a time or by selecting footprints and selecting the 'Valid' button. The provider could also print off or download their coverage for their own tracking purposes.



All validation results are tracked internally through our Validation Table, which also improves the overall **Confidence Value** as mentioned below.

FURTHER BROADBAND PROVIDER VALIDATION

Following the completion of each data submission, maps are supplied to each provider in PDF format for them to perform further validation and review with their staff. These maps are also utilized as marketing material for their websites, internal communications, etc., which further fosters participation.

Any feedback or changes received following the delivery of these maps are incorporated into the overall broadband map and reviewed again with the provider.

RF PROPAGATION – PREDICTIVE MODELING

For this data submission, we have started using EDX to perform RF propagation analysis and create predictive modeling of wireless coverage based on available tower data. The analysis performed thus far has not required us to make significant adjustments to the provider submitted shapefiles; however we are working with providers to collect further tower information, as well as potential extra signal strength that may be gained from repeaters.

We are also offering these maps created to providers as a service, so they can use it to further validate the coverage area and use it for marketing material. This will help ensure continuous participation in the program.

INDUSTRY KNOWLEDGE – SUBJECT MATTER EXPERTS

South Dakota's technology and telecommunications businesses are highly consolidated, with the State of South Dakota often being the largest consumer of services in the state. Given that, relationships and partnerships often already exist between the State of South Dakota and the broadband providers, giving a first-hand look at the services offered and where they are offered. In addition, the South Dakota broadband team has ready access to industry experts within the SD Public Utilities Commission, telecommunications association's boards, and technology industry experts in the fields of telecommunications and data networking.

Our office has met and consulted with these experts regarding provider data as issues were found. Examples of these consultations are the review of provider coverage areas against telecommunications exchange areas with the Public Utilities Commission and against known technological capabilities. Any anomalies or questioned material is relayed to the providers for review.

FIELD VERIFICATION

A number of field verification efforts have taken place during the last six months.

- For newly discovered fixed wireless providers, we send remote office staff out to document and photograph the tower infrastructure reported by the provider.

- For mobile wireless providers, broadband staff and other team members have completed over 40,000 miles of drive testing utilizing mobile wireless phones collecting information on coverage and broadband performance. This drive testing has collected over 1.86 million data points across the state that confirm the availability of wireless broadband signal at a geographic location by coordinates, with the data collected every 10 seconds during the drive testing. Tower location information and wireless speed test results were also collected during this drive testing, with over 25,000 test results collected. This gives us a total of 175,000 speed test results with the information collected during our field verification efforts and the Ookla mobile data.

An important point to note is that with the development of an automated toolset that allows team members to start data collection upon entering the vehicle and not need any further intervention, a number of staff members have been volunteering time to drive untested roads and territories of the state during vacations, other state business, or leisure time at no cost to the program.

Due to the nature of our organization being a centralized IT group for government and education, we are uniquely positioned to request field verification by our remote office staff. As technicians travel the state, they have performed speed tests at businesses, homes, and government offices, as well as surveyed remote office staff on availability of coverage areas at their homes.

THIRD-PARTY DATA VERIFICATION

The South Dakota broadband team has collected data from the FCC CBT and Mobile tests, the FCC dead zone reporting tool, FCC ASR datasets, our own hosted speed test application, provider speed test results, census data, provider exchange boundaries and commercially available datasets from Ookla to confirm the availability of broadband service. Of particular interest to our program were datasets that tied a specific address to the broadband data, as we have found other location-based services (IP geolocation) to be woefully inaccurate in our state.

Collected third-party data is overlaid against provider coverage areas for comparison. Most valuable has been our hosted speed test server (speedtest.sd.gov). This test collects specific address location information and provider details, while providing consumers the ability to directly provide more accurate location information via a clickable map in the event that their address is not geocoded correctly. This provides benefits to our verification effort as well as our Improved Address Files grant program.

Recently added to our verification efforts have been more accurate provider exchange boundaries and 2010 Census information on population density. Provider coverage areas are compared against known exchange boundaries, and census population density information is used to explain any possibly gaps in coverage.

CROWD SOURCING

In addition to our Crowd sourced speed test system, our state broadband website offers consumers the ability to report broadband dead zones, take surveys on available broadband and related topics, report inaccuracies in our online static/interactive maps, as well as any other relevant feedback about the broadband environment of South Dakota. This feedback is compared against provider coverage areas, with relevant information reported to the providers for comments and/or correction.

Website Hyperlink: **http://broadband.sd.gov/**

CONFIDENCE VALUES

All verification, validation and manual quality review results are tracked by provider/technology type and stored and maintained within a **Validation table**. A confidence value is assigned, based on internal assessments of the collected information, to highlight the provider coverage areas and/or attributions that would benefit from further investigation and/or enhancements.

With the continued efforts on provider validation, 3rd party verification and the release of the public interactive map with feedback collection functionality, the confidence values will be utilized further to identify specific areas in need of attention.

QUALITY CONTROL

Following collection, processing and analysis of the provider and CAI data, the product is checked manually and algorithmically against the NTIA data model. Some of the items included within these checks are:

- Format correctness;
- Table and field structure;
- Valid values, including default values, where applicable;
- Geographic extent and topology errors.

Prior to data submission, another quality control script supplied by NTIA is run. This script, SBDD_CheckSubmission.py, creates an output in text form that is required to be submitted along with the final deliverable. All errors must come up clean, unless otherwise specified by NTIA.

DETAILED PROCESS REVIEW

To review the detailed process, please review the attached object:

BMap_ProcessDetails_2012_10_01.docx

PROVIDERS RESEARCHED

Below is a list of providers that were researched and contacted, but identified as non-broadband providers and didn't require inclusion within the data submission. Some may be due to different naming conventions or inaccurate FRN/DBA names and were therefore considered a closed source.

5LINX Enterprises, Inc.
Airespring, Inc.
Apptix, Inc.
Aptela, Inc.

OFFICIAL OCTOBER 2012 UPDATE SUBMISSION TO THE NATIONAL TELECOMMUNICATIONS AND INFORMATION ADMINISTRATION UNDER THE STATE BROADBAND INITIATIVE GRANT PROGRAM FOR THE STATE OF TENNESSEE

CONNECTED Tennessee

THE TRAIL TO INNOVATION®

October 1, 2012

TABLE OF CONTENTS

October 1, 2012

Ms. Anne W. Neville
SBI Grant Program Director
National Telecommunications and Information Administration
U.S. Department of Commerce
Room 4716
1401 Constitution Avenue, NW
Washington, DC 20230

Dear Ms. Neville:

As the State Broadband Designated Entity, Connected Tennessee, in partnership with the Department of Finance and Administration's Office of Information Resources and the Department of Economic and Community Development and other agencies, please accept this submission from Connected Tennessee on behalf of the State of Tennessee's State Broadband Initiative (SBI) Grant Program.

The Connected Tennessee program and its collective stakeholder community continue to be faithful and energized contributors to the National Telecommunications and Information Administration's (NTIA) SBI program. Now more than ever, the significance of complete and validated data as compiled through the Federal Communications Commission's (FCC) National Broadband Map is instrumental in forging the innovation economy of the 21st century. As the Commission relies upon this unique resource to distribute monies under the Connect America Fund, through the Universal Service Fund reform, the Connected Tennessee program equally values this data in informing meaningful program interventions relating to broadband access, adoption, and use initiatives. Truly, this coordination embodies the spirit of the SBI and demonstrates the joint effort of the NTIA, FCC, state governments, industry, and non-profits like Connected Nation as it continues to serve as a key tool for the American public and policymakers. We are proud of the role that Connected Tennessee has played in creating and maintaining such a powerful tool that has benefitted and surely will continue to benefit broadband providers, consumers, and businesses nationwide.

The artifacts that comprise this submission should be found to be compliant with the October 1, 2012, deadline for the semi-annual data update and in accordance with the terms of the July 1, 2009, Notice of Funds Availability (NOFA) and all subsequent clarifications pertaining to delivery of state-level mapping of broadband service availability. This packet includes:

Inventory of Deliverables, Connected Tennessee: October 1, 2012

NOFA Requirement	Data Transfer Model	Data Description
Appendix A: 1(a)(i)	BB_Service_CensusBlock	Broadband Service Availability of Facilities-Based Providers in

		Census Blocks of No Greater Than Two Square Miles in Area
Appendix A: 1(a)(ii)	BB_Service_RoadSegment	Broadband Service Availability of Facilities-Based Providers by Road Segment in Census Blocks Larger in Area Than Two Square Miles
Appendix A: 1(b)	BB_Service_Wireless	Broadband Service Availability of Wireless Services Not Provided to a Specific Address
Appendix A: 3(b)	BB_ConnectionPoint_MiddleMile	Broadband Service Infrastructure Middle-Mile and Backbone Interconnection Points
Appendix A: 4	BB_Service_CAInstitutions	Community Anchor Institutions-Listing
Appendix A: 4	n/a	Community Anchor Institutions-Narratives
VII.A.1(a)	n/a	Accuracy and Verification Report
n/a	DataPackage.xlsx	Worksheets of Contact Information, Record Count, and Provider Summary Table
n/a	n/a	List of Changes and Corrections to the Dataset
n/a	n/a	Non-Participating Provider (NPP) Narratives
n/a	n/a	Broadband Provider Roster and Participation Status

In addition, this data update submission should be found to be compliant with the additional program requirements instituted by the National Telecommunications and Information Administration since the time of the April 2012 SBI data submission for the Connected Tennessee program. Specifically, these new requirements are:

SBI Data Transfer Model
The submission of the broadband dataset for October 1, 2012, is contained within the SBI Data Transfer Model as released on the Grantee Workspace on August 9, 2012. All efforts have been made to comply with formatting, domain, and metadata requirements to include as much information on each provider as possible.

Additional Submission Guidance
New to the semi-annual submission for October 2012 is a more robust version of the ReadMe text file. As per the template released on the Grantee Workspace on May 18, 2012, this file contains a high-level summary of the items contained within the submission, including the exact file deliverables, a description of the errors and warnings from the Check Submission report, and extraneous information of which the NTIA and other users of the dataset should be made aware.

This submission continues to follow the speed technology guidance released by the Program Office on August 9, 2012, to review speed tier codes in correspondence with technology of transmission codes. In the April 2012 submission, descriptions were provided in the methodology paper that offered an explanation for any submitted technology of transmission and speed combinations that were outside of the expected value range. That practice continues in this submission as technology and speed combinations are reviewed and scrutinized; any questionable information supplied by providers is reviewed more in depth with the provider to ensure the information is accurately captured or a proper explanation is provided as to why the speed information should be submitted as supplied even if it falls outside the expected value range.

Also in this submission are narratives describing the data and coverage estimation of non-participating providers. While Connected Tennessee continues outreach to all providers prior to each submission period, the need to submit broadband service data for all providers regardless of their participation is evident as the SBI program continues into this sixth round of data submissions. The submission of this estimated broadband service area for providers that have not supplied data to Connected Tennessee is essential in being able to portray a more accurate depiction of the current broadband landscape.

In addition to the requirements mentioned above, please find this methodology paper to be inclusive of the ongoing section pertaining to industry mergers and acquisitions – specifically this section details any and all mergers or acquisitions that have taken place in Tennessee since the April 2012 submission. The intent of this updated section is to provide a better understanding of how the broadband provider landscape has changed since the last submission cycle.

This October 2012 semi-annual data update under the SBI Grant Program continues to demonstrate our dedication to implementing the joint purposes of the Recovery Act and the Broadband Data Improvement Act (BDIA) by gathering comprehensive and accurate state-level broadband mapping data, developing state-level broadband maps, aiding in the development and maintenance of the National Broadband Map, and undertaking statewide initiatives for broadband planning.

Broadband Service Availability — Provider Outreach and Verification

This data update submission under the SBI program includes datasets for approximately 96.55 percent of the Tennessee provider community, or 84 of 87 total providers. There are 82 participating providers and 2 additional non-participating providers whose estimated coverage areas have been submitted. Of the 82 participating providers, 27 supplied an update to their network or coverage area(s), while 34 have reported no change. The remaining 21 represent providers who previously supplied data but were non-responsive in the October 2012 update effort; therefore their previous dataset is being put forward as part of this compilation. A complete roster by provider depicting participation status and contact record is contained herein. The 3 providers that are not represented in the attached datasets have refused to participate in the voluntary program or were non-responsive to multiple contact attempts.

As the aforementioned roster and attached methodology documentation will attest, it is the collective opinion of the Connected Tennessee principals that all commercially reasonable efforts were made to account for 100 percent of the known Tennessee broadband provider community, pursuant to this semi-annual data update submission.

Connected Tennessee has also continued to perform broadband verification activities through several means. In addition to confirmation of service area(s) by each provider, Connected Tennessee conducts field validation efforts. To date, 63 (72.41percent) providers have been validated through field verification activities. Additional details on verification activities are contained within the Field Validation Methodology.

The Connected Tennessee website, (www.connectedtn.org), continues to serve a prominent role in the outreach and data collection effort. This program asset provides a way for the general public to participate in the process by offering interactive tools for users to test their connection speed, submit broadband inquiries, or contact a program representative.

As an indicator of stakeholder penetration, the Connected Tennessee website encountered 4,635 unique visits during this reporting period (44,291 total to date for the life of the grant awarded on December 20, 2009). Additionally, this pronounced Web activity netted 81 broadband inquiries over this same reporting period (1,528 grant inception to date). The website also provides access to the My ConnectView™ interactive mapping application, which allows consumers and broadband providers to confirm or dispute the coverage represented on the broadband inventory map. These consumer-initiated actions are facilitated through the Connected Tennessee website and the Connected Tennessee interactive mapping tool (My ConnectView™) that offer the stakeholders the vehicles to provide information regarding availability in their respective service area, either in affirmation or contest of the reported data represented in the Connected Tennessee mapping artifacts. Since the initial data collection and release of corresponding maps, feedback in the form of broadband inquiries has allowed Connected Tennessee to identify additional areas that are in need of field validation, which is scheduled as soon as possible.

Community Anchor Institutions

Connected Tennessee has established an ongoing mechanism for gathering data on the location and broadband connectivity of Community Anchor Institutions (CAI), in accordance with the data requirements of the SBI NOFA Technical Appendix. Since the April 2012 data submission, the CAI outreach process method has been modified to improve data collection. Specifically, the outreach process is a more focused sector-specific and relationship-oriented approach that generates more responses than general contact.

Outreach was conducted during this data update reporting period by Connected Tennessee to continue identification of existing, centralized sources for CAI connectivity data. Additionally, outreach was coordinated to distribute the CAI survey to institutions throughout the state through multiple methods including a customized online survey available on the Connected Tennessee website. During this reporting period Connected Tennessee has continued working with a number of statewide entities such as NetTN to promote the importance of broadband connectivity at anchor institutions and participation in this data collection process. It became apparent that these relationships are beneficial to the entire success of the Grant Program, and the CAI engagement is a logical extension of new and existing relationships. Connected Tennessee will continue to build upon these new relationships over the coming months and utilize its contacts throughout the state to collect data and raise awareness of this project.

In addition to fostering and building relationships with state agencies, associations, and organizations, Connected Tennessee has also developed a sector-specific calendar that supports CAI outreach as well as research and communications efforts. This focused approach allows a corporate commitment to capturing CAI data in addition to developing meaningful sector-specific content.

Connected Tennessee is also working hard to clarify CAI information associated with wireless broadband. NTIA has requested in-depth questioning of CAI listing a wireless broadband service as their sole form of connectivity. This follow-up allows us to better understand the reason for adopting the wireless broadband service.

From our work in Tennessee, as well as other states, we recognize the great value of this data to future collaboration efforts within the state as well as its value to the National Broadband Map. We plan to continue to bring best practices to the Connected Tennessee efforts, along with an investment of both human and technical resources required to reach our goal of increasing the data that is secured and reported as part of this process.

The Connected Tennessee program exists to improve data on the deployment and adoption of broadband services and to assist in the extension of broadband technology across all regions of the great State of Tennessee, as well as the United States and its territories through contribution to the National Broadband Map. We look forward to the continuing work ahead and improving upon our data collection methods.

Respectfully submitted,

Corey R. Johns
Executive Director
Connected Tennessee

Thomas W. Ferree
President and Chief Operating Officer
Connected Nation, Inc.

DATA ACQUISITION: TENNESSEE COMMUNITY ANCHOR INSTITUTIONS METHODOLOGY

In this sixth reporting period of the SBI, Connected Tennessee, working in close coordination with the State of Tennessee, has established an ongoing mechanism for gathering data on the location and broadband connectivity of Community Anchor Institutions (CAI), in accordance with the data requirements of the SBI NOFA Technical Appendix. Since the April 2012 data submission, the CAI outreach process method has been modified to improve data collection. Specifically, the outreach process is a more focused sector-specific and relationship-oriented approach that generates more responses than general contact.

Connected Tennessee has continued to identify and process CAI data obtained through an ongoing statewide outreach campaign. Physical address information continues to be augmented through manual sourcing and geocoded by Connected Tennessee through Esri ArcGIS software.

Connected Tennessee continues to utilize a customized online survey hosted through SurveyMonkey, with a landing page on the Connected Tennessee website that was developed during the first reporting period. This survey, in combination with a customized data-gathering spreadsheet, was distributed on a regular basis to a targeted list of CAI throughout the state as well as organizations and agencies that work closely with the CAI. The distributions were completed with the support of the state client. Connected Tennessee will continue to use these data-gathering tools for future targeted outreach efforts throughout the coming months leading up to the next reporting period. These materials are customized to fit the CAI categories as defined in the SBI NOFA.

The survey can be accessed at this link:
http://www.surveymonkey.com/s/RJK59FP

In addition to the survey, Connected Tennessee has continued working with a number of statewide associations such as NetTN to promote the importance of broadband connectivity at Community Anchor Institutions and participation in this data collection process. It is apparent that these relationships are beneficial to the entire success of the grant program, and the CAI engagement is a logical extension of new and existing relationships. Connected Tennessee will continue to build upon these new relationships over the coming months and utilize its contacts throughout the state to collect data and raise awareness of this project.

In addition to fostering and building relationships with state agencies, associations, and organizations, Connected Tennessee has also developed a sector-specific calendar that supports CAI outreach as well as research and communications efforts. This focused approach allows a corporate commitment to capturing CAI data in addition to developing meaningful sector-specific content.

Connected Tennessee conducts significant research as part of an ongoing process to identify existing, centralized sources for CAI connectivity data. In tandem with these efforts to identify existing data, Connected Tennessee continues to identify key CAI contacts in an effort to distribute and promote the online survey and raise awareness of the importance of CAI broadband connectivity. Also, when possible, Connected Tennessee works with the Department of Finance and Administration's Office of Information Resources and the Department of Economic and Community Development and other agencies to identify existing relationships that can support CAI outreach.

Connected Tennessee has an ongoing mission to educate CAI throughout the state on the importance of participating in the project. Participation by these institutions will raise awareness about the importance of broadband connectivity and the need to report the requested data for inclusion on the National Broadband Map.

The greatest challenge with collecting CAI data continues to be educating the CAI about the Connected Tennessee project as well as self-awareness of their own CAI connectivity (specifically upload and download speeds). Connected Tennessee will continue to research key CAI organizations and agency contacts in an effort to raise awareness of this project among CAI. When applicable, the Department of Finance and Administration's Office of Information Resources and the Department of Economic and Community Development and other agencies will continue to be briefed on the current CAI data and provided information so it can assist with outreach and promotion within the state.

A CAI summary of all processed and submitted data is provided below:

CAI Type	Total	Physical Address	Lat/Long	Technology of Transmission	Download Speed	Upload Speed
K-12 Schools	2,364	2,364	2,358	1,166	1,166	1,163
Libraries	317	317	317	225	225	225
Healthcare	821	821	816	120	119	119
Public Safety	748	748	744	266	113	113
Higher Ed Institutions	387	387	386	153	156	101
Other Government	1,289	1,289	1,281	1,220	1,183	1,183
Other Non-Government	164	164	163	73	69	69
Total	6,090	6,090	6,065	3,223	3,031	2,973

During the coming months, CAI data collection will be supported by regular reporting to the Connected Tennessee team. The CAI data is proving an invaluable resource to all components of the Connected Tennessee effort. The data identifies potential local champions, sector trends, and opportunities for improvement as well as opportunities to educate CAI not familiar with their current connectivity.

SBI Data Submission Methodology

The submission of the broadband dataset for October 1, 2012, is contained within the SBI Data Transfer Model and additional components as released on the Grantee Workspace on August 9,

2012. Connected Nation (CN) has reviewed all literature that relates to the release and use of this data transfer model and recognizes that it does not replace or dictate how data is stored, processed, or displayed for the state, as it is meant primarily as a means to transfer the broadband data from all states and territories and populate the National Broadband Map in a seamless fashion.

Connected Nation has complied with the following guidance documents published by NTIA:

- Technical Mapping Guide, as released on the Grantee Workspace on March 24, 2011, was followed to ensure the completeness and validity of the submission through completion steps and checklists, completing the DataPackage spreadsheet, uploading broadband datasets into the Data Transfer Model, and checking the dataset using the SBDD_CheckSubmission receipt process.
- Naming Conventions and Category of End User, as released on the Grantee Workspace on March 26, 2012, was followed to ensure the consistency of individual file and zip package naming.

In addition to the methodologies contained herein, the Changes and Corrections documentation, as well as the DataPackage.xls containing contact information, the data dictionary, and a provider summary table, the following feature classes are submitted within the SBI Data Transfer Model for the State of Tennessee.

Inventory of Deliverables, Connected Tennessee: October 1, 2012

NOFA Requirement	Data Transfer Model	Data Description
Appendix A: 1(a)(i)	BB_Service_CensusBlock	Broadband Service Availability of Facilities-Based Providers in Census Blocks of No Greater Than Two Square Miles in Area.
Appendix A: 1(a)(ii)	BB_Service_RoadSegment	Broadband Service Availability of Facilities-Based Providers by Road Segment in Census Blocks Larger in Area Than Two Square Miles.
Appendix A: 1(b)	BB_Service_Wireless	Broadband Service Availability of Wireless Services Not Provided to a Specific Address.
Appendix A: 3(b)	BB_ConnectionPoint_MiddleMile	Broadband Service Infrastructure Middle-Mile and Backbone Interconnection Points.
Appendix A: 4	BB_Service_CAInstitutions	Community Anchor Institutions-Listing.

The provider data collected by CN on behalf of the State of Tennessee have been formatted per the given specifications and uploaded into the appropriate feature classes of the SBI Data Transfer Model. Wireline availability is contained within census blocks and road segments, wireless availability is contained as polygons of coverage areas, and middle-mile connections and Community Anchor Institutions are contained as point data. All speed data is contained at the census block, road segment, or wireless polygon level of availability. All efforts have been made to comply with formatting, domain, and metadata requirements to include as much information as possible.

Connected Nation has continued outreach to satellite providers on their availability, technology, and speed information, but granular coverage is not yet available. Submitted within the wireless feature class are the satellite companies providing service to Tennessee as a polygon of the state boundary. Efforts will continue to collect, process, or otherwise create more granular satellite data based on availability analyses and guidance received from NTIA. Process development is underway at CN as well to be able to create more granular satellite coverage based on satellite equipment positioning and geographic inputs.

TENNESSEE FIELD VALIDATION METHODOLOGY

CN focused a portion of its time on specific validation processes such as:

- conducting random spectrum analysis studies throughout the state using an Avcom PSA-37-XP spectrum analyzer;
- conducting mobile speed tests throughout the state using an iPhone, Android (or other smart phone) as well as provider-specific aircards (Sprint 3G/4G, Clearwire et al);
- identifying pre-selected, provider-submitted wireless transmit tower sites and cross-referencing data about that tower against the Federal Communications Commission (FCC) databases such as Antenna Structure Registration and/or the Universal Licensing System;
- cross-referencing Federal Registration Number data against available FCC Form 477 data as well as the FCC **CO**mmission **RE**gistration **S**ystem (CORES);
- validating provider submitted data (for example: latitude/longitude) using a handheld Garmin eTrex Summit GPS unit or GPS enabled software such as Microsoft Streets and Trips;
- locating physical wire-line attributes (such as Central Offices, Remote Terminals, CATV plant, etc.) and comparing them against provider submitted data; and
- conducting on-net and off-net speed tests using the FCC portal at http://www.broadband.gov/qualitytest/about/ or using the Ookla Net Metrics enabled speed test utility located on each of CN's program specific websites.

Additionally, CN cross-referenced numerous public documents in order to ensure that all known broadband providers were located and contacted. This included searching membership logs from trade associations (WISPA, WCAI, PCIA, etc.), the Cable Television Fact Book, Public Utility Commission records, Public Service Commission records, Chamber of Commerce, etc.

To date, Connected Nation's staff conducted on-site validation tests in Tennessee on the following providers: Ardmore Telephone Company Inc.; AT&T; Aurora Cable TV; Beasley Wireless; Ben Lomand Rural Telephone Cooperative Inc.; BreezeAir.Net; Bristol Tennessee Essential Services; Cable ONE; Cellular South Inc.; CenturyLink; Charter Communications; Clarksville Department of Electricity (d.b.a. CDE Lightband); Clearwire Corporation; Columbia Power & Water Systems; Comcast; CRU Enterprises; DeKalb Telephone Cooperative Inc.; DotSpot Wireless; ECSIS.Net; FiberNet; Frontier Communications Corporation; High Country Online; InfoEd Wireless; Infostructure Cable; Jackson Energy Authority; James Cable; Ken-Tenn Wireless LLC;; Leap

Wireless International Inc.; Level 3 Communications; Loretto Telephone Company Inc.; Mediacom Southeast LLC. (d.b.a. Mediacom Communications Corporation; Rapid Communications LLC and Mediacom); MidSouth Satellite; Millington Telephone Company (also d.b.a. Big River); Morristown Utilities; NetEase; North Central Telephone; OrbWireless.net; Planet Connect Internet; QuickRelay Wireless Communications; Skyline Telephone Membership Cooperative; Softek; Spirit Broadband; Sprint Nextel Corporation; Surfmore; TDS Telecom; TEC of Jackson Inc.; Tele-Page; Inc.; Tennessee Wireless; Time Warner Cable (formerly under New Wave Communications); T-Mobile USA Inc.; TNWeb; Trenton Cable TV Company; Twin Lakes Telephone; U.S. Cellular; Ultra High Speed Internet; UltraNet; United Telephone Company; Verizon Communications Inc.; West Kentucky Rural Telephone; Wide Open West (formerly d.b.a. Knology of Tennessee Wisper LLC; Xpansion Network; and Zito Media.

In addition to the field verification tests that have been conducted, Connected Tennessee has also conducted work in the field to collect information for the non-participating providers, Tennessee Wireless and TNWeb which, by nature of the methodology required for this collection, are also included in the above list.

From program initiation through this reporting period, CN has completed in-the-field validation testing against 63 companies (out of a universe of 87 viable providers) totaling 72.41 percent within the State of Tennessee. This percentage also considers the non-participating provider (NPP) records submitted to NTIA as may be contained herein (see "Data Submission and Coverage Estimation of Non-Participating Providers" below).

CN has also continued to review provider datasets for accurate speed information, platform listings, and other intricacies that may fall outside of the standard SBI Data Transfer Model parameters, as published on the NTIA Grantee Workspace on August 9, 2012. Any providers whose submitted coverage and attributes are anticipated to come into question have been further reviewed and confirmed; details on a case-by-case basis are presented below.

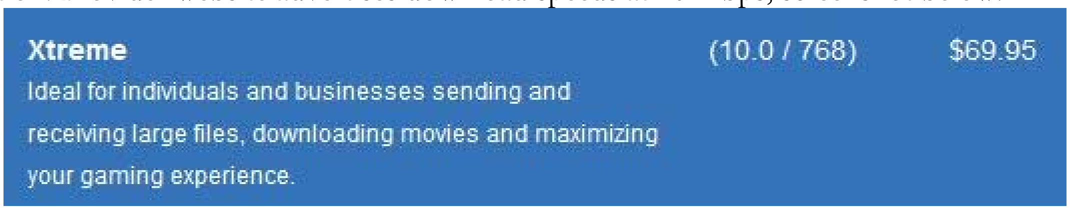
AT&T Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises download speeds up to 24 Mbps; screenshot below.

Compare Internet Packages

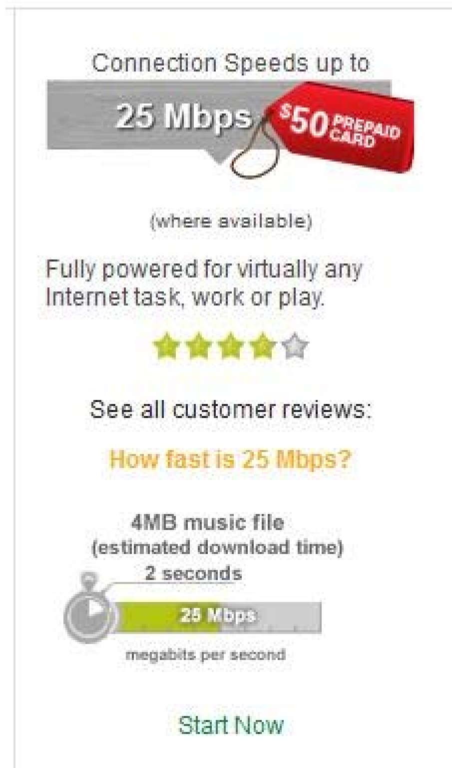
	Pro	Elite	Max	Max Plus	Max Turbo
Standard Monthly Rate	$38*	$43*	$48*	$53*	$63*
Downstream Speed	Up to 3 Mbps	Up to 6 Mbps	Up to 12 Mbps	Up to 18 Mbps	Up to 24 Mbps

AT&T Inc.
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider confirmed that tier 7 service is available.

Ben Lomand Rural Telephone Coop., Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises download speeds at 10 Mbps; screenshot below.



CenturyLink
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises download speeds packages at 25 Mbps; screenshot below.



Columbia Power & Water Systems
Issue: Technology of transmission code 41 with maximum advertised download speed in tier 8, higher than expected value range for the technology.
Resolution: Provider website advertises up to 50 Mbps service, which requires DOCSIS 3.0 modem; however, most of the system is still on DOCSIS 2.0; screenshot below.

Residential Service Packages for Cable TV Subscribers

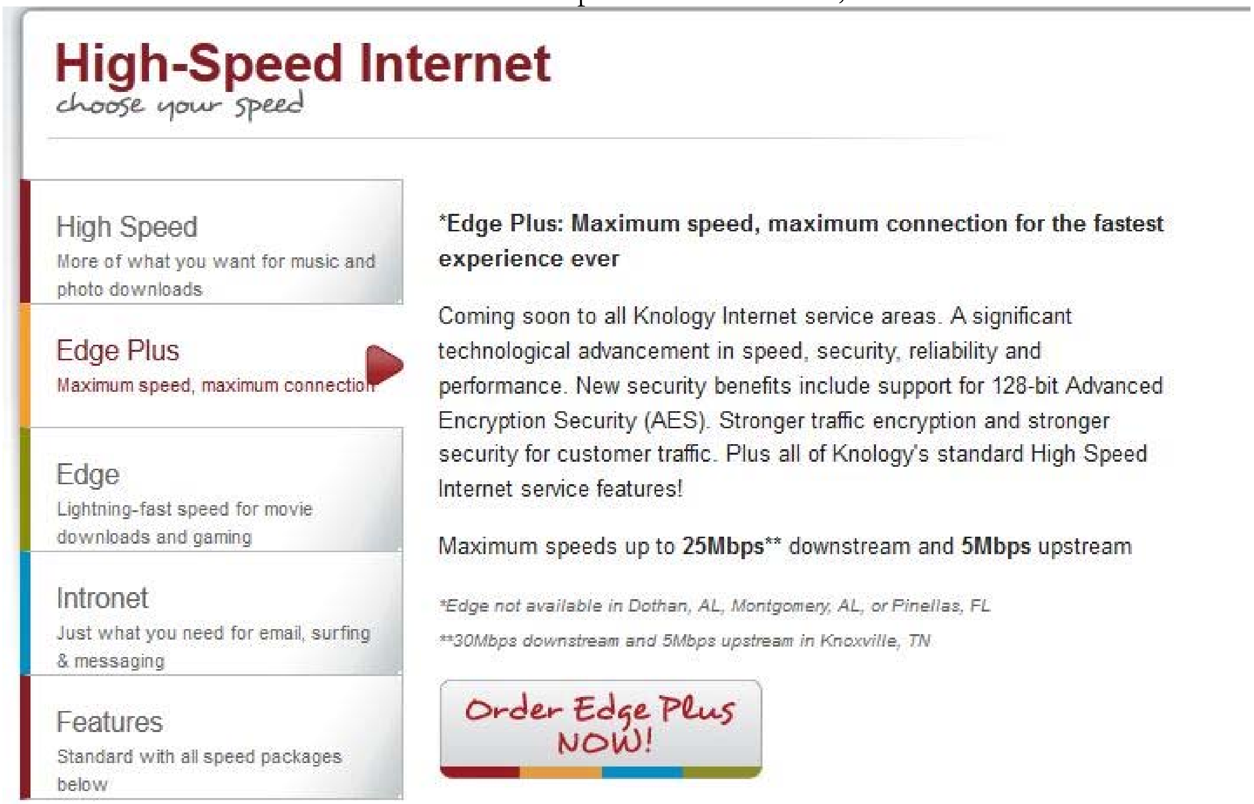
PowerNet Basic *Up to 3.0 Mbps download/384 kbps upload*	$ 24.95
PowerNet 5.0 *Up to 5.0 Mbps download/512 kbps upload*	$ 29.95
PowerNet 8.0 *Up to 8.0 Mbps download/896 kbps upload*	$ 34.95
PowerNet 12.0 *Up to 12.0 Mbps download/1.2 Mbps upload*	$ 42.50
PowerNet 18.0 *Up to 18.0 Mbps download/1.8 Mbps upload*	$ 52.95
PowerNet 50.0 *Up to 50.0 Mbps download/5.0 Mbps upload* *(Requires DOCSIS 3.0 modem.)*	$ 60.00

Comcast Cable Communications, LLC
Issue: Technology of transmission code 40 with maximum advertised download speed in tiers 6 and 7, lower than expected value range for the technology.
Resolution: Confirmed use of DOCSIS 3.0 with speed tier 7. Speeds are kept lower currently to be backwards compatible.

DeKalb Telephone Cooperative, Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps; screenshot below.

(Max Download / Max Upload)
1M down / 512k up
3M down / 512k up
6M down / 512k up
12M down / 512k up

Knology of Tennessee, Inc.
Issue: Cable platform with maximum advertised download speed in tier 8.
Resolution: Provider website advertises 30 Mbps for Knoxville area; screenshot below.



MegaPath Inc.
Issue: DSL platform with maximum advertised download speed in tiers 7 and 8, higher than expected value range for the technology.
Resolution: Provider website advertises 20 Mbps and 45 Mbps service; screenshots below.

DSL service provides download speeds up to 20 Mbps over a nationwide, multi-redundant private network that optimizes performance and security. DSL is an ideal broadband solution for small and medium-sized businesses that download large files or use the Internet extensively.

For maximum connectivity at a minimum cost, there's no greater value than MegaPath Business Ethernet. Choose the bandwidth—2 Mbps up to 45 Mbps—that best fits your business' needs.

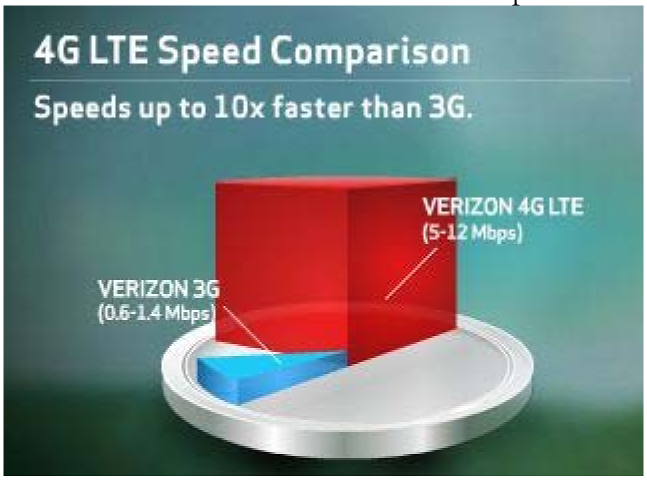
T-Mobile USA, Inc.
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 4G services with speeds greater than speed tier 6.

> T-Mobile customers with 4G phones are already experiencing data speeds that are comparable to or faster than the speed of a home broadband network. And with recent improvements to our 4G network-doubling our theoretical download speeds-we're giving our customers enhanced 4G data speeds. We've seen average download speeds on our HSPA+ 42 Mbps-capable data stick approaching 10 Mbps with peak speeds of 27 Mbps, and download speeds approaching 8 Mbps with peak speeds of 20 Mbps on our upcoming HSPA+ 42 Mbps-capable smartphones.

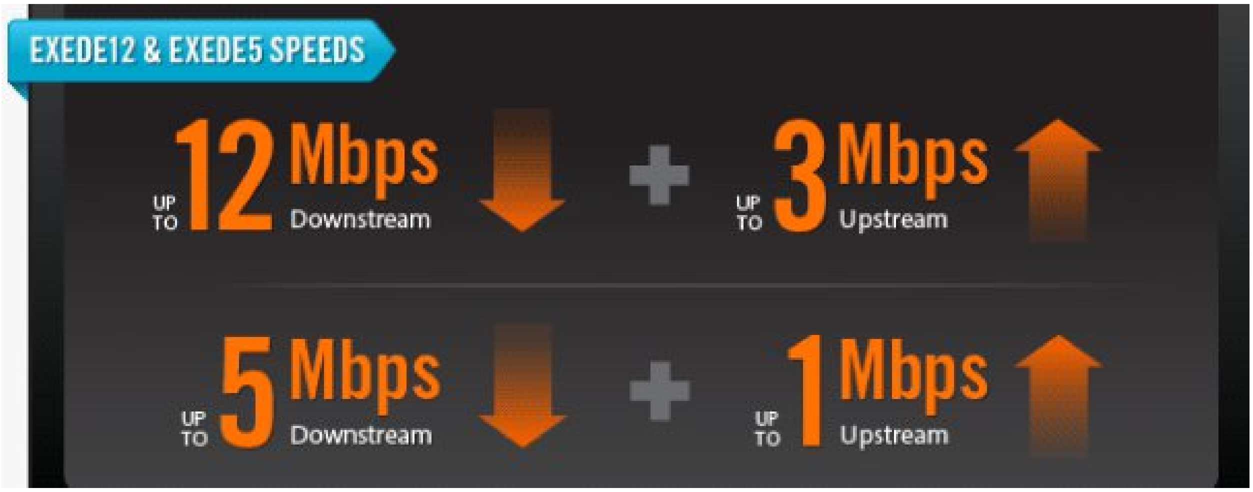
TDS Telecommunications Corporation
Issue: DSL platform with maximum advertised download speed in tiers 7 and 8, higher than expected value range for the technology.
Resolution: Provider website advertises speeds at 15 and 25 Mbps; screenshot below.

Twin Lakes Telephone Cooperative Corporation
Issue: Fixed wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider representative confirmed that 10 Mbps download and upload speeds are available to residential customers, but it is not readily advertised.

Verizon Communications, Inc.
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 4G LTE service at 12 Mbps.



ViaSat, Inc.
Issue: Satellite platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.



DATA SUBMISSION AND COVERAGE ESTIMATION OF NON-PARTICIPATING PROVIDERS

As part of its ongoing broadband mapping efforts, CN has developed a series of processes with the goal of submitting coverage estimation mapping data to NTIA for every known and qualifying last-mile broadband provider, regardless of platform type (cable modem, DSL, fixed wireless, etc.). This state specific collection of coverage estimation methodology papers (see Appendix A) demonstrates the estimated broadband service territory for the providers in this state that have either been non-responsive or that have refused to participate in the SBI mapping initiative.

ACCURACY AND VERIFICATION: PROVIDER VALIDATION METHODOLOGY

Broadband providers maintain their service area data in many different formats, all in varying levels of complexity and granularity. In order to ensure that the data required by the NTIA is standardized across all providers and that it is as accurate as possible, CN translates and formats the data that providers are able to supply into a GIS shapefile and produces maps for the provider to review. The resulting map(s) and review process allow for providers to see their service area in a geographic format – for some providers, this is the first time they have seen maps of their broadband service area. Having the mapped service area allows providers to quickly identify any issues that appear in the data representation, whether the issue is in the data translation into a GIS format or from the original data collection and submission. Often data is provided from various sources and through the review and revision process, local engineers who operate the networks and work in the field are able to ensure that the tabular data that has been submitted is accurate and represents the real-world network extent. Any issues in how the service area is represented on the map(s) are remedied by CN, whether they are additions, removal of service, or any other revisions. Revised maps of service area representations are sent to the provider for review and approval; CN will revise data and return maps as many times as necessary until the provider is in agreement that the map represents their service area as accurately as possible. Once the review process has been completed and final approval of the data is provided, the data is deemed ready for NTIA submission.

Once the data collection has been aggregated at a statewide level, static maps of statewide and county-level availability are produced and made publicly available. In addition, consumers can visit the interactive online tool, My ConnectView, to create customized views of broadband service areas and analyze corresponding demographic information. Leveraging broadband service data on various platforms allows for public users, providers, and other stakeholders to review, scrutinize, and provide feedback on the represented data. This feedback becomes a validation method in itself as consumers submit inquiries to CN either affirming where service is not available or identifying areas where broadband service is shown on the map, but in actuality is not available. This allows for a follow-up to providers regarding revisions to the data as it is represented; it also allows for CN to identify locations where on-site visits may be necessary to complete field validation of available services. Public feedback on all forms of mapping products serves as a localized validation method for provider-supplied information and allows CN to resolve inaccuracies as they are identified to ensure that only the highest quality information is provided to stakeholders.

Additionally, non-participating provider narratives that were submitted in previous mapping cycles are subjected to the same level of scrutiny. Occasionally, a provider may elect to voluntarily participate (thus eliminating the need for future data estimation activities in the field). However, more often than not, the NPP narrative is updated with a combination of data gleaned from the provider's website, data obtained through FCC research and/or data collected/verified in the field by a CN staff engineer.

Estimates derived from provider-validated data indicate that approximately 3.99 percent of Tennessee households do not have terrestrial fixed broadband service available, and approximately 0.23 percent of Tennessee households have neither mobile nor fixed broadband service available.

Within rural areas of the state, results derived from provider-validated data indicate that approximately 7.41 percent of rural Tennessee households do not have terrestrial fixed broadband service available, and approximately 0.44 percent of rural Tennessee households have neither mobile nor fixed broadband service available. Please note that the availability estimates presented are based on Census 2010 household information.

The estimates above, in accordance with NTIA's definition of available broadband service as specified in the SBI NOFA, include broadband service with download speeds of at least 768 Kbps and upload speeds greater than 200 Kbps.

In addition, due to the nature of the SBI data collection methodology as defined by the NTIA and based on both census block geographic units and street segment data, the estimates of broadband availability derived from provider-validated data may include an overstatement of the actual number of households with broadband availability. Under the census block-based data collection method, a provider will typically report broadband availability for an entire census block whether its network is present across the whole or only a subset of that census block. This potential overestimation at the census block level can be amplified as the data is aggregated across the entire state.

Wireless Methodology

Broadband Service Availability in Provider's Service Area
Wireless Services Not Provided to a Specific Address

Data solicited from a fixed wireless provider to create propagation models include, but are not limited to:

1. The name of the structure.
2. Whether the transmitting device is operational or proposed.
3. The maximum advertised downstream speed, the maximum advertised upstream speed.
4. The typical downstream speed, the typical upstream speed (peak periods for both).
5. The frequency range of spectrum being used (as prescribed by NTIA). This may include (but is not limited to) spectrum authorizations identified within the Federal Communications Commission (FCC) Universal Licensing System (ULS) database or

located on the FCC's Spectrum Dashboard. This research often proves to be exceptionally effective when estimating the coverage area of an NPP.

6. The primary population center(s) being served (for geopolitical boundary reference).
7. The physical address of the transmit site (in the event latitude/longitude is unavailable from the provider this allows a quick reference point for geocoding).
8. Latitude in either Degrees, Minutes, and Seconds and/or in Decimal Degrees (typically received as NAD 27 or NAD 83).
9. Longitude in either Degrees, Minutes and Seconds and/or in Decimal Degrees (typically received as NAD 27 or NAD 83).
10. Antenna pattern (e.g. omni-directional, 180°, 120°, 90°, etc.).
11. Azimuth of antenna (e.g. 360° with magnetic declination if known).
12. Approximate transmit radius (in feet, miles, or kilometers).
13. Polarity of transmit antenna (Vertical or Horizontal).
14. Transmit antenna gain (in dBi).
15. Line loss (applicable only to providers using coax, heliax, waveguide or other forms of cabling – excludes power-over-Ethernet devices).
16. Mechanical and/or Electrical beam tilt (if applicable).
17. Equipment Manufacturer (allows easy cross-reference against manufacturer's specification sheet).
18. Power output of the transmitting device (if unknown, FCC standards or manufacturer specifications are applied).
19. AMSL at base of tower site.
20. Antenna centerline AGL (height of antenna above ground level measured at the centerline of the actual antenna).
21. Foliage factors (Evergreens/Deciduous and percent of ground cover).
22. Ground Clutter (primarily used in rural areas to account for foliage and in metropolitan areas to account for types and heights of buildings if known).
23. Average gain of receive antenna.
24. Receive antenna is estimated at height above average terrain (HAAT) of 6.2 meters/20 feet.
25. Federal Registration Numbers (if applicable) which may allow opportunities to cross-reference and/or obtain additional data from the FCC's ULS and the **CO**mmission **RE**gistration **S**ystem.

Propagation modeling combines scientific data and empirical mathematical formulation for the characterization of radio wave propagation as a function of frequency, distance, and other conditions. Propagation software(s) typically use the Irregular Terrain Model (also known as Longley-Rice) of radio propagation for frequencies between 20 MHz and 20 GHz. This model is based on electromagnetic theory and statistical analyses of the combination of terrain features and radio measurements, then predicting the median attenuation of a radio signal as a function of distance and the variability of the signal in time and in space. For metropolitan areas, the software can typically be adjusted to use the Okumura-Hata model which accounts for predicting the behavior of cellular transmissions in areas where buildings are the primary obstructions. The resulting product from either model depicts a graphical illustration of the theoretical propagation characteristics of a selected frequency range based on defined variables (receiver sensitivity of the home/mobile device, foliage factor, and digital elevation terrain input).

After converting propagation models into a geospatial format, additional processing is completed to remove the small pixels representing service present in the resulting dataset. These areas are initially created based on the parameters entered in the software from the provider equipment information, the underlying data parameters of elevation, hillshade, etc., and the limitations of the software itself to display a broadband service area as accurately as possible. Generally, these random pixel striations appear as a result of signal levels reaching the highest elevated points within the prescribed radius. Typically, while this pixilation anomaly shows legitimate areas where signals can be received, these highly elevated points may have exceedingly sparse populations or are entirely void of population. As a result, and congruent to the *Wireless Technology Methodologies and Business Logic* white paper submitted to NTIA on January 20, 2011, all independent pixels representing service that are less than 0.125 square miles in area have been removed from the geospatial representation of each wireless provider.

BROADBAND INQUIRIES METHODOLOGY

CN collects consumer feedback in the form of broadband inquiries (BBIs). These inquiries represent any type of communication received from the public regarding broadband service. Once BBIs are received across the state, this information is overlaid with the broadband availability information which was collected through the SBI program. This allows for a real-world comparison of the broadband landscape to the information received from broadband inquiries. Consumers submitting these inbound comments and/or inquiries are able to provide information regarding five categories: 1) residents who do not have broadband but want it; 2) residents who have broadband but want a different provider; 3) residents who do not have broadband, but the broadband inventory maps indicate that they do; 4) residents who have broadband but want a faster connection speed; and 5) residents who have broadband but want a less expensive service option.

BBIs are submitted frequently by consumers via the Connected Tennessee website. Inquiries often seek help to identify local broadband provider options, or to learn when a specific provider may be able to provide service to that consumer. Consumer comments also provide information which may help modify maps with actual service area information. The primary objectives of CN regarding these inquiries are 1) to improve the accuracy of the state maps with submitted consumer information and follow-up field research; 2) to provide broadband options to consumers through cooperation with mapped providers and by facilitating new broadband service options; and 3) to map and analyze information from consumers about areas of unmet broadband demand and alternatives to currently mapped services. A prime example of the second option is the utilization of the Rural Utility Service satellite eligibility tool. By simply entering the consumer's address, the CN engineer can quickly determine if the consumer meets the initial qualification status for BIP satellite subsidies.

New BBIs are assigned to either the GIS department or the Engineering & Technical Services (ETS) team depending on the category entered by the consumer on the website submission form. The GIS or ETS team members respond to each inquiry according to the information requested by the consumer. Many BBIs can be resolved through desktop research; however, if a BBI requires research in the field, the assigned ETS team member conducts such research when performing field validations in the area of the inquiry, or at other such time as is practical and appropriate. GIS and ETS team members respond to and conclude BBIs via telephone contact and/or e-mail communication.

The broadband inquiry process has been implemented in each of the CN state programs with successful results. Altogether CN has received over 18,600 broadband inquiries since 2007, allowing the state programs to evaluate each inquiry for broadband demand and data verification. These inquiries are continuously examined against current broadband availability, updated every six months, to determine if previously unserved households have been expanded to and can now receive broadband at their residence. This database of broadband inquiries has also allowed the CN state programs to aggregate demand in concentrated areas to show providers the exact locations where the population has made it clear that they would purchase broadband if it was made available to them. Providers in the states have responded to this process and have expanded to areas knowing that their investment will be worthwhile. Data verification methods have also proven successful, as the state programs have been able to show those inquiries that indicate the broadband service areas are misrepresented on the map to providers, who then verify where service cannot reach in regard to that residence(s). The broadband coverage in these states has been altered to create a more accurate map based on the inquiries submitted by the public.

During this reporting period, the Connected Tennessee project has received a total of 81 inquiries (1,528 grant inception to date). As more inquiries are submitted to Connected Tennessee, a more thorough validation of the broadband landscape can be performed, while also allowing providers to see which areas have a high demand for broadband adoption.

My ConnectView Methodology

My ConnectView is an online, interactive mapping tool for viewing, analyzing, and validating broadband data. Developed using Esri's ArcGIS for Server and Adobe's Flex Framework and hosted and maintained by Connected Nation, My ConnectView is a multi-functional, user-friendly way for local leaders, policymakers, consumers, and technology providers to devise a plan for the expansion and adoption of broadband.

First and foremost, My ConnectView allows consumers to locate their residence and identify providers that offer broadband Internet service to that location. The interactive platform allows for users to build and evaluate broadband expansion scenarios using a wealth of data, including several coverage analysis layers, speed analyses, Community Anchor Institutions, and tools to search and export household demographic information, as well as extract data in GIS, spreadsheet, and/or PDF formats.

My ConnectView also features more interactive data layers and additional tools than ever before to allow the consumer to explore the broadband data. My ConnectView provides consumers with the ability to print, e-mail, and provide feedback on the broadband data displayed on the interactive map. Through the collection of this feedback, a visual demand for broadband is presented. This visualization allows the CN state programs the ability to validate the broadband availability for accuracy. If residents within a region state they are without broadband, but the interactive map shows otherwise, this allows CN to approach the providers within that area in an effort to trim down their coverage to more accurately represent real-world availability on the ground.

The Connected Tennessee project launched My ConnectView on April 2, 2012, and received 1,100 visits this reporting period; to date, the interactive mapping applications have received 8,639 visits.

Speed Test Methodology

The 1,761 speed tests that are represented in the Connected Tennessee Speed Test Report during this reporting period (14,532 grant inception to date) are the result of a partnership between CN and Ookla Net Metrics. Utilizing this relationship increases the level of confidence in the data being collected and provides for a far greater sample size than could be collected by a single testing site.

Ookla owns and operates Speedtest.net, as well as develops and deploys speed tests, such as the Connected Tennessee speed test website, for partners around the world. This network of sites that is developed and run on its testing technology provides Ookla with a vast dataset that, due to the variability of geographic information collected across the varying speed test sites, is geocoded utilizing Geo-IP technology. This technology allows for tests to be geocoded to points of aggregation, typically larger nodes across provider networks. While there are hundreds of thousands of tests that have been conducted, the level of aggregation is only sufficient for county-level detail due to the test results being located at these larger nodes and not at an absolute location for each speed test.

In an effort to validate broadband data from the Connected Tennessee project, speed test information is collected throughout the state. Speed tests provide speed information on the path taken through all networks (a provider's network as well as additional networks) a local machine must connect to in order to reach the host test. The benefit of this collection of speed information is two-tiered. First, it allows for a comprehensive dataset of speeds, while also providing Connected Tennessee with the information on where broadband services are available. Second, unlike theoretical speed information which was received through the data collection process, the use of speed tests provide real-world information on the speeds that currently exist within the State of Tennessee.

PROVIDERS DEEMED NON-VIABLE

The following list of companies represents the remainder of the broadband provider universe that was originally identified as complete for outreach to begin for the State Broadband Initiative. These providers are not included in the Data Package for the October 2012 submission because they have been deemed non-eligible under the parameters and guidance of the SBI grant program. This list of companies includes, but is not limited to: providers offering service but below the current definition of broadband, those that have gone out of business, technology consulting firms, infrastructure or network construction companies, non-facilities based general resellers, etc.

	Company Name	URL	Comments
1	21Globe, Inc.	www.21globe.com	General reseller of DSL and backhaul.
2	A 007 Access	www.a007.com	General reseller of Quest DSL and mobile wireless; DSL does not qualify as the max advertised speed is 768 kbps x 128 kbps.
3	Aaccess Network Communications	www.aaccess.net	Not a broadband provider; installs and maintains WiFi systems.
4	Access123.net	www.access123.net	URL no longer in service.
5	ACERX.NET	www.acerx.net	General reseller but no contact information listed on website; requests for information were never returned.
6	Adelphia	n/a	No longer in business; assets liquidated.
7	Aeneas Communications, LLC	www.aeneas.com	Facilities-based CLEC that resells dial-up, DSL, and VoIP to consumers and business accounts.
8	Airespring, Inc.	www.airespring.com	General reseller of VOIP, long distance and data circuits (non-residential).
9	Airewaves Broadband, LLC	www.airewaves.com	URL no longer in service.
10	Airmail247.com	www.airmail247.com	Business mailing list search site; not a broadband provider.
11	America Internet & Communications	www.americainter.net	Offers high-speed business DSL and wireless point-to-point wireless services to business accounts.

12	Antioch Wireless Broadband	www.antiochwirelessbroadband.com	Resells DSL and cellular service in Antioch, IL only.
13	Arrowheadnet.com	www.arrowheadnet.com	Domain registration and web hosting company.
14	Atris	www.atris.biz	Offers VoIP, data, and softphone services to business accounts.
15	bargainisp.net	www.bargainisp.net	Generic web directory site; company does not offer broadband.
16	BeaDun Communications	www.beasleywireless.net	Subsidiary of Beasley Wireless; services offered to business accounts fall below NTIA's definition of "broadband."
17	Broadband National	www.broadbandnational.com	Nonfacilities-based general reseller of DSL and satellite for 36 companies (e.g., ACC Business, HughesNet, et al.).
18	Broadcore, Inc.	www.broadcore.com	Provides business solutions such as VOIP and network integration services.
19	Broadview Networks Holdings, Inc.	www.broadviewnet.com	Wholesale reseller of partners' communication products and services; company is nonfacilities-based.
20	Broadwing Communications	www.level3.com	Acquired by Level 3.
21	BullsEye Telecom, Inc.	www.bullseyetelecom.com	Integrated suite of telecommunications services for businesses and general reseller of backhaul.
22	Business Telecom, Inc.	www.earthlinkbusiness.com	B2B services only.
23	Camino-Net Internet Services	www.camino-net.com	No longer in business; was dial-up only.
24	CCIS.net	www.ccis.net	Now owned by Beacon Technologies; offers dial-up and is general reseller of DSL in Pennsylvania.
25	Cebridge Connections	suddenlink.net	Acquired by SuddenLink.
26	Celito Communications	www.celito.net	Offers dial-up and wireless in North Carolina.

27	Cinergy Communications Company	n/a	Acquired by Windstream.
28	Cleartouch.Com	www.cleartouch.com	Inactive URL; out of business.
29	Cognisurf	www.cognisurf.com	Offers dial-up only.
30	Deltaforce	www.deltaforce.net	Dial-up and webhosting services only.
31	deluxehost.com	deluxe-host.com	Offers web hosting only.
32	DGUI	www.dgui.com	No longer in business; domain name for sale.
33	Dial National	www.dialnational.com	Inactive URL; out of business.
34	Dialer.net	www.dialer.net	Offers international dial-up services.
35	DIECA Communications, Inc.	n/a	Acquired by Covad; then acquired by MegaPath.
36	Dixie-Net, Incorporated	www.dixie-net.com/wireless	Offers fixed wireless and DSL in Mississippi only.
37	Dresden Cable	n/a	Provider does not offer broadband; limited to CATV and satellite services only.
38	DSL @ Interlync	www.interlync.com	General reseller of DSL, wireless, VoIP, dial-up, web hosting etc.
39	DTS-NET.COM	www.dts-net.com	Provider of wholesale and retail telecommunications services.
40	Eagle One Wireless	www.e1w.com	Offers direct connect wireless internet services to businesses in northeast Mississippi, south central Tennessee, and northwest Alabama.
41	Endless Sphere Technology	www.endless-sphere.com	Electric Vehicle Technology Forums.
42	Enventis Telecom Inc.	www.enventis.com	Doing business as Hickory Tech; general reseller in Iowa and Minnesota area; local agent claimed they do not offer "broadband services."
43	ETI - Connecting Your World	www.cyberenet.net	General reseller of DSL services from infrastructure owned by Verizon, AT&T, and Covad.
44	Fast Dependable Access	www.fda.net	Not a broadband provider.
45	Gainesboro CATV	n/a	Does not offer broadband, CATV

			only.
46	Global Crossing Telecommunications, Inc.	http://www.globalcrossing.com	Acquired by another company.
47	Haywood Cablevision	www.cbvnol.com	Out-of-state provider; offers service in the Carolina Mountain area.
48	Highertech.Net	www.highertech.net	Appears to have been acquired by Chattanooga Net.
49	Hubwest Protected Networks LLC	www.hubwest.com	Dial-up and web hosting only recently merged with Southwest Cyberport.
50	Imbris, Inc.	www.imbris.com	Provides fixed wireless in Idaho only.
51	IMGISP.NET	www.imgisp.net	Search engine, generic web page.
52	Incredible Networks	n/a	Inactive URL; out of business.
53	Inercom Communications Inc.	www.inercom.com	Inactive URL; out of business, url for sale.
54	Interactiveinfo.com Inc.	www.rocketbroadband.com	Offers cable television services in NY only.
55	iRadical	n/a	Inactive URL; out of business.
56	ISPartner.net	n/a	Inactive URL; out of business.
57	Jenco Speed Web	www.jencospeed.net	Offers wireless service in Ohio only.
58	LARIAT.NET	www.lariat.net	Offers fixed wireless services in Wyoming only.
59	LCSisp.com	www.lcsisp.com	Offers national dial-up services only.
60	Lightyear Network Solutions, LLC	www.lightyear.net	Nonfacilities-based general reseller.
61	LinkAmerica.Net	www.linkamerica.net	Inactive URL; out of business.
62	MacWebTown.Net Works	www.macwebtown.net	McIntosh web services and technical assistance.
63	MainBoard	www.mainboard.cc	General reseller in Virginia.
64	Maine Cable and Wireless	www.mainecableandwireless.com	Inactive URL; out of business.
65	Marcin Company	n/a	Inactive URL; out of business.

66	Metropolitan Telecommunications Holding Company	www.mettel.net	MetTel provides facilities-based and resold services (certified CLEC in some states). The company provides a variety of voice, including wireless, and data services to commercial customers.
67	Millenicom Inc.	www.millenicom.com	General reseller of dial-up and mobile broadband (Sprint network).
68	MYWEBSTAR	www.mywebstar.com	Inactive URL.
69	Nanomega.Com	www.nanomega.com	Inactive URL; out of business.
70	NetAccess, Inc.	www.nas.net	Offers wireless B2B services only.
71	NetFire	n/a	No longer in business.
72	NetSpeed Online	www.netspeed-online.net	Inactive URL; out of business.
73	NetStar Communications	n/a	Offers virtual ISP services and web hosting.
74	New Edge Network, Inc.	www.newedgenetworks.com	Company has no residential service and re-sells backhaul; acquired by Earthlink.
75	NewWave Communications	http://www.newwavecom.com/	Acquired by another company.
76	Northwest ISP	www.northwestisp.com	Inactive URL; out of business.
77	NTCH, Inc.	www.cleartalkwireless.net	Acquired by Cleartalk Wireless.
78	NuVox, Inc.	www.windstream.com	Acquired by Windstream.
79	OnWav, Inc.	www.onwav.com/	Acquired by Twin Lakes Telephone Cooperative.
80	Overarch Broadband	n/a	Offers services in Idaho only.
81	Pacific Internet Exchange	www.pie.us	Inactive URL; company appears to have gone out of business.
82	PAETEC Communications, Inc.	http://www.paetec.com/	Acquired by another company.
83	Paknet Limited	www.ptcl.com.pk	Subsidiary of Pakistan Telephone Company; no services offered in the U.S.
84	Planet Online	www.planetonline.net	Offers website hosting services.
85	Point2Point	www.p2p-innovations.com	Out of business.
86	PremoWeb	www.premoweb.com	Offers national dial-up services only.

87	Qwest Communications Company, LLC	www.centurylink.com	Acquired by CenturyLink.
88	Rapid Communications, LLC	n/a	Acquired by Mediacom; subsequently acquired by Comcast.
89	Renaissance Networks	www.renaissancenetworks.com	Offers IT support to small businesses in New Mexico.
90	Rural Tennessee Wireless Broadband (RTWB)	http://www.rtwb.net/	No longer in business.
91	Scott County Telephone Cooperative	www.sctc.org	CLEC offering business class services only.
92	Shentel Converged Services, Inc.	www.shentel.com	Shentel Converged Services is classified as a Private Cable Operator and offers service to MDU housing facilities.
93	SI Wireless	www.siwirelessco.com	Resells Sprint 3G services.
94	Simply Dialup A Metrogeek Company	www.simplydialup.com	Offers dial-up only.
95	Sling Broadband	www.slingbroadband.com	Out-of-state provider; offers DSL and wireless services to business accounts in Florida.
96	Smartresort Co, LLC	www.baldwincountyinternet.com	General reseller of local ISP services.
97	Solutions IT Consulting, LLC	www.solutionsitc.com	Technology consulting firm.
98	Sparkplug Chicago, Inc.	www.airband.com	Offers point-to-point wireless and business solutions in Illinois.
99	Spring City Cable	n/a	Out-of-state provider; offers services in Utah only.
100	Surferz.Net	www.surferz.net	Offers dial-up in upstate NY only.
101	T1 Shopper	www.t1shopper.com	Search engine for general reseller.
102	Talk America Inc.	www.cavtel.com	Acquired by Cavalier Business Communications.
103	Telovations, Inc.	www.telovations.com	IT and IP solutions consultant.
104	The Nexus Group, Inc.	www.nxs.net	General reseller of AT&T DSL.
105	Total Access Networks, Inc.	www.totalaccess.net	Inactive URL.
106	TSISP.NET	www.tsisp.net	Inactive URL; out of business.

107	Two Rivers Media	n/a	Inactive URL; acquired by MediaCom.
108	University Corporation for Advanced Internet Development	www2.ntia.doc.gov/grantee/university-corporation-for-advanced-internet-development	Currently ineligible under the parameters and guidance of the SBI grant program.
109	UNUM Telecommunications, Inc.	www.utinet.net	Inactive URL; out of business.
110	VOLstate, Inc.	www.volstate.net	Offers Internet solutions and technical support to business accounts.
111	Waypoint Wireless	n/a	Consulting firm.
112	WilTel Communications, LLC.	www.level3.com	Acquired by Level 3.

122	ZOOM Internet Services, LLC	n/a	Michigan-based dial-up provider and web hosting company.

APPENDIX A: ESTIMATION OF NON-PARTICIPATING PROVIDERS

Tennessee Wireless

TNWeb

TENNESSEE WIRELESS LLC

As part of its ongoing broadband mapping efforts, Connected Nation (CN) has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying last-mile broadband provider, regardless of whether the provider has chosen to support and participate in the State Broadband Initiative (SBI) mapping project.

The following narrative provides detail regarding the recent, and ongoing, data collection and coverage estimation activities related to Tennessee Wireless, LLC, a wireless Internet service provider (WISP), located in Centerville, Tennessee, with a service area around Centerville and Grinder's Switch. The narrative will include information regarding how and where CN obtained publicly available data and the on-the-ground validation and site verification techniques that support the underlying data.

Background

CN staff members have continued trying to obtain the participation of the provider with 12 instances of communication via telephone and e-mail sessions since October 24, 2011, through August 30, 2012. Only one communication reply was received from a company representative on January 31, 2012, with a response of wanting to participate. Additionally, CN staff members visited the Tennessee Wireless office on July 24, 2012, to discuss the broadband mapping project in person with Tennessee Wireless staff, but the office was closed.

The Issue

Tennessee Wireless, by its lack of responsiveness since January 31, 2012, has predicated its unwillingness and/or inability to participate in the Tennessee broadband mapping initiative.

Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing

CN began building a file based on research information and, as time progressed, enriched the file with information obtained through the public domain and from on-the-ground data collection and site identification. For example, CN reviewed the provider's website (www.tennwireless.com) to determine the residential service plans **(Exhibit A)** and the service area **(Exhibit B)** of the provider's wireless network. A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) system, using multiple company name searches, did not yield an FRN **(Exhibit C).** Also, to support field validation of access points, the company name was referenced against the FCC Universal Licensing System (ULS) to identify any spectrum authorizations the provider might hold which could possibly enhance locating active wireless transmit and/or access points for the service area. This process yielded no attributes of any license issued to Tennessee Wireless, LLC **(Exhibit D).**

Exhibit A: Service Plans

Exhibit B: Service Area

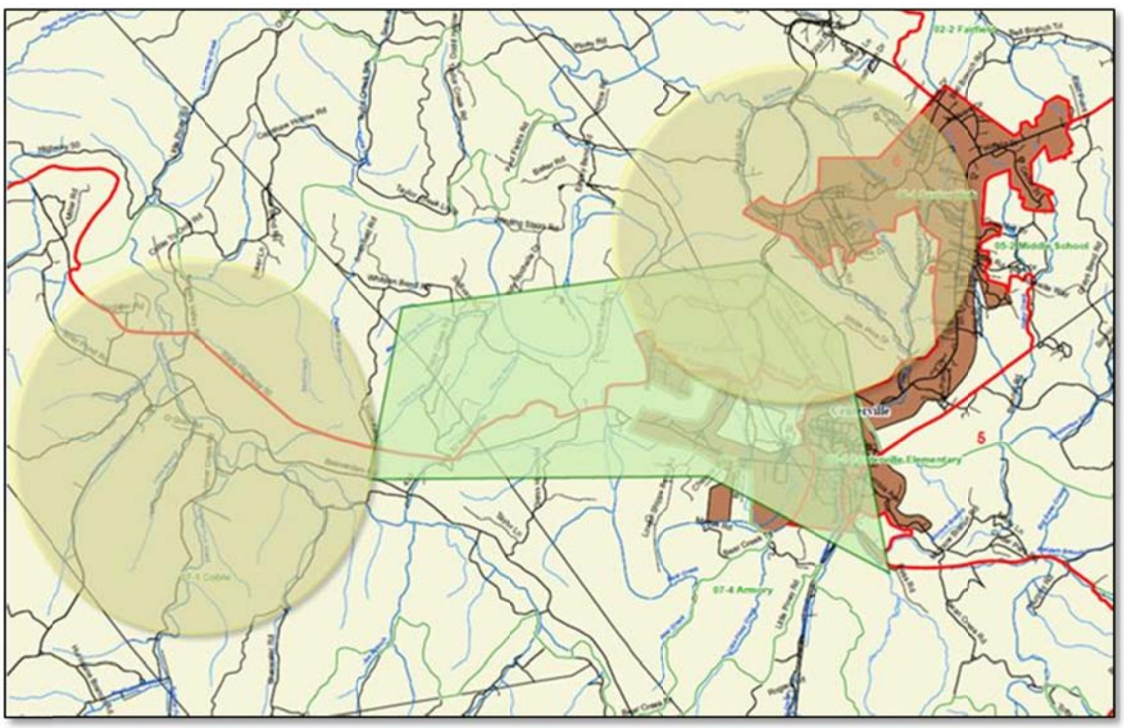

Exhibit C: Federal Registration Number Search Results

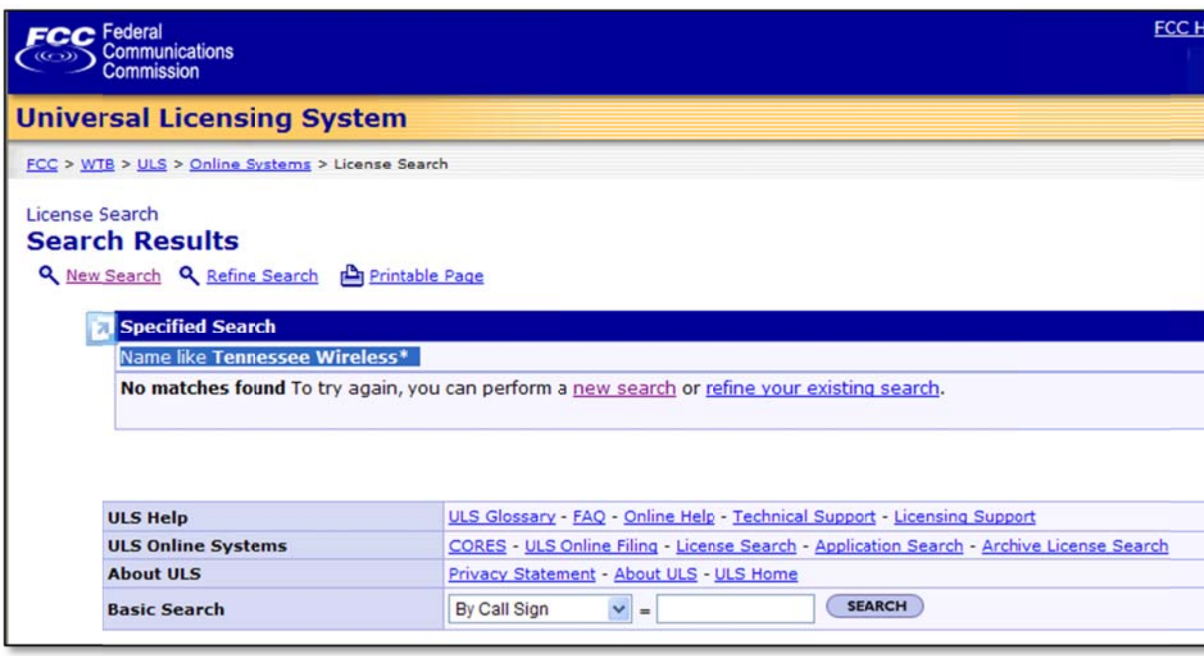
Exhibit D: License Search Results



Preliminary Identification of Provider's Coverage Area

Connected Nation extracted the Tennessee Wireless service area map from the provider's website, along with transmit site specific information from the same website. This combined information was utilized to create a Google Earth image overlay **(Exhibit E).** The image overlay was positioned to match the Google Earth base map's roadways, county boundaries, and water bodies. The degree of accuracy of the image overlay was maintained at less than .1 mile (528 ft.) to establish a minimum search criteria of a given wireless transmit site and/or access point. The provider's service area depiction is represented by shaded symbols (polygons) as shown in **Exhibit B**. Using the site names (2 unique locations) available through the Tennessee Wireless website, a Google search was conducted to determine the locations of the sites. The coordinates for these 2 locations were entered into Google Earth and examined utilizing the zoom option of the aerial imagery. Both locations structures were identified. Both locations were then entered into the Microsoft *Streets & Trips* mapping application **(Exhibit F)** to develop a route for the on-the-ground data collection, site verification, and signal validation process.

Exhibit E: Google Earth: Provider's Service Area Image Overlay

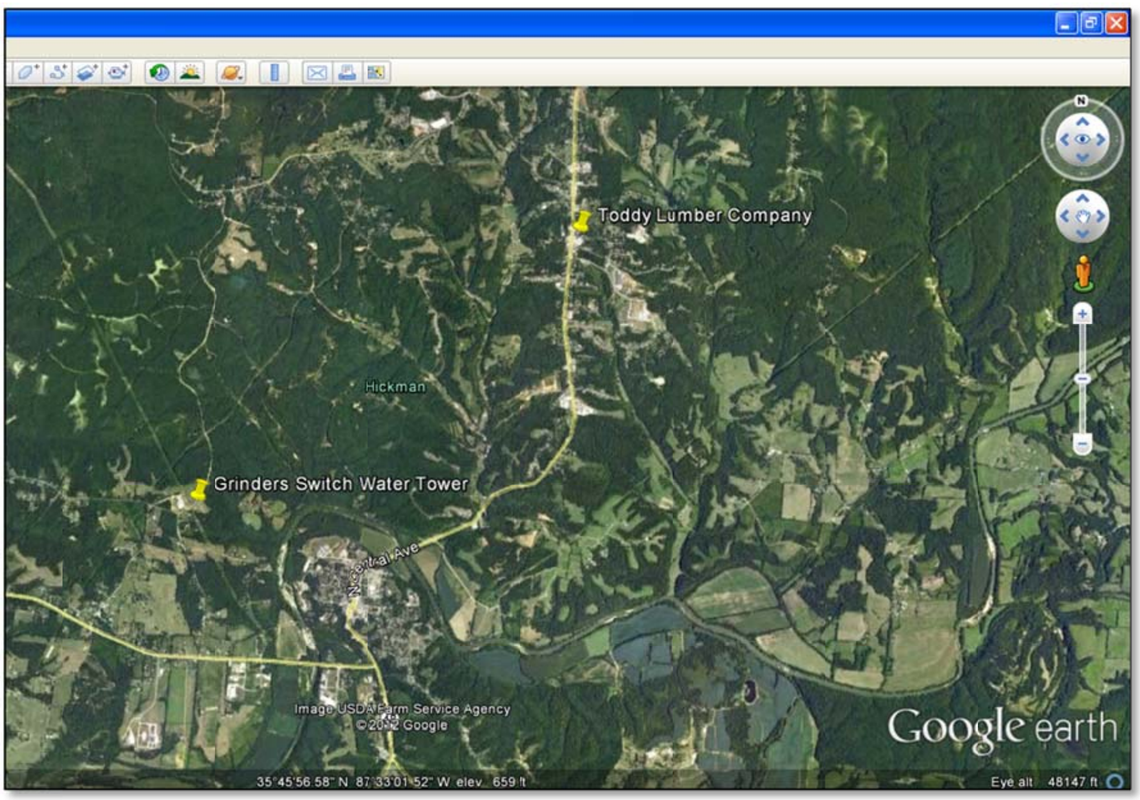


Exhibit F: Validation Points for AP Structures

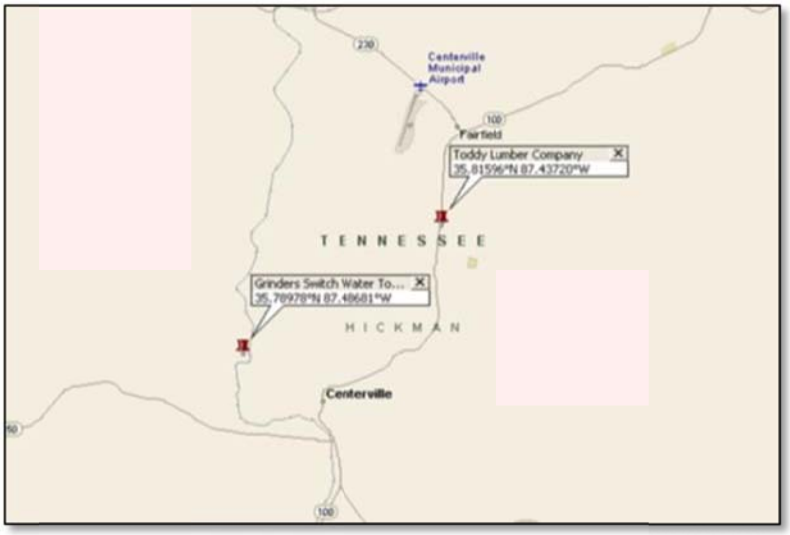

Testing Techniques

A Connected Nation staff wireless engineer then developed a site validation route based on the datum established with the Google Earth image. The CN wireless engineer was equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900 MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands **(Exhibit G)**. Each validation point was scrutinized for frequency of operation. A screen image of the operating frequency (or frequencies) was captured; general notes were recorded for each location-approximate antenna height, frequency of operation, antenna type (omnidirectional or directional antenna) and photographs were taken of the wireless transmit sites and access points.

Exhibit G: Field Data for Tennessee Wireless Toddy Lumber Location

Results and Submission for October 2012

Of the 2 locations visited during the validation point route, 2 access points were identified and relative information was logged into the Tennessee Wireless field validation notes file **(Exhibit H)**. The field and the publicly available data were transferred to the Connected Nation Provider Information file. A composite propagation study was completed based on the field data **(Exhibit I)**. Both documents were forwarded to Tennessee Wireless and the provider was advised that the information would be submitted to Connected Tennessee and to the NTIA if the provider did not respond with additions or discrepancies within a 48-hour period. To date, no response has been received from the provider.

Exhibit H: Field Validation Notes

	Provider	Location	Latitude	Longitude	Frequency Availability				Structure	Approximate Antenna Height	Notes

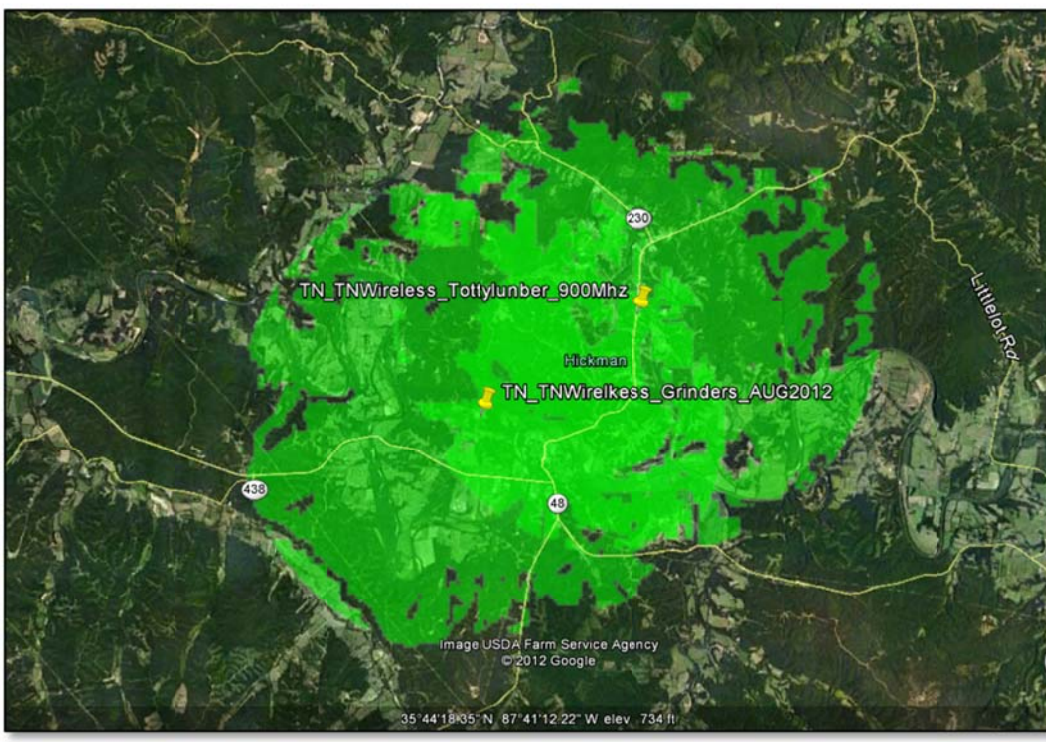
Exhibit I: Tennessee Wireless, LLC Composite Coverage



TNWEB, LLC

As part of its ongoing broadband mapping efforts, Connected Nation (CN) has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying broadband provider, regardless of whether the provider has chosen to support and participate in the State Broadband Initiative (SBI) program.

The following narrative provides detail regarding the recent data collection and coverage estimation activities related to TNWeb, LLC (TNWeb), a wireless Internet service provider (WISP), located in Lewisburg, Tennessee, with a service area around Marshall County. The narrative will include information regarding how and where CN obtained publicly available data and the on-the-ground validation techniques that support the underlying data.

Background

CN staff members have continued trying to obtain the participation of the provider with 18 instances of communication via telephone and e-mail sessions since January 7, 2010, through July 10, 2012. Telephone conversations took place during the April and October 2010 submissions, but the company was non-responsive during both submission periods. Since the April 2011 submission the provider has either chosen to not respond to telephone and e-mail outreach or has refused to participate. Additionally, a CN staff member visited the business office of TNWeb on July 10, 2012, to discuss the broadband mapping project in person with a representative of TNWeb. A staff member there provided a brochure but almost immediately, another staff member appeared stating their refusal to participate and asking the CN employee to leave at once.

The Issue

TNWeb, by its lack of responsiveness since October 2010, has predicated its unwillingness to participate in the Connected Tennessee broadband mapping initiative.

Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing

CN began building a file based on research information and, as time progressed, enriched the file with information obtained through the public domain. For example, CN reviewed the provider's website (http://www.tnweb.com), and used the brochure obtained on July 10, 2012, to determine the residential service plans **(Exhibit A)** and the service area **(Exhibit B)** of the provider's wireless network. A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) system yielded an FRN of 0019020932 **(Exhibit C)** with contact information relative to the owner of the company. Also, to support field validation of access points, the FRN was referenced to the FCC Universal Licensing System (ULS) to identify any licenses the provider may hold which could possibly enhance locating active access points for the service area. This process yielded no results **(Exhibit D)**.

Wireless Broadband

Broadband Wireless Access for Businesses (Wi-Fi* 802.11) offers high-speed connections without wires. It works the same way a cordless phone does, transmitting a signal from a base station to a receiving device. TNWEB's Wi-FI signal operates in the 2.4 GHz radio band. The speed of the connection you receive is affected by several things including the amount of users using a single point, the distance the equipment is from the access point, any obstructions that might block the signal, and the speed of the line that connects to the access point.

Advantages of Broadband Wireless Internet Access:

- Deliver Internet Bandwidth without the cost of expensive Telco local loop charges.
- Cost Effective Dedicated Internet Access Solution, you can save thousands of dollars a year.
- Internet Access integrates directly into your existing Ethernet LAN.
- Wireless Broadband Internet Access is 40% to 50% less expensive traditional leased line dedicated Internet Access.
- Save the cost of monthly telephone line charges. Pay only for the equipment and Internet service.

Wireless Broadband Access			
Type of Service	Setup Fee	Access Fee	Equipment Rental
Residential	**$99.95** One Time	**$35.00/mo.**	**$4.95**** Per Month
Commercial	**$99.95** One Time	**$49.95/mo.** One Year Contract Required	**$4.95**** Per Month

* Wi-Fi is only available in select areas.
** Local TN Sales Tax applicable to equipment purchases and rentals.

- Cost Effective Dedicated Internet Access Solution, you can save thousands of dollars a year.
- Internet Access integrates directly into your existing Ethernet LAN.
- Wireless Broadband Internet Access is 40% to 50% less expensive traditional leased line dedicated Internet Access.
- Save the cost of monthly telephone line charges. Pay only for the equipment and Internet service.

Residential

- Unlimited Hours per month*
- 5 e-mail address
- Billed monthly unless otherwise requested

One Time Fees:
Setup Fee: $99.95**
Router: $59.95 and up ◊

Monthly fee:
Access fee: $35.00
Equipment rental: $4.95

Commercial

- Unlimited Hours per month*
- 10 e-mail address
- Billed monthly unless otherwise requested

One Time Fees:
Setup Fee: $99.95**

Monthly fee:
Access fee: $79.95
Equipment rental: $4.95

* Unlimited access is not intended for dedicated usage
** Setup fee is for one machine. Networking multiple machines may incur additional charges
∗ Wi-Fi stands for Wireless Fidelity. This is not a "Hot Spot" and is not portable to multiple locations.
◊ A router is required for our wireless installations. Customer may provide one of their own for TNWEB techs to setup or may purchase one through TNWEB

<u>Preliminary Identification of Provider's Coverage Area</u>

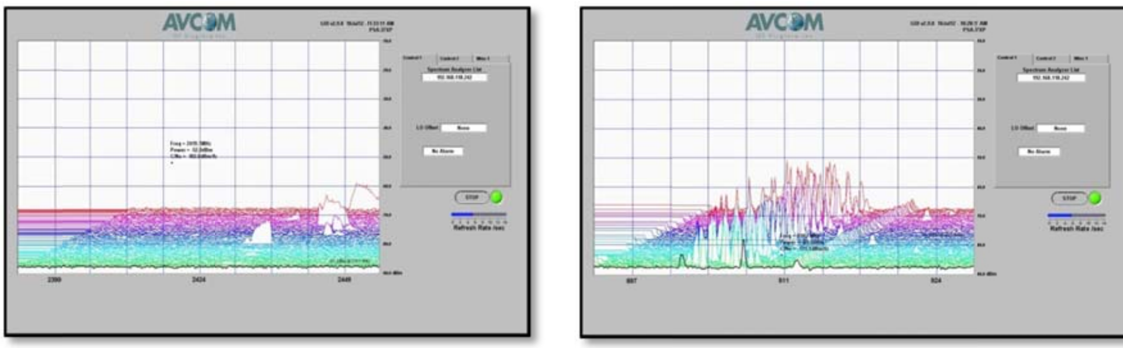
Connected Nation, using the information extracted from the TNWeb website, drove to the address given to validate that TNWeb was still in business. The address is the location of the TNWeb sales office, as well as the location of one of the identified towers for their wireless internet operations. The TNWeb, LLC sales office confirmed that the business is still operational and upon speaking with employees, wireless service availability was confirmed. The tower adjacent to the store was observed, coordinates were taken, and spectrum analysis was performed, along with pictures of the tower and equipment **(Exhibit E)**.

Exhibit E: TNWeb LLC Sales Office

Testing Techniques

Connected Nation staff developed a site validation route based on the information obtained from the TNWeb brochure and website. The CN wireless engineer was equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900 MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands **(Exhibit F)**. Each validation point was scrutinized for frequency of operation. A screen image of the operating frequency (or frequencies) was captured; general notes were recorded for each location-approximate antenna height, frequency of operation, antenna type (omnidirectional or sectored) and photographs were taken of the access points.

Exhibit F: Field Data for TNWeb Office/Hub Locations



Results and Submission for October 2012

Of the 2 locations visited during the validation point route, 2 access points were identified and relative information was logged into the TNWeb field validation notes file **(Exhibit G)**. The field and the publicly available data were transferred to the CN Provider Information file. A composite propagation study was completed based on the field data **(Exhibit H)**. Both documents were forwarded to Bitwise Wireless as courtesy copies, and the provider was advised that the estimated coverage information would be submitted to Connected Tennessee and to the NTIA unless the provider notified CN within 48 hours of discrepancies of the estimated coverage. The provider did not respond to CN and, as of this date, CN believes the information to be an accurate estimation of the service area of TNWeb, LLC.

Provider Name	Platform	Status	NDA Execution Date	Notes
Ken-Tenn Wireless, L.L.C.	Fixed Wireless	Approval for Update Not Received - Data Still Submitted	1/25/2010	[SEP-14-12 Frank Aryee] Change: Provider added four fixed wireless towers.
AT&T Inc.	DSL	Data Added to Statewide Inventory	12/16/2009	[AUG-24-12 Frank Aryee] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
AT&T Inc.	Mobile Wireless	Data Added to Statewide Inventory	12/16/2009	[AUG-21-12 Frank Aryee] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission. There was also a speed upgrade.
Ben Lomand Rural Telephone Coop., Inc.	DSL	Data Added to Statewide Inventory	10/21/2009	[JUL-17-12 Frank Aryee] Changes/Corrections: Provider expanded service area; also corrected coverage in Marion and Franklin Counties and made significant correction in Coffee County.
Ben Lomand Rural Telephone Coop., Inc.	Fiber	Data Added to Statewide Inventory	10/21/2009	[JUL-17-12 Frank Aryee] Change: Provider expanded service to additional areas in Van Buren, White, and Warren Counties.
BreezeAir.net	Fixed Wireless	Data Added to Statewide Inventory	8/17/2010	[AUG-02-12 Frank Aryee] Change: Provider activated new tower. There were also speed updates.
Capshaw Enterprises, LLC	Fixed Wireless	Data Added to Statewide Inventory	10/20/2011	[JUL-18-12 Frank Aryee] Change: Provider activated two new towers.
CenturyLink	DSL	Data Added to Statewide Inventory	12/4/2009	[AUG-15-12 Frank Aryee] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission
Charter Communications, Inc.	Cable	Data Added to Statewide Inventory	12/15/2009	[AUG-03-12 Frank Aryee] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Comcast Cable Communications, LLC	Cable	Data Added to Statewide Inventory	12/7/2009	[AUG-30-12 Frank Aryee] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
DeKalb Telephone Cooperative, Inc.	Fiber	Data Added to Statewide Inventory	2/24/2010	[SEP-14-12 Frank Aryee] Change: Provider expanded service to city limits of Carthage and South Carthage.
Frontier Communications Corporation	DSL	Data Added to Statewide Inventory	1/22/2010	[AUG-16-12 Frank Aryee] Change: Provider activated four new DSLAMs.
High Country Online LLC	Fixed Wireless	Data Added to Statewide Inventory	3/4/2010	[JUL-18-12 Frank Aryee] Change: Provider activated new tower.
JTM Broadband	Fixed Wireless	Data Added to Statewide Inventory		[JUL-17-12 Frank Aryee] Change: This is a brand new broadband provider in the market.
Leap Wireless International, Inc.	Mobile Wireless	Data Added to Statewide Inventory	4/6/2010	[AUG-02-12 Frank Aryee] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
MegaPath Inc.	DSL	Data Added to Statewide Inventory	2/15/2010	[AUG-31-12 Frank Aryee] Correction: Initial submission of provider's coverage, but they were in service previously.
Spacenet Inc.	Satellite	Data Added to Statewide Inventory		[SEP-14-12 Frank Aryee] Correction: Initial submission of provider's coverage, but they were in service previously.
Sprint Nextel Corporation	Mobile Wireless	Data Added to Statewide Inventory	1/14/2010	[JUL-18-12 Frank Aryee] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
T-Mobile USA, Inc.	Mobile Wireless	Data Added to Statewide Inventory	1/8/2010	[AUG-09-12 Frank Aryee] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.

TDS Telecommunications Corporation	DSL	Data Added to Statewide Inventory	1/27/2010	[AUG-21-12 Frank Aryee] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
TDS Telecommunications Corporation	Fiber	Data Added to Statewide Inventory	1/27/2010	[AUG-20-12 Frank Aryee] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission. There was also speed upgrade to fiber coverage.
TEC of Jackson, Inc	DSL	Data Added to Statewide Inventory	7/29/2010	[JUL-31-12 Ashley Hitt] Change: Provider activated a new DSLAM location.
TEC of Jackson, Inc	DSL	Data Added to Statewide Inventory	7/29/2010	[JUL-31-12 Ashley Hitt] Change: A DSLAM was decommissioned and a new one was installed at a new location near the previous site.
Time Warner Cable LLC.	Cable	Data Added to Statewide Inventory	12/21/2009	[AUG-15-12 Frank Aryee] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Verizon Communications, Inc.	Mobile Wireless	Data Added to Statewide Inventory	12/14/2009	[JUL-19-12 Frank Aryee] Changes and/or Corrections: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
ViaSat, Inc.	Satellite	Data Added to Statewide Inventory	1/8/2010	[AUG-14-12 Frank Aryee] Change: Provider increased maximum advertised speeds.

Windstream Communications	Backhaul	Solicited Initial Data		
Highland Telephone Cooperative, Inc.	Fiber	Other	3/14/2010	AUG-07-12 Chip Spann] Per company representative, the fiber project remains in BETA mode. Construction has been completed in the KY counties, but subscribers have not yet been "cut over" in the TN counties. Target for commercial deployment is September 2012.
North Central Communications	Fiber	Other	2/5/2010	[JUL-06-12 Chip Spann] Provider is apparently working in three counties and has a few test customers, but coverage is not fully available yet.
Twin Lakes Telephone Cooperative Corporation	Fiber	Other	1/14/2010	[AUG-15-12 Wes Kerr] A company representative noted that they did not yet have the ability to provide the data for this round; however they will participate in a timely fashion during the next round.
West Kentucky and Tennessee Telecommunications	Fiber	Other	1/7/2010	[SEP-17-12 Ashley Hitt] Provider indicated that the fiber coverage is not yet active; will confirm with provider for next submission and likely submit data in April 2013.
Birch Communications, Inc.	Backhaul	Refused to Participate		[JUN-27-12 Chip Spann] A company representative replied via e-mail that her company declines to participate.

EnterSource	Fixed Wireless	Non-Responsive to Multiple Attempts	7/7/2010	In addition to numerous contact attempts made during past mapping submission periods, 5 contact attempts were made this period.
Trinity Communications LLC	Cable	Non-Responsive to Multiple Attempts		In addition to numerous contact attempts made during past mapping submission periods, 2 contact attempts were made this period.
Wisper, LLC	Fixed Wireless	Slated Field Audit for Estimated Coverage Analysis	2/22/2011	

OFFICIAL OCTOBER 2012 UPDATE SUBMISSION TO THE NATIONAL TELECOMMUNICATIONS AND INFORMATION ADMINISTRATION UNDER THE STATE BROADBAND INITIATIVE GRANT PROGRAM FOR THE STATE OF TEXAS

October 1, 2012

TABLE OF CONTENTS

October 1, 2012

Ms. Anne W. Neville
SBI Grant Program Director
National Telecommunications and Information Administration
U.S. Department of Commerce
Room 4716
1401 Constitution Avenue, NW
Washington, DC 20230

Dear Ms. Neville:

As the State Broadband Designated Entity for Texas, please accept this submission from Connected Nation on behalf of the state of Texas' State Broadband Initiative (SBI) Grant Program, known as Connected Texas.

The Connected Texas program and its collective stakeholder community continue to be faithful and energized contributors to the National Telecommunications and Information Administration's (NTIA) SBI program. Now more than ever, the significance of complete and validated data as compiled through the Federal Communications Commission's (FCC) National Broadband Map is instrumental in forging the innovation economy of the 21st century. As the Commission relies upon this unique resource to distribute monies under the Connect America Fund, through the Universal Service Fund reform, the Connected Texas program equally values this data in informing meaningful program interventions relating to broadband access, adoption, and use initiatives. Truly, this coordination embodies the spirit of the SBI and demonstrates the joint effort of the NTIA, FCC, state governments, industry, and non-profits like Connected Nation as it continues to serve as a key tool for the American public and policymakers. We are proud of the role that Connected Texas has played in creating and maintaining such a powerful tool that has benefitted and surely will continue to benefit broadband providers, consumers, and businesses nationwide.

The artifacts that comprise this submission should be found to be compliant with the October 1, 2012, deadline for the semi-annual data update and in accordance with the terms of the July 1, 2009, Notice of Funds Availability (NOFA) and all subsequent clarifications pertaining to delivery of state-level mapping of broadband service availability. This packet includes:

Inventory of Deliverables, Connected Texas: October 1, 2012

NOFA Requirement	Data Transfer Model	Data Description
Appendix A: 1(a)(i)	BB_Service_CensusBlock	Broadband Service Availability of Facilities-Based Providers in Census Blocks of No Greater Than Two Square Miles in Area

Appendix A: 1(a)(ii)	BB_Service_RoadSegment	Broadband Service Availability of Facilities-Based Providers by Road Segment in Census Blocks Larger in Area Than Two Square Miles
Appendix A: 1(b)	BB_Service_Wireless	Broadband Service Availability of Wireless Services Not Provided to a Specific Address
Appendix A: 3(b)	BB_ConnectionPoint_MiddleMile	Broadband Service Infrastructure Middle-Mile and Backbone Interconnection Points
Appendix A: 4	BB_Service_CAInstitutions	Community Anchor Institutions-Listing
Appendix A: 4	n/a	Community Anchor Institutions-Narratives
VII.A.1(a)	n/a	Accuracy and Verification Report
n/a	DataPackage.xlsx	Worksheets of Contact Information, Record Count, and Provider Summary Table
n/a	n/a	List of Changes and Corrections to the Dataset
n/a	n/a	Non-Participating Provider (NPP) Narratives
n/a	n/a	Broadband Provider Roster and Participation Status

In addition, this data update submission should be found to be compliant with the additional program requirements instituted by the National Telecommunications and Information Administration since the time of the April 2012 SBI data submission for the Connected Texas program. Specifically, these new requirements are:

SBI Data Transfer Model
The submission of the broadband dataset for October 1, 2012, is contained within the SBI Data Transfer Model as released on the Grantee Workspace on August 9, 2012. All efforts have been made to comply with formatting, domain, and metadata requirements to include as much information on each provider as possible.

Additional Submission Guidance
New to the semi-annual submission for October 2012 is a more robust version of the ReadMe text file. As per the template released on the Grantee Workspace on May 18, 2012, this file contains a high-level summary of the items contained within the submission, including the exact file deliverables, a description of the errors and warnings from the Check Submission report, and extraneous information of which the NTIA and other users of the dataset should be made aware.

This submission continues to follow the speed technology guidance released by the Program Office on August 9, 2012, to review speed tier codes in correspondence with technology of transmission codes. In the April 2012 submission, descriptions were provided in the methodology paper that offered an explanation for any submitted technology of transmission and speed combinations that were outside of the expected value range. That practice continues in this submission as technology and speed combinations are reviewed and scrutinized; any questionable information supplied by providers is reviewed more in depth with the provider to ensure the information is accurately captured or a proper explanation is provided as to why the speed information should be submitted as supplied even if it falls outside the expected value range.

Also in this submission are narratives describing the data and coverage estimation of non-participating providers. While Connected Texas continues outreach to all providers prior to each submission period, the need to submit broadband service data for all providers regardless of their participation is evident as the SBI program continues into this sixth round of data submissions. The submission of this estimated broadband service area for providers that have not supplied data to Connected Texas is essential in being able to portray a more accurate depiction of the current broadband landscape.

In addition to the requirements mentioned above, please find this methodology paper to be inclusive of the ongoing section pertaining to industry mergers and acquisitions – specifically this section details any and all mergers or acquisitions that have taken place in Texas since the April 2012 submission. The intent of this updated section is to provide a better understanding of how the broadband provider landscape has changed since the last submission cycle.

This October 2012 semi-annual data update under the SBI Grant Program continues to demonstrate our dedication to implementing the joint purposes of the Recovery Act and the Broadband Data Improvement Act (BDIA) by gathering comprehensive and accurate state-level broadband mapping data, developing state-level broadband maps, aiding in the development and maintenance of the National Broadband Map, and undertaking statewide initiatives for broadband planning.

Broadband Service Availability — Provider Outreach and Verification

This data update submission under the SBI program includes datasets for approximately 85.86 percent of the Texas provider community, or 170 of 198 total providers. There are 156 participating providers and 14 additional non-participating providers whose estimated coverage areas have been submitted. Of the 156 participating providers, 55 supplied an update to their network or coverage area(s), while 80 have reported no change. The remaining 21 represent providers who previously supplied data but were non-responsive in the October 2012 update effort; therefore their previous dataset is being put forward as part of this compilation. A complete roster by provider depicting participation status and contact record is contained herein. Of the 28 providers that are not represented in the attached datasets, 26 have refused to participate in the voluntary program or were non-responsive to multiple contact attempts, and 2 providers are currently in some form of progress toward data submission but were not able to submit coverage areas at the time of this submission.

As the aforementioned roster and attached methodology documentation will attest, it is the collective opinion of the Connected Texas principals that all commercially reasonable efforts were made to account for 100 percent of the known Texas broadband provider community, pursuant to this semi-annual data update submission.

Connected Texas has also continued to perform broadband verification activities through several means. In addition to confirmation of service area(s) by each provider, Connected Texas conducts field validation efforts. To date, 146 (73.74 percent) providers have been validated through field verification activities. Additional details on verification activities are contained within the Field Validation Methodology.

The Connected Texas website, (www.connectedtx.org), continues to serve a prominent role in the outreach and data collection effort. This program asset provides a way for the general public to participate in the process by offering interactive tools for users to test their connection speed, submit broadband inquiries, or contact a program representative.

As an indicator of stakeholder penetration, the Connected Texas website encountered 6,858 unique visits during this reporting period (47,133 total to date for the life of the grant awarded on January 1, 2010). Additionally, this pronounced Web activity netted 21 broadband inquiries over this same reporting period (534 grant inception to date). The website also provides access to the My ConnectView™ interactive mapping application, which allows consumers and broadband providers to confirm or dispute the coverage represented on the broadband inventory map. These consumer-initiated actions are facilitated through the Connected Texas website and the Connected Texas interactive mapping tool (My ConnectView™) that offer the stakeholders the vehicles to provide information regarding availability in their respective service area, either in affirmation or contest of the reported data represented in the Connected Texas mapping artifacts. Since the initial data collection and release of corresponding maps, feedback in the form of broadband inquiries has allowed Connected Texas to identify additional areas that are in need of field validation, which is scheduled as soon as possible.

Community Anchor Institutions

Connected Texas has established an ongoing mechanism for gathering data on the location and broadband connectivity of Community Anchor Institutions (CAI), in accordance with the data requirements of the SBI NOFA Technical Appendix. Since the April 2012 data submission, the CAI outreach process method has been modified to improve data collection. Specifically, the outreach process is a more focused sector-specific and relationship-oriented approach that generates more responses than general contact.

In conjunction with the Texas Department of Agriculture, outreach was conducted during this data update reporting period by Connected Texas to continue identification of existing, centralized sources for CAI connectivity data. Additionally, outreach was coordinated to distribute the CAI survey to institutions throughout the state through multiple methods including a customized online survey available on the Connected Texas website. During this reporting period Connected Texas has developed a number of new relationships with statewide associations such as the following:

Texas Association of Counties
Texas Computer Education Association
Texas Department of State Health Services
Texas Health Care Association
Texas HIE
Texas Hospital Association
Texas Library Association
Texas Municipal League
Texas State Teachers Association

Building relationships with entities such as these yields a positive impact in promoting the importance of broadband connectivity at anchor institutions and participation in this data collection process. It became apparent that these relationships are beneficial to the entire success of the Grant Program, and the CAI engagement is a logical extension of new and existing relationships. Connected Texas will continue to build upon these new relationships over the coming months and utilize its contacts throughout the state to collect data and raise awareness of this project.

In addition to fostering and building relationships with state agencies, associations, and organizations, Connected Texas has also developed a sector-specific calendar that supports CAI outreach as well as research and communications efforts. This focused approach allows a corporate commitment to capturing CAI data in addition to developing meaningful sector-specific content.

Connected Texas is also working hard to clarify CAI information associated with wireless broadband. NTIA has requested in-depth questioning of CAI listing a wireless broadband service as their sole form of connectivity. This follow-up allows us to better understand the reason for adopting the wireless broadband service.

From our work in Texas, as well as other states, we recognize the great value of this data to future collaboration efforts within the state as well as its value to the National Broadband Map. We plan to continue to bring best practices to the Connected Texas efforts, along with an investment of both human and technical resources required to reach our goal of increasing the data that is secured and reported as part of this process.

The Connected Texas program exists to improve data on the deployment and adoption of broadband services and to assist in the extension of broadband technology across all regions of the great state of Texas, as well as the United States and its territories through contribution to the National Broadband Map. We look forward to the continuing work ahead and improving upon our data collection methods.

Respectfully submitted,

Thomas W. Ferree
President and Chief Operating Officer
Connected Nation, Inc.

DATA ACQUISITION: TEXAS COMMUNITY ANCHOR INSTITUTIONS METHODOLOGY

In this sixth reporting period of the SBI, Connected Texas, working in close coordination with the state of Texas, has established an ongoing mechanism for gathering data on the location and broadband connectivity of Community Anchor Institutions (CAI), in accordance with the data requirements of the SBI NOFA Technical Appendix. Since the April 2012 data submission, the CAI outreach process method has been modified to improve data collection. Specifically, the outreach process is a more focused sector-specific and relationship-oriented approach that generates more responses than general contact.

Connected Texas has continued to identify and process CAI data obtained through an ongoing statewide outreach campaign. Physical address information continues to be augmented through manual sourcing and geocoded by Connected Texas through Esri ArcGIS software.

Connected Texas continues to utilize a customized online survey hosted through SurveyMonkey, with a landing page on the Connected Texas website that was developed during the first reporting period. This survey, in combination with a customized data-gathering spreadsheet, was distributed on a regular basis to a targeted list of CAI throughout the state as well as organizations and agencies that work closely with the CAI. The distributions were completed with the support of the state client. Connected Texas will continue to use these data-gathering tools for future targeted outreach efforts throughout the coming months leading up to the next reporting period. These materials are customized to fit the CAI categories as defined in the SBI NOFA.

The survey can be accessed at this link:
http://www.surveymonkey.com/s/2S72YFV

In addition to the survey, Connected Texas has developed a number of new relationships with statewide associations such as: Texas Association of Counties, Texas Computer Education Association, Texas Department of State Health Services, Texas Health Care Association, Texas HIE, Texas Hospital Association, Texas Library Association, Texas Municipal League, and Texas State Teachers Association to promote the importance of broadband connectivity at Community Anchor Institutions and participation in this data collection process. It is apparent that these relationships are beneficial to the entire success of the grant program, and the CAI engagement is a logical extension of new and existing relationships. Connected Texas will continue to build upon these new relationships over the coming months and utilize its contacts throughout the state to collect data and raise awareness of this project.

In addition to fostering and building relationships with state agencies, associations, and organizations, Connected Texas has also developed a sector-specific calendar that supports CAI outreach as well as research and communications efforts. This focused approach allows a corporate commitment to capturing CAI data in addition to developing meaningful sector-specific content.

Connected Texas conducts significant research as part of an ongoing process to identify existing, centralized sources for CAI connectivity data. In tandem with these efforts to identify existing data, Connected Texas continues to identify key CAI contacts in an effort to distribute and promote the online survey and raise awareness of the importance of CAI broadband connectivity. Also, when possible, Connected Texas works with the Texas Department of Education to identify existing relationships that can support CAI outreach.

Connected Texas has an ongoing mission to educate CAI throughout the state on the importance of participating in the project. Participation by these institutions will raise awareness about the importance of broadband connectivity and the need to report the requested data for inclusion on the National Broadband Map.

The greatest challenge with collecting CAI data continues to be educating the CAI about the Connected Texas project as well as self-awareness of their own CAI connectivity (specifically upload and download speeds). Connected Texas will continue to research key CAI organizations and agency contacts in an effort to raise awareness of this project among CAI. When applicable, the Texas Department of Education will continue to be briefed on the current CAI data and provided information so it can assist with outreach and promotion within the state.

A CAI summary of all processed and submitted data is provided below:

CAI Type	Total	Physical Address	Lat/Long	Technology of Transmission	Download Speed	Upload Speed
K-12 Schools	10,601	10,601	10,102	105	97	97
Libraries	1,197	1,197	1,188	104	261	101
Healthcare	870	870	851	97	179	97
Public Safety	2,904	2,904	2,812	260	547	258
Higher Ed Institutions	441	441	425	36	106	35
Other Government	710	710	687	469	101	52
Other Non-Government	6	6	6	5	5	5
Total	16,729	16,729	16,071	1,076	1,296	645

During the coming months, CAI data collection will be supported by regular reporting to the Connected Texas team. The CAI data is proving an invaluable resource to all components of the Connected Texas effort. The data identifies potential local champions, sector trends, and opportunities for improvement as well as opportunities to educate CAI not familiar with their current connectivity.

SBI Data Submission Methodology

The submission of the broadband dataset for October 1, 2012, is contained within the SBI Data Transfer Model and additional components as released on the Grantee Workspace on August 9, 2012. Connected Nation (CN) has reviewed all literature that relates to the release and use of this data transfer model and recognizes that it does not replace or dictate how data is stored, processed, or displayed for the state, as it is meant primarily as a means to transfer the broadband data from all states and territories and populate the National Broadband Map in a seamless fashion.

Connected Nation has complied with the following guidance documents published by NTIA:

- Technical Mapping Guide, as released on the Grantee Workspace on March 24, 2011, was followed to ensure the completeness and validity of the submission through completion steps and checklists, completing the DataPackage spreadsheet, uploading broadband datasets into the Data Transfer Model, and checking the dataset using the SBDD_CheckSubmission receipt process.
- Naming Conventions and Category of End User, as released on the Grantee Workspace on March 26, 2012, was followed to ensure the consistency of individual file and zip package naming.

In addition to the methodologies contained herein, the Changes and Corrections documentation, as well as the DataPackage.xls containing contact information, the data dictionary, and a provider summary table, the following feature classes are submitted within the SBI Data Transfer Model for the state of Texas.

Inventory of Deliverables, Connected Texas: October 1, 2012

NOFA Requirement	Data Transfer Model	Data Description
Appendix A: 1(a)(i)	BB_Service_CensusBlock	Broadband Service Availability of Facilities-Based Providers in Census Blocks of No Greater Than Two Square Miles in Area.
Appendix A: 1(a)(ii)	BB_Service_RoadSegment	Broadband Service Availability of Facilities-Based Providers by Road Segment in Census Blocks Larger in Area Than Two Square Miles.
Appendix A: 1(b)	BB_Service_Wireless	Broadband Service Availability of Wireless Services Not Provided to a Specific Address.
Appendix A: 3(b)	BB_ConnectionPoint_MiddleMile	Broadband Service Infrastructure Middle-Mile and Backbone Interconnection Points.
Appendix A: 4	BB_Service_CAInstitutions	Community Anchor Institutions-Listing.

The provider data collected by CN on behalf of the state of Texas have been formatted per the given specifications and uploaded into the appropriate feature classes of the SBI Data Transfer Model. Wireline availability is contained within census blocks and road segments, wireless availability is contained as polygons of coverage areas, and middle-mile connections and Community Anchor Institutions are contained as point data. All speed data is contained at the census block, road segment, or wireless polygon level of availability. All efforts have been made to comply with formatting, domain, and metadata requirements to include as much information as possible.

Connected Nation has continued outreach to satellite providers on their availability, technology, and speed information, but granular coverage is not yet available. Submitted within the wireless feature class are the satellite companies providing service to Texas as a polygon of the state boundary. Efforts will continue to collect, process, or otherwise create more granular satellite data based on availability analyses and guidance received from NTIA. Process development is underway at CN as well to be able to create more granular satellite coverage based on satellite equipment positioning and geographic inputs.

DATASETS FOR IN-KIND MATCH

All datasets used in this project have been contributed in-kind. Datasets used by the project to date and their respective in-kind contribution value are as follows:

- Commission on State Emergency Communications Regional Planning Commission's input - $7,395
- District & Municipal Public Safety Answering Point data - $1,419
- K-12 School address data - $26,895
- Texas ISD Superintendents and Technology Coordinators - $3,768
- Texas Water Board Orthoimagery - $465,000
- Texas Workforce Commission IT - $82
- Workforce Solutions data - $770

TEXAS FIELD VALIDATION METHODOLOGY

CN focused a portion of its time on specific validation processes such as:

- conducting random spectrum analysis studies throughout the state using an Avcom PSA-37-XP spectrum analyzer;
- conducting mobile speed tests throughout the state using an iPhone, Android (or other smart phone) as well as provider-specific aircards (Sprint 3G/4G, Clearwire et al);
- identifying pre-selected, provider-submitted wireless transmit tower sites and cross-referencing data about that tower against the Federal Communications Commission (FCC) databases such as Antenna Structure Registration and/or the Universal Licensing System;
- cross-referencing Federal Registration Number data against available FCC Form 477 data as well as the FCC **CO**mmission **RE**gistration **S**ystem (CORES);
- validating provider submitted data (for example: latitude/longitude) using a handheld Garmin eTrex Summit GPS unit or GPS enabled software such as Microsoft Streets and Trips;
- locating physical wire-line attributes (such as Central Offices, Remote Terminals, CATV plant, etc.) and comparing them against provider submitted data; and

- conducting on-net and off-net speed tests using the FCC portal at http://www.broadband.gov/qualitytest/about/ or using the Ookla Net Metrics enabled speed test utility located on each of CN's program specific websites.

Additionally, CN cross-referenced numerous public documents in order to ensure that all known broadband providers were located and contacted. This included searching membership logs from trade associations (WISPA, WCAI, PCIA, etc.), the Cable Television Fact Book, Public Utility Commission records, Public Service Commission records, Chamber of Commerce, etc.

To date, Connected Nation's staff conducted on-site validation tests in Texas on the following providers: Aledo Broadband; Alenco Communications, Inc.; Allegiance Communications; Alpheus (d.b.a. Aspen Communications); AMATechTel; Anvil Communications; AT&T, Inc.; AwesomeNet, Inc.; Baja Broadband; Basin 2 Way Radio, Inc.; Basin Broadband, Inc.; Big Bend Telephone Company, Inc.; Blossom Telephone; Border to Border Communications, Inc.; Brazoria Telephone Company (d.b.a. Coastal Link); Broadband Data Services of Texas LLC; Broadcomm.US; Broadwaves; Buffalo Cable TV; Cable One, Inc.; Cameron Telephone Company LLC; Cap Rock Telephone Cooperative, Inc.; Central Texas Cable Partners, Inc.; Central Texas Telephone Cooperative, Inc.; CenturyLink; Cequel Communications (also d.b.a. Cebridge, Suddenlink); Charter Communications; CKS Wireless, Inc.; Clearwire Corporation; Coleman County Telephone Cooperative LLC; Colorado Valley Telephone Cooperative LLC; Comcast Cable Communications LLC; Community Telephone Company, Inc.; Consolidated Communications; Conterra Communications; Cumby Telephone Company, Inc.; DCT Texas.Net; Dell Telephone Cooperative, Inc.; DET-com; Digitex.com; Dot 10 Wireless (which went recently went out of business but was assumed operational as of June 10, 2012); East Texas Broadband; East Texas Cable; East Texas DSL; East Texas WiFi; Eastex Telephone Cooperative, Inc.; ECTISP; Electra Telephone Company; eNet; ENMR Telephone Cooperative, Inc. (d.b.a. ENMR Plateau Communications, Inc.); ERF Wireless; ETAN Industries; Etex Communications LP; ETS Cablevision Company, Inc.; Farm to Market Broadband LP; Five Area Telephone Company, Inc.; Ganado Telephone Company, Inc.; GEUS; Gilmer Cable; Gower Computer Support, Inc.; GoZoe Wireless, LLP; Grande Communications Network LLC; Grayson CableRocket LLC; Greasy Bend Ventures, Inc. (d.b.a. Live Air Networks); GTEK Communications; Guadalupe Valley Communications Systems; GVEC.net; Helmsco/CentralLink; Hill Country Telephone Cooperative; Hometown Computing; Iguana Net; Indian Creek Internet; Industry Telephone Company; Internet America; JAB Wireless(also d.b.a.Dot 11 Networks, Partnership Broadband, Element Networks, and KeyOn Communications, Inc.); James Cable; La Ward Telephone Exchange, Inc.; Lake Livingston Telephone Company; Leap Wireless International, Inc.; Livingston Telephone Company, Incorporated; Maverick Internet; McDonald Group; Mid-Plains Rural Co-op, Inc.; Millenium Telecom; NDemand; NetWest Online, Inc.; Neu Ventures, Inc.; Nortex Communications; North Texas Broadband LLC; North Texas Cellular, Inc.; Northland Communications; NTS Communications; Our Town Internet; Panhandle Telephone Cooperative, Inc.; Peoples Communication; Phantom Wave (d.b.a. Argon Technologies); Poka Lambro Telephone Cooperative, Inc.; Presdidio Community Wireless Network; Promptwireless LLP; RB3 LLC; Ridgewood Cable; Rioplex Wireless Ltd.; Riviera Telephone Company, Inc.; Rock Solid Internet & Telephone; Rodzoo Wireless; Santa Rosa Telephone Cooperative, Inc.; Skynet Communications; Skynet Country Online; Smithville System; SOS Communications; South Plains Telephone

Cooperative, Inc.; Southwest Arkansas Telephone Cooperative, Inc.; Southwest Texas Telephone Company; Speed of Light Broadband, Inc.; Sprint Nextel Corporation; Stamford Community Networks (scheduled to go out of business at the end of September); Starnet; Stelera Wireless LLC; Tatum Telephone; Taylor Telephone Cooperative, Inc.; Telecom Cable LLC; Texas Broadband, Inc.; Texas CellNet; Texas Wireless Internet; Texhoma Wireless; TheSPECnet (also d.b.a. ELC Internet Services, Inc.); TierOne Converged Networks, Inc.; Time Warner Cable, Inc.; TISD; T-Mobile USA, Inc.; Totalcom Communications, Inc.; TXOL Internet; Valley Telephone Cooperative, Inc.; Verizon Southwest, Inc.; Versalink Enterprises; VRFutureNet; WEHCo Video (d.b.a. Kilgore Video, Kilgore Cable); West Tex Connect; West Texas Rural Telephone Cooperative; Wes-Tex Telecommunications Ltd.; Wharton County Electric Cooperative, Inc.; Windjammer Communications, LLC; Windstream Communications; XIT Telecommunications & Technology Ltd.; Zito Midwest LLC (d.b.a. Galaxy Cable)and Zulu Internet.

In addition to the field verification tests that have been conducted, Connected Texas has also conducted work in the field to collect information for the non-participating providers, AMA TechTel, Anvil Communications, Broadwaves, CKS Wireless, East Texas Broadband, East Texas Cable Company, GoZoe Wireless, NDemand, Skynet Communications, StarNet Online, Telecom Cable, TheSPECnet, Inc., VRFuturnet, and Zulu Internet which, by nature of the methodology required for this collection, are also included in the above list.

From program initiation through this reporting period, CN has completed in-the-field validation testing against 146 companies (out of a universe of 198 viable providers) totaling 73.74 percent within the state of Texas. This percentage also considers the non-participating provider (NPP) records submitted to NTIA as may be contained herein (see "Data Submission and Coverage Estimation of Non-Participating Providers" below).

CN has also continued to review provider datasets for accurate speed information, platform listings, and other intricacies that may fall outside of the standard SBI Data Transfer Model parameters, as published on the NTIA Grantee Workspace on August 9, 2012. Any providers whose submitted coverage and attributes are anticipated to come into question have been further reviewed and confirmed; details on a case-by-case basis are presented below.

Alenco Communications, Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider representative indicated that tier 7 speeds are indeed available to all customers in the Knippa exchange.

AT&T Communications of Texas, Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 24 Mbps; screenshot below.

Compare Internet Packages

	Pro	Elite	Max	Max Plus	Max Turbo
Standard Monthly Rate	$38*	$43*	$48*	$53*	$63*
Downstream Speed	Up to 3 Mbps	Up to 6 Mbps	Up to 12 Mbps	Up to 18 Mbps	Up to 24 Mbps

AT&T Communications of Texas, Inc.
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider confirmed tier 7 service is available.

Big Bend Telephone Company, Inc.
Issue: Fixed wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises up to 12 Mbps service; screenshot below.

Now offering speeds up to 12 Meg in Alpine and Ft. Davis!!!

Buffalo Cable TV
Issue: Technology of transmission code 40 with maximum advertised download speed in tier 5, lower than expected value range for the technology.
Resolution: Provider representative confirmed that service area is DOCSIS 3.0, but lower speeds are still advertised and in use.

CenturyLink
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 25 Mbps service; screenshot below.

Cequel Communications (Suddenlink)
Issue: Technology of transmission code 40 with maximum advertised download speed in tiers 7 and 8, lower than expected value range for the technology.
Resolution: Provider representative confirmed that DOCSIS 3.0 is indeed in use, but speeds have not been turned up higher at this time.

Consolidated Communications
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 20 Mbps service; screenshot below.

Get The Internet Speed You Need

- 3 Mbps – Ideal for sharing photos with your family and friends
- 6 Mbps – Ideal for watching media-rich content, movies and gaming
- 10 Mbps – Ideal for multiple users in a household
- 20 Mbps – Ideal for all the above plus more

ENMR Telephone Cooperative, Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 15 Mbps service; screenshot below.

FiTTurbo

Downloads up to 15 Mb, uploads up to 3 Mb.

- All the speed you need for downloading music and movies, and uploading photos and streaming video.
- Free SPAM and e-mail virus protection services.
- Five e-mail accounts, each with 1 GB of storage.
- Access to Plateautel.net to share photos, check e-mail and more.
- Free Web Hosting with 20 M of storage.

$149.95
per month*

Guadalupe Valley Communications Systems
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.

MegaPath Inc.
Issue: DSL platform with maximum advertised download speed in tiers 7 and 8, higher than expected value range for the technology.
Resolution: Provider website advertises 20 Mbps and 45 Mbps service; screenshots below.

DSL service provides download speeds up to 20 Mbps over a nationwide, multi-redundant private network that optimizes performance and security. DSL is an ideal broadband solution for small and medium-sized businesses that download large files or use the Internet extensively.

For maximum connectivity at a minimum cost, there's no greater value than MegaPath Business Ethernet. Choose the bandwidth—2 Mbps up to 45 Mbps—that best fits your business' needs.

Millennium Telcom, LLC
Issue: Technology of transmission code 40 with maximum advertised download speed in tier 8, lower than expected value range for the technology.
Resolution: Use of DOCSIS 3.0 throughout service area was confirmed, even at lower speeds.

Nortex Communications
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 15 Mbps service; screenshot below.

Package	Max Speeds	Monthly Price	Mail Boxes	Web Page	IP Address	Dial Up Account	DNS Hosting
DSL 3.0	3.0Mb x 512k	$39.95 $29.95 with Choice pkg.	5	5mb personal	1 dynamic	1	No
DSL 5.0	5.0Mb x 768k	$49.95 $39.95 with Choice pkg.	5	5mb personal	1 dynamic	1	No
DSL 8.0	8.0Mb x 1.0Mb	$59.95 $49.95 with Choice pkg.	5	5mb personal	1 dynamic	1	No
DSL 15.0	15.0Mb x 2.0Mb	$69.95 $59.95 with Choice pkg.	5	5mb personal	1 dynamic	1	No

Nortex Communications
Issue: Technology of transmission code 40 with maximum advertised download speed in tier 7, lower than expected value range for the technology.
Resolution: Confirmed use of DOCSIS 3.0 throughout service area; however, speeds are currently kept lower to be backwards compatible.

North Texas Broadband, LLC
Issue: Technology of transmission code 40 with maximum advertised download speed in tier 6, lower than expected value range for the technology.
Resolution: Use of DOCSIS 3.0 throughout service area was confirmed, even at lower speeds.

Panhandle Telephone Cooperative, Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.

Speed	Residential
12 Mbps download**/1 Mbps up*	$59.99
6 Mbps download/1 Mbps up*	$54.99
3 Mbps download/384 Kbps up*	$44.99

Poka Lambro Telephone Cooperative, Inc.
Issue: DSL platform with maximum advertised download speed in tiers 7 and 8, higher than expected value range for the technology.
Resolution: Provider website advertises up to 30 Mbps service; screenshot below.

Speeds up to 30
Mbps available
in certain areas!
Ask for details

Rock Solid Internet & Telephone
Issue: Fixed wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 15 Mbps service; screenshot below.

The Top of The Rock™ - $99.95/mo.
Our finest service! Speeds of up to 15000k (15 Mbps) download and up to 1524k upload. There is no better service anywhere in South Texas! Gamers and Power Downloaders get priority routing of their service!

Skynet Communications
Issue: Fixed wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: While this is a non-participating provider, customer service confirmed that 10 Mbps service is available.

South Plains Telephone Cooperative, Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 20 Mbps service; screenshot below.

SPTC is pleased to offer broadband internet service packages with speeds up to 20Mg download for residence and business.
We are confident you will find an option that will meet your needs and provide you good value for the price.

Stelera Wireless, LLC
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 10 Mbps; screenshot below.

Fast Facts

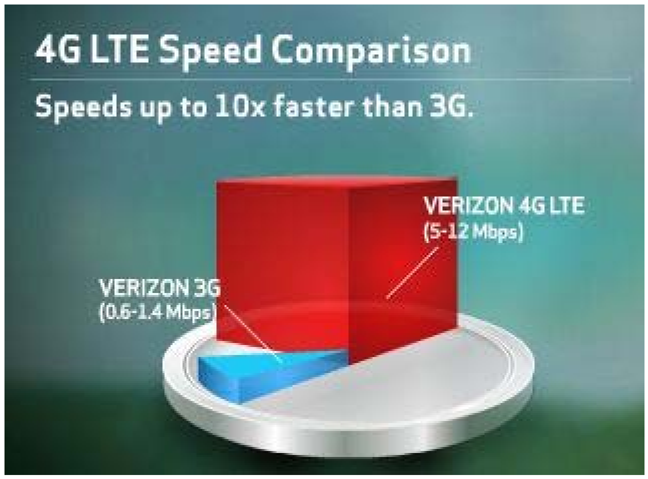
Network Technology:	HSPA (High-Speed Packet Access)
Frequency:	1700/2100 MHz FCC licensed spectrum
Current Speeds:	Up to 10mbps on downloads, UP to 2mbps on uploads
Headquarters:	Oklahoma City, OK

T-Mobile USA, Inc.
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than the expected value range for the technology.
Resolution: Provider website indicates that speeds higher than tier 6 are available; screenshot below.

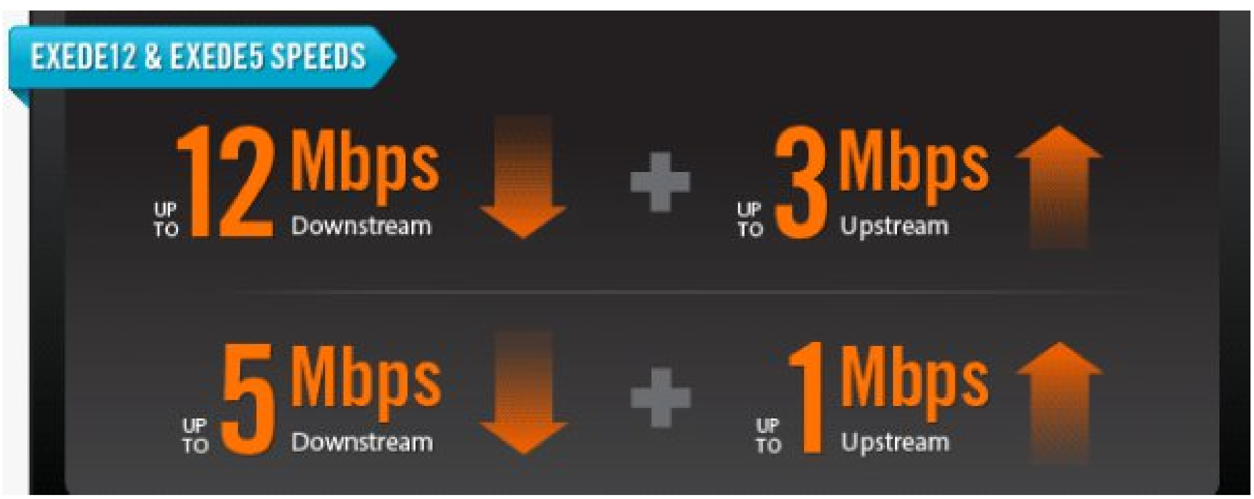
T-Mobile customers with 4G phones are already experiencing data speeds that are comparable to or faster than the speed of a home broadband network. And with recent improvements to our 4G network-doubling our theoretical download speeds-we're giving our customers enhanced 4G data speeds. We've seen average download speeds on our HSPA+ 42 Mbps-capable data stick approaching 10 Mbps with peak speeds of 27 Mbps, and download speeds approaching 8 Mbps with peak speeds of 20 Mbps on our upcoming HSPA+ 42 Mbps-capable smartphones.

Time Warner Cable LLC
Issue: Technology of transmission code 41 with maximum advertised download speed in tier 8, higher than expected value range for the technology.
Resolution: Provider website advertises 30 Mbps service; screenshot below.

Verizon Southwest Inc.
Issue: Mobile wireless platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.



ViaSat, Inc.
Issue: Satellite platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.



Windstream Communications
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider website advertises 12 Mbps service; screenshot below.

See which of our speeds matches your online activities. Choose the right Internet speed (WATCH VIDEO)	3 Mbps (Basic Use)	6 Mbps (Most Popular)	12 Mbps (Fastest Option)

West Texas Rural Telephone Cooperative, Inc.
Issue: DSL platform with maximum advertised download speed in tier 7, higher than expected value range for the technology.
Resolution: Provider confirmed that tier 7 service is now available in Friona and Bovina.

Data Submission and Coverage Estimation of Non-Participating Providers

As part of its ongoing broadband mapping efforts, CN has developed a series of processes with the goal of submitting coverage estimation mapping data to NTIA for every known and qualifying last-mile broadband provider, regardless of platform type (cable modem, DSL, fixed wireless, etc.). This state specific collection of coverage estimation methodology papers (see Appendix A) demonstrates the estimated broadband service territory for the providers in this state that have either been non-responsive or that have refused to participate in the SBI mapping initiative.

Accuracy and Verification: Provider Validation Methodology

Broadband providers maintain their service area data in many different formats, all in varying levels of complexity and granularity. In order to ensure that the data required by the NTIA is standardized across all providers and that it is as accurate as possible, CN translates and formats the data that providers are able to supply into a GIS shapefile and produces maps for the provider to review. The resulting map(s) and review process allow for providers to see their service area in a geographic format – for some providers, this is the first time they have seen maps of their broadband service area. Having the mapped service area allows providers to quickly identify any issues that appear in the data representation, whether the issue is in the data translation into a GIS format or from the original data collection and submission. Often data is provided from various sources and through the review and revision process, local engineers who operate the networks and work in the field are able to ensure that the tabular data that has been submitted is accurate and represents the real-world network extent. Any issues in how the service area is represented on the map(s) are remedied by CN, whether they are additions, removal of service, or any other revisions. Revised maps of service area representations are sent to the provider for review and approval; CN will revise data and return maps as many times as necessary until the provider is in agreement that the map represents their service area as accurately as possible. Once the review process has been completed and final approval of the data is provided, the data is deemed ready for NTIA submission.

Once the data collection has been aggregated at a statewide level, static maps of statewide and county-level availability are produced and made publicly available. In addition, consumers can visit the interactive online tool, My ConnectView, to create customized views of broadband service areas and analyze corresponding demographic information. Leveraging broadband service data on various platforms allows for public users, providers, and other stakeholders to review, scrutinize, and provide feedback on the represented data. This feedback becomes a validation method in itself as consumers submit inquiries to CN either affirming where service is not available or identifying areas where broadband service is shown on the map, but in actuality is not available. This allows for a follow-up to providers regarding revisions to the data as it is represented; it also allows for CN to identify locations where on-site visits may be necessary to complete field validation of available services. Public feedback on all forms of mapping products serves as a localized validation method for provider-supplied information and allows CN to resolve inaccuracies as they are identified to ensure that only the highest quality information is provided to stakeholders.

Additionally, non-participating provider narratives that were submitted in previous mapping cycles are subjected to the same level of scrutiny. Occasionally, a provider may elect to voluntarily participate (thus eliminating the need for future data estimation activities in the field). However, more often than not, the NPP narrative is updated with a combination of data gleaned from the provider's website, data obtained through FCC research and/or data collected/verified in the field by a CN staff engineer.

Estimates derived from provider-validated data indicate that approximately 1.67 percent of Texas households do not have terrestrial fixed broadband service available, and approximately 0.10 percent of Texas households have neither mobile nor fixed broadband service available.

Within rural areas of the state, results derived from provider-validated data indicate that approximately 4.85 percent of rural Texas households do not have terrestrial fixed broadband service available, and approximately 0.30 percent of rural Texas households have neither mobile nor fixed broadband service available. Please note that the availability estimates presented are based on Census 2010 household information.

The estimates above, in accordance with NTIA's definition of available broadband service as specified in the SBI NOFA, include broadband service with download speeds of at least 768 Kbps and upload speeds greater than 200 Kbps.

In addition, due to the nature of the SBI data collection methodology as defined by the NTIA and based on both census block geographic units and street segment data, the estimates of broadband availability derived from provider-validated data may include an overstatement of the actual number of households with broadband availability. Under the census block-based data collection method, a provider will typically report broadband availability for an entire census block whether its network is present across the whole or only a subset of that census block. This potential overestimation at the census block level can be amplified as the data is aggregated across the entire state.

WIRELESS METHODOLOGY

Broadband Service Availability in Provider's Service Area
Wireless Services Not Provided to a Specific Address

Data solicited from a fixed wireless provider to create propagation models include, but are not limited to:

1. The name of the structure.
2. Whether the transmitting device is operational or proposed.
3. The maximum advertised downstream speed, the maximum advertised upstream speed.
4. The typical downstream speed, the typical upstream speed (peak periods for both).
5. The frequency range of spectrum being used (as prescribed by NTIA). This may include (but is not limited to) spectrum authorizations identified within the Federal Communications Commission (FCC) Universal Licensing System (ULS) database or located on the FCC's Spectrum Dashboard. This research often proves to be exceptionally effective when estimating the coverage area of an NPP.
6. The primary population center(s) being served (for geopolitical boundary reference).
7. The physical address of the transmit site (in the event latitude/longitude is unavailable from the provider this allows a quick reference point for geocoding).
8. Latitude in either Degrees, Minutes, and Seconds and/or in Decimal Degrees (typically received as NAD 27 or NAD 83).
9. Longitude in either Degrees, Minutes and Seconds and/or in Decimal Degrees (typically received as NAD 27 or NAD 83).
10. Antenna pattern (e.g. omni-directional, 180°, 120°, 90°, etc.).
11. Azimuth of antenna (e.g. 360° with magnetic declination if known).
12. Approximate transmit radius (in feet, miles, or kilometers).
13. Polarity of transmit antenna (Vertical or Horizontal).
14. Transmit antenna gain (in dBi).
15. Line loss (applicable only to providers using coax, heliax, waveguide or other forms of cabling – excludes power-over-Ethernet devices).
16. Mechanical and/or Electrical beam tilt (if applicable).
17. Equipment Manufacturer (allows easy cross-reference against manufacturer's specification sheet).
18. Power output of the transmitting device (if unknown, FCC standards or manufacturer specifications are applied).
19. AMSL at base of tower site.
20. Antenna centerline AGL (height of antenna above ground level measured at the centerline of the actual antenna).
21. Foliage factors (Evergreens/Deciduous and percent of ground cover).
22. Ground Clutter (primarily used in rural areas to account for foliage and in metropolitan areas to account for types and heights of buildings if known).

23. Average gain of receive antenna.
24. Receive antenna is estimated at height above average terrain (HAAT) of 6.2 meters/20 feet.
25. Federal Registration Numbers (if applicable) which may allow opportunities to cross-reference and/or obtain additional data from the FCC's ULS and the **CO**mmission **RE**gistration **S**ystem.

Propagation modeling combines scientific data and empirical mathematical formulation for the characterization of radio wave propagation as a function of frequency, distance, and other conditions. Propagation software(s) typically use the Irregular Terrain Model (also known as Longley-Rice) of radio propagation for frequencies between 20 MHz and 20 GHz. This model is based on electromagnetic theory and statistical analyses of the combination of terrain features and radio measurements, then predicting the median attenuation of a radio signal as a function of distance and the variability of the signal in time and in space. For metropolitan areas, the software can typically be adjusted to use the Okumura-Hata model which accounts for predicting the behavior of cellular transmissions in areas where buildings are the primary obstructions. The resulting product from either model depicts a graphical illustration of the theoretical propagation characteristics of a selected frequency range based on defined variables (receiver sensitivity of the home/mobile device, foliage factor, and digital elevation terrain input).

After converting propagation models into a geospatial format, additional processing is completed to remove the small pixels representing service present in the resulting dataset. These areas are initially created based on the parameters entered in the software from the provider equipment information, the underlying data parameters of elevation, hillshade, etc., and the limitations of the software itself to display a broadband service area as accurately as possible. Generally, these random pixel striations appear as a result of signal levels reaching the highest elevated points within the prescribed radius. Typically, while this pixilation anomaly shows legitimate areas where signals can be received, these highly elevated points may have exceedingly sparse populations or are entirely void of population. As a result, and congruent to the *Wireless Technology Methodologies and Business Logic* white paper submitted to NTIA on January 20, 2011, all independent pixels representing service that are less than 0.125 square miles in area have been removed from the geospatial representation of each wireless provider.

Broadband Inquiries Methodology

CN collects consumer feedback in the form of broadband inquiries (BBIs). These inquiries represent any type of communication received from the public regarding broadband service. Once BBIs are received across the state, this information is overlaid with the broadband availability information which was collected through the SBI program. This allows for a real-world comparison of the broadband landscape to the information received from broadband inquiries. Consumers submitting these inbound comments and/or inquiries are able to provide information regarding five categories: 1) residents who do not have broadband but want it; 2) residents who have broadband but want a different provider; 3) residents who do not have broadband, but the broadband inventory maps indicate that they do; 4) residents who have broadband but want a faster connection speed; and 5) residents who have broadband but want a less expensive service option.

BBIs are submitted frequently by consumers via the Connected Texas website. Inquiries often seek help to identify local broadband provider options, or to learn when a specific provider may be able to provide service to that consumer. Consumer comments also provide information which may help modify maps with actual service area information. The primary objectives of CN regarding these inquiries are 1) to improve the accuracy of the state maps with submitted consumer information and follow-up field research; 2) to provide broadband options to consumers through cooperation with mapped providers and by facilitating new broadband service options; and 3) to map and analyze information from consumers about areas of unmet broadband demand and alternatives to currently mapped services. A prime example of the second option is the utilization of the Rural Utility Service satellite eligibility tool. By simply entering the consumer's address, the CN engineer can quickly determine if the consumer meets the initial qualification status for BIP satellite subsidies.

New BBIs are assigned to either the GIS department or the Engineering & Technical Services (ETS) team depending on the category entered by the consumer on the website submission form. The GIS or ETS team members respond to each inquiry according to the information requested by the consumer. Many BBIs can be resolved through desktop research; however, if a BBI requires research in the field, the assigned ETS team member conducts such research when performing field validations in the area of the inquiry, or at other such time as is practical and appropriate. GIS and ETS team members respond to and conclude BBIs via telephone contact and/or e-mail communication.

The broadband inquiry process has been implemented in each of the CN state programs with successful results. Altogether CN has received over 18,600 broadband inquiries since 2007, allowing the state programs to evaluate each inquiry for broadband demand and data verification. These inquiries are continuously examined against current broadband availability, updated every six months, to determine if previously unserved households have been expanded to and can now receive broadband at their residence. This database of broadband inquiries has also allowed the CN state programs to aggregate demand in concentrated areas to show providers the exact locations where the population has made it clear that they would purchase broadband if it was made available to them. Providers in the states have responded to this process and have expanded to areas knowing that their investment will be worthwhile. Data verification methods have also proven successful, as the state programs have been able to show those inquiries that indicate the broadband service areas are misrepresented on the map to providers, who then verify where service cannot reach in regard to that residence(s). The broadband coverage in these states has been altered to create a more accurate map based on the inquiries submitted by the public.

During this reporting period, the Connected Texas project has received a total of 21 inquiries (534 grant inception to date). As more inquiries are submitted to Connected Texas, a more thorough validation of the broadband landscape can be performed, while also allowing providers to see which areas have a high demand for broadband adoption.

My ConnectView Methodology

My ConnectView is an online, interactive mapping tool for viewing, analyzing, and validating broadband data. Developed using Esri's ArcGIS for Server and Adobe's Flex Framework and hosted and maintained by Connected Nation, My ConnectView is a multi-functional, user-friendly way for local leaders, policymakers, consumers, and technology providers to devise a plan for the expansion and adoption of broadband.

First and foremost, My ConnectView allows consumers to locate their residence and identify providers that offer broadband Internet service to that location. The interactive platform allows for users to build and evaluate broadband expansion scenarios using a wealth of data, including several coverage analysis layers, speed analyses, Community Anchor Institutions, and tools to search and export household demographic information, as well as extract data in GIS, spreadsheet, and/or PDF formats.

My ConnectView also features more interactive data layers and additional tools than ever before to allow the consumer to explore the broadband data. My ConnectView provides consumers with the ability to print, e-mail, and provide feedback on the broadband data displayed on the interactive map. Through the collection of this feedback, a visual demand for broadband is presented. This visualization allows the CN state programs the ability to validate the broadband availability for accuracy. If residents within a region state they are without broadband, but the interactive map shows otherwise, this allows CN to approach the providers within that area in an effort to trim down their coverage to more accurately represent real-world availability on the ground.

The Connected Texas project launched My ConnectView on April 2, 2012, and received 1,641 visits this reporting period; to date, the interactive mapping applications have received 17,644 visits.

Speed Test Methodology

The 555 speed tests that are represented in the Connected Texas Speed Test Report during this reporting period (7,492 grant inception to date) are the result of a partnership between CN and Ookla Net Metrics. Utilizing this relationship increases the level of confidence in the data being collected and provides for a far greater sample size than could be collected by a single testing site.

Ookla owns and operates Speedtest.net, as well as develops and deploys speed tests, such as the Connected Texas speed test website, for partners around the world. This network of sites that is developed and run on its testing technology provides Ookla with a vast dataset that, due to the variability of geographic information collected across the varying speed test sites, is geocoded utilizing Geo-IP technology. This technology allows for tests to be geocoded to points of aggregation, typically larger nodes across provider networks. While there are hundreds of thousands of tests that have been conducted, the level of aggregation is only sufficient for county-level detail due to the test results being located at these larger nodes and not at an absolute location for each speed test.

In an effort to validate broadband data from the Connected Texas project, speed test information is collected throughout the state. Speed tests provide speed information on the path taken through all networks (a provider's network as well as additional networks) a local machine must connect to in order to reach the host test. The benefit of this collection of speed information is two-tiered. First, it allows for a comprehensive dataset of speeds, while also providing Connected Texas with the information on where broadband services are available. Second, unlike theoretical speed information which was received through the data collection process, the use of speed tests provide real-world information on the speeds that currently exist within the state of Texas.

PROVIDERS DEEMED NON-VIABLE

The following list of companies represents the remainder of the broadband provider universe that was originally identified as complete for outreach to begin for the State Broadband Initiative. These providers are not included in the Data Package for the October 2012 submission because they have been deemed non-eligible under the parameters and guidance of the SBI grant program. This list of companies includes, but is not limited to: providers offering service but below the current definition of broadband, those that have gone out of business, technology consulting firms, infrastructure or network construction companies, non-facilities based general resellers, etc.

	Company Name	URL	Comments
1	01 Communications of Texas	http://www.o1.com	CLEC in California and a nonfacilities-based nationwide reseller.
2	1Source Tech	http://www.1sourcetc.com	Does not offer broadband services; not a broadband provider.
3	21Globe, Inc.	http://www.21globe.com/	Does not offer broadband services; not a broadband provider.
4	2473365 Wireless	n/a	No information could be located on company.
5	360networks	http://www.360networks.com/	Acquired by another company.
6	36db	n/a	Acquired by ERF Wireless.
7	4D Networks Corp.	http://www.4dn.com	Provider does not serve consumers in Texas; Oklahoma provider.
8	802DSL.com	n/a	No information could be located on company; not a broadband provider.
9	A 007 Access	http://www.a007.com/	Nonfacilities-based reseller of Quest DSL and mobile wireless.

10	AAA Internet Service	http://aaainter.net/dsl	Dial-up service and is also a nonfacilities-based DSL reseller.
11	Aaccess Network Communications, Inc.	http://www.aaccess.net	Not a broadband provider.
12	ABI Network Solutions, Inc.	http://abinetworksolutions.com	General reseller; requests for information were never returned.
13	AboveNet Communications, Inc.	http://www.abovenet.com	Company is a business provider only; does not offer residential service.
14	Acceris Communications Corporation	http://www.accerispartners.com	Company does not provide Internet service; not a broadband provider.
15	Access Integrated Networks, Inc.	http://www.birch.com/About/accesscommredirect.aspx	Company no longer exists; changed name to Birch Communications in 2006.
16	Access One, Inc.	http://www.accessoneinc.com/access_one_direct.php	Company is a business provider only; does not offer residential service.
17	Access Point, Inc.	http://www.accesspointinc.com/products.htm	General reseller; nonfacilities-based.
18	Access123.net	http://access123.net/	Website is a search engine for all types of products; company is not a broadband provider.
19	Access2Go, Inc.	http://www.acc2go.com/	General reseller; nonfacilities-based.
20	Accutel of Texas, LP	http://www.accutel.net/	No viable information could be located on company; URL inactive; not a broadband provider.
21	ACERX.NET	http://acerx.net/	General reseller; nonfacilities-based.
22	ACN Communications Services, Inc.	https://www.myacn.com/phone/dslbundle.html	General reseller; nonfacilities-based.
23	Adirondack Area Network	http://www.aanet.org/	Provider does not serve consumers in Texas; New York State provider.
24	Advance Telephone Services	http://www.advanced-telephone.com/	Company does not provide Internet service; not a broadband provider.
25	Advanced Communicating Techniques	n/a	No viable information could be located on company; URL inactive; not a broadband provider.

26	Advanced Integrated Technologies, Inc.	http://www.a-i-t.com/	Company does not provide Internet service; not a broadband provider.
27	Advanced Wireless Solutions	http://www.awsolutions.net	Company is B2B provider of networking solutions; not a broadband provider.
28	AEConnect	n/a	No information could be located on company; not a broadband provider.
29	AEI Wireless	http://www.aeiwireless.net	Based on website; speed offerings are not compliant to FCC broadband definition.
30	Aerie Network Services, Inc.	http://www.aerienetworks.com/	No viable information could be located on company; URL is web search engine; not a broadband provider.
31	Aero Communications, LLC	n/a	Company categorized under Telecommunications consultant; no website located and is not a broadband provider.
32	Aeroconnect	http://www.aeroconnect.net	Company is B2B provider of networking solutions; not a broadband provider.
33	Affinity Network, Inc.	http://www.affinitynetworkinc.com/	Company is B2B provider of long distance and calling card services; not a broadband provider.
34	Affordable USAWide.Net, Inc.	http://www.usawide.net	General reseller; non-facilities based; offers DSL and dial-up.
35	Air2LAN	n/a	Company was purchased by U.S. Wireless Online in February 2005; no longer in business.
36	AirChips Communcation, LLC	http://www.airchips.com	Company performs network consulting services and does not have broadband operations; not a broadband provider.
37	AIRDIS Telecom	http://www.airdis.com/	Company sells telecommunications equipment to business and does not have broadband operations; not a broadband provider.

38	Airewaves Broadband, LLC	www.airewaves.com	Airewaves is an Internet media download center; not a broadband provider.
39	Airimba Wireless, Inc.	http://airimba.com/	Provider supplies bulk level agreements to housing communities; B2B
40	Airmail247.com	http://airmail247.com/	No viable information could be located on company; URL is not located; not a broadband provider.
41	Airo Networks, LLC	http://www.aironetworks.com	No viable information could be located on company; URL is not located; not a broadband provider.
42	Airocom	http://www.airocom.net	Acquired by NetWest Online.
43	Akeva	n/a	Reseller of Verizon Mobile Phones in mall kiosk; not a broadband provider.
44	Alec, Inc.	http://www.singlepipecom.com	Nonfacilities reseller of DSL services; however does not serve the state of Texas.
45	Allo Telecommunications, Inc.	http://tc.allophone.com/	Nonfacilities reseller of business circuits.
46	Allumera	http://www.amirarif.com/	Not a broadband provider.
47	Almega Cable	http://almega.com	Currently only supplies Internet connectivity to one anchor institution in Texas; no residential services.
48	AltiComm, Inc.	n/a	Based on Internet research and PUCT report the organization is nonfacilities-based or resells internet services.
49	Amarillo Cell Telco	http://www.cell1amarillo.com/	Acquired by Alltel.
50	American Dial Tone (Ganoco, Inc.)	n/a	Company offers dial-up services only.
51	American Fiber Network, Inc.	https://www.afnltd.com	Company performs network consulting services and does not have broadband operations; not a broadband provider.

52	Americans Conex, LLC	n/a	No viable information could be located on company; URL is not located; not a broadband provider.
53	America's Tele-Network Corp	n/a	Company is no longer in business.
54	AmeriMex Communications Corp.	http://www.amerimex.biz/	Company sells international calling plans and does not provide broadband services; not a broadband provider.
55	AMERIPHONE NETWORK, LLC	n/a	No viable information could be located on company; URL is not located; not a broadband provider.
56	Amigos - Tu Compania De Telefono	n/a	No viable information could be located on company; URL is not located; not a broadband provider.
57	Amtel	n/a	No viable information could be located on company; URL is not located; not a broadband provider.
58	An Elite State Telephone Company	n/a	No viable information could be located on company; URL is not located; not a broadband provider.
59	Annox, Inc.	n/a	Company is no longer in business and is listed as inactive in the state of Texas.
60	Antioch Wireless Broadband	n/a	No viable information could be located on company; URL is not located; not a broadband provider.
61	AP Telecommunications	http://www.academicplanet.com	Company offers dial-up services only; not a broadband provider.
62	Apache Networks	http://www.apachenetworks.net	Company offers VOIP services only; not a broadband provider.
63	Apogee Telecom, Inc.	http://www.apogeenet.net	Company does not provide direct residential service; design and build networks for institutions of higher learning; not a broadband provider.
64	Arrowheadnet.com	http://www.arrowheadnet.com/	Company offers web hosting services only; not a broadband provider.

65	Artisan Communications	http://www.artisan.tv	Company offers telephony services to business only; not a broadband provider.
66	ATC Outdoor DAS, LLC	n/a	Company offers radio services for business only; not a broadband provider.
67	A-Tech Telecom, Inc.	n/a	No viable information could be located on company; URL is not located; not a broadband provider.
68	Ateck Internet Providers	www.atxip.net/	Information located on company shows no longer in business.
69	AURIC Marketing LLC	n/a	Company offers Pots and Private T-1 services; not a broadband provider.
70	Austin Bestline Company	http://www.bestline.net/	Reseller who provides Internet access to business only; B2B provider.
71	Austin Teleco Usa, Inc.	n/a	No viable information could be located on company; URL is not located; not a broadband provider.
72	AzleTexas.Net	n/a	Information located on company shows not a broadband provider.
73	Backbone Communications, Inc.	http://www.backbonecommunications.com/	Not a broadband provider; assist with development of technology platforms for classroom environment.
74	bargainisp.net	http://www.bargainisp.net/	Not a broadband provider; web search engine.

AMA TechTel

As part of its ongoing broadband mapping efforts, Connected Nation has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying broadband provider, regardless of whether the provider has chosen to support and participate in the SBI mapping initiative.

The following narrative provides detail regarding continued data collection activities related to AMA TechTel, a wireless Internet service provider (WISP), located in Amarillo, Texas with a service area around the Central Panhandle, including but not limited to, the city of Amarillo and multiple surrounding towns and rural areas. The narrative will include information regarding how and where CN obtained publicly available data and the on-the-ground validation techniques that support the underlying data. As of April 2012 CN identified additional service areas during routine exploration and field validation activity in Abilene, Texas and surrounding rural areas. The narrative for the October 2012 activity is located at the end of this document (after Exhibit I) and titled *Results for October 2012 Submission.*

<u>Background</u>
CN staff members have continued trying to obtain the participation of the provider with 33 instances of communication via telephone and e-mail sessions since September 9, 2009, through August 6, 2012. Communication reply received from a company representative on February 4, 2011, with a response of electing not to participate due to the nationwide providers' involvement in the mapping project. Additionally, a CN staff member visited the AMA TechTel office on October 4, 2011, to discuss the broadband mapping project in person with AMA TechTel staff but decision-making staff members were not available.

<u>The Issue</u>
AMA TechTel, by its lack of responsiveness since September 9, 2009, has predicated its unwillingness to participate in the Connected Texas broadband mapping initiative.

<u>Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing</u>
CN began building a file based on research information and, as time progressed, enriched the file with information obtained through the public domain. For example, CN reviewed the provider's website (http://www.amatechtel.com/) and called the AMA TechTel office to determine the residential service plans offered to Residential as 1.1 Mbps download and 512 Kbps upload, which is well within the website speeds and OOKLA data sample (Over 2,800 total speed tests) in service plans **(Exhibit A)** and the service area **(Exhibit B)** of the provider's wireless network. A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) **(Exhibit C)** system yielded an FRN of 0008064941 and 0013822721 with contact information relative to the owner of the company. Also, to support field validation of access points, the FRN's were referenced to the FCC Universal Licensing System (ULS) to identify any licenses the provider may hold which could possibly enhance locating active access points for the service area. This process yielded license WQJC218 **(Exhibit D)**, Radio Service: WQJC218 with 10 unique locations.

Exhibit A: Service Plans

Services

High-Speed Internet Access	Web Site Hosting	Collocation
512Kb up to 45Mb	Dedicated and Shared (virtual) hosting plans available	By collocating your servers in our Network Operating Center (NOC), you are free from the cost of expensive routers, hubs, switches and firewalls.
Network Administration	**Virtual Private Networking (VPN)**	**Internet & Network Security**
Affordable network administration is provided by a company who knows networking. You can choose to pay by the hour or purchase discounted service plans.	Virtual Private Networking provides secures network access to home or remote business sites.	We offer a security level that provides the IPSec 168 bit 3DES encryption needed to meet OCC and HIPAA requirements to

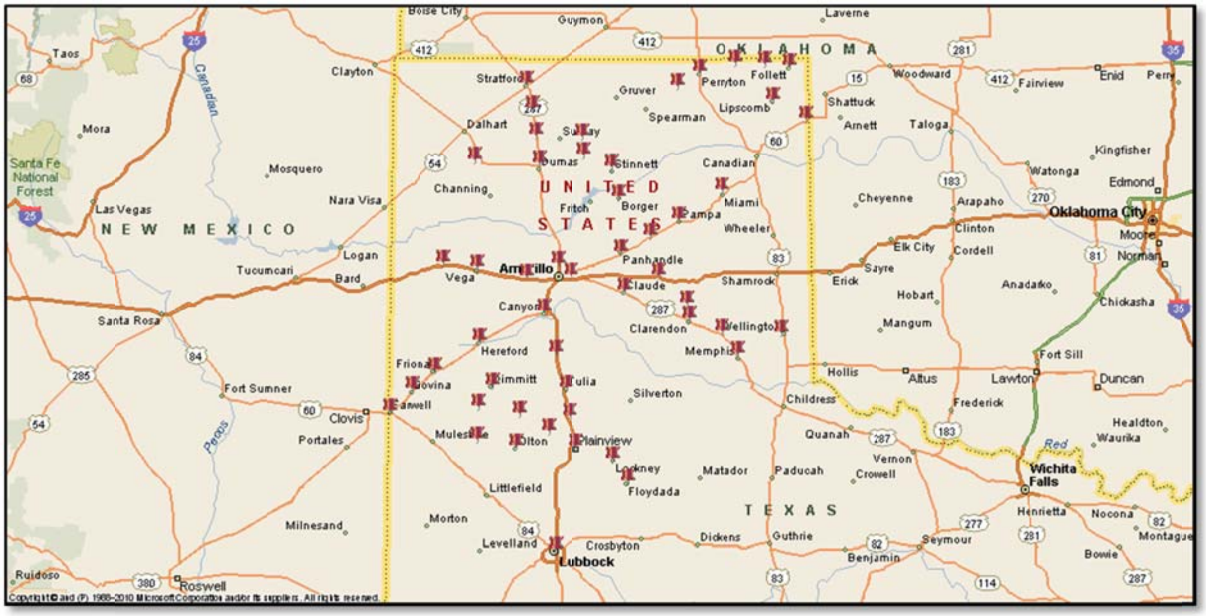
Preliminary Identification of Provider's Coverage Area

Connected Nation extracted the AMA TechTel service area map from its website and the information through the FCC ULS database in reference to license WQJC218. The website service area was utilized to create a Google Earth image overlay **(Exhibit E).** The image overlay was positioned to match the Google Earth base map's roadways, county boundaries, and water bodies. The degree of accuracy of the image overlay was maintained at less than .5 mile (2640 ft.) to establish a minimum search criteria of a given access point. The provider's service area depiction is represented by tower symbols as shown in **Exhibit B**. Using the coordinates (10 unique locations) available through the FCC ULS license search an accuracy validation of the image overlay was conducted to determine the feasibility of utilizing the tower symbols for identifying coordinates of the remaining 40 locations. The 10 licensed locations' coordinates were inputted into Google Earth and examined utilizing the zoom option of the aerial imagery. Six locations structures were identified within the provider's website defined coverage area. This provided a means of establishing coordinates for the 44 remaining access point locations. All 50 locations were entered into the Microsoft *Streets & Trips* mapping application **(Exhibit F)** to develop a route for the validation process.

Exhibit E: Google Earth: AMA TechTel's Service Area Image Overlay

Exhibit F: Validation Points for AP Structures



Testing Techniques

Connected Nation staff developed a site validation route based on data established with the Google Earth image overlay and publicly available data through the FCC ULS database for AMA TechTel WQJC218 radio service. The CN wireless engineer was equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900 MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands **(Exhibit G)**. Each validation point was scrutinized for frequency of operation. A screen image of the operating frequency (or frequencies) was captured; general notes were recorded for each location-approximate antenna height, frequency of operation, antenna type (omnidirectional or sectored) and photographs were taken of the access points.

Results and Submission for April 2012

Of the 50 locations visited during the validation point route, 50 access points were identified and relative information was logged into the AMA TechTel field validation notes file **(Exhibit H)**. The field and the publicly available data were transferred to the Connected Nation Provider Information file. A composite propagation study was completed based on the field data **(Exhibit I)**. Both documents were forwarded to AMA TechTel and advised the information will be submitted to Connected Texas and the NTIA broadband mapping project for processing if there are no discrepancies of the estimated coverage received from the provider within a 48-hour period.

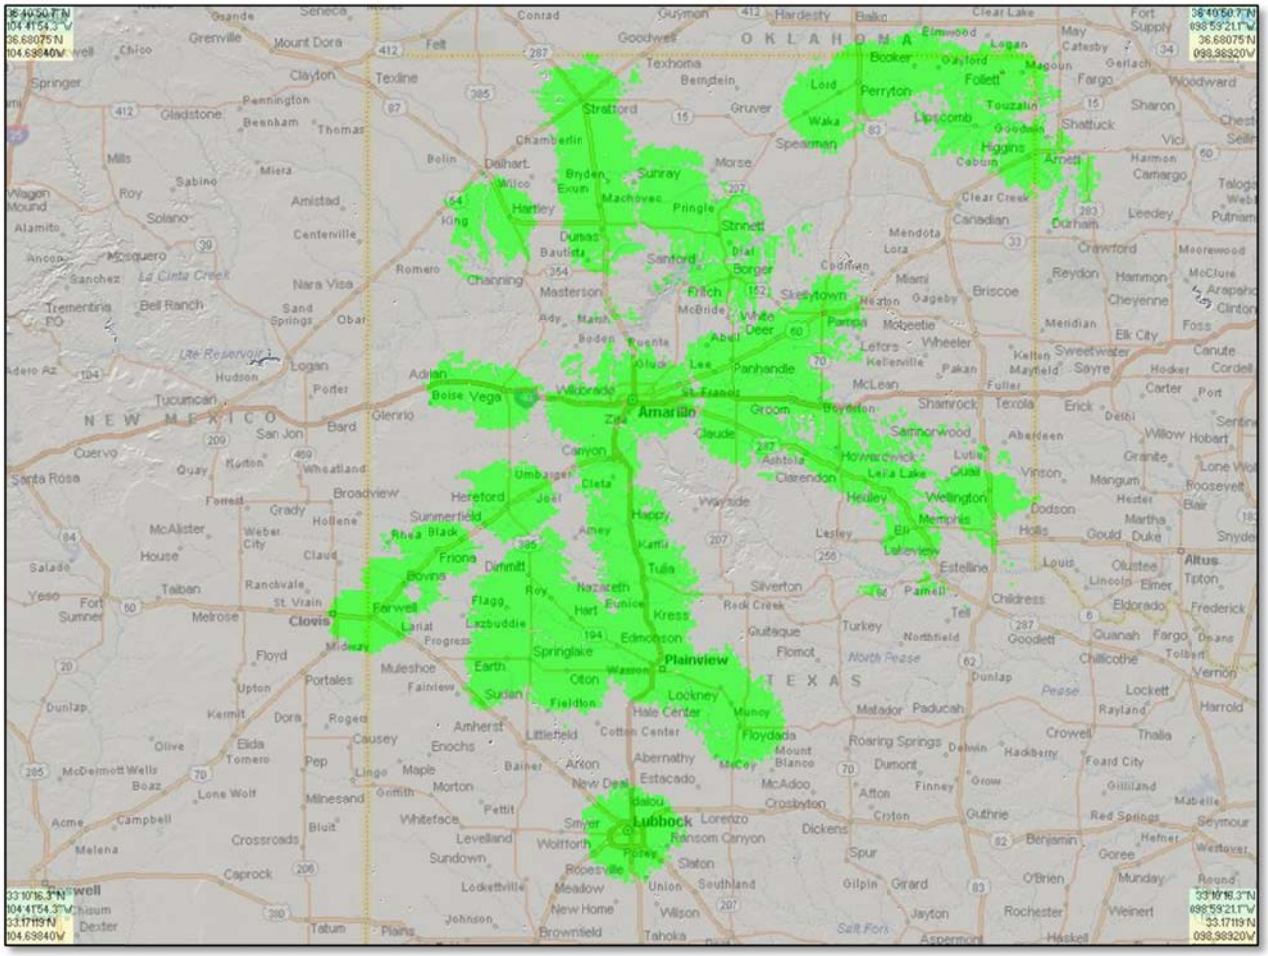
Exhibit I: AMA TechTel Composite Coverage (April 2012)



Results for October 2012 Submission

During a routine exploration and field validation routine on April 22, 2012 a CN staff member identified an AMA TechTel business office **(Exhibit J)** located in Rising Star, Texas. A brief visit with office personnel identified broadband Internet service being available in Rising Star, May, Cross Plains, and Blackwell, Texas; a brochure **(Exhibit K)** was provided identifying the rate and service level availability. The CN staff member reviewed the AMA TechTel 3.65 GHz license WQJC218 (Exhibit D) via the FCC ULS database to pinpoint registered site locations. The coordinates were obtained and entered into the *Streets & Trips* mapping application **(Exhibit L)** to develop a route for a site and radio frequency (RF) validation process. RF presence was obtained at each location **(Exhibit M)** and antenna arrays **(Exhibit N)** were validated based on the location registration. Propagation studies **(Exhibit O)** were completed based on field validation and utilization of radio and antenna parameters defined within the FCC ULS location record. Documents were forwarded to AMA TechTel and they were advised the information will be submitted to Connected Texas and the NTIA broadband mapping project for processing if there are no discrepancies of the estimated coverage received from the provider within a 48-hour period.

Exhibit M: AMA TechTel 3.65 GHz RF Testing Validation Sample - Rising Star

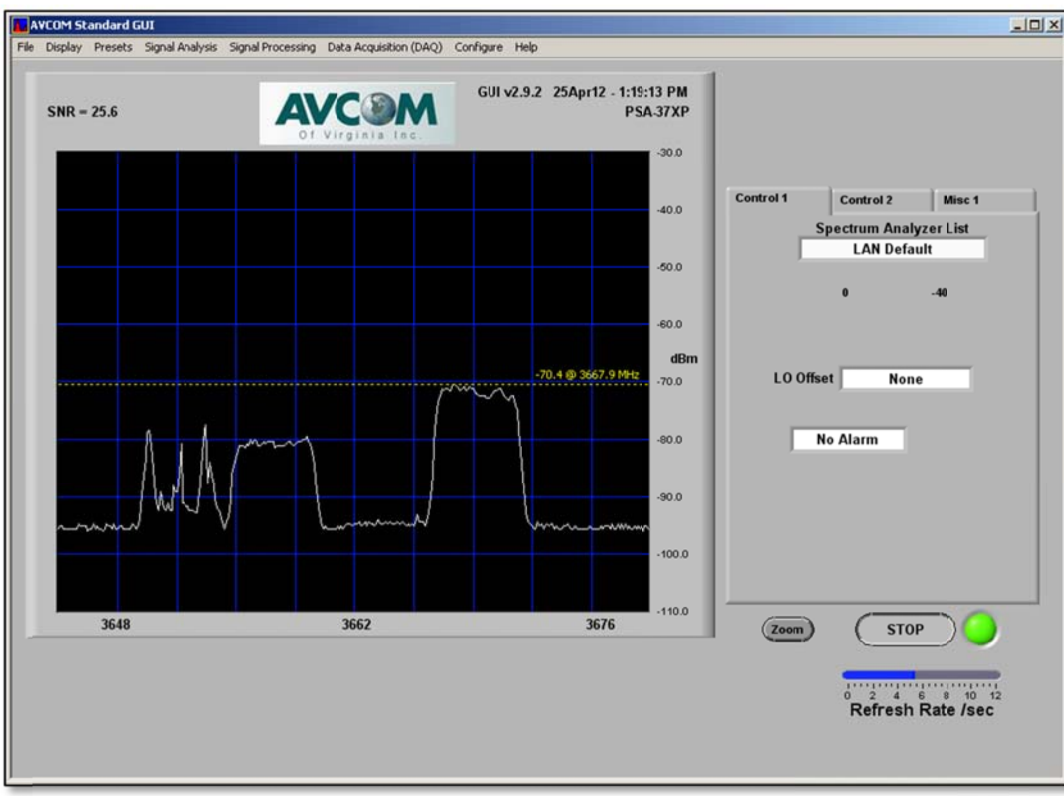

Exhibit N: AMA TechTel 3.65 GHz Antenna Validation Sample - Rising Star

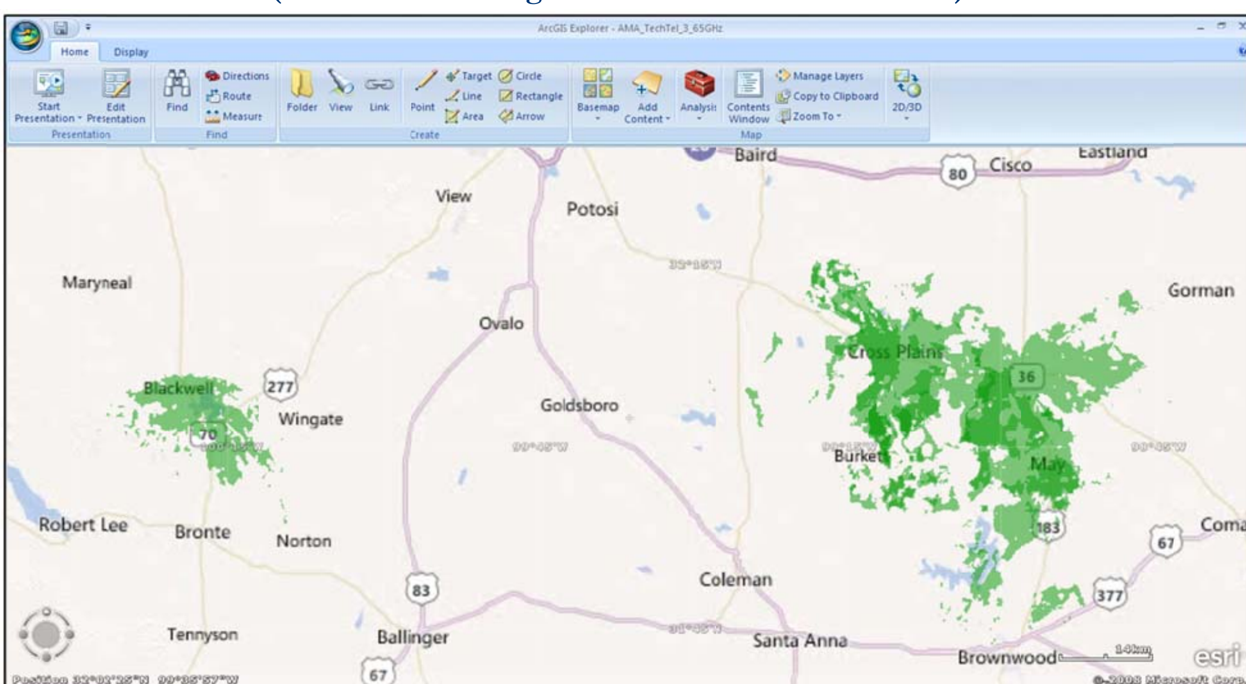
Exhibit O: AMA TechTel 3.65 GHz Composite Propagation Study
(Additional Coverage for October 2012 Submission)



ANVIL COMMUNICATIONS

As part of its ongoing broadband mapping efforts, Connected Nation (CN) has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying broadband provider, regardless of whether the provider has chosen to support and participate in the SBI mapping initiative.

The following narrative provides detail regarding the recent data collection and coverage estimation activities related to Anvil Communications, a wireless Internet service provider (WISP) located in Wimberley, Texas, with a service area throughout most of Hays County, Texas. The narrative will include information regarding how and where CN obtained publicly available data and the on-the-ground validation and/or estimation techniques that support the underlying data.

Background
CN staff members have attempted to obtain the participation of the provider with 16 instances of communication via telephone, e-mail, and personal visits from September 9, 2009 to August 1, 2012. The provider has refused to participate on more than one occasion. Most recently, a CN technician visited the provider's office to discuss the program, but the provider again refused stating that the data collection process was "too intrusive."

The Issue
Connected Nation has been unable to obtain this provider's broadband coverage information through typical outreach efforts. Anvil Communications has, since March 2010, repeatedly stated its refusal to participate in the Connected Texas broadband mapping initiative.

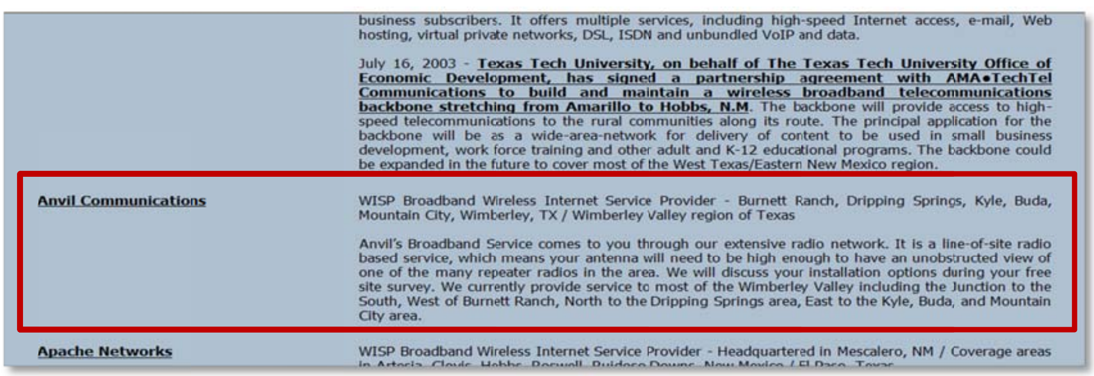
Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing
CN has built a file of research information based on information obtained through the public domain. For example, CN reviewed the provider's website (www.anvilcom.com) to determine the residential service plans and the service area of the provider's wireless network. Although the website does not advertise specific speeds or a designated coverage area, indications of both items were found through extensive research throughout the Internet. For example, the provider's website states that its Internet access speed "…varies from installation to installation depending on location…" **(Exhibit A)**. Further research suggested that advertised download speeds have been as high as 3-4 Mbps, while a market analysis completed by the provider's host city specified a comparative download speed of "Up to 5 Mbps" for this provider.

Similarly, the provider's website does not specify a coverage or service area except for a reference to "central Texas"; however, Internet research led to an alphabetical listing in a WISP directory that specified certain geographic areas **(Exhibit B)**.

A search for a Federal Registration Number (FRN) for the provider on the FCC COmmission REgistration System (CORES) using the company business name did not reveal a verifiable FRN. A similar search in the Texas business licensing system also did not identify Anvil Communications as an entity licensed to do business in the state. Finally, a search of the FCC's Universal Licensing System (ULS) for Hays County, Texas, did not identify any wireless licenses held by the provider.

Exhibit A: Service Plans

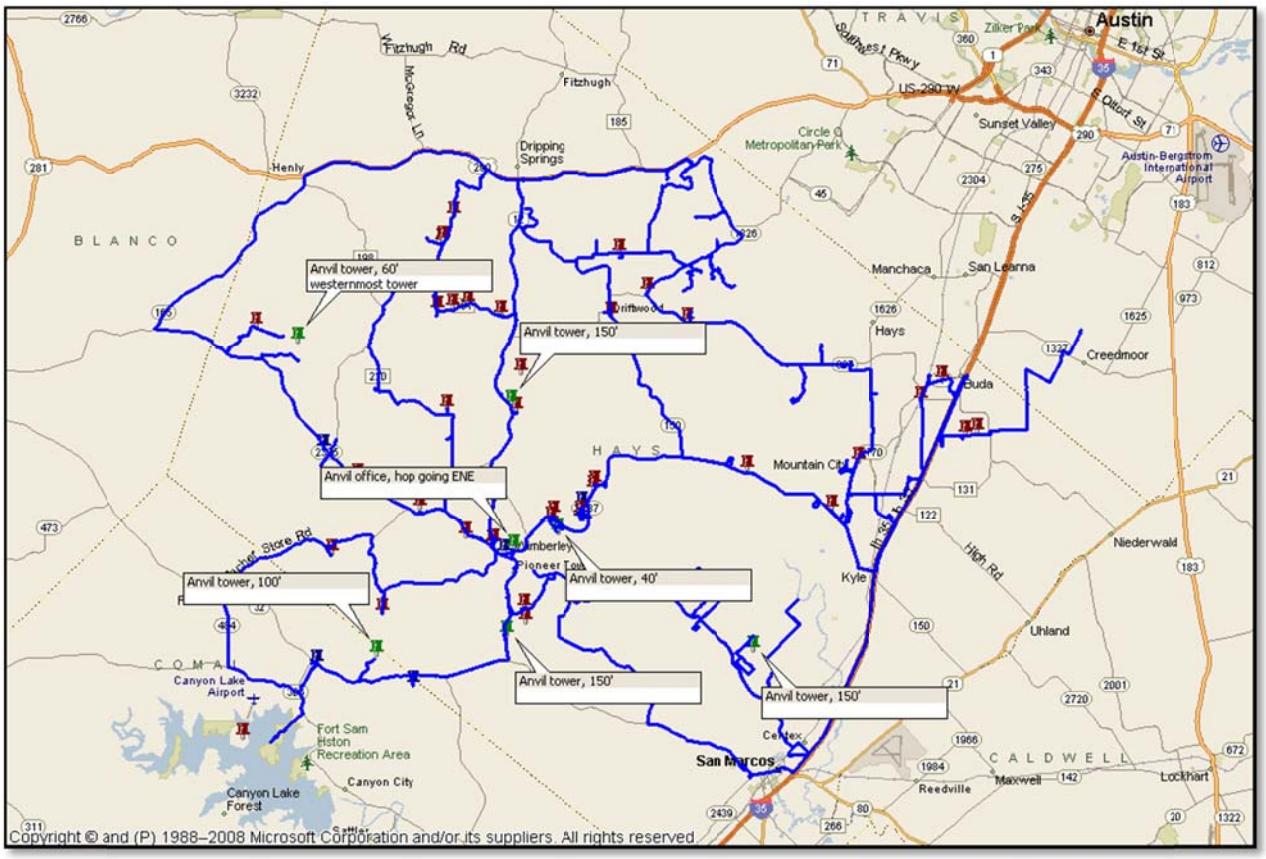
Exhibit B: Service Area



Preliminary Identification of Provider's Coverage Area

Because Connected Nation was unable to (a) extract a service area map from the provider's website and (b) identify licensing information through the FCC ULS database, alternate methods were required to identify and to confirm tower sites for the provider. A CN technician drove hundreds of miles throughout Hays County seeking wireless transceivers, triangulating the transmission paths of those receivers to pinpoint tower locations, conducting interviews with wireless Internet customers, and performing directional frequency tests. Utilizing Microsoft *Street and Trips* software, the field research results are depicted in **Exhibit C**. Although the researched provider claims a service area of as much as one thousand square miles (Hays County covers 680 square miles), CN's conversations with the provider's office personnel determined that the provider (i) did not offer service north of Dripping Springs, and (ii) offered little practical service south of the county line. Further, Internet research suggested the westernmost tower was within Hays County lines. To the east, wireless Internet service is dominated by another provider, and Anvil's service area does not appear to extend eastward beyond the interstate highway (I-35).

Exhibit C: Confirmed Tower Sites for Anvil Communications



In all, more than sixty (60) points of research were mapped and documented (with the pushpins in the exhibit above), with many serving as confirmation of the provider's tower locations. Where possible, the CN technician confirmed (through a third party) that the tower location was being utilized by Anvil. One example is the confirmation of the Anvil tower north of Wimberley offered by a neighboring land manager. In other instances, using Intel PROSet/WiFi Connection Utility, the presence of network signatures or nomenclatures identified the Anvil network on a tower as in **Exhibit D**. Photographs were also taken at each tower site of the equipment, the support structure, and the general location of the site (e.g., populated vs. rural).

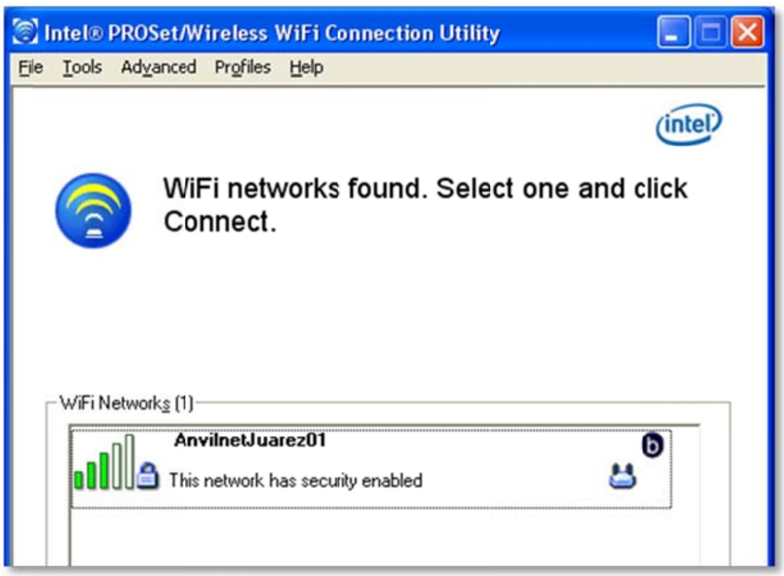
It is important to note that certain tower locations are better characterized as relay points connecting disparate locations along river valleys that would otherwise not be able to receive service from a centralized tower due to terrain blockage.

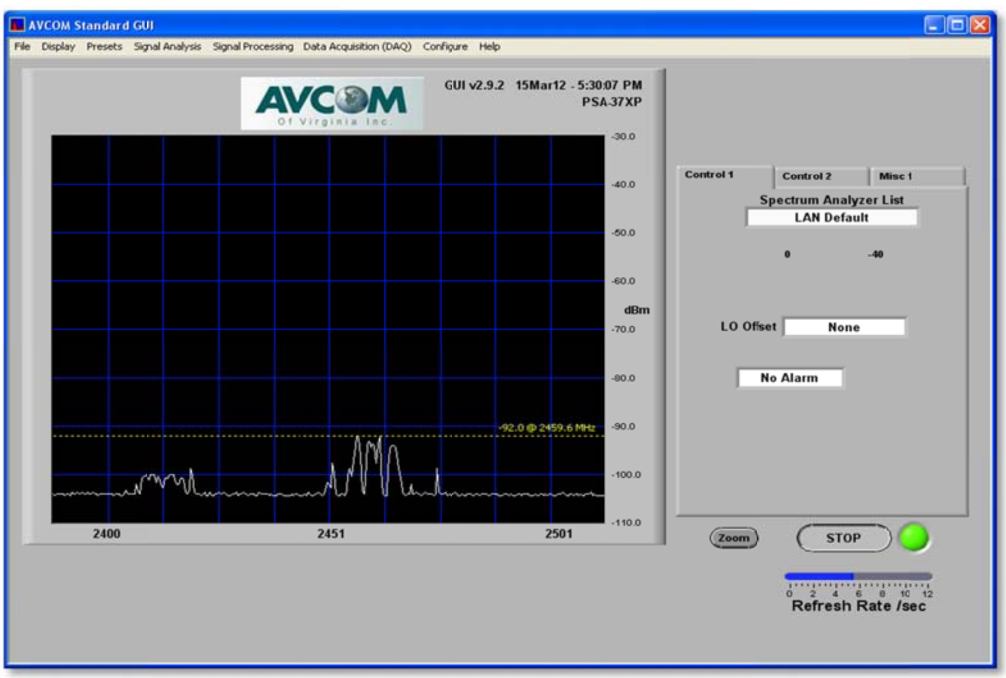
Exhibit D: Network Nomenclature at El Rancho Cima Location

Field Testing Techniques

Having confirmed tower locations comprising Anvil's service area, the CN technician then performed signal tests for the detection of active wireless frequencies typically utilized to provide WISP service. The CN technician was equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900 MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands. At each signal test location, the CN technician attempted to be isolated from unrelated Wi-Fi networks in the test area, facilitated spectrum readings from the AVCOM analyzer, and captured the results of the frequency tests as validation data for wireless tower transmissions (**Exhibit E**).

Exhibit E: Frequency Test Data for Juarez (Westernmost) Tower Location





Signal Propagation Maps

At each confirmed tower site, the CN technician estimated the antenna height, determined the GPS coordinates for the tower, and recorded this and other information into the standard Excel provider data collection format. With the objective of reasonably representing the provider's practical service area, the CN technician utilized the information for each tower site (**Exhibit F**), and prepared propagation maps (**Exhibit G**) based on that information.

Exhibit F: Tower Research and Propagation Data

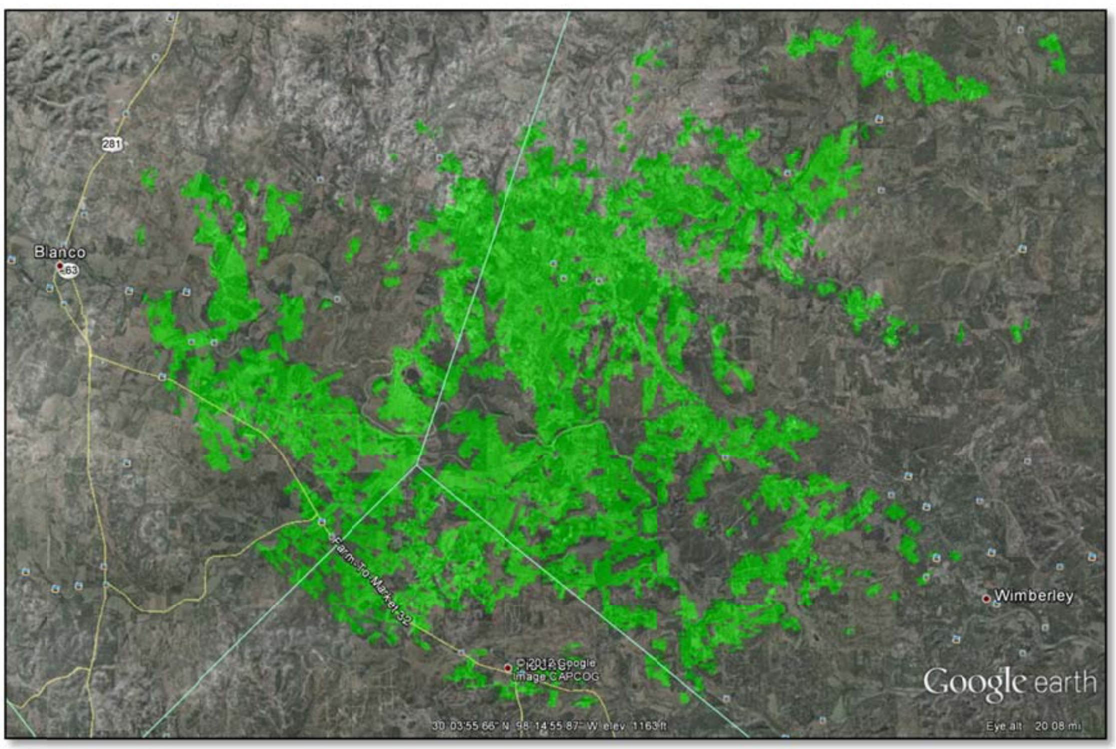
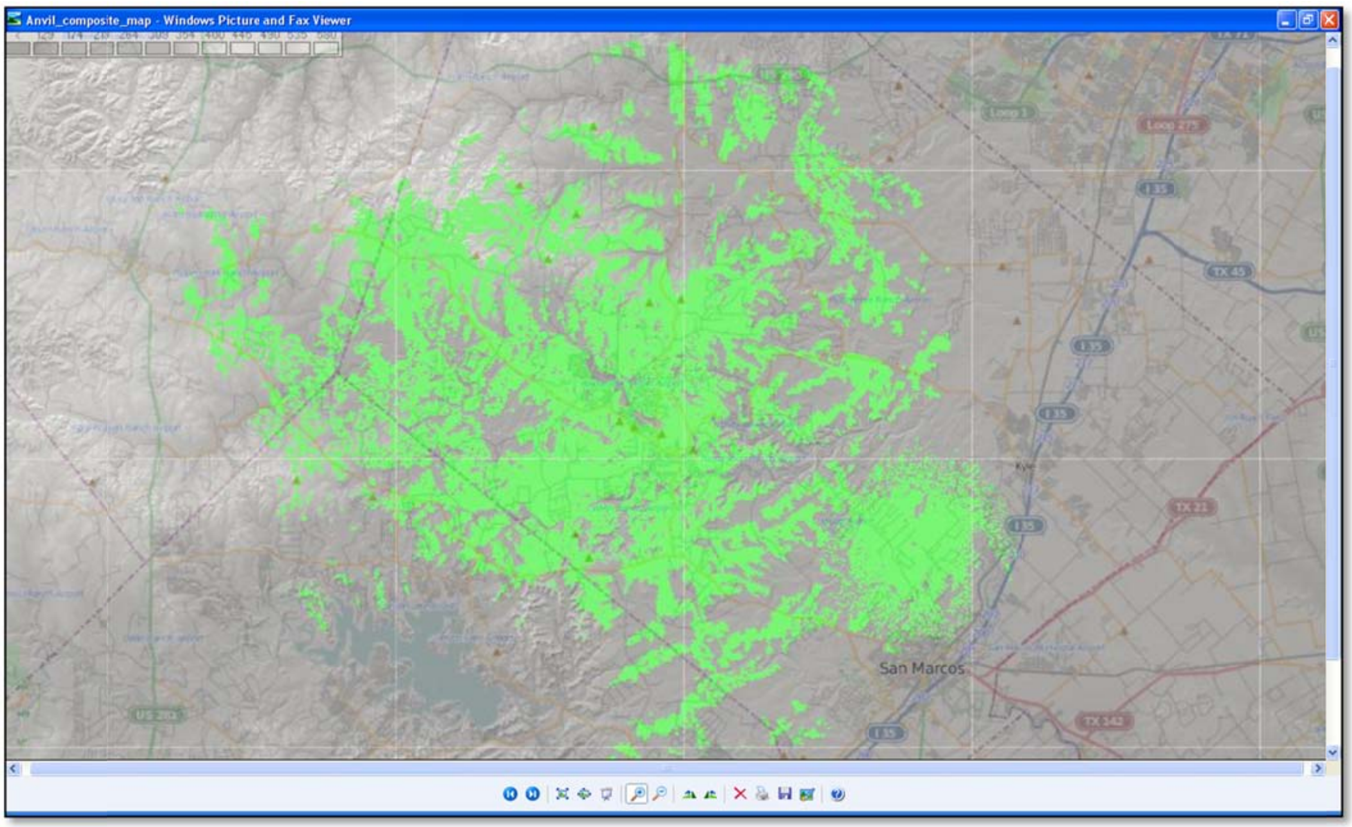
Exhibit G: Propagation Map for the Juarez (Westernmost) Tower Location



<u>Results and Submission for October 2012</u>

Seven tower locations for Anvil which were likely to be operational were visited and tested, as well as numerous additional sites in the search for customer premise equipment, frequencies utilized by potential competitors, and other verification data points. Testing determined that wireless signal was available for broadband service. A composite propagation analysis was completed **(Exhibit H)**, which reasonably represents the estimated broadband coverage area based on all information identified as of August 1, 2012. The composite propagation map was forwarded to the provider for review and feedback prior to CN's inclusion of the coverage area in the Texas Broadband Map's October 2012 iteration; however, no response was received by August 15, 2012.

Exhibit H: Anvil Communications Composite Coverage



BROADWAVES

As part of its ongoing broadband mapping efforts, Connected Nation has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying last-mile broadband provider, regardless of whether the provider has chosen to support and participate in the State Broadband Initiative (SBI) mapping program.

For the, April 2012 mapping cycle, CN submitted an updated white paper detailing the determination of the coverage area for Broadwaves, a wireless Internet service provider (WISP), located in Brenham, Texas, with a service area in and around Washington County. This document accounts for updates to the coverage area for this October 2012 mapping cycle.

Background

Subsequent to the accumulation of research related to the service area for Broadwaves as of June 30, 2011, the CN technician most familiar with this provider noted changes to the coverage information on the provider's website. At that time, the advertised coverage area included nine concentric circles representing the provider's wireless access points **(Exhibit A.1)**. In early September 2011 the CN technician plotted the likely center points for each circle, and in October and November of 2011, performed field research at more than 30 locations in Washington County to determine the actual tower locations **(Exhibit B). A**fter conducting site verification and field data collection he used the data to create a coverage estimation map of Broadwaves **(Exhibit A.2)**.

The CN technician spoke extensively with the owner of Broadwaves on October 26, 2011, in regard to the mapping project. The provider refused to offer assistance (e.g. tower locations) or other useful information. When asked if all the advertised tower sites were active, the provider indicated some of them were but would not specify which sites were inactive. Further, the provider stated that he did not want to be part of the state map, and remarked that the state should be told that the company was going out of business in a couple of months so as to eliminate the need to collect required information. Further conversation suggested that the company was not actively pursuing buyers for the business, and would not be terminating service in the near term.

Exhibit A.1: Broadwaves Advertised Coverage Subsequent to June 30, 2011

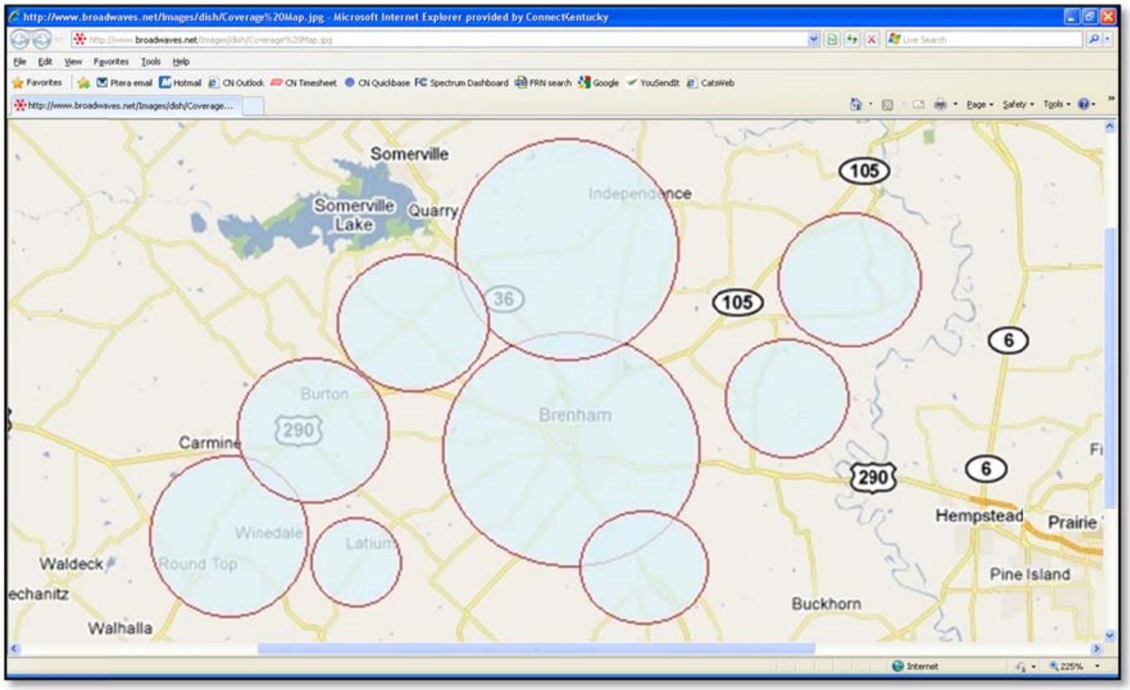


Exhibit A.2: Broadwaves Estimated Coverage for April 2012

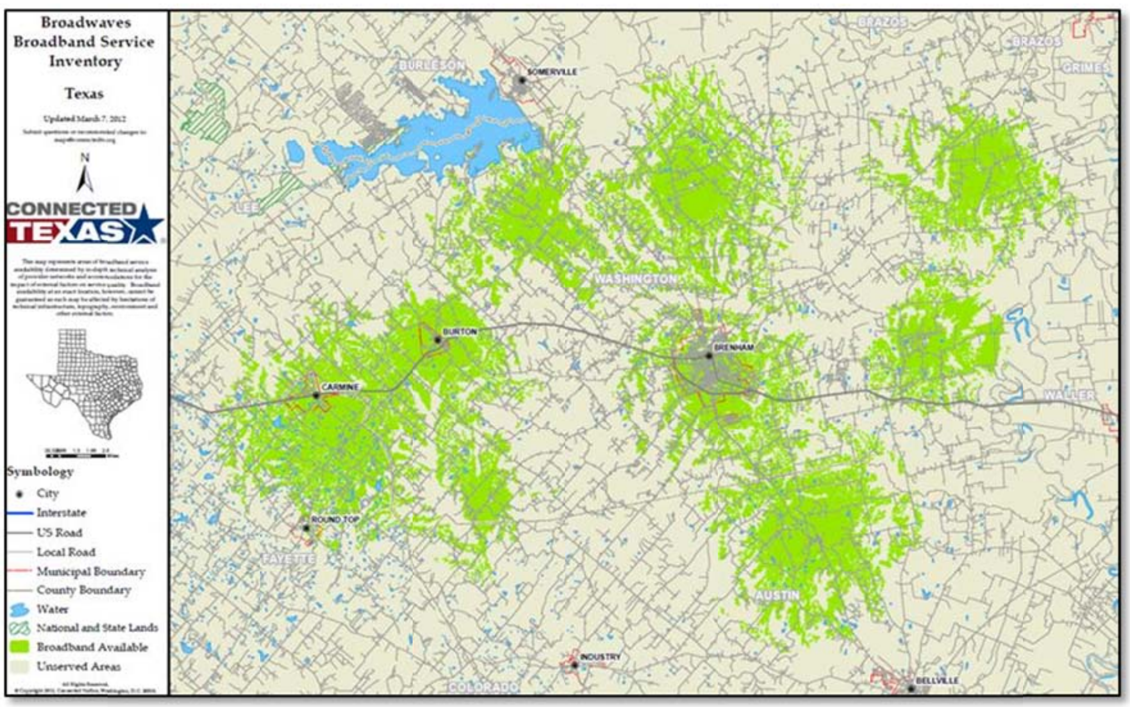

Exhibit B: Actual Tower Locations

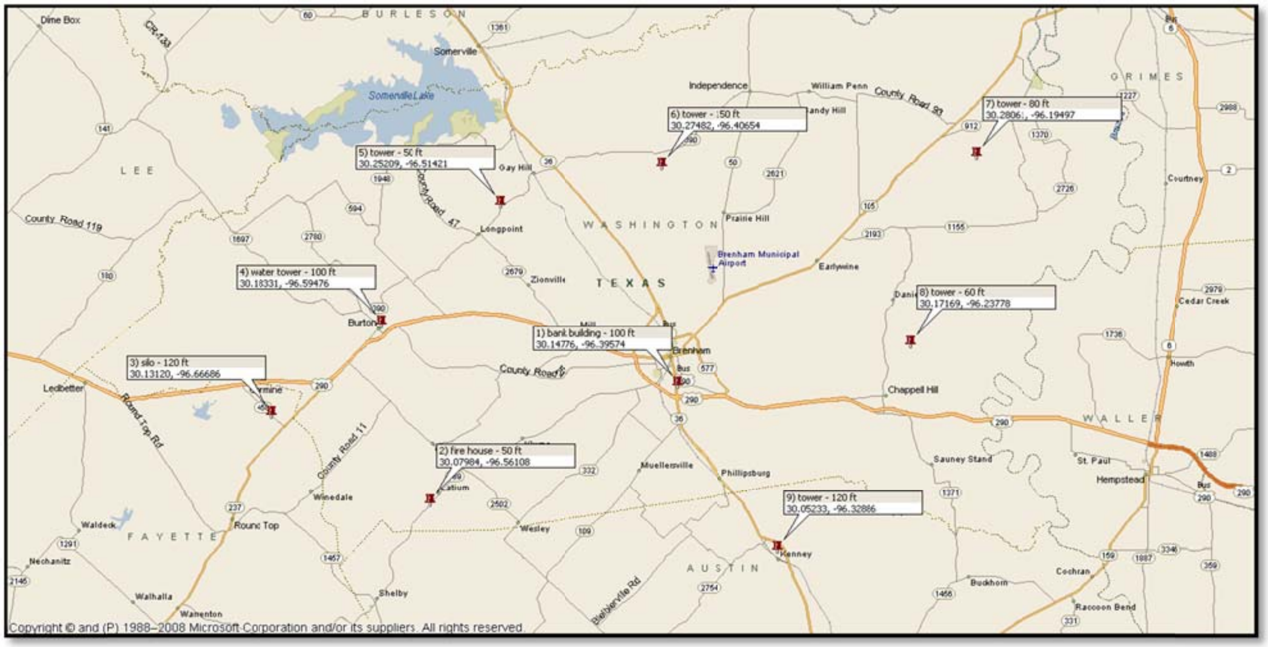
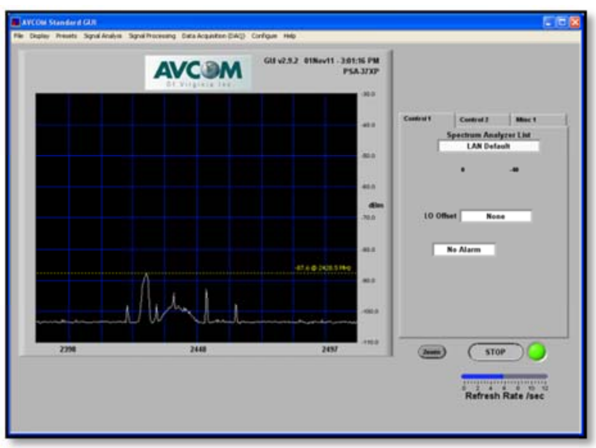


Field Testing Techniques

Where possible, the CN technician confirmed (through a third party or by other independent means) that the tower location was actually being utilized by Broadwaves. Confirmation from a bank representative that Broadwaves' equipment was operational on the rooftop of the Brenham Bank, a customer in Kenney pointing out the tower on which Broadwaves provides service, and comparison of network nomenclatures between markets all support this known tower location. In other instances, the presence of identical wireless transmission gear (on multiple tower locations) added confidence to the identification of the likely Broadwaves tower sites. Photographs were taken at each tower site of the equipment and the support structure.

Having established the tower location for each circular coverage area represented on the Broadwaves website, the CN technician then performed signal tests for the detection of active wireless frequencies. The CN technician was equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900 MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands. At each signal test location, the CN technician attempted to be isolated from Wi-Fi networks in the test area, facilitated spectrum readings from the AVCOM analyzer and captured the results of the frequency tests as validation data for wireless tower transmissions. One such sample is illustrated below as **Exhibit C**.

Exhibit C: Signal Test Results for the Washington Service Area



Signal Propagation Maps

Upon making a reasonable confirmation that the tested tower site was a Broadwaves tower site, the CN technician estimated the antenna height, determined the GPS coordinates for the tower, and recorded this and other information into the standard Excel provider data collection format. With the objective of reasonably representing the provider's practical service area, the CN technician catalogued information for each tower site **(Exhibit D)**, and prepared propagation maps **(Exhibit E)** based on that information as well as the provider's own advertised service area representations.

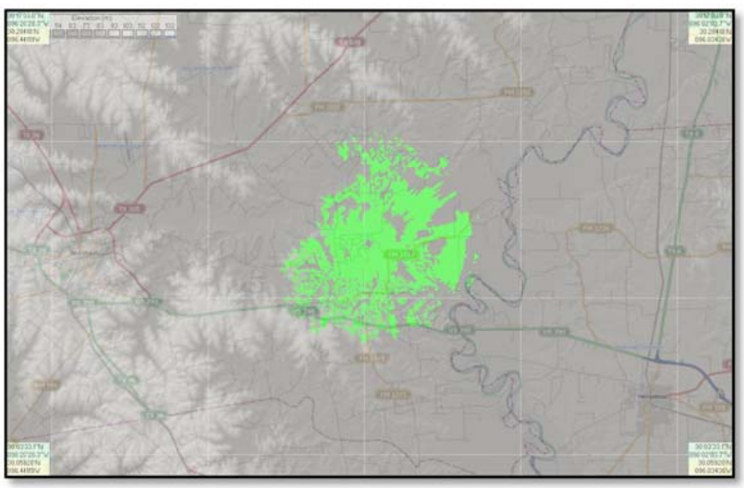
Exhibit E: Sample Propagation Map for the Chappell Hill Tower Location



Legacy Results and Submission from April 2012

After driving several hundred miles combing the highways, streets, and county roads of the provider's overall service area, nine access points were identified, eight of which were confirmed independently, and one which was confirmed through common network nomenclature. The composite propagation study (Exhibit A.2) reasonably represented (at the time) the researched service area based on then current information. Additionally, the provider's website listed maximum advertised downstream speeds and pricing structures represented herein as **Exhibit F**.

Results and Submission for October 2012

Recently, a review of the provider's website revealed the addition of a wireless propagation-style coverage map **(Exhibit G)**.

Between June 15 and August 15, 2012, at least three attempts were made to contact the provider and seek insight into the website map. The provider did not respond. Comparing Exhibits A.1 and G, the towers identified by CN for the April 2012 update are all represented in the provider's latest coverage map, and an expanded coverage is theoretically possible assuming the use of directional antennas, lowered line loss, higher gain customer premise antennas, etc.

Exhibit H represents the provider's coverage estimate for this October 2012 mapping update. The coverage map represents the green signal areas in the depiction from the provider's website, based on propagation software parameters utilized by a CN engineer to reasonably replicate the website map. For the April 2013 update cycle, CN will perform field tests to validate the extended signal propagation as indicated by the provider's website map.

Exhibit G: Broadwaves Website Coverage Map

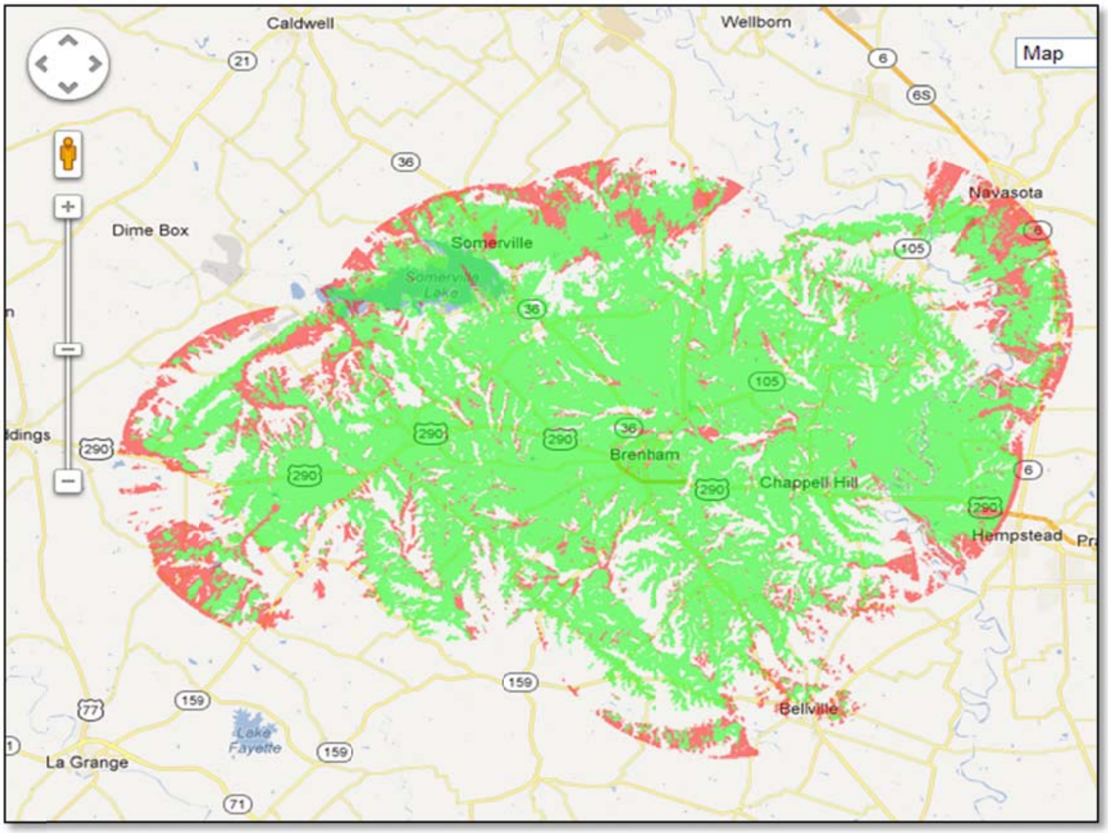

Exhibit H: Broadwaves October 2012 Coverage Map Update

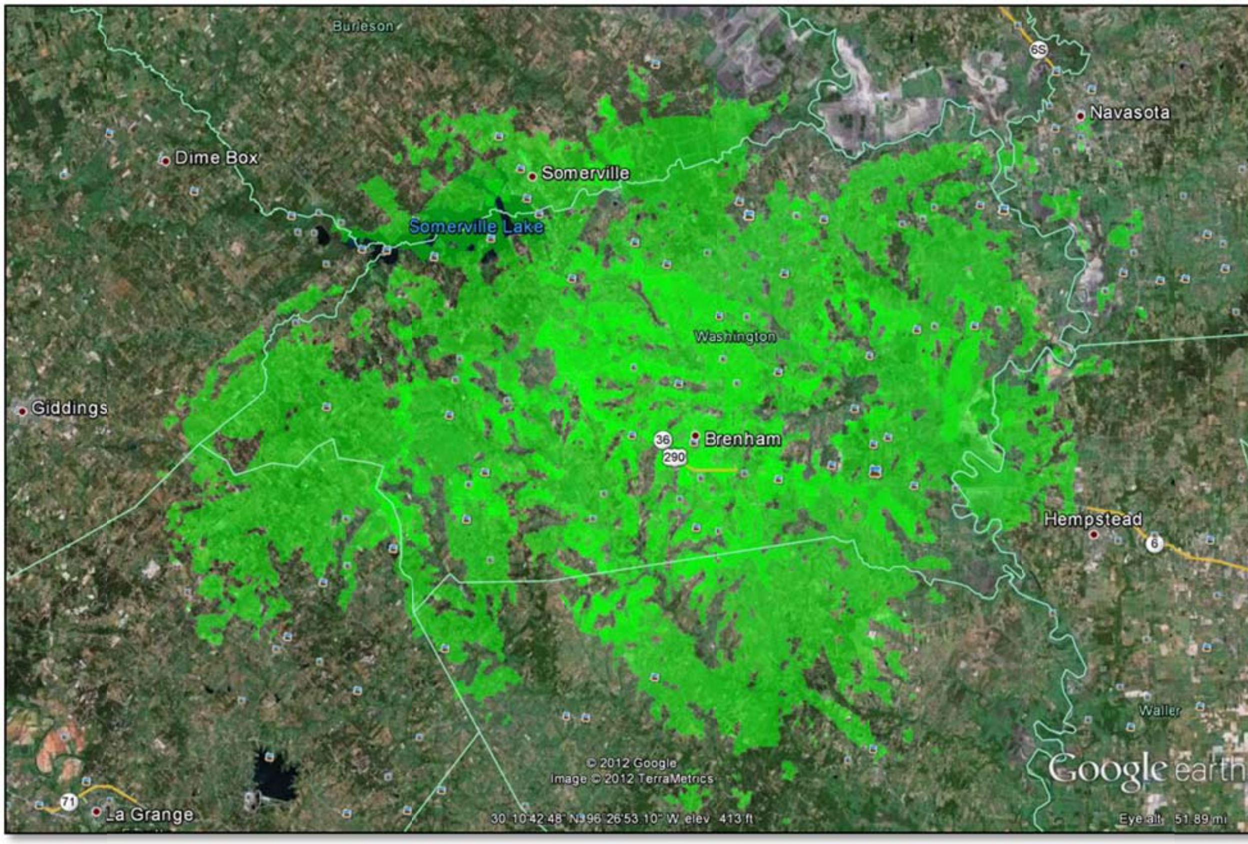

CKS Wireless, Inc.

As part of its ongoing broadband mapping efforts, Connected Nation has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying broadband provider, regardless of whether the provider has chosen to support and participate in the SBI mapping initiative.

The following narrative provides detail regarding the recent, and ongoing, data collection and coverage estimation activities related to CKS Wireless, Inc., a wireless Internet service provider (WISP), located in Jacksonville, Texas with a service area around Mount Selman, Ponta, Jacksonville, and Rusk, Texas. The narrative will include information regarding how and where CN obtained publicly available data and used on-the-ground validation techniques that support the underlying data.

October 2012 Submission Commentary

Connected Nation created this coverage estimation document during the October 2011 submission period as a result of the ongoing non-participatory status of the provider. Since the inception of the SBI program, CN made 30 attempts to contact the provider (either by phone, e-mail or in person). On August 12, 2012, the estimated coverage map **(Exhibit I),** that had been produced during the October 2011 submission cycle, was once again presented to the provider requesting their review and comments. As of August 27, 2012, no replies were received from the provider.

CN has continued to closely monitor the provider's website to determine if any changes to the coverage area or maximum advertised speeds have occurred. To date, CN has been unable to locate evidence of any recent changes reported on the provider's website for infrastructure that was current as of June 30, 2012. To that end, CN is resubmitting this coverage estimation narrative, substantially in its original format, and will continue to monitor the provider's website as well as ensure ongoing outreach until either the expiration of the SBI grant or until such time as the provider voluntarily contributes data. Given the very recent update for tower locations **(Exhibit J)**, CN engineers have flagged this provider's file and will conduct additional field validation and site verification activities in order to update this document for the April 2013 mapping cycle.

The Issue

CKS Wireless, Inc. by its lack of responsiveness since May 13, 2010, has predicated its unwillingness to participate in the Connected Texas broadband mapping initiative.

Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing

CN has built a file based on research information and, as time progressed, enriched the file with information obtained through the public domain or through on-the-ground research and site verification. For example, CN reviewed the provider's website (www.ckswireless.com) to determine the residential service plans **(Exhibit A)** and the service area **(Exhibit B)** of the provider's wireless network. A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) the system yielded an FRN of 0006165625 **(Exhibit C)** with contact information relative to the owner of the company. Also, to support field validation of access points, the FRN was referenced to the FCC Universal Licensing System (ULS) to identify any licenses the provider may hold which could possibly enhance locating active access points for the service area. This process yielded license WQJW906 **(Exhibit D)**, Radio Service: NN-3650-3700MHz with 7 reported (5 unique) locations.

installation prices

The price of installation varies, depending on the location of you home or business, and surrounding terrain. Exact price is determined at the time of the site survey, but is usually between $150.00 and $250.00. This is a one time, upfront cost for installation only, as CKS maintains ownership of the equipment.

Preliminary Identification of Provider's Coverage Area

Connected Nation extracted the CKS Wireless, Inc. service area map from its website and the information through the FCC ULS database in reference to license WQJW906. The website service area was utilized to create a Google Earth image overlay **(Exhibit E).** The image overlay was positioned to match the Google Earth base map's roadways, county boundaries, and water bodies. The degree of accuracy of the image overlay was maintained at less than .1 mile (528 ft.) to establish a minimum search criteria of a given access point. The provider's service area depiction is represented by tower symbols as shown in Exhibit B. Using the coordinates (5 unique locations) available through the FCC ULS license search an accuracy validation of the image overlay was conducted to determine the feasibility of utilizing the tower symbols for identifying coordinates of the remaining 7 locations. Coordinates were entered into Google Earth for the 5 unique 3650 MHz licensed locations and examined utilizing the zoom option of the aerial imagery. All five locations structures were identified. This provided a means of establishing coordinates for the remaining access point locations. All 12 locations were entered into the Microsoft *Streets & Trips* software program **(Exhibit F)** to develop a route for the validation process.

Exhibit E: Google Earth - Provider's Service Area Image Overlay

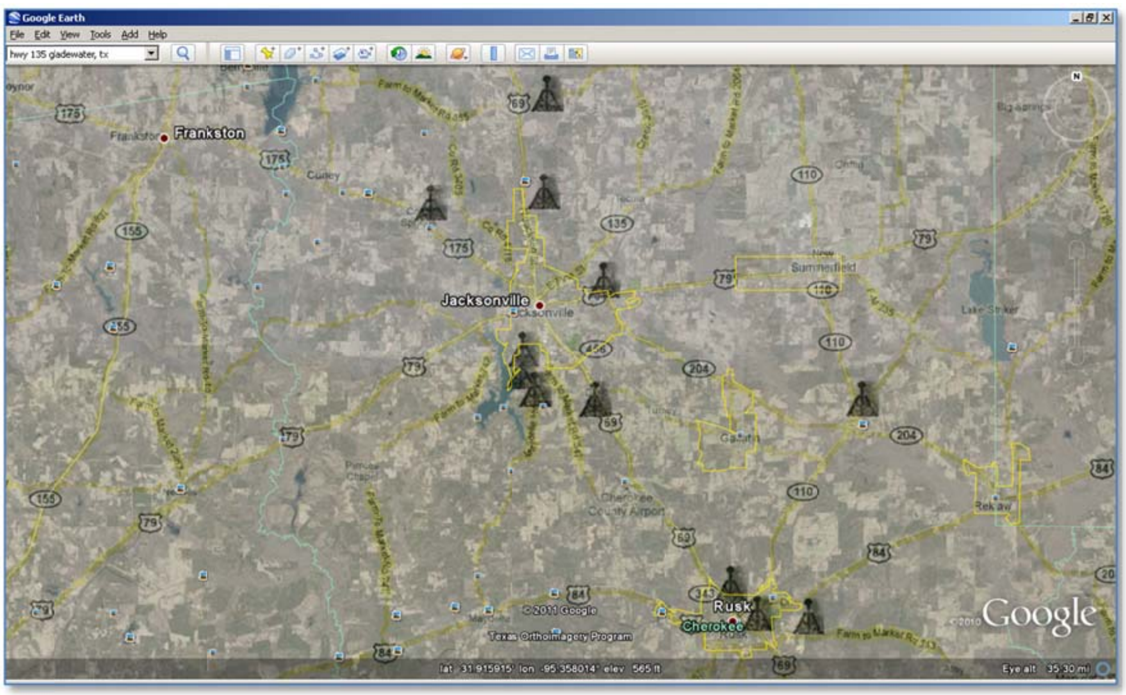

Exhibit F: Validation Points for AP Structures

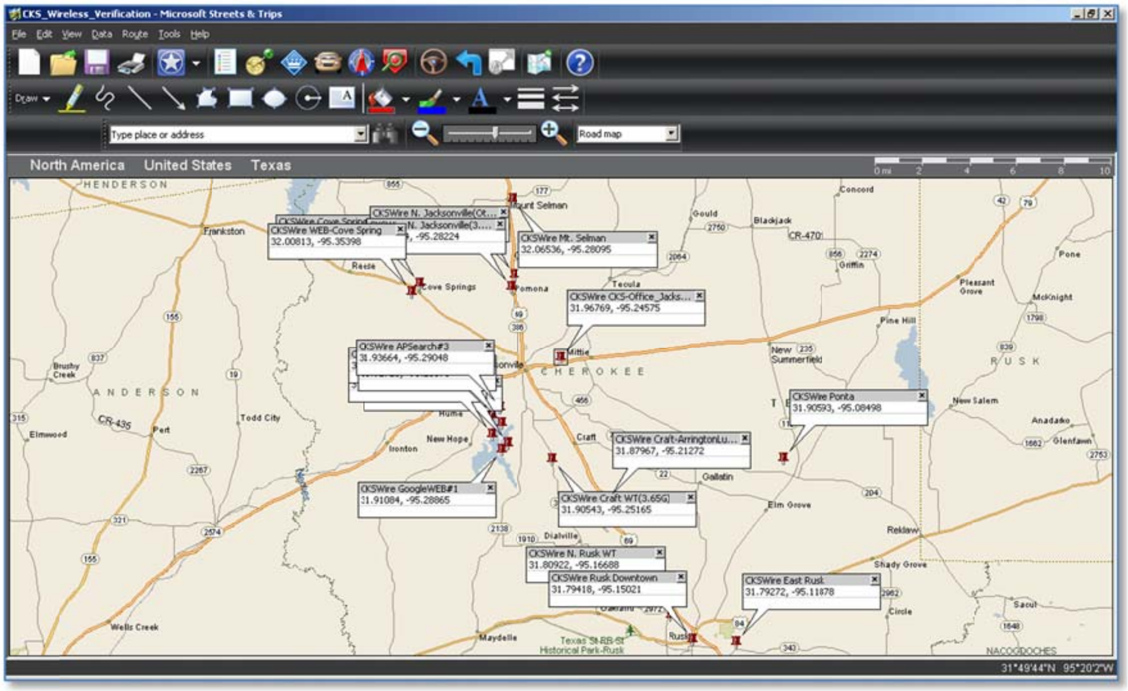
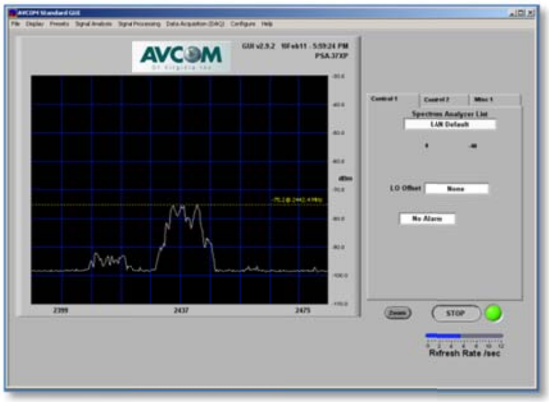
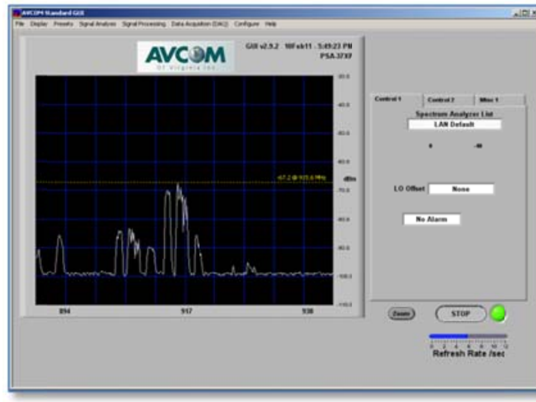


Testing Techniques

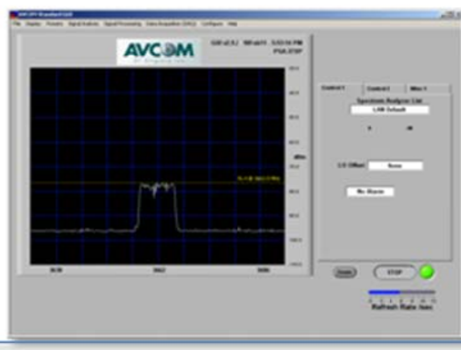
Connected Nation staff developed a site validation route based on data established with the Google Earth image overlay and publicly available data through the FCC ULS database for CKS Wireless, Inc. 3650-3700MHz radio service. The CN wireless engineer was equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900 MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands **(Exhibit G)**. Each validation point was scrutinized for frequency of operation. A screen image of the operating frequency (or frequencies) was captured; general notes were recorded for each location-approximate antenna height, frequency of operation, antenna type (omnidirectional or sectored) and photographs were taken of the access points.

Exhibit G: Field Data for CKS Wireless, Inc. Office/Hub Location





Provider	Location	Latitude	Longitude	Frequency Availability				Structure	Approximate Antenna Height	Notes
				900MHz	2.4GHz	3.65GHz	5.0GHz			
CKSWire	CKS-Office_Jacksonville(3.65G)	31.967694	-95.245750			X		Tower	39 meters	3.65GHz, azimuth 184 degrees, vertical polarity-39 meters/azimuth 325 degrees, horizontal polarity-39 meters (serving as backhaul)
				X					120 ft.	Estimated height. Omni antenna.
					X				120 ft.	Estimated height. Sector array-120 degrees.



Background Results and Submission for October 2012

Of the 18 locations visited during the validation point route, 12 access points were identified and relative information was logged into the CKS Wireless, Inc. field validation notes file **(Exhibit H)**. The field and the publicly available data were transferred to the Connected Nation Provider Information file. A composite propagation study was completed based on the field data **(Exhibit I)**. Both documents were forwarded to CKS Wireless, Inc. and advised the information will be submitted to Connected Texas and the NTIA broadband mapping project for processing if there are no discrepancies of the estimated coverage received from the provider within a 48-hour period. Despite that aforementioned call-to-action and the 3 additional contact attempts during this mapping cycle, the provider continues to be non-responsive.

EAST TEXAS BROADBAND

As part of its ongoing broadband mapping efforts, Connected Nation has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying broadband provider, regardless of whether the provider has chosen to support and participate in the SBI mapping initiative.

The following narrative provides detail regarding the recent data collection activities related to East Texas Broadband, a wireless Internet service provider (WISP), located in Palestine, Texas, with a service area around Palestine, Elkhart, and Elmwood, Texas. The narrative will include information regarding how and where CN obtained publicly available data and the on-the-ground validation techniques that support the underlying data.

October 2012 Submission Commentary
Connected Nation created this coverage estimation document during the October 2011 submission period as a result of the ongoing non-participatory status of the provider. In addition to the 7 instances of e-mail and/or telephone communication during the October 2011 and April 2012 submission periods (as previously reported), CN made 4 additional attempts to contact the provider during this mapping cycle. On August 12, 2012, the estimated coverage map **(Exhibit G)** which was produced during the October 2011 submission cycle was once again forwarded to the provider requesting review and comments. As of August 27, 2012, no replies were received from the provider.

CN has continued to closely monitor the provider's website to identify any changes in the coverage area or maximum advertised speeds but did not locate evidence of any recent changes. To that end, CN is resubmitting this coverage estimation narrative, substantially in its original format, and will continue to monitor the provider's website as well as ensure ongoing outreach until either the expiration of the SBI grant or until such time as the provider voluntarily contributes data.

The Issue
East Texas Broadband, by its lack of responsiveness since February 4, 2011, has predicated its unwillingness to participate in the Connected Texas broadband mapping initiative.

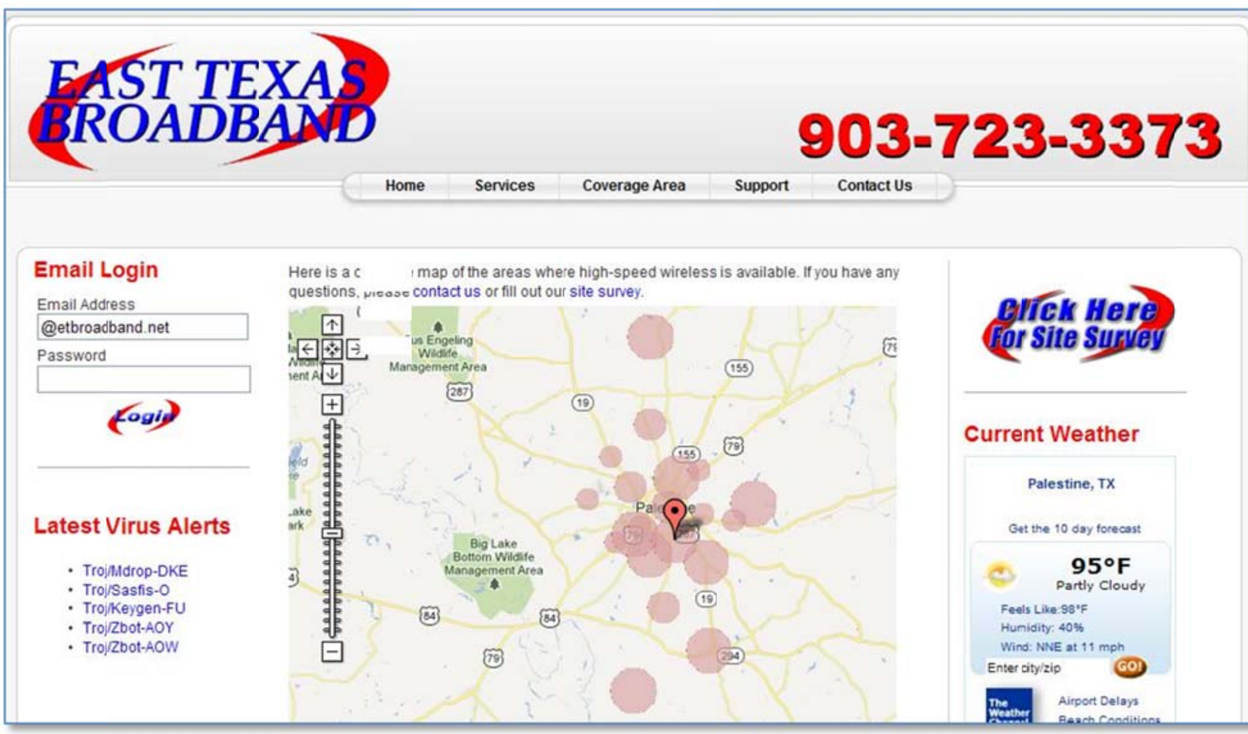
Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing
CN has built a file based on research information and as time has progressed, enriched the file with information obtained through the public domain or by phone inquiry through the provider's customer support line. Additionally, CN staff spent substantial time in the field compiling data, verifying infrastructure, and generating this coverage estimation document. For example, CN reviewed the provider's website (http://www.etbroadband.net) to determine the residential service plans. However, the website did not identify the residential service plans. A telephone call was placed through customer support and the residential plans were quoted over the phone **(Exhibit A)** and the service area **(Exhibit B)** of the provider's wireless network was identified. A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) system yielded no FRN for East Texas Broadband. Also, to support field validation of access points, the FCC Universal Licensing System (ULS) was utilized to identify any licenses the provider may

hold which could possibly enhance locating active access points for the service area. This process yielded no licensed frequencies associated to East Texas Broadband, indicating the provider's broadband delivery is by way of the unlicensed Wi-Fi frequencies band (900 MHz, 2.4 GHz, and 5 GHz).

Exhibit A: Service Plans

Speed Tier Offerings		Residential Service Price
Download	**Upload**	
512Kbps	256Kbps	$24.95
1Mbps	512Kbps	$39.95
2Mbps	1Mbps	$54.95
3Mbps	1Mbps	$69.95

Exhibit B: Service Area



<u>Preliminary Identification of Provider's Coverage Area</u>

Connected Nation extracted the East Texas Broadband service area map from its website. The website service area was utilized to create a Google Earth image overlay **(Exhibit C).** The image overlay was positioned to match the Google Earth base map's roadways, county boundaries, and water bodies. The degree of accuracy of the image overlay was maintained at less than .1 mile (528 ft.) to establish a minimum search criteria of a given access point. The provider's service area depiction is represented by circular type polygons as shown in Exhibit B. Based on the provider's website coverage depiction there are nineteen (19) locations identified as possible locations for access point structures. Utilizing Google Earth with the provider's coverage overlay (Exhibit C), coordinates were established of the circular polygons center points for route development. Further enhancement for possible structure identification was completed by a satellite aerial imagery and street level session with the Google Earth application. Possible structure locations were identified around the center points. This provided a means of establishing coordinates for the access point locations. Twenty-one (21) locations were entered into Microsoft *Streets & Trips* software program **(Exhibit D)** to develop a route for the validation process.

Exhibit C: Google Earth - Provider's Service Area Image Overlay

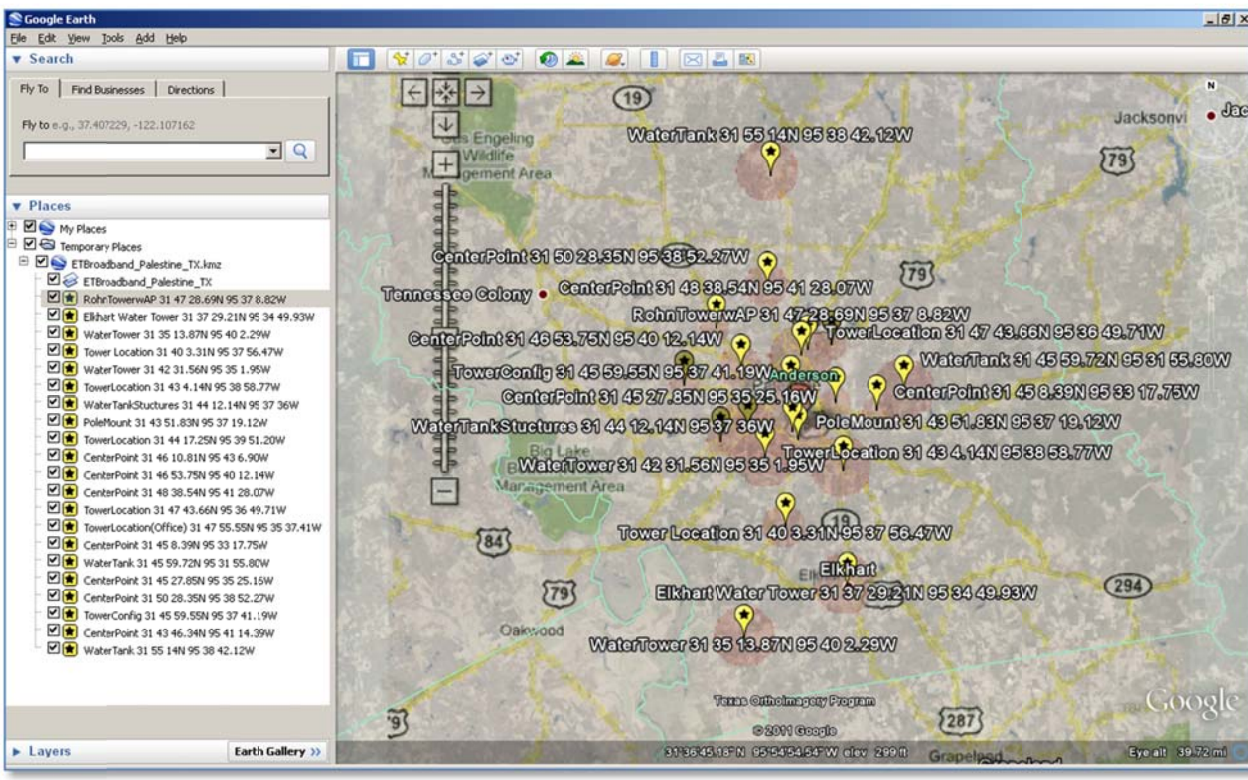


Exhibit D: Validation Points for AP Structures

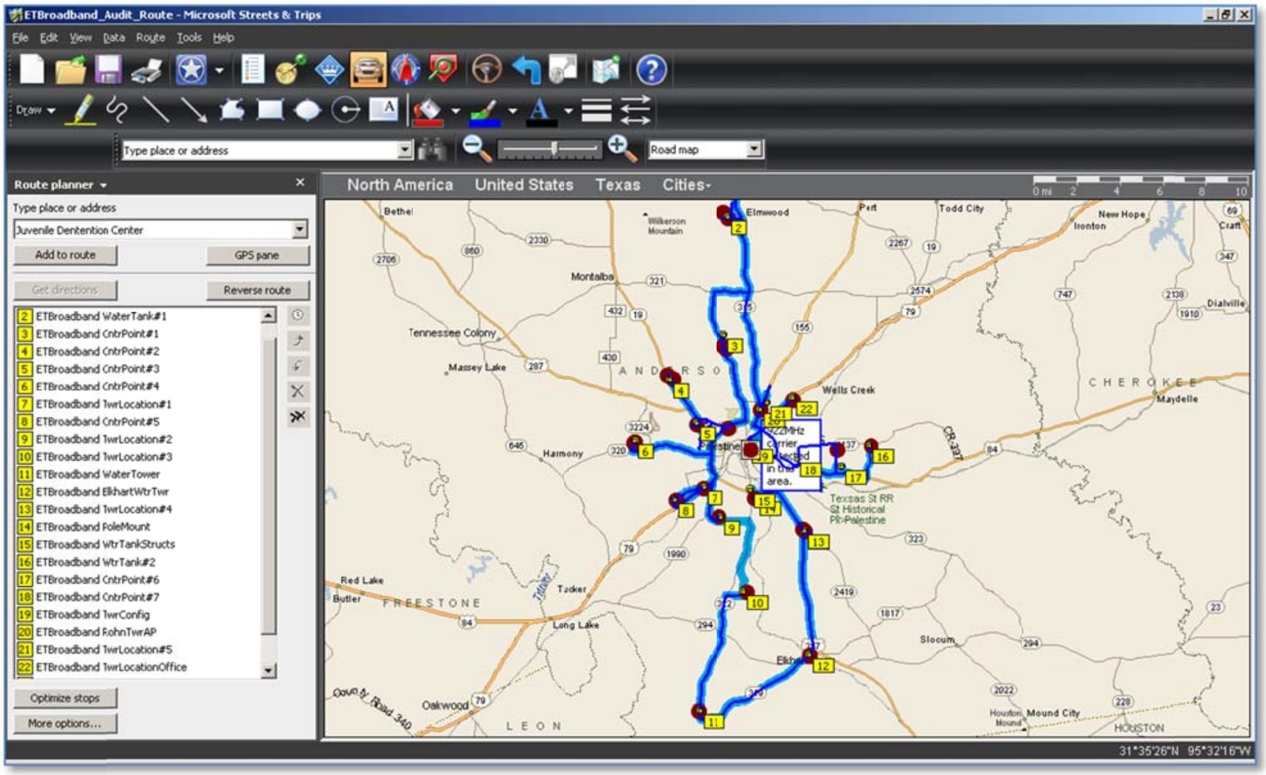
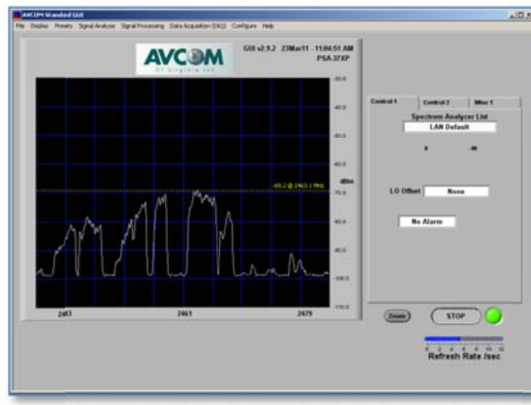


Testing Techniques

Connected Nation staff developed a site validation route based on data established with the Google Earth image overlay and publicly available data through East Texas Broadband's website. The CN wireless engineer was equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900 MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands **(Exhibit E)**. Each validation point was scrutinized for frequency of operation. A screen image of the operating frequency (or frequencies) was captured; general notes were recorded for each location-approximate antenna height, frequency of operation, and antenna type (omnidirectional or sectored), and photographs were taken of the access points.

Exhibit E: Sample Field Data for East Texas Broadband
CR433-ROHN (CntrPoint#2) Location



Provider	Location	Latitude	Longitude	Frequency Availability				Structure	Approximate Antenna Height	Notes
				900MHz	2.4GHz	3.65GHz	5.0GHz			
East Texas BB	CR433-ROHN (CntrPoint#2)	31.813611	-95.693056		X			Residential Rohn	80	

<u>Background Results and Submission for October 2012</u>

Of the 21 locations visited during the validation point route, 17 access points were identified and relative information was logged into the East Texas Broadband field validation notes file **(Exhibit F)**. The field and the publicly available data were transferred to the Connected Nation Provider Information file. A composite propagation study was completed based on the field data **(Exhibit G)**. Both documents were forwarded to East Texas Broadband and advised the information will be submitted to Connected Texas and the NTIA broadband mapping project for processing if there are no discrepancies of the estimated coverage received from the provider within a 48-hour period. Despite that aforementioned call-to-action and the 4 additional contact attempts during this mapping cycle, the provider continues to be non-responsive.

Exhibit F: Field Validation Notes

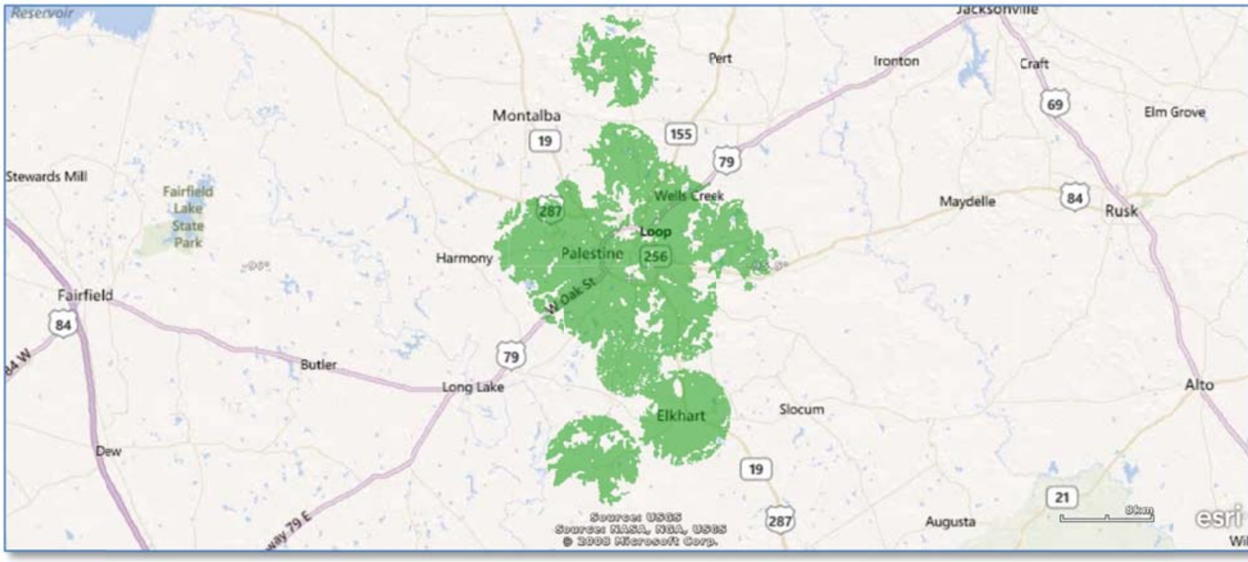
Exhibit G: East Texas Broadband Composite Coverage



EAST TEXAS CABLE

As part of its ongoing broadband mapping efforts, Connected Nation (CN) has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying broadband provider, regardless of whether the provider has chosen to support and participate in the SBI mapping initiative.

The following narrative provides detail regarding the recent data collection activities related to East Texas Cable, a cable broadband Internet provider in Canton, Texas. The narrative will include information regarding how and where CN obtained publicly available data and the consumer-provided validation techniques that support the underlying data.

October 2012 Submission Commentary

Connected Nation created this coverage estimation document during the October 2012 submission period as a result of the ongoing non-participatory status of the provider. In addition to the 6 instances of e-mail and/or telephone communication during the April 2012 submission period (as previously reported), CN made 4 additional attempts to contact the provider during this mapping cycle, yet the provider remained non-responsive.

CN has closely monitored the provider's website to identify any information related to maximum advertised speed tiers, coverage areas or other information that could be used as part of this coverage estimation document. CN presents, herein, its methodologies used for creating a coverage estimation of East Texas Cable.

The Issue

East Texas Cable, by its lack of responsiveness since the inception of the State Broadband Initiative (SBI) program, has predicated its unwillingness to participate in the Texas broadband mapping program.

Identification of Provider's Legal Name, d.b.a., and FRN

CN began building a file based on research information and, as time progressed, enriched the file with information obtained through the public domain. For example, CN reviewed the provider's website (www.etcable.net) to determine the residential service plans **(Exhibit A)**. A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) system yielded an FRN of 0003782166 **(Exhibit B)**.

Exhibit A: Residential Service Plan

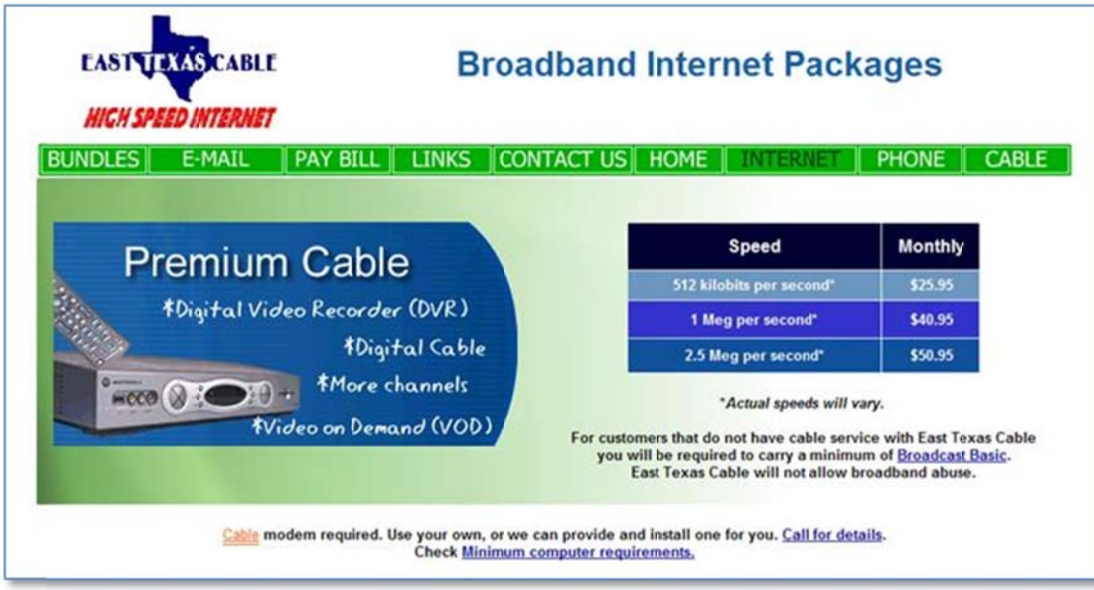


Exhibit B: FRN

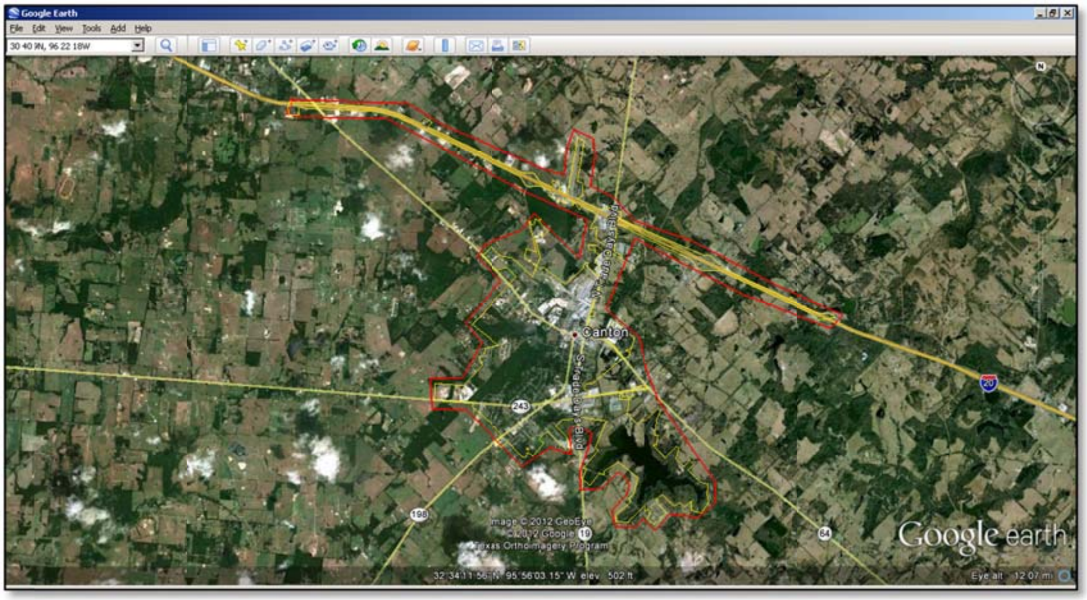
Identification of Provider's Coverage Area

Connected Nation identified the municipality boundary for Chandler, Texas via *Google Earth* application **(Exhibit C)**. The identification of the municipality boundary was utilized to establish possible "end of line (termination points)" of the East Texas Cable network distribution along the thoroughfares (easements). Markers were established for these points **(Exhibit D)** to develop a route for the CN staff member to complete a field audit of the cable television delivery system for identifying components and the distribution routing of the East Texas Cable network.

Exhibit C: Boundary



Testing Techniques

Possible "end of line" reference points **(Exhibit D)** were pre-selected and entered into Microsoft *Streets & Trips* software. The goal was to drive through each thoroughfare and determine the existence (or lack thereof) of CATV plant and identify the end of line (termination points). As distribution components and assets of East Texas Cable were identified, markers were placed within *Streets & Trips* **(Exhibit E)** pinpointing the end of line (termination points) and identifying the area where service was likely to exist.

Exhibit D: End of Line Reference Points

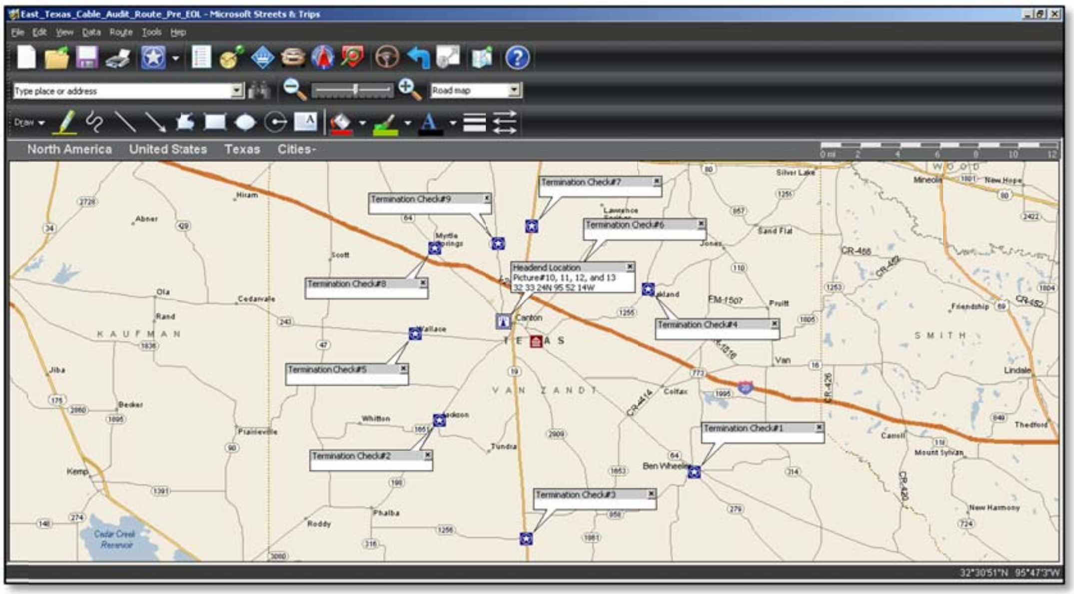


Exhibit E: Cable Components and Asset Locations

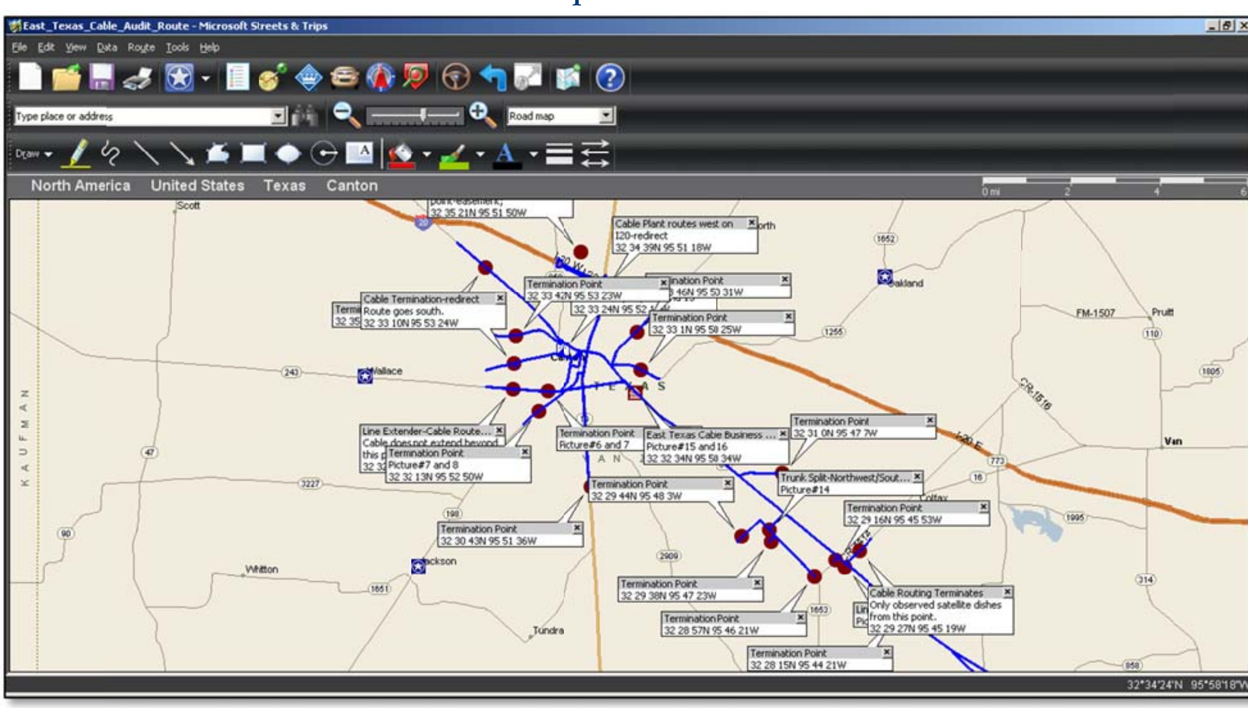


Visual identification of the headend **(Exhibit F and G)** and the business office **(Exhibit H)** were relatively easy and straightforward.

Exhibit F:
Cable Headend Tower

Exhibit G:
Cable Headend Satellite Dishes & Equipment Building

Exhibit H: East Texas Cable Business Office

The Connected Nation staff member (former Sr. Field Engineer for a CATV supplier) had very little difficulty in identifying CATV line distribution components. The images below **(Exhibit I and J)** demonstrate that the Connected Nation staff member was able to obtain visuals to assist with an estimated coverage. The depictions are just a sample observed throughout the audit route.

Exhibit I:
Trunk Distribution AmplifierAerial Plant

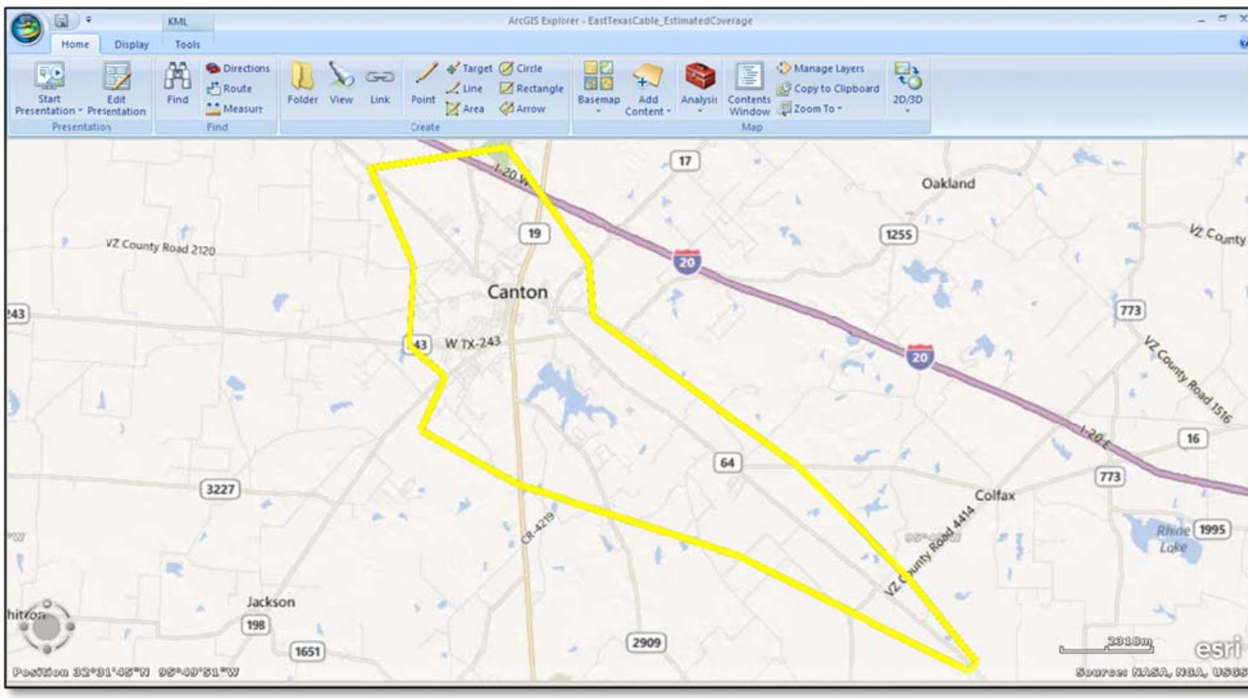
Exhibit J:
End of Line – Termination Point

Results and Submission for October 2012

As a result of the collection of publicly available information, and the on-the-ground validation efforts, Connected Nation is submitting this document in support of its coverage estimation for the cable modem broadband service area of East Texas Cable. Without provider participation and support of the SBI mapping initiative, CN proceeded with a logical, relevant and feasible methodology for collecting and validating the service area of this non-participating broadband provider.

Exhibit K depicts the estimated coverage area based on the results of data gathered through publically available sources combined with visual drive testing techniques.

Exhibit K: Validation Results



GoZoe Wireless

As part of its ongoing broadband mapping efforts, Connected Nation has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying broadband provider, regardless of whether the provider has chosen to support and participate in the SBI program.

The following narrative provides detail regarding the recent data collection and coverage estimation activities related to GoZoe Wireless, a wireless Internet service provider (WISP), located in Marshall, Texas, with a service area around Marshall, Texas, Harrison County. The narrative will include information regarding how and where CN obtained publicly available data and the on-the-ground validation techniques that support the underlying data.

October 2012 Submission Commentary

Connected Nation created this coverage estimation document during the April 2012 submission period (as a result of the ongoing non-participatory status of the provider). Fifteen total instances of e-mail and/or telephone communication have occurred leading up to this mapping cycle. On August 12, 2012, the estimated coverage map **(Exhibit I),** which was produced during the April 2012 submission cycle, was once again presented to the provider requesting review and comments. As of August 27, 2012, no replies were received from the provider.

CN has continued to closely monitor the provider's website to determine if any changes in the coverage area or maximum advertised speeds have occurred but did not locate evidence of any recent changes. To that end, CN is resubmitting this coverage estimation narrative, substantially in its original format, and will continue to monitor the provider's website as well as ensure ongoing outreach until either the expiration of the SBI grant or until such time as the provider voluntarily contributes data.

The Issue

GoZoe Wireless, by its lack of responsiveness since October 17, 2011, has predicated its unwillingness to participate in the Connected Texas broadband mapping initiative.

Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing

CN began building a file based on research information and, as time progressed, enriched the file with information obtained through the public domain. For example, CN reviewed the provider's website (http://www.gozoe.com/) to determine the residential service plans **(Exhibit A)** and the service area **(Exhibit B)** of the provider's wireless network. A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) system yielded an FRN of 0019577873 **(Exhibit C)** with contact information relative to the owner of the company. Also, to support field validation of access points, the FRN was referenced against the FCC Universal Licensing System (ULS) to identify any spectrum authorizations that may be held by the provider that could supplement the dataset of estimated coverage by isolating and identifying active wireless access points for the service area. This process yielded license WQMG924 **(Exhibit D)**, Radio Service: NN-3650-3700 MHz with 0 active locations.

MARSHALL PRICING
Installation - $99.00
Basic Equipment- ~~$150.00~~ Promotional Equipment Fee Waived

Monthly Packages

512k	$49.95 - Best for basic surfing and email usage
1Mb	$69.95 - Best for online video streaming, photo sharing , music downloads
1.5Mb	$89.95 - Best for VPN, large file transfers, VOIP or other high usage apps
Wide Open	$119.95 - Best for online gaming and movie downloads

CHOOSING YOUR SPEED
You will want to choose your speed based on what you will be doing on the internet. If you are doing basic web surfing, email, or sending and receiving small files you should be happy with 512k. If you are doing file sharing, VPN, or large file transfers you will want to go with 1-1.5Mb. This is also best for downloading photos, music, and online videos. If you are going to be downloading movies or gaming online, our Wide Open package is the best for you. Wide open means you are not throttled, guaranteeing you a minimum of 1.5Mb and allowing you to burst up to 3Mb.

<u>Preliminary Identification of Provider's Coverage Area</u>
CN extracted the GoZoe Wireless service area map directly from the provider's website. Information from that website was utilized to create a Google Earth image overlay **(Exhibit E).** The image overlay was positioned to match the Google Earth base map's roadways, county boundaries, and water bodies. The degree of accuracy of the image overlay was maintained at less than .1 mile (528 ft.) to establish a minimum search criteria of a given wireless access point. The provider's service area depiction is represented by polygons as shown in **Exhibit B**. Using the Google Earth image overlay each location was examined via an aerial zoom and street level observation to identify possible wireless access point structures at the center points of the polygons. This process provided a means of establishing coordinates for 15 validation points to identify structures with operational wireless transmit equipment. All 15 locations were entered into Microsoft *Streets & Trips* **(Exhibit F)** to develop a route for the data collection and validation process.

Exhibit E: Google Earth: Provider's Service Area Image Overlay

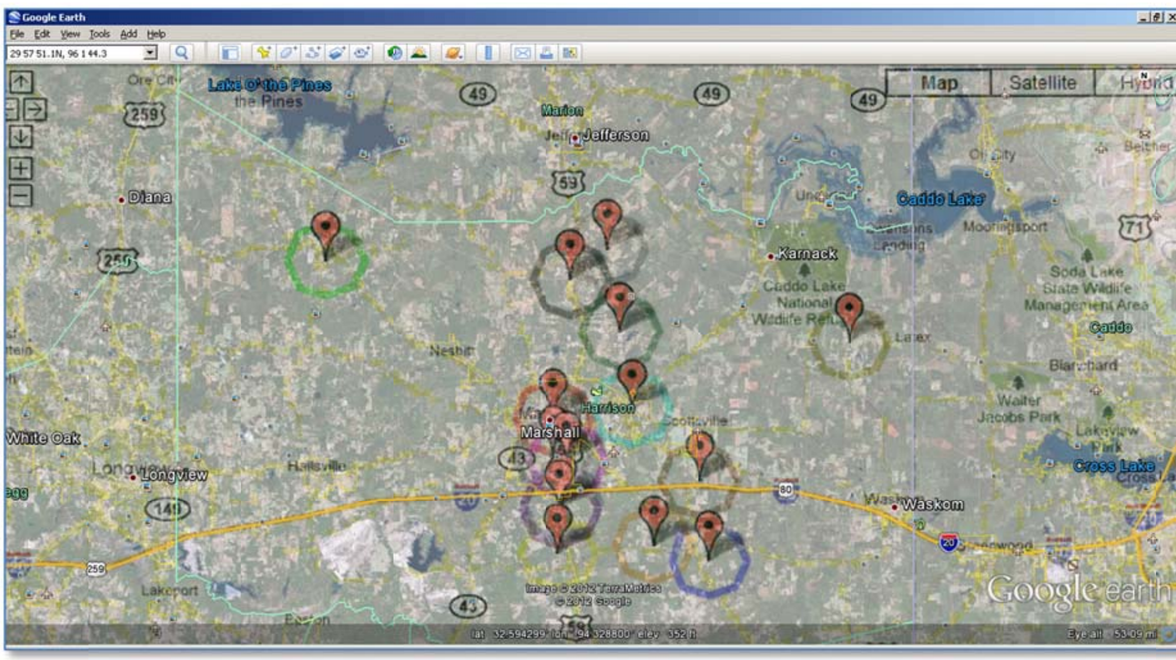

Exhibit F: Validation Points for AP Structures

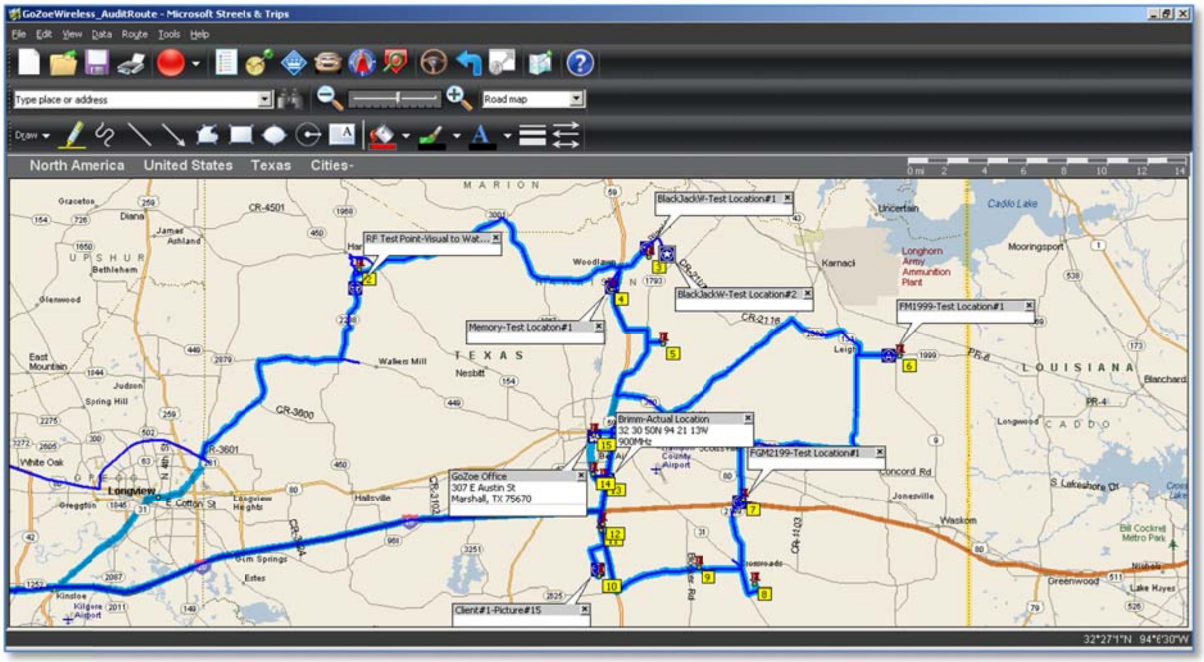
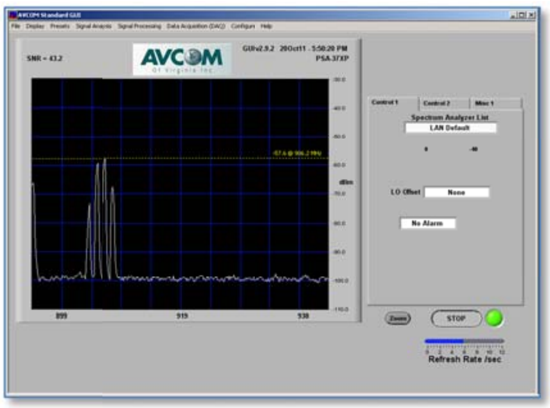
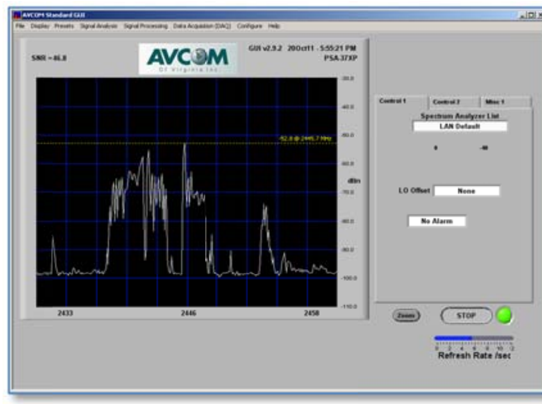


Testing Techniques

CN staff developed a data collection and site validation route based on information derived from the Google Earth image overlay of GoZoe Wireless' publicly available coverage on its website. The CN wireless engineer was equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900 MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands **(Exhibit G)**. Each validation point was scrutinized for frequency of operation. A screen image of the operating frequency (or frequencies) was captured; general notes were recorded for each location-approximate antenna height, frequency of operation, antenna type (omnidirectional or sectored) and photographs were taken of the access points.

Exhibit G: Field Data for GoZoe Wireless Office/Hub Location





Results and Submission for October 2012

Of the 15 locations visited during the coverage estimation and validation point route, 14 access points were identified and relative information was logged into the GoZoe field validation notes file **(Exhibit H)**. The field and the publicly available data were transferred to the CN Provider Information file. A composite propagation study was completed based on the field data **(Exhibit I)**. Both documents were forwarded to GoZoe Wireless as courtesy copies, and the provider was advised the estimated coverage information would be submitted to Connected Texas and to the NTIA unless the provider notified CN, within 48 hours, of discrepancies of the estimated coverage. The provider did not respond to CN and, as of this date, CN believes the information to be an accurate estimation of the service area of GoZoe Wireless.

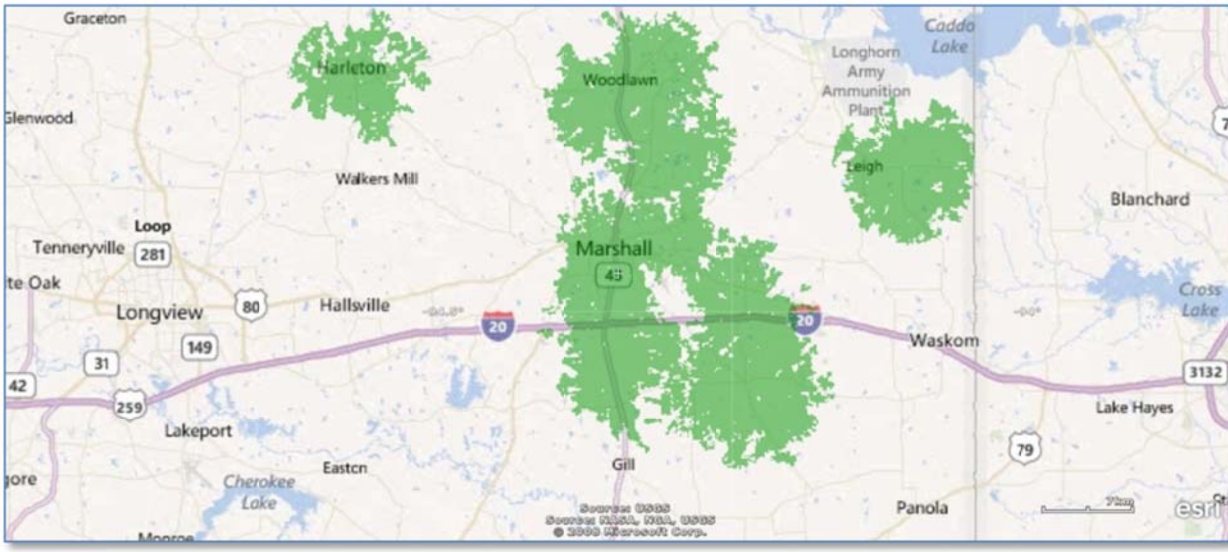
Exhibit I: GoZoe Wireless Composite Coverage



NDEMAND, INC.

As part of its ongoing broadband mapping efforts, Connected Nation (CN) has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying broadband provider, regardless of whether the provider has chosen to support and participate in the SBI mapping initiative.

The following narrative provides detail regarding the recent data collection activities related to NDemand, Inc., a wireless Internet service provider (WISP) located in Katy, Texas, with its service area in Nacogdoches County and Shelby County in eastern Texas. This narrative will include information regarding how and where CN obtained publicly available data, and the on-the-ground validation techniques that support the resulting broadband coverage estimate.

Background

CN staff members have attempted to obtain the participation of the provider with at least 15 recorded instances of communication via telephone and e-mail from September 19, 2011, through August 8, 2012. During that period, three personal visits were also made to the provider's office in Katy, Texas.

The Issue

NDemand, by its lack of responsiveness since September 19, 2011, has predicated its unwillingness to participate in the Connected Texas broadband mapping initiative. Connected Nation has been unable to obtain NDemand's broadband coverage information through typical outreach efforts, and the provider continues to show reluctance to participate in the Connected Texas broadband mapping initiative.

Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing

CN began building a file based on research information and, as time progressed, enriched the file with information obtained through the public domain. As a first step, CN reviewed the provider's website (www.ndemand.com) to determine the residential service plans **(Exhibit A)** and the service area **(Exhibit B)** advertised for the provider's wireless network.

Exhibit A: Advertised Service Plans

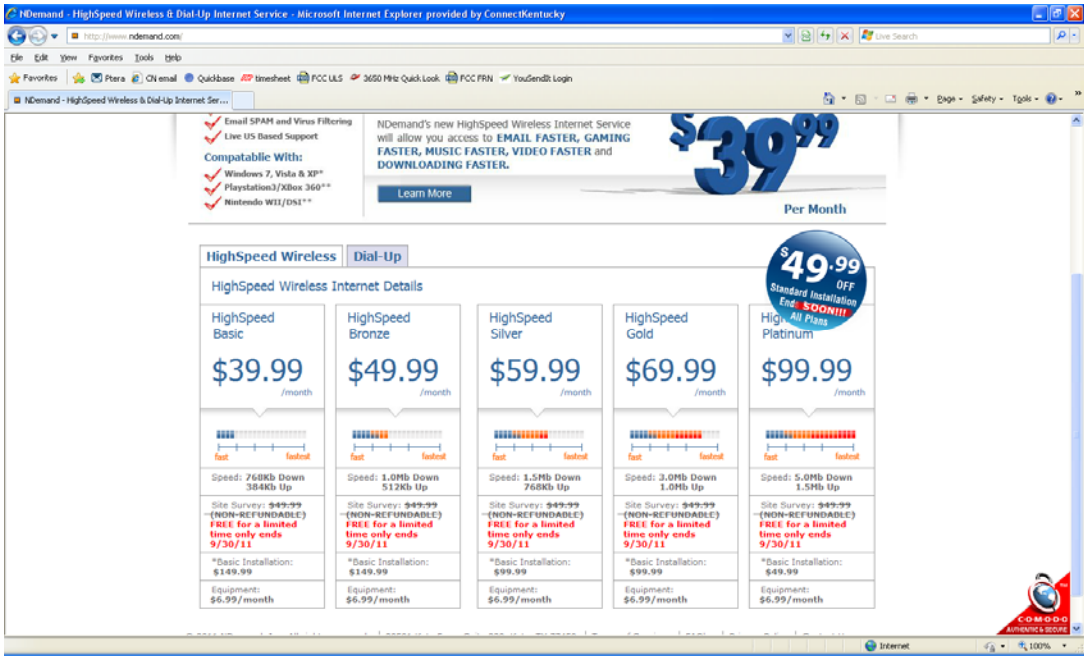


Exhibit B: Advertised Service Area

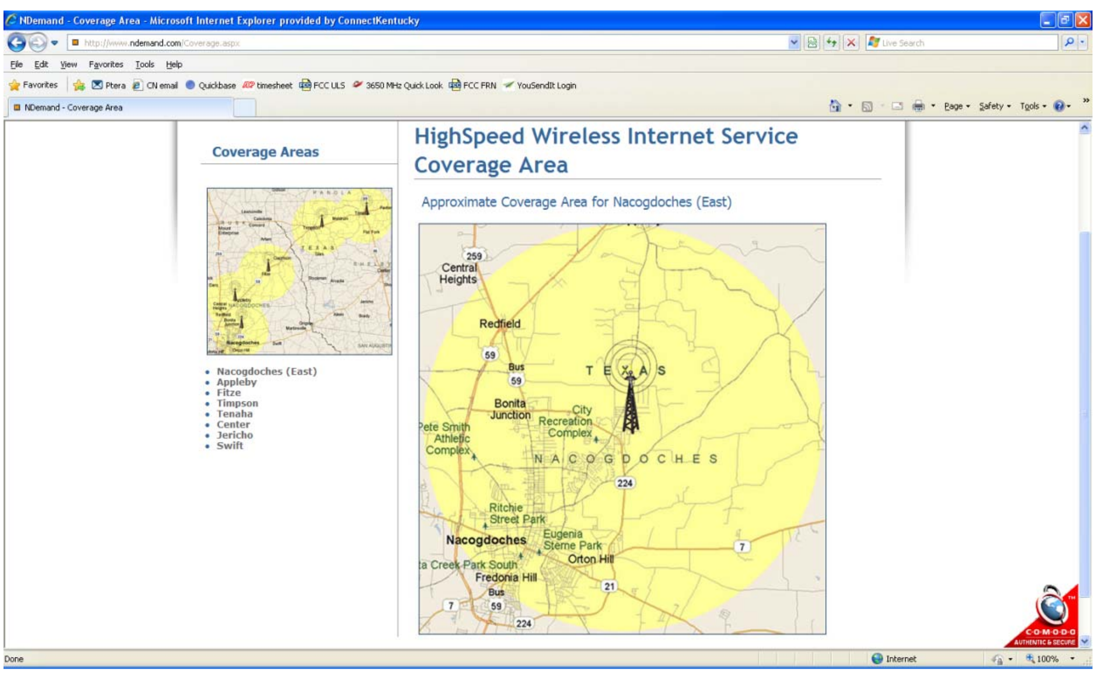

A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) system yielded an FRN of 0019660794 **(Exhibit C)** with company contact information. Also, to support field validation of access points, the FRN was referenced to the FCC Universal Licensing System (ULS) to identify any licenses the provider may hold which could assist in specifying active access points for the service area. This process yielded license WQLX343 **(Exhibit D)** utilizing frequencies at 3650-3700 MHz (FCC Radio Service Code "NN"), with 14 unique locations. Other licenses were also identified, however, these other licenses appeared to be specific to microwave backhaul usage rather than to last-mile residential wireless broadband service.

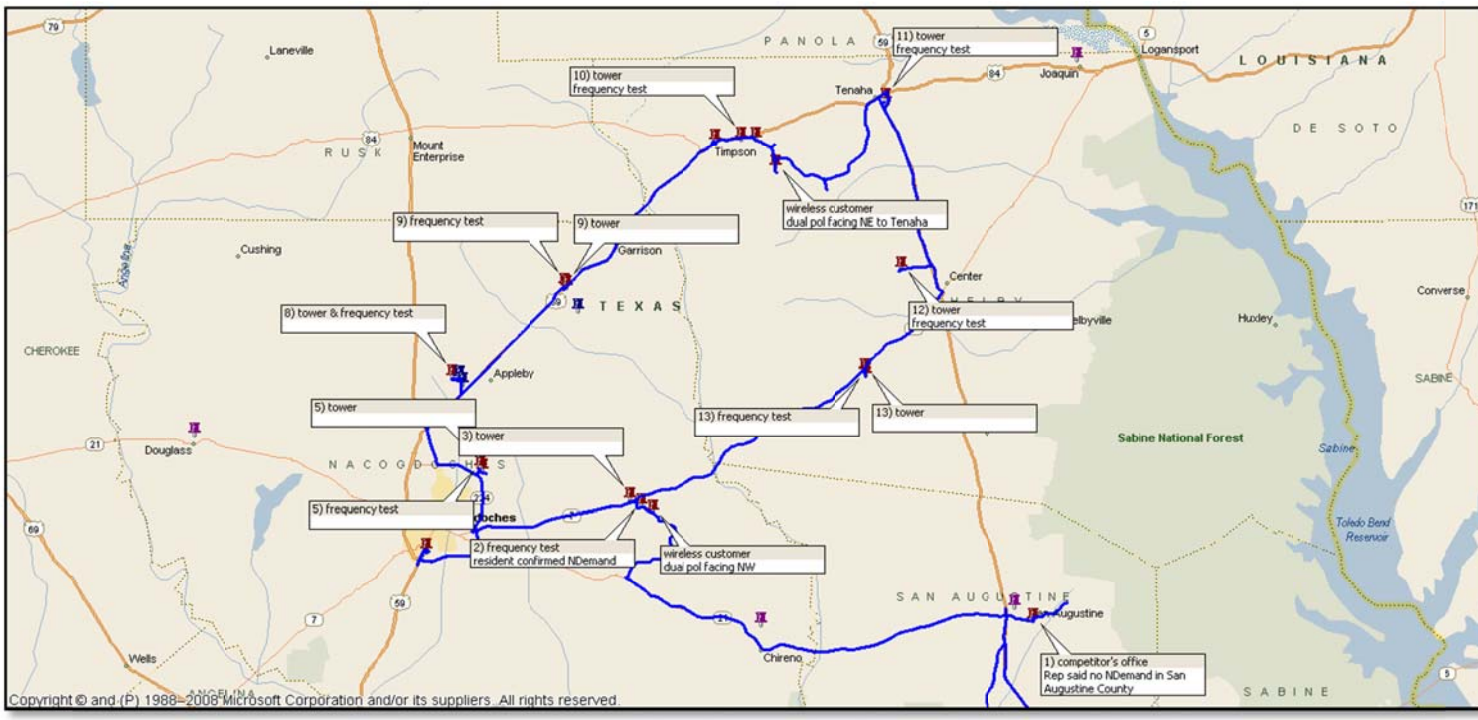
<u>Preliminary Identification of Provider's Coverage Area</u>
Utilizing location information contained in the license for WQLX343, images from the provider's website, and through other research (including a call to the provider's customer service telephone number), a CN staff member determined that no more than 8 of the license's 14 identified coordinates (shown above) were currently able to provide last-mile broadband service. Those 8 locations were compiled into a service area map for NDemand, and recorded in the Microsoft *Streets & Trips* mapping application **(Exhibit E)** to develop a route for the validation process.

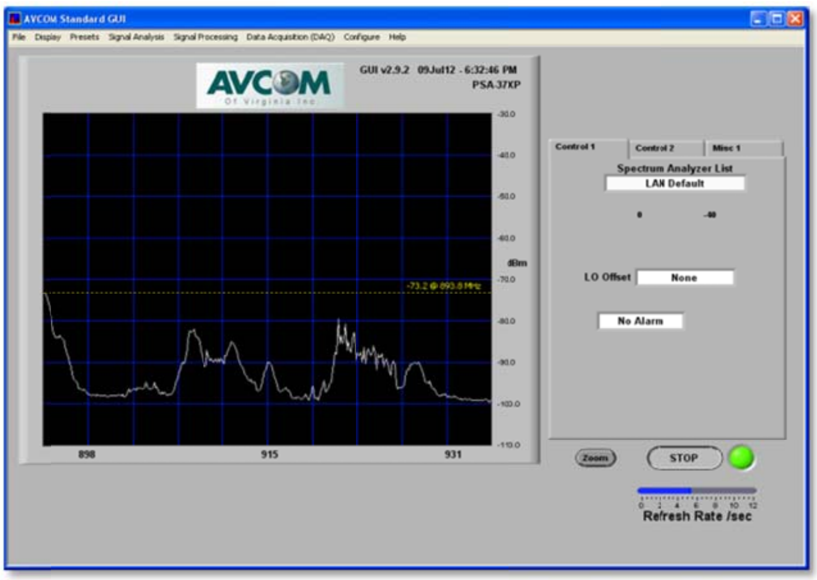
Exhibit E: Validation Points for Tower Structures

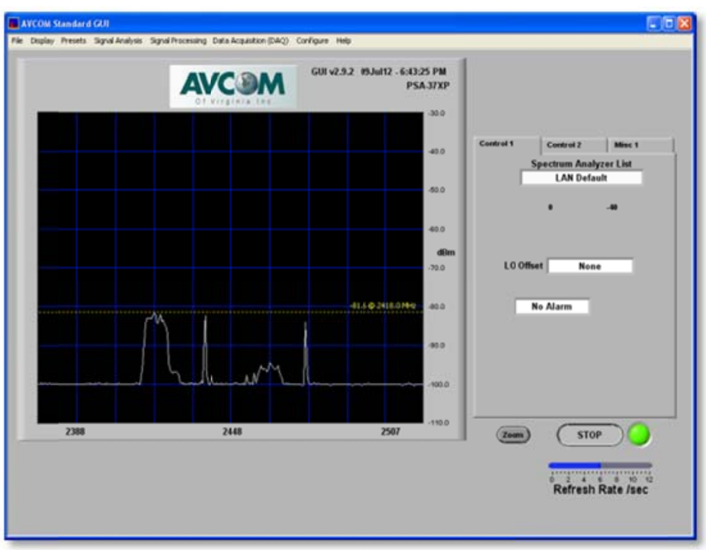


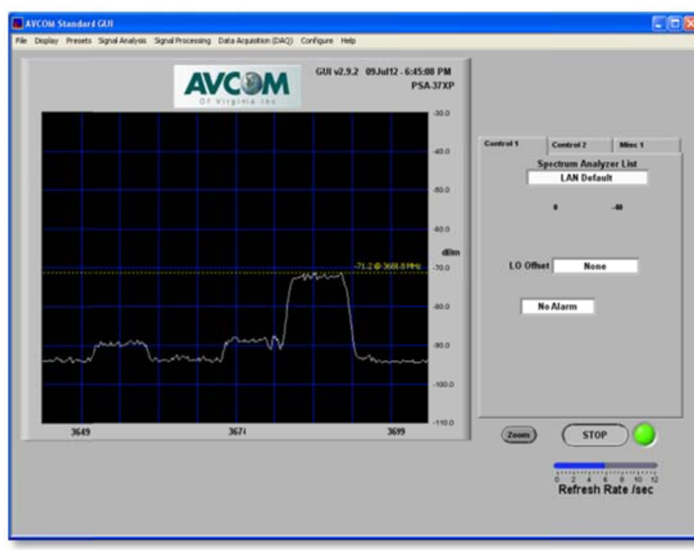
Field Testing Techniques

Having recorded the licensed locations for each of the circular coverage areas represented on the NDemand website, a CN technician drove to each location and performed signal tests for the detection of active wireless frequencies typically utilized to provide WISP service. The CN technician was equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900 MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands. At each signal test location, the CN technician attempted to be isolated from Wi-Fi networks in the test area, facilitated spectrum readings from the AVCOM analyzer, and captured the results of the frequency tests as validation data for wireless tower transmissions (**Exhibit F**).

Exhibit F: Signal Test Results for the Swift, Texas Tower Location







Signal Propagation Maps

In order to prepare propagation maps for each tower location, the CN technician identified the antenna height from the license information, verified the GPS coordinates for the tower while on-site, and recorded this and other information for each location into the standard Excel provider data collection format (**Exhibit G**). With the objective of reasonably representing the provider's practical service area, CN staff prepared propagation maps (**Exhibit H**) based on that information.

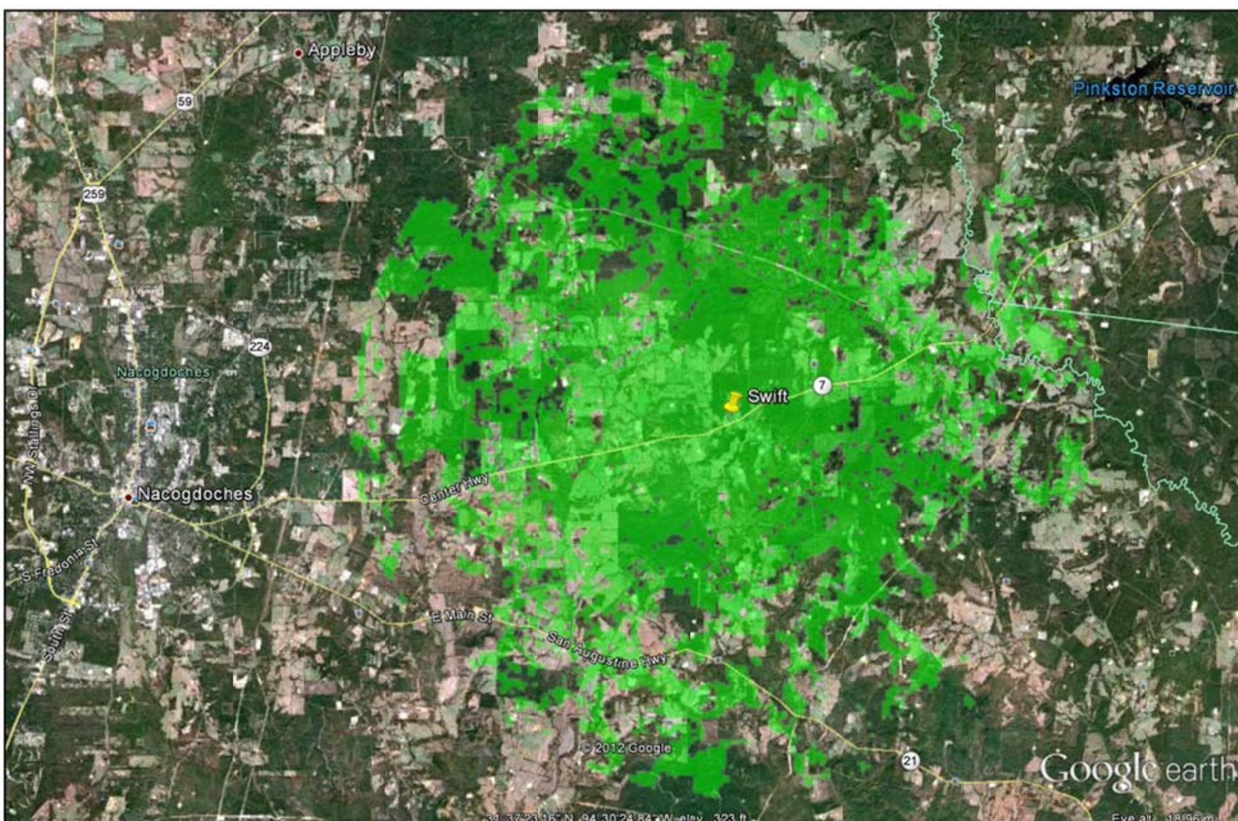
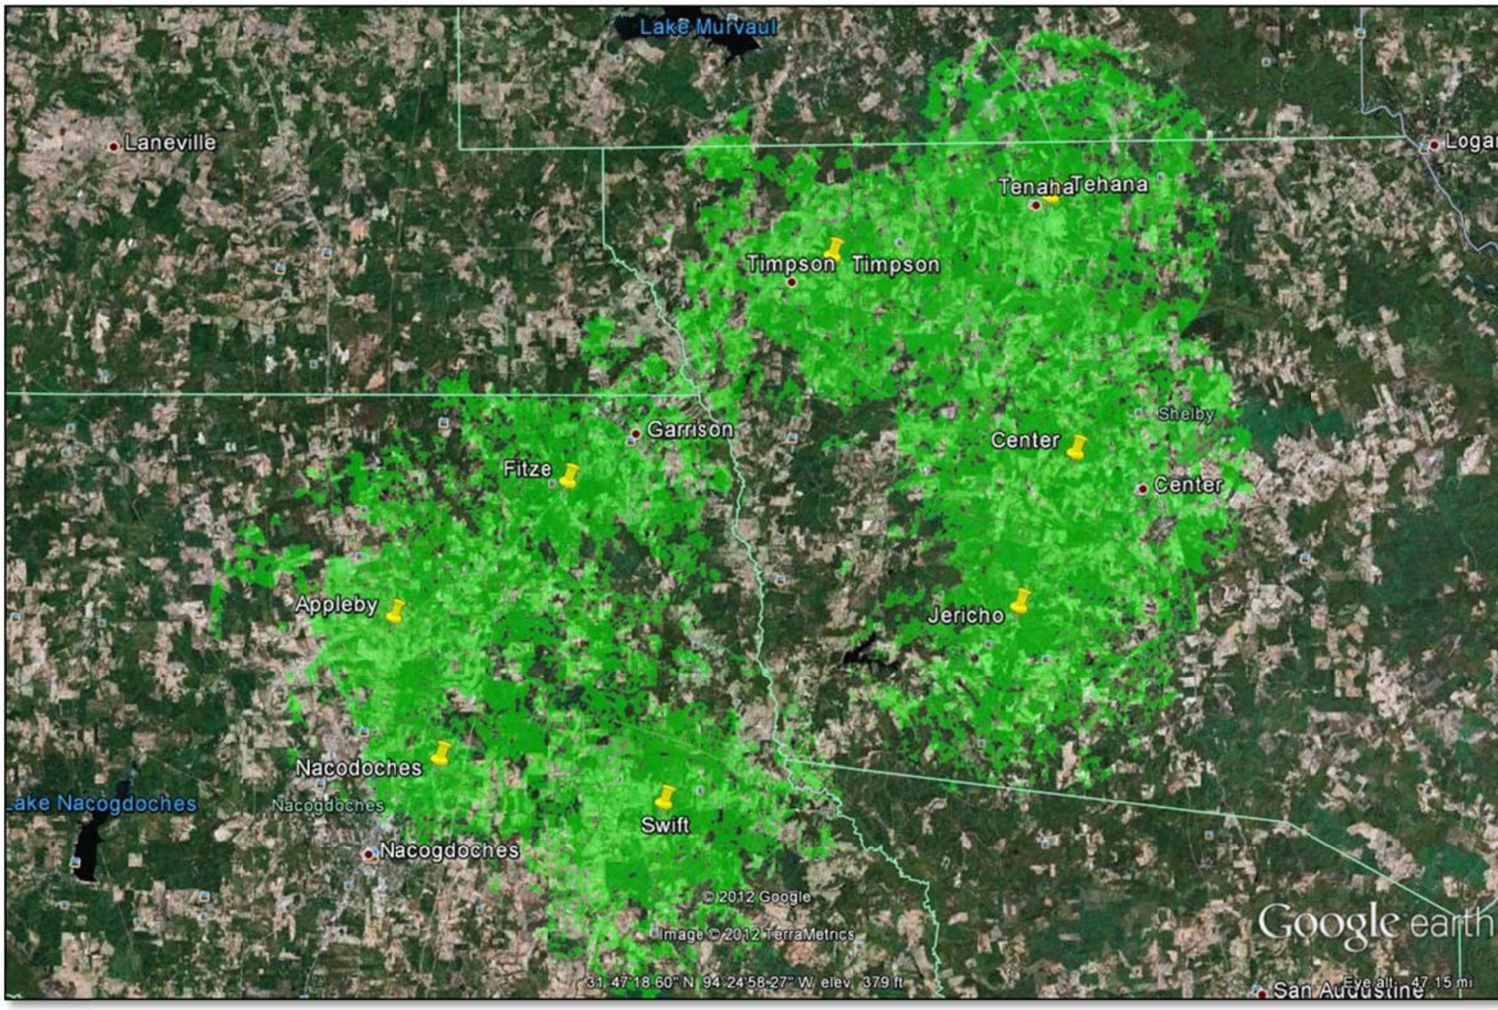
Exhibit H: Propagation Map for the Swift, Texas Location



Results and Submission for October 2012

All eight licensed tower locations for NDemand which were likely to be operational were visited and tested, as well as numerous additional sites in the search for customer premise equipment, frequencies utilized by potential competitors, and other verification data points. Testing at each site determined that wireless signal was available for broadband service. A composite propagation analysis was completed **(Exhibit I)**, which reasonably represents the estimated broadband coverage area based on all information identified as of July 10, 2012. The composite propagation map was forwarded to the provider for review and feedback prior to CN's including the coverage area in the Texas Broadband Map's October 2012 iteration; no response was received as of August 15, 2012.

Exhibit I: NDemand, Inc. Composite Coverage



SKYNET COMMUNICATIONS

As part of its ongoing broadband mapping efforts, Connected Nation (CN) has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying broadband provider, regardless of whether the provider has chosen to support and participate in the SBI mapping initiative.

The following narrative provides detail regarding the recent data collection and coverage estimation activities related to Skynet Communications (Skynet), a wireless Internet service provider (WISP) located in Fulshear, Texas, with its service area in the counties of Fort Bend, Wharton, and Brazoria. This narrative will include information regarding how and where CN obtained publicly available data, and the on-the-ground validation and site verification techniques that support the resulting broadband coverage estimate.

Background
CN staff members have attempted to obtain the participation of the provider with at least 12 instances of communication via telephone, e-mail, and personal visits from November 24, 2011, through August 1, 2012. Although the provider indicated that the company would likely participate in the mapping project, the lead representative has been reluctant to take the final step of reviewing the propagation maps for edits.

The Issue
Skynet, by its lack of active participation since November 24, 2011, has predicated its refusal to participate in the Connected Texas broadband mapping initiative. Connected Nation has been unable to obtain Skynet's broadband coverage information through typical outreach efforts, and the provider continues to show reluctance to participate in the Connected Texas broadband mapping initiative, even after being presented with a pre-populated datasheet and a complete set of propagation studies created after the field verification exercise.

Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing
CN discovered the presence of the provider through a wireless license search of the geographic area. Typical outreach efforts yielded little action on the part of the provider. Thus, CN began building a file based on information available from the public domain (website and other on-line) research. As a first step, CN reviewed the provider's website (www.skynetwisp.com) to determine the residential service plans and the service area advertised for the provider's wireless network. The website did not identify any broadband service plans, and the displayed coverage area was a combination of active and proposed transmission sites (**Exhibit A**). A few weeks after the original website research was completed, a revised search of the website revealed a new coverage map (**Exhibit B**).

Exhibit A: Advertised Service Area, Original Version

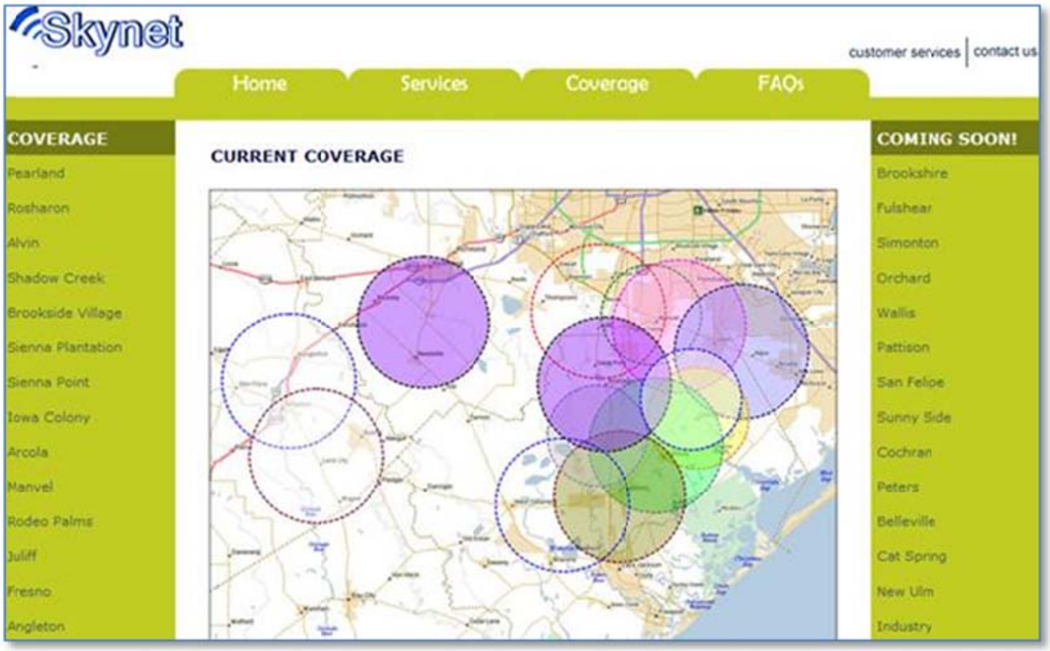


Exhibit B: Advertised Service Area, Latest Version

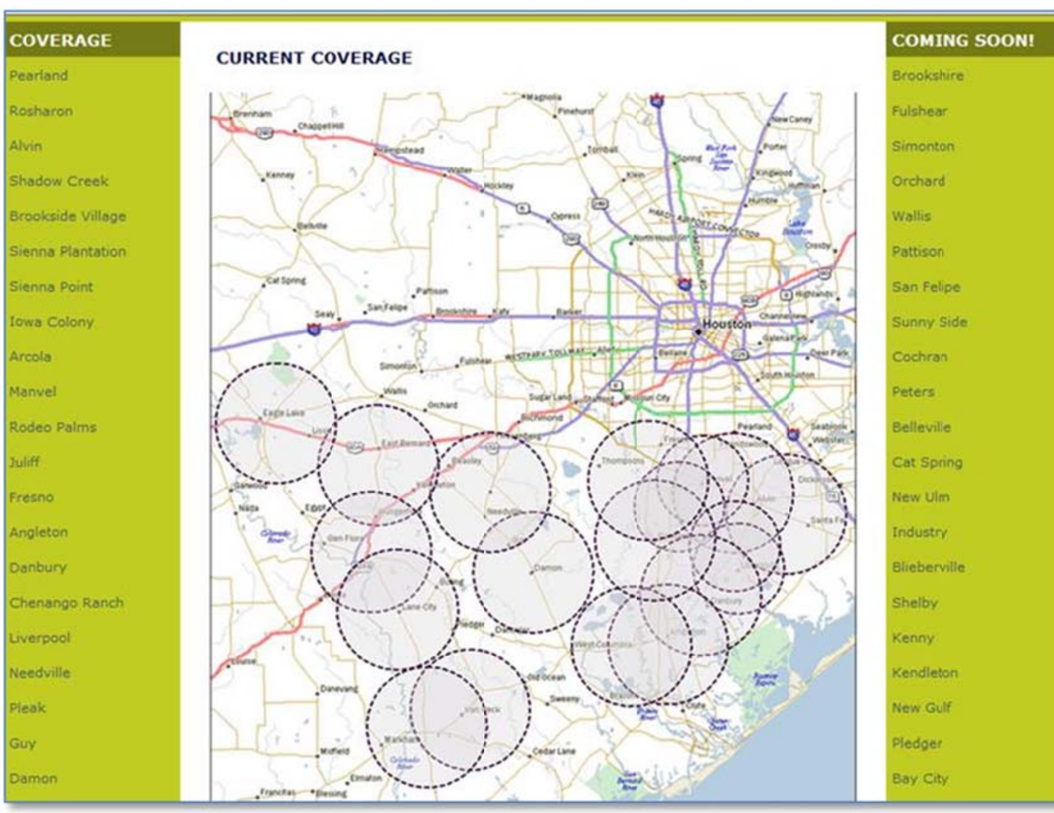

A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) yielded an FRN of 0018610774 (**Exhibit C**) with company contact information. The original license search was performed utilizing the FCC Universal Licensing System, which specified call sign WQMI310 (**Exhibit D**), utilizing frequencies at 3650-3700 MHz, with 317 unique locations. Other licenses were also specified, however, an analysis of all licensed locations revealed that WQMI310 provided the principal basis for the identification of operational tower locations.

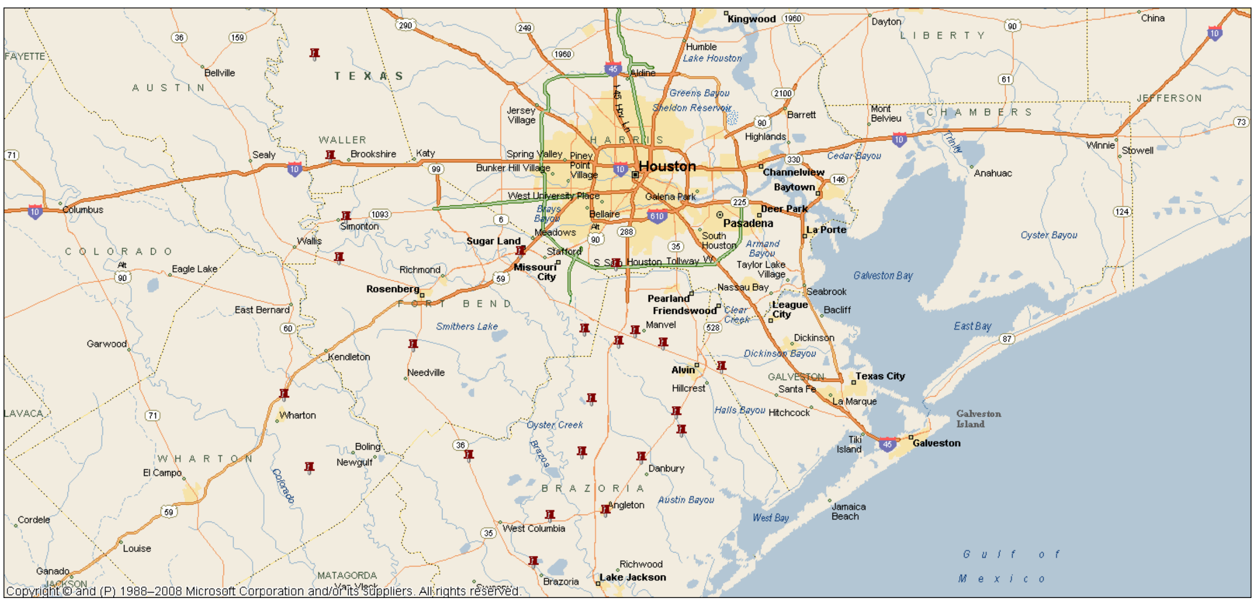
<u>Preliminary Identification of Provider's Coverage Area</u>

By comparing the coordinate information from Skynet's wireless licenses and the website coverage maps of concentric circles, 23 possible tower locations were identified (red pushpins in **Exhibit E)** that required testing and verification.

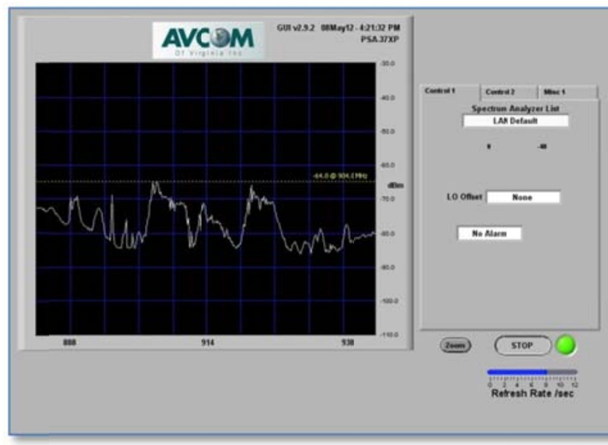
Exhibit E: Validation Test Points for Tower Structures

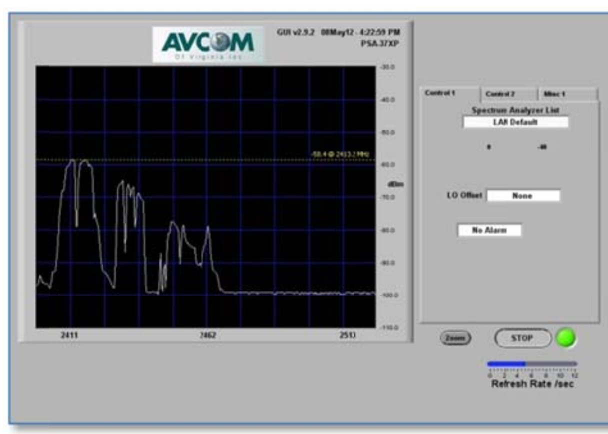


Field Testing Techniques

Having recorded the licensed locations for each of the circular coverage areas represented on the Skynet website, as well as other possible tower locations, CN technicians and engineers drove to each location and performed signal tests for the detection of active wireless frequencies typically utilized to provide WISP service. The technicians and engineers were equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands. At each signal test location, the CN technicians attempted to be isolated from Wi-Fi networks in the test area, facilitated spectrum readings from the AVCOM analyzer, and captured the results of the frequency tests as validation data for wireless tower transmissions (**Exhibit F**).

Exhibit F: Signal Test Results for the Manvel, Texas Tower Location





Signal Propagation Maps

In order to prepare propagation maps for each tower location, the CN technicians and engineers identified the antenna height from the FCC ULS license information, verified the GPS coordinates for the tower while on-site, and recorded this and other information for each viable location into the standard Excel provider data collection format (**Exhibit G**). With the objective of reasonably representing the provider's practical service area, CN staff prepared propagation maps (**Exhibit H**) based on that information.

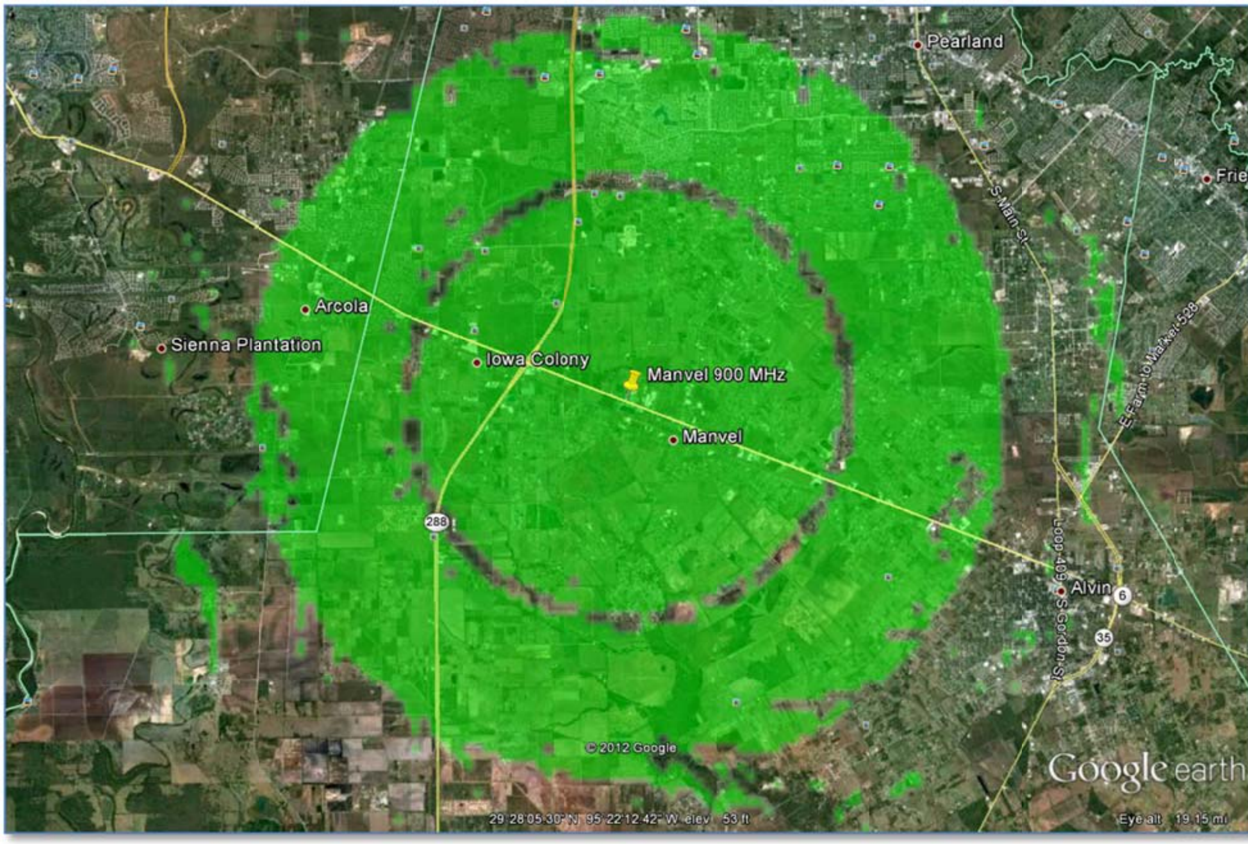
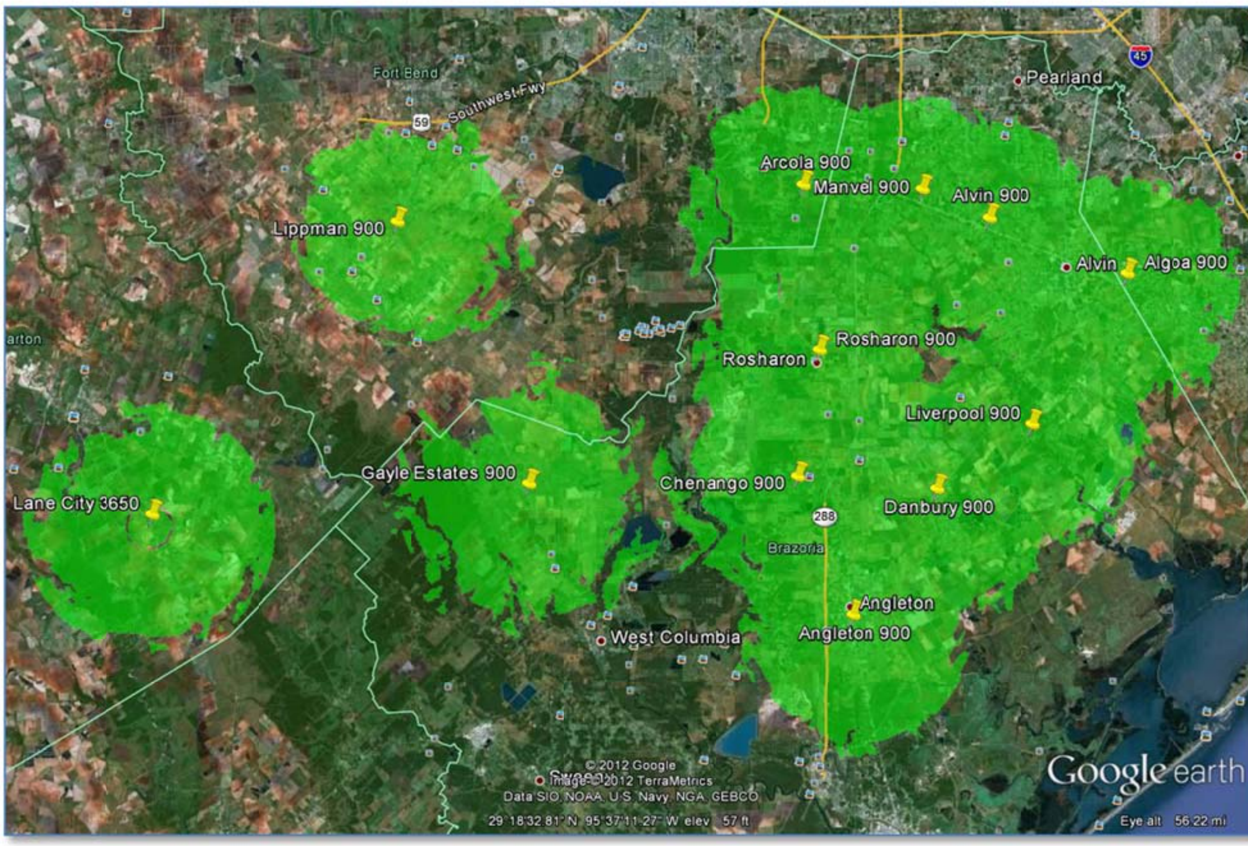
Exhibit H: Propagation Map for the Manvel, Texas Location



Results and Submission for October 2012

Of the 23 original test locations for Skynet, 12 towers were determined to be operational based on two separate in-the-field site verification tests. These tests determined that wireless signal was indeed available for broadband service at each site. A composite propagation analysis was completed **(Exhibit I)**, which reasonably represents the estimated broadband coverage area based on all information identified as of August 3, 2012. The provider's customer service department reports maximum advertised speeds of 10 Mbps (downstream) by 3 Mbps (upstream). The composite propagation map was forwarded to the provider for review and feedback prior to CN's inclusion of the coverage area in the Texas Broadband Map's October 2012 iteration; however, no definitive response was received by August 15, 2012.

Exhibit I: Skynet Communications Composite Coverage



STARNET ONLINE SYSTEMS

As part of its ongoing broadband mapping efforts, Connected Nation (CN) has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying broadband provider, regardless of whether the provider has chosen to support and participate in the State Broadband Initiative mapping program.

The following narrative provides detail regarding the recent data collection and coverage estimation activities related to Starnet Online Systems (SOS) , a wireless Internet service provider (WISP), located in Paris, Texas, with a primary service area of Lamar County. The narrative will include information regarding how and where CN obtained publicly available data and the on-the-ground site verification and validation techniques that support the underlying data.

Background

CN staff members have continued trying to obtain the participation of the provider with 24 instances of communication via telephone and e-mail sessions since September 10, 2009, through August 14, 2012. Only one communication reply was received from a company representative on May 6, 2011, with a response of electing not to participate. Since that date the provider has been non-responsive to multiple outreaches.

The Issue

SOS, by its lack of responsiveness since May 6, 2011, has predicated its unwillingness to participate in the Connected Texas broadband mapping initiative.

Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing

CN has built a file based on research information from the public domain and, as time progressed, enriched the file with information obtained through the on-the-ground site verification and data collection exercises. For example, CN reviewed the provider's website (www.1starnet.com) to determine the residential service plans **(Exhibit A)** and the service area **(Exhibit B)** of the provider's wireless network. A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) system yielded an FRN of 0016093411; the FRN reference to the SOS operations was correlated to a Dun and Bradstreet report **(Exhibit C)** with contact information relative to the owner of the company. Also, to support field validation of access points, the FRN was referenced to the FCC Universal Licensing System (ULS) to identify any licenses the provider may hold which could possibly enhance locating active access points for the service area. This process yielded license WQNG630 **(Exhibit D)**, Radio Service: NN 3650-3700 MHz with 0 unique locations.

Preliminary Identification of Provider's Coverage Area

Connected Nation extracted SOS's service locations from its website as identified in Exhibit B. The website service locations were utilized to develop a reference point **(Exhibit E)** for potential service areas. Using Google Earth an image overlay **(Exhibit F)** was developed. The image overlay was positioned to match the Google Earth base map's roadways, county boundaries, and water bodies. The degree of accuracy of the image was maintained at less than .1 mile (528 ft.) to establish minimum search criteria of a potential access point structure within the service area. The zoom option with Google Earth's aerial imagery was utilized to establish potential structures serving as access point mounts. The process only yielded 2 possible water towers within the service area. Combined with the water tower locations and Starnet Online Systems service locations a route was developed with the Microsoft *Streets & Trips* mapping application for the validation process as illustrated with Exhibit E.

Exhibit E: Provider's Service Area Reference

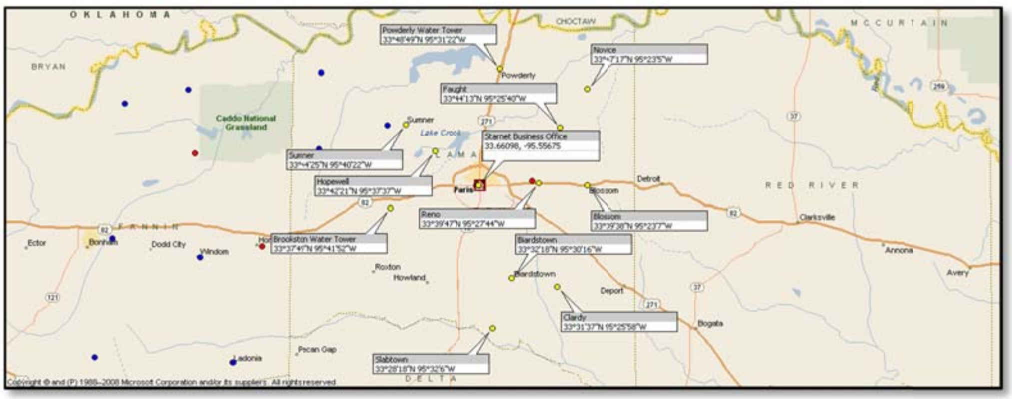

Exhibit F: Google Earth: Provider's Service Area Reference Image Overlay for AP Structures

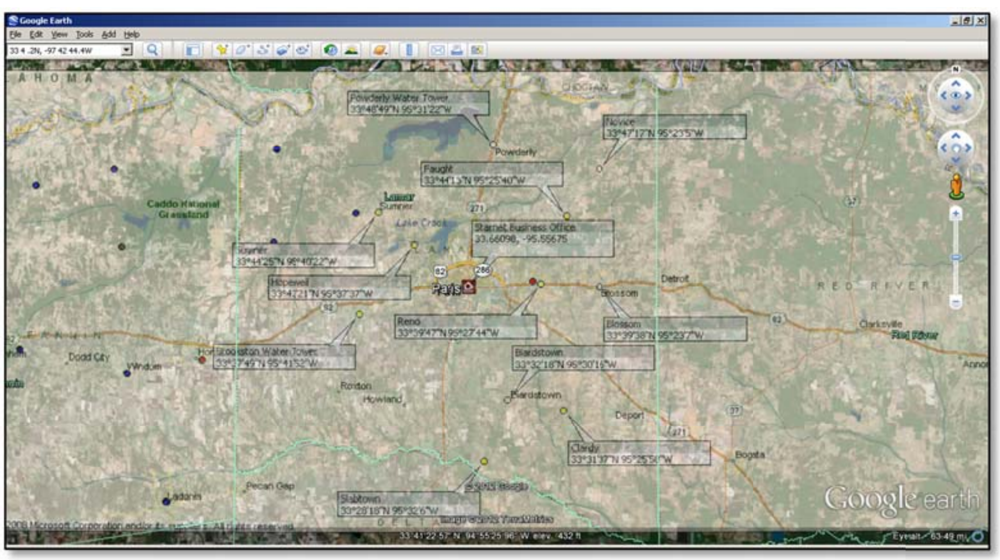
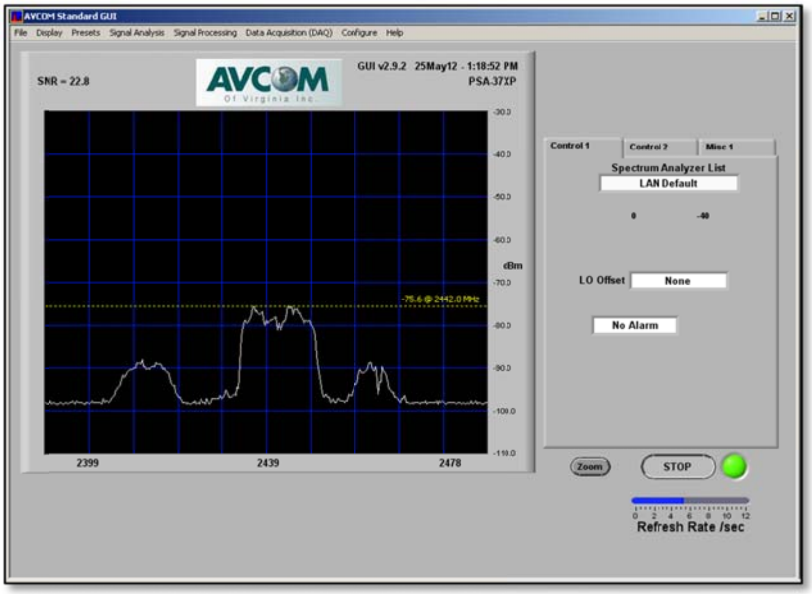


Testing Techniques

Connected Nation staff then developed a site validation route based on data established with the Google Earth image overlay and publicly available data through SOS website. The CN wireless engineer was equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900 MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands **(Exhibit G)**. Each validation point was scrutinized for frequency of operation. A screen image of the operating frequency (or frequencies) was captured; general notes were recorded for each location-approximate antenna height, frequency of operation, antenna type (omnidirectional or directional antenna) and photographs were taken of the access points.

Exhibit G: Field Data for Starnet Online Systems - Faught Location



Provider	Location	Latitude	Longitude	Frequency Availability				Structure	Approximate Antenna Height	Notes
				900MHz	2.4GHz	3.65GHz	5.0GHz			
StarNet Online Faught		33 44 55N	95 24 54W		X			Comm Towwer	160ft.	Sectored 120 degrees (3); 2.4GHz; Confirmed
StarNet Online Faught_AP Search Location		33°44'13"N	95°25'40"W							

Results and Submission for October 2012

Of the 12 locations targeted during the validation point route, 12 access points were identified and relative information was logged into the SOS field validation notes file **(Exhibit H)**. The field data and the publicly available data were transferred to the Connected Nation Provider Information file. A composite propagation study was completed based on the composite data **(Exhibit I)**. Both documents were forwarded to SOS and the provider was advised that the information would be submitted to Connected Texas and the NTIA broadband mapping project for processing if the provider did not respond within 48-hours with deletions, revisions or other datum related to this coverage estimation whitepaper. As of this report date, no response has been received from the provider.

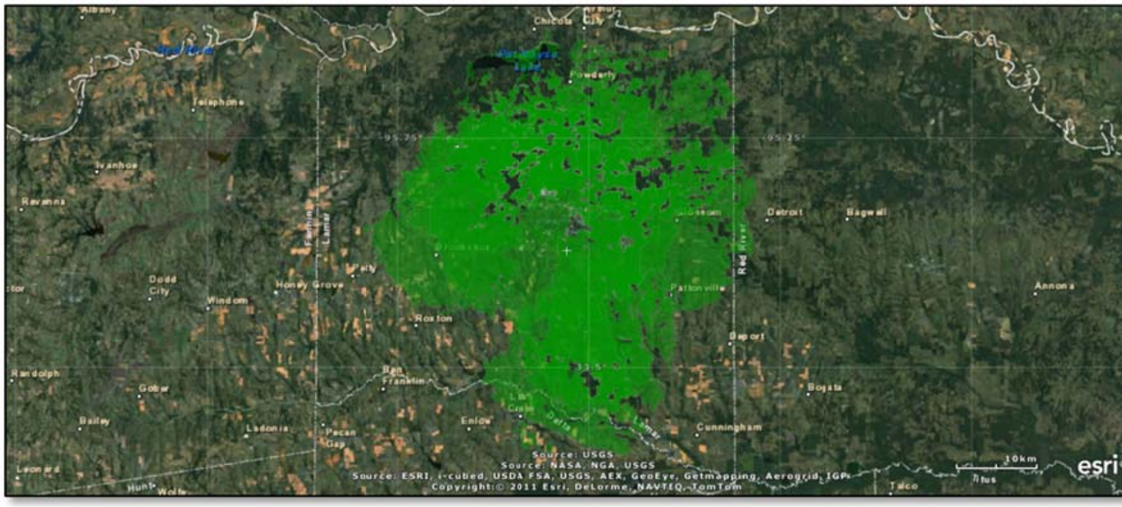
Exhibit I: Starnet Online Systems Composite Coverage



TELECOM CABLE, LLC

As part of its ongoing broadband mapping efforts, Connected Nation (CN) has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying broadband provider, regardless of whether the provider has chosen to support and participate in the SBI mapping initiative.

The following narrative provides detail regarding the recent data collection activities related to Telecom Cable, LLC, a cable broadband Internet provider in Corrigan, Oyster Creek, and Weston Lakes, Texas. The narrative will include information regarding how and where CN obtained publicly available data and the consumer-provided validation techniques that support the underlying data.

October 2012 Submission Commentary

Connected Nation created this coverage estimation document during the October 2012 submission period as a result of the ongoing non-participatory status of the provider. Since commencement of Texas' SBI program in 2010, CN engineers have conducted 8 rounds of personal telephone outreach and 10 attempts via e-mail, with 6 instances of e-mail and/or telephone communication occurring during the April 2012 and October 2012 mapping submission cycles. On August 2, 2012, a company representative responded to e-mail outreach and closed the response as follows "I reiterate my full intent to provide no information pertaining to any internet services our company provides or where we elect to offer them." CN has closely monitored the provider's website to identify any information related to maximum advertised speed tiers, coverage areas, or other information that could be used as part of this coverage estimation document.

The Issue

Telecom Cable, through its unwillingness to participate since the inception of the SBI program, has clearly articulated its desire to remain a non-participant in regard to the Texas broadband mapping program.

Identification of Provider's Legal Name, d.b.a., and FRN

CN began building a file based on research information and, as time progressed, enriched the file with information obtained through the public domain. For example, CN reviewed the State-Issued Certificate of Franchise Authority (SICFA) database purposed to facilitate the identification of local telecommunications providers serving municipalities within the State of Texas through the Texas Public Utility Commission (PUC) website (www.puc.state.tx.us), in order to further verify the provider's residential service area **(Exhibit A)**. A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) system yielded an FRN of 0016605263 **(Exhibit B)**.

Identification of Provider's Coverage Area

Upon review of the provider's website to determine residential service offerings (http://www.telecomcable.net/), the provider continues to exclude information pertaining to internet services or packages via the "internet services" link; however, the provider website does contain detailed information for cable television service areas, as well as a link to a member services portal, "MyAccount" (http://myaccount.telecomcable.net/), which allows broadband subscribers to access the tool as a "control panel for your Broadband Connection" **(Exhibit C)** after logging in.

Exhibit C: Broadband Connection Portal

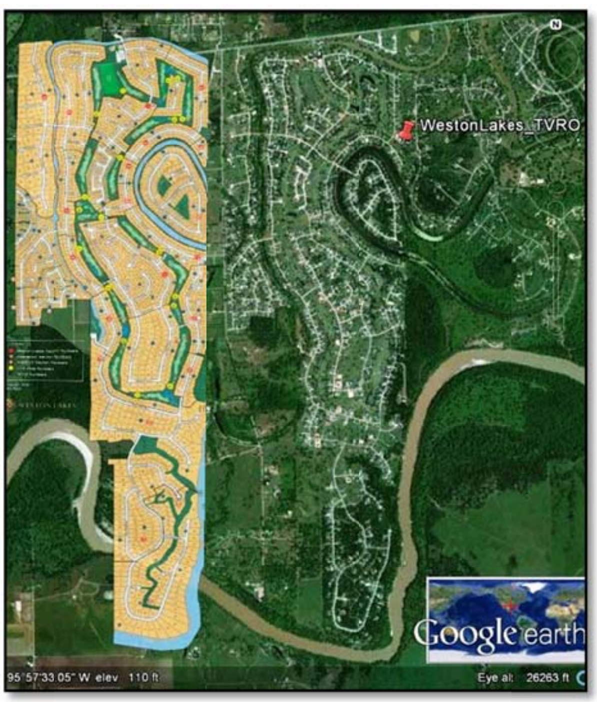
Connected Nation identified TVRO locations via *Google Earth* application for Corrigan, Weston Lakes, and Oyster Creek areas **(Exhibit D).** A boundary for Weston Lakes Community was identified, and access to the gated community was provided by on-site developer and HOA office, who also provided a neighborhood map for use with validation. A route was then established for the entire Weston Lakes community using an informed community map and TVRO location **(Exhibit E).**

Exhibit D: Identified TVRO Locations

Using the *Google Earth* application, Connected Nation successfully identified Telecom Cable TVRO locations for Corrigan, Weston Lakes, and Oyster Creek areas.

Prior to field verification, Connected Nation identified the municipality boundary for Corrigan and Oyster Creek Areas via *Google Earth* application and established a route using TVRO locations as starting point. The identification of the community boundary was utilized to establish possible end of line (termination points) of the Telecom Cable network distribution along the thoroughfares (easements) during on-site validation within the community boundary as shown in Exhibit E.

Exhibit E: Boundary Identification



Testing Techniques

Possible TVRO reference points were pre-selected and entered into Microsoft *Streets & Trips* software and CN Engineers drove through each thoroughfare to determine the existence (or lack thereof) of CATV plant and visually identify the end of line (termination points). As distribution components and assets of Telecom Cable were identified, they were recorded into *Streets & Trips* with corresponding latitude/longitude coordinates, photographs, and Wi-Fi utility tests where applicable **(Exhibit F)**.

Exhibit F: Visually Verified Telecom Cable Assets

Visual identification of the headends found in Oyster Creek, Weston Lakes, and Corrigan were simple to identify. Connected Nation engineers spoke with residents at City Hall in Oyster Creek and Corrigan, as well as the Weston Lakes Community Office to verify provider's presence in all three areas. The end of line (termination points) was identified by driving each street within the possible service area, while noting assets as previously mentioned, in tandem with creation of final service area map. The images demonstrate that CN staff was able to obtain visuals to assist with coverage estimation. The depictions are just a sample observed throughout the audit route **(Exhibits G & H).**

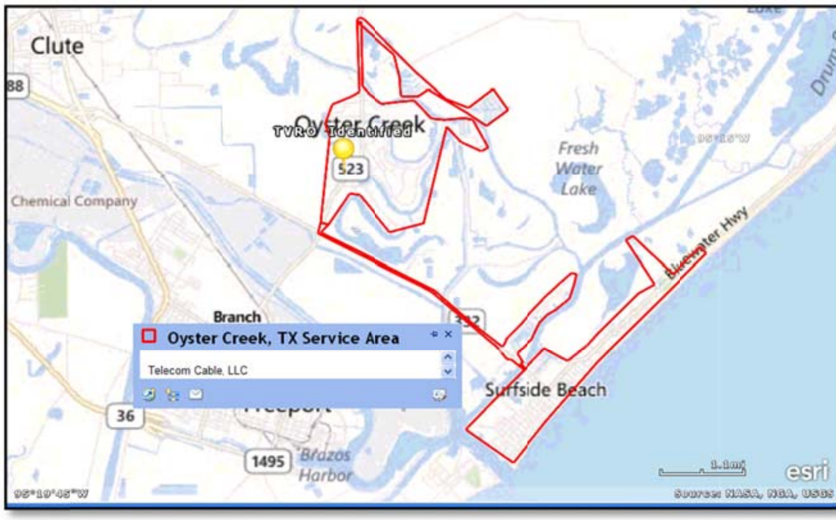
Results and Submission for October 2012

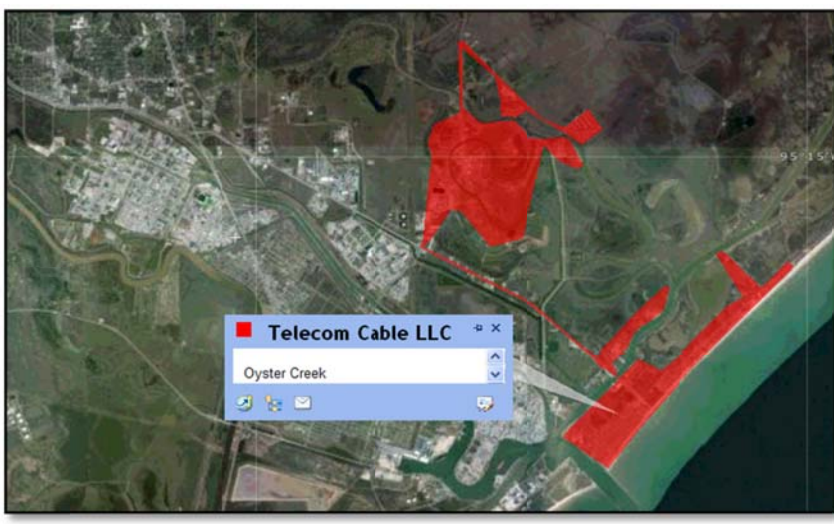
As a result of the collection of publicly available information, hands-on, and the on-the-ground validation efforts, Connected Nation is submitting this document in support of its coverage estimation for the cable modem broadband service area of Telecom Cable, LLC. In lieu of the valuable information gleaned from provider participation in the SBI mapping initiative, Connected Nation set out to obtain an exact replica of the provider's service area which qualifies as a fair and precise substitute in this instance.

Exhibit H (H1, H2, and H3) (below) depicts the estimated coverage areas for Telecom Cable, LLC, based upon the results of data gathered through publically available sources, visual drive testing, and confirmation techniques.

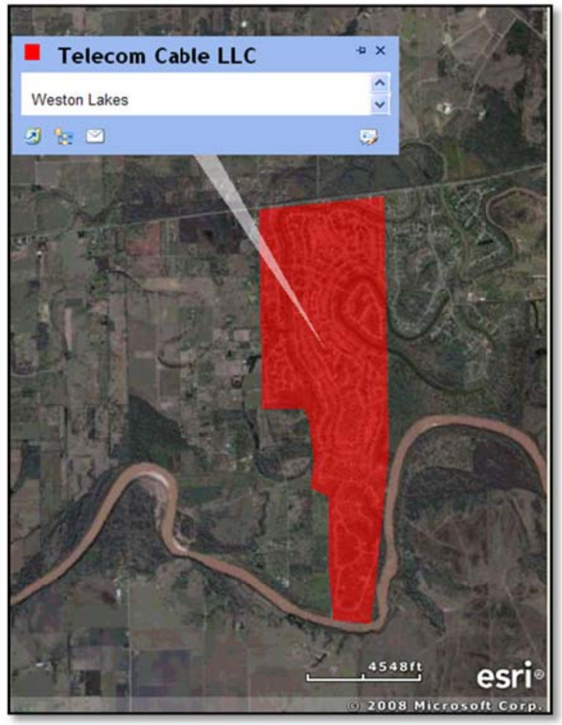
Exhibit H: Validation Results

H1: Oyster Creek Coverage Estimation

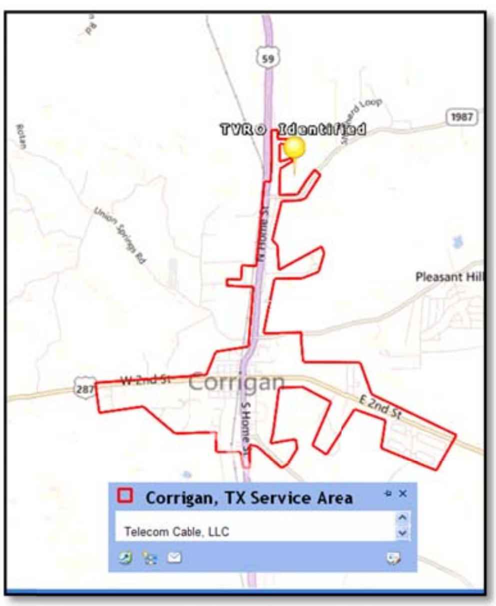


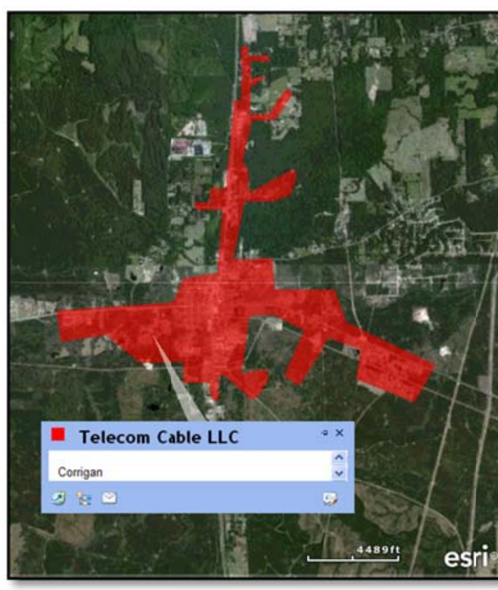


H2: Weston Lakes Coverage Estimation



H3: Corrigan Coverage Estimation





THESPECNET, INC.

As part of its ongoing broadband mapping efforts, Connected Nation (CN) has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying broadband provider, regardless of whether the provider has chosen to support and participate in the SBI mapping initiative.

The following narrative provides detail regarding the recent data collection activities related to TheSPECnet, Inc., a wireless Internet service provider (WISP), located in Weimar, Texas, with a primary service area of Colorado County. The narrative will include information regarding how and where CN obtained publicly available data and the on-the-ground validation techniques that support the underlying data.

Background

CN staff members have continued trying to obtain the participation of the provider with 15 instances of communication via telephone and e-mail sessions since September 19, 2011, through August 15, 2012. Two communication sessions over the telephone were completed with the owner of the company describing the project goals and data requirements, with the first occurrence on September 22, 2011, and the second on June 22, 2012. With each contact session the owner indicated the project would be taken into consideration and discussed with his partner. All other communication sessions received no response.

The Issue

TheSPECnet, Inc., by its lack of responsiveness since June 22, 2012, has predicated its unwillingness to participate in the Connected Texas broadband mapping initiative.

Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing

CN began building a file based on research information and, as time progressed, enriched the file with information obtained through the public domain. For example, CN reviewed the provider's website (http://www.thespecnet.com) to determine the residential service plans **(Exhibit A)** and the service area **(Exhibit B)** of the provider's wireless network. A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) system yielded no FRN for the company by business name or last name of owner. Also, to support field validation, the FCC Universal Licensing System (ULS) was researched to identify any licenses the provider may hold which could possibly enhance locating active access points for the service area. This process yielded no license associations for the company.

Pricing

Our Basic service with a 1.5 mbps cap is $50.00 + tax. The tax is $1.69.

Additional 1.5 mbps with a 3.0 mbps cap is an additional $20.00 per month. $50.00 + $20.00 or $70.00 for 3.0 mbps.

Installation is $250.00. This includes everything needed to get you up and running, with NO CONTRACT and no extras.

We can also break the $250.00 installation into 3 or 4 payments to lessen the burden of the installation charge. Some payment is required at installation time. We require some buy in from you.

Exhibit B: Service Area

http://www.thespecnet.com/Areas_of_Coverage.html

Areas of Coverage

Areas of Coverage (Tower Locations)

Please note, we reach out as far as 10 miles from some of these towers listed below. Our reach is dependant on tree lines, etc. We need a clear line of sight from our tower to the radio on your roof.

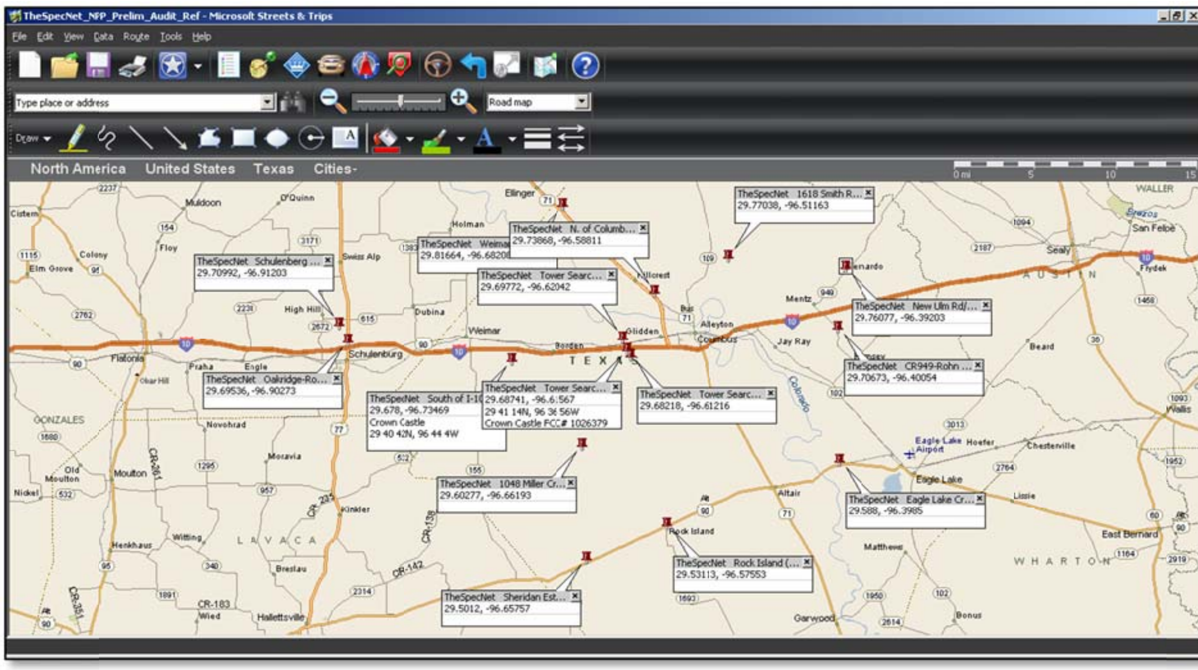
1. 2434 Tower - This tower is a Crown Castle commercial tower 492 ft. located on 2434 and Dee Allen. We are 320 ft. or 3/4 of the way up this tower
2. Oakridge Tower - This is a private road tower 100 ft.
3. Sheridan Tower - This is a private tower 90 ft. located on the south side of Lake Sherian in Sheridan Estates.
4. Rock Island Tower - This is a Rohn G25 private 100 ft. tower. This tower is very close to the water tower in Rock Island.
5. Daley Salvage Tower - This is a 200 Ft. Private Rohn G25.
5. Dr. Neal Tower - This is a Rohn G25 private 100 ft. tower located on Dr. Neal Dr. Close to the Falls.
6. Fayetteville Tower - This is a 195 ft. Rohn G24 private tower that covers Fayetteville with a reach of 8-10 miles.
7. CR 949 Tower - This is a private 90 ft. Rohn G24 located 1.5 miles on CR 949.
8. Jones Tower - This is a private 190 ft. Rohn G25 located north of Columbus 2-3 miles and west of Hwy 71, This tower will allow us to offload users on the 2434 tower. Traffic and user management.
9. Weimar Tower - This is a 490 ft. Crown Castle commercial tower located South of I 10 and East on CR 220. This tower will allow us to go head to head with wired/DSL customers in Wiemar and also provide us with better coverage in the Weimar area. This tower also allows us to hop (Backhaul) to the Schulenberg tower so we can provide services in Schulenberg.
10. Bernardo/949 tower is operational.
11. Weimar Tower - This is a 400 ft. tower owned by Crown Castle. We now provide service from this tower.

12 Eagle Lake - We are live in Eagle Lake with state of the art hardware and software solutions. We are a fully routed network which is a big deal
If you have HighuesNet, Wildblue or ELC or any other broadband Internet solution give us a chance, and if your not 100% satisfied with us, you can simply FIRE us, simple as that. Run our service side by site with your present broadband carrier and give us a chance to prove ourselves.
Want to do on line banking do it with us, want to VPN in to your work, do it with us, you can do most everything with ius because we have made a large capitol investment with both hardware and software. We are not penny wise and dollar foolish, this is one of the reasons we do not have you sign a contact.
P.S. This is a 400 ft. commercial tower

Preliminary Identification of Provider's Coverage Area

Connected Nation extracted TheSPECnet, Inc. service area locations from its website. Information that identified a tower management company (such as Crown Cast on number 1 – Areas of Coverage) were searched (through the FCC ASR database) to identify such commercial tower structures within the given area. The website service area descriptions were utilized as a search point criteria to assist in utilizing a Google Earth street level view to identify structures that may be serving as access points for TheSPECnet, Inc.'s network. Fifteen preliminary validation points were then established (**Exhibit C)** by utilizing the process. All 15 locations were entered into Microsoft *Streets & Trips* mapping application to develop a route for the validation process.

Exhibit C: Validation Points for AP Structures

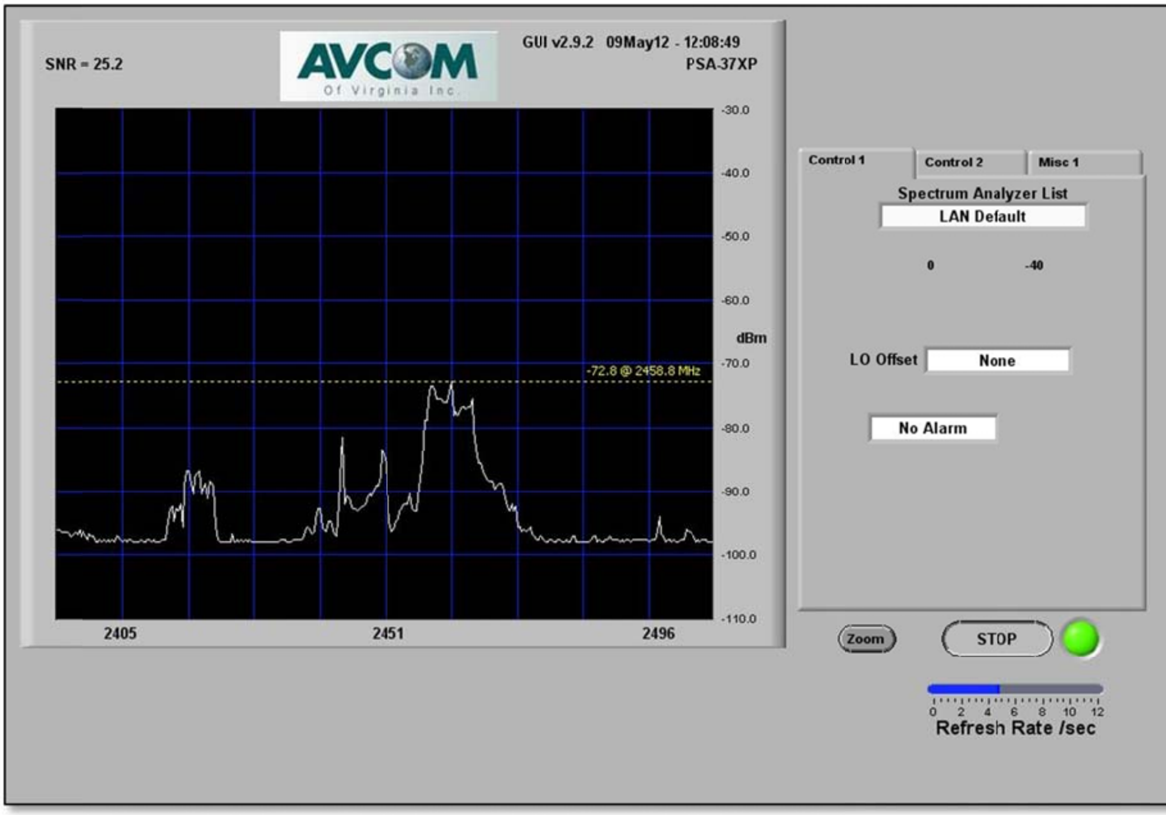


Testing Techniques

Connected Nation staff developed a site validation route based on information obtained from TheSPECnet, Inc.'s website "Area of Coverage" page. The CN wireless engineer was equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900 MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands **(Exhibit D)**. Each validation point was scrutinized for frequency of operation. A screen image of the operating frequency (or frequencies) was captured; general notes were recorded for each location-approximate antenna height, frequency of operation, antenna type (omnidirectional or sectored); and photographs were taken of the access points.

Exhibit D: Field Data for TheSPECnet, Inc. Daley Salvage Area

Provider	Location	Latitude	Longitude	Frequency Availability				Structure	Approximate Antenna Height	Notes
				900MHz	2.4GHz	3.65GHz	5.0GHz			
TheSpecNet	Daley Salvage	29 46 13N	96 30 42W		X			Rohn Guyed	180ft.	Actual AP location identified. 3 sectors-120 degree.
TheSpecNet	1618 Smith Rau Columbus, TX 78934-Search	29.770378	-96.511631							Used provider website description with preliminary Google Earth search.



<u>Results and Submission for October 2012</u>

Of the 15 locations visited during the validation point route, 12 access points were identified **(Exhibit E)** and relative information was logged into TheSPECnet, Inc. field validation notes file **(Exhibit F)**. The field (and the publicly available) data was transferred to the Connected Nation provider information file. A composite propagation study was completed based on the field data **(Exhibit G)**. Both documents were forwarded to TheSPECnet, Inc. and they were advised that the information will be submitted to Connected Texas and the NTIA broadband mapping project for processing. The provider was asked to respond, within 48 hours, if there were discrepancies of the estimated coverage area, but no response was received.

Exhibit E: Access Points Confirmations

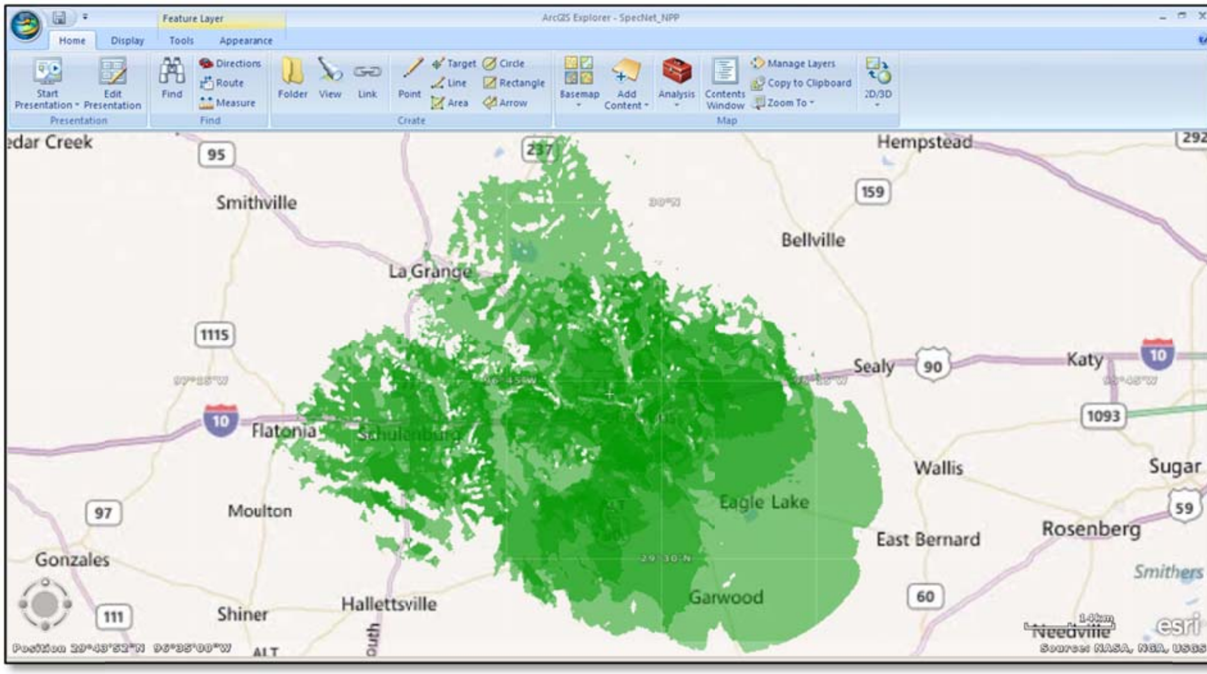
Exhibit G: TheSPECnet, Inc. Composite Coverage



VRFUTURENET

As part of its ongoing broadband mapping efforts, Connected Nation (CN) has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying last-mile broadband provider, regardless of whether the provider has chosen to support and participate in the SBI mapping initiative.

The following narrative provides detail regarding the recent data collection and site verification activities related to VRFuturenet, a wireless Internet service provider (WISP) , located in Fort Worth, Texas with a service area in Tarrant, Parker, Wise, Palo Pinto, and Erath counties. The narrative will include information regarding how and where CN obtained publicly available data and the on-the-ground validation and site verification techniques that support the underlying data.

Background

CN staff members have continued trying to obtain the participation of the provider with 35 instances of communication via telephone and e-mail sessions since September 10, 2009, through September 2, 2012. Only one communication reply was received from a company representative on November 9, 2009, requesting that a CN staff member resend the participation documents (mapping program description, provider information file, and non-disclosure agreement). Since November 9, 2009, the provider has been non-responsive to all outreach activity. Additionally, a CN staff member visited VRFuturenet office on June 8, 2012, to discuss the broadband mapping project in person with staff. A company representative stated they see no benefit to the participation of the mapping project and the company's position will not change.

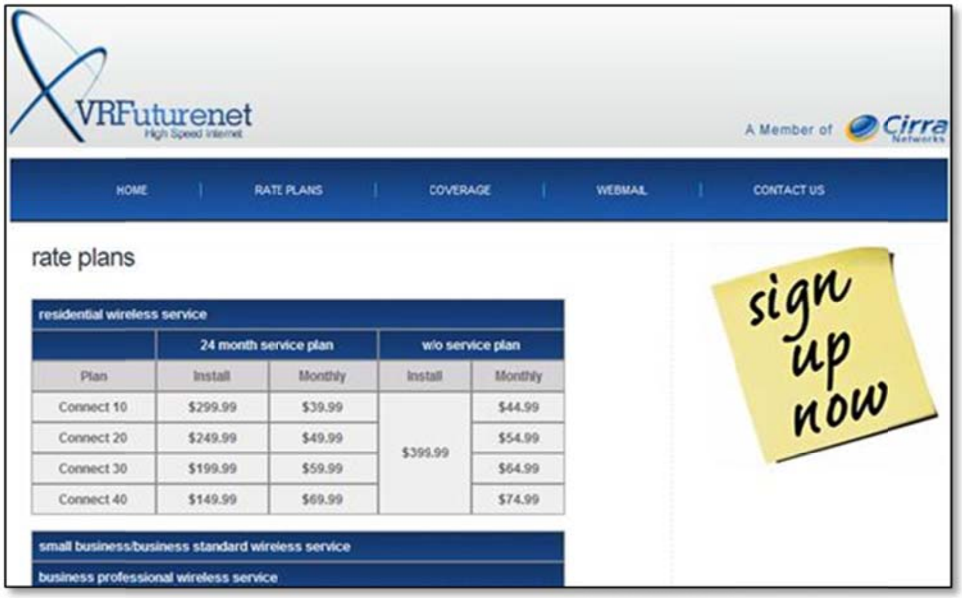
The Issue

VRFuturenet, by its lack of responsiveness and cooperation since September 10, 2009, has predicated its unwillingness to participate in the Connected Texas broadband mapping initiative.

Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing

CN has built a file based on research information and, as time progressed, enriched the file with information obtained through the public domain and from on-the-ground data collection and site verification activities. For example, CN reviewed the provider's website (www.vrfuturenet.com) to determine the residential service plans **(Exhibit A)** and the service area **(Exhibit B)** of the provider's wireless network. A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) system yielded an FRN of 0018547935 **(Exhibit C)** with contact information relative to the owner of the company. Also, to support field validation of access points, the FRN was cross-referenced against the FCC Universal Licensing System (ULS) database to identify any licenses the provider may hold. This process yielded license for Station WQKD375 **(Exhibit D)**, Radio Service: NN 3650-3700 MHz with 0 unique locations.

Exhibit A: Service Plans



residential wireless service				
	24 month service plan		w/o service plan	
Plan	Install	Monthly	Install	Monthly
Connect 10	$299.99	$39.99	$399.99	$44.99
Connect 20	$249.99	$49.99		$54.99
Connect 30	$199.99	$59.99		$64.99
Connect 40	$149.99	$69.99		$74.99

Plans speed offerings per phone call into customer service:

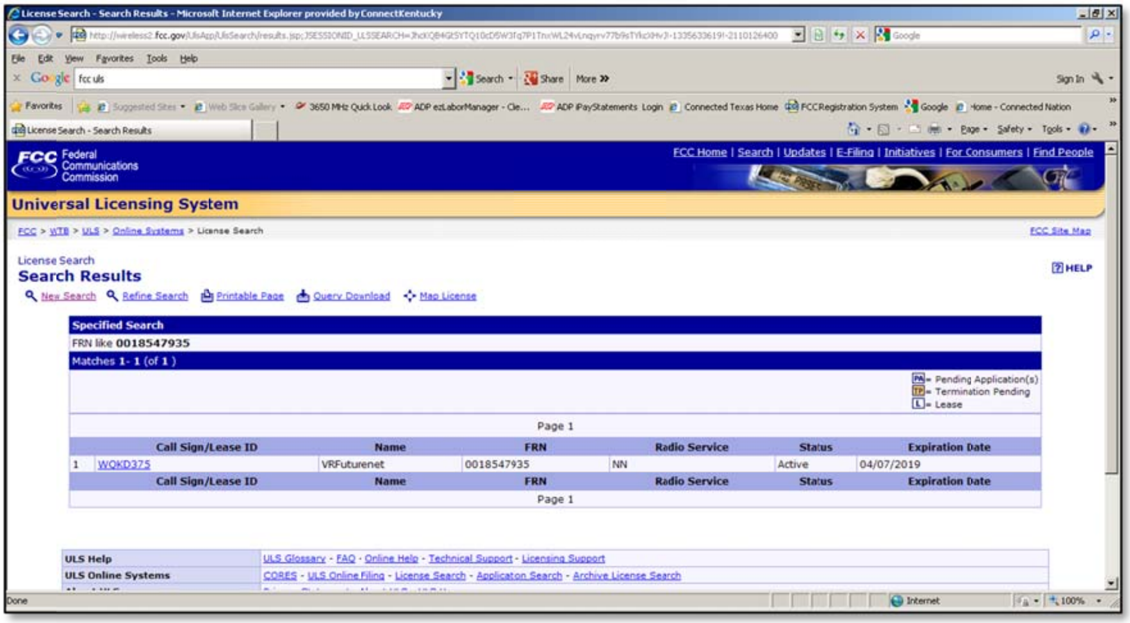
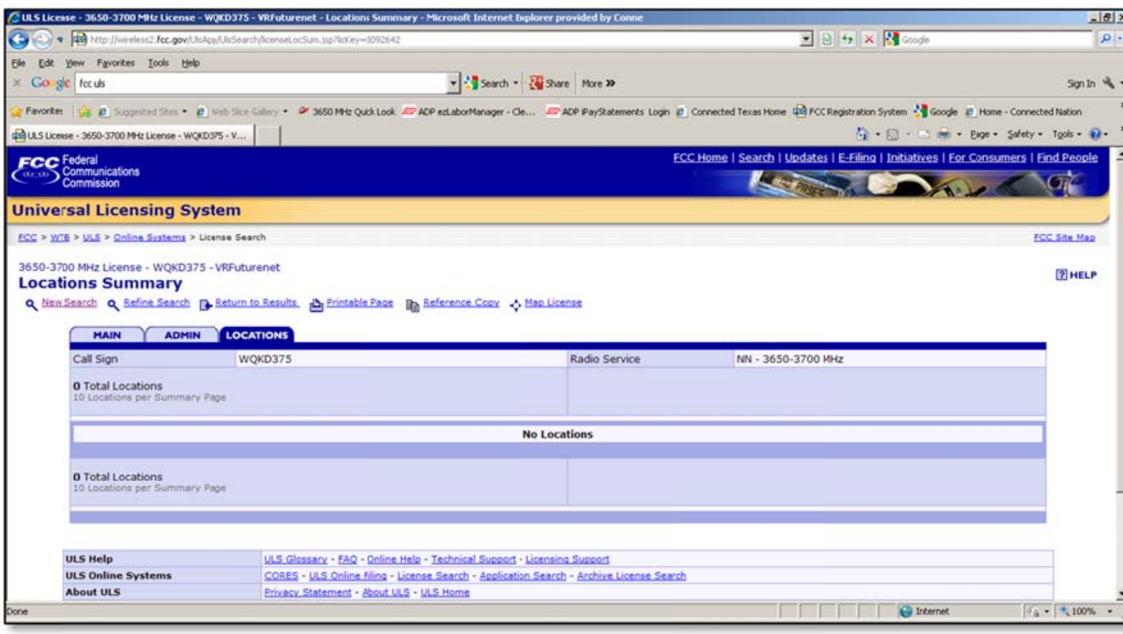
Exhibit D: WQKD375 License Reference





Preliminary Identification of Provider's Coverage Area

Connected Nation extracted the VRFuturenet's service area map from the provider's website. The website service area was utilized to create a Google Earth image overlay **(Exhibit E).** The image overlay was positioned to match the Google Earth base map's roadways, county boundaries, and water bodies. The degree of accuracy of the image overlay was maintained at less than .1 mile (528 ft.) to establish a minimum search criterion of a potential wireless access point. The provider's service area depiction is represented by a composite of concentric circles as shown in Exhibit B. Estimated center points were established measuring from the outer radius of the circles as shown in Exhibit E. Using the approximated center points, the zoom function with the Google Earth application was utilized to identify structures that could possibly be serving as wireless transmit sites and/or access points. The information was logged and used as a reference for the field validation exercise necessary to conduct site verification or to locate and isolate transmit sites. Fourteen (14) locations were entered into Microsoft *Streets & Trips* mapping application **(Exhibit F)** to develop a route for the validation process. Also, the area is heavily served by other WISPs; therefore, all participating providers' "reported" access points were entered into Microsoft *Streets & Trips* to serve as a differentiator against potential VRFuturenet access points.

Exhibit E: Google Earth - Provider's Service Area Image Overlay

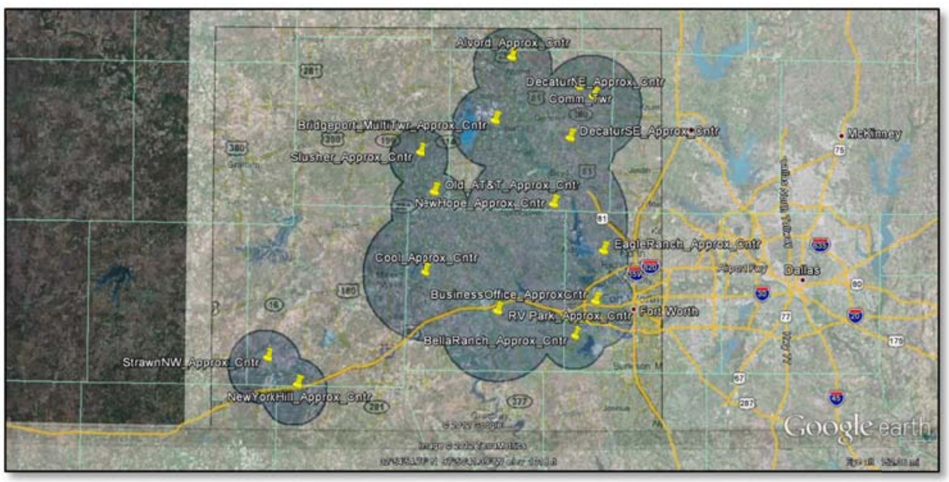


Exhibit F: Validation Points for AP Structures

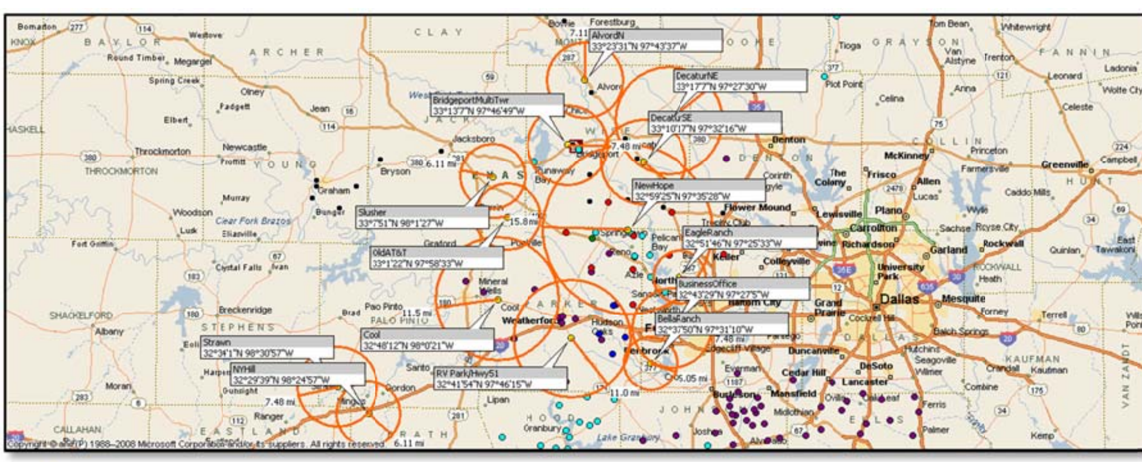
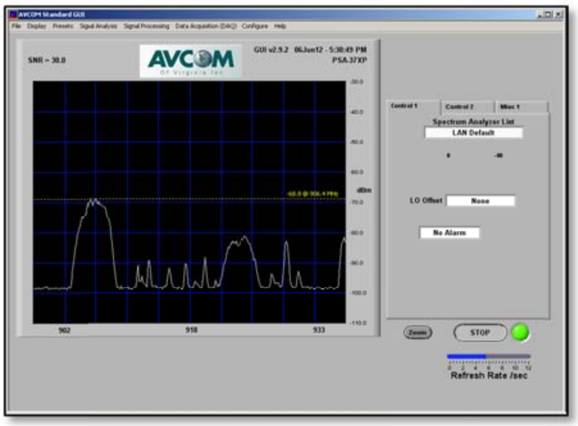
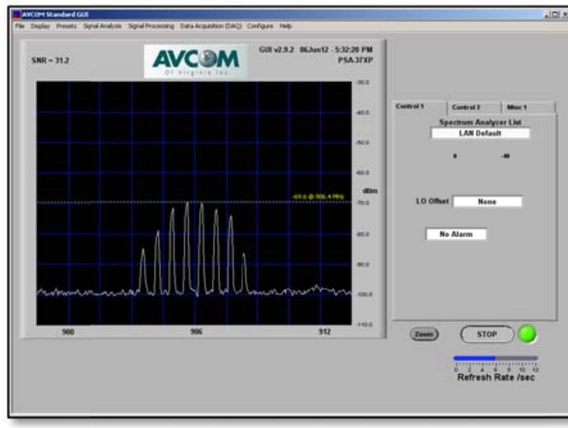


Testing Techniques

Connected Nation staff developed a site validation route based on data established with the Google Earth image overlay and publicly available data. The CN wireless engineer was equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900 MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands **(Exhibit G)**. Each validation point was scrutinized for frequency of operation. A screen image of the operating frequency (or frequencies) was captured; general notes were recorded for each location-approximate antenna height, frequency of operation, antenna type (omnidirectional or sectored) and photographs were taken of the access points.

Exhibit G: Field Data for VRFuturenet Hwy 51 Site - 900 MHz Location





Provider	Location	Latitude	Longitude	Frequency Availability				Structure	Approximate Antenna Height	Notes
				900MHz	2.4GHz	3.65GHz	5.0GHz			
VRFuturenet	VRF_Hwy51	32 39 49N	97 48 0W	X				Rohn	190 ft.	Sectored 900MHz with mutiple backhaul antennas. Private property.
VRFuturenet	RVPark/Hwy51 Center Point	32°41'54"N	97°46'15"W							Google Earth View-no structure observed in immediate area.

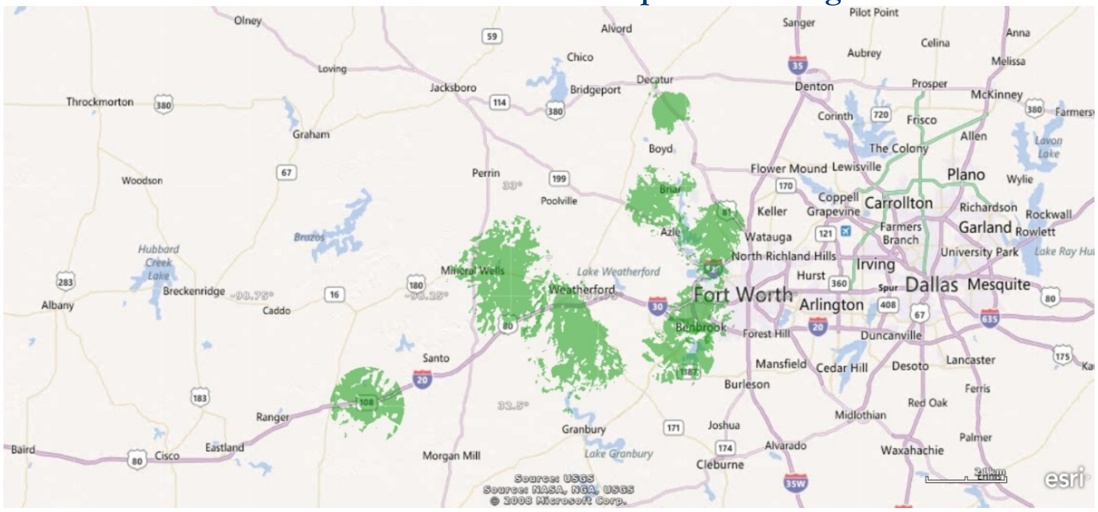
<u>Results and Submission for October 2012</u>

Of the 14 locations visited during the validation point and site verification route, 8 access points were positively identified and relative information was logged into the VRFuturenet field validation notes file **(Exhibit H)**. The field and the publicly available data were transferred to the Connected Nation Provider Information file. A composite propagation study was completed based on the field data **(Exhibit I)**. Both documents were forwarded to VRFuturenet and the provider was advised that the information would be submitted to Connected Texas and to the NTIA unless a response was received within 48 hours pointing out necessary edits, decommissioned tower sites, or other potential discrepancies of the estimated coverage area. No such response was received from VRFuturenet. Connected Nation staff will continue outreach to engage voluntary participation. In the interim the area will be revisited by Connected Nation engineering staff to obtain additional data to encompass the full extent of the publicly available coverage as identified on VRFuturenet's website.

Exhibit H: Field Validation Notes

Location	Latitude	Longitude	Frequency			Structure	Approximate Antenna Height	Notes
			900Mhz	2.4GHz	5GHz			
VRF_NY Hill	32 29 55N	98 24 38W		X		Rohn on Bldg	120 ft.	SSID identified on channel 1; identified structure in distance (private property) via RF analysis with directional antenna.
NYHill Center Point	32°29'39"N	98°24'57"W						Google Earth View-no structure observed in immediate area.
VRF_Cool	32 47 35N	98 0 56W		X		Rohn	140 ft.	Omni antenna. SSID channel 4. Private property.
Cool Center Point	32°48'12"N	98°0'21"W						Google Earth View-no structure observed in immediate area.
VRF_Hwy51	32 39 49N	97 48 0W	X			Rohn	190 ft.	Sectored 900MHz with mutiple backhaul antennas. Private property.
RVPark/Hwy51 Center Point	32°41'54"N	97°46'15"W						Google Earth View-no structure observed in immediate area.
VRF_Bella Ranch	32 37 50N	97 31 10W		X				SSID identified on channel 9; assumed 120 ft. structure for propagation purpose. Could not get a fix on a tower due to unsafe conditions on highway.
Bella Ranch Center Point	32°37'50"N	97°31'10"W						Google Earth View-no structure observed in immediate area.
VRF_Bus Office	32 43 29N	97 27 5W		X		Rohn on Bldg	70 ft.	Omni antenna. VRFuturenet business/customer service office.
BusinessOffice Center point	32°43'29"N	97°27'5"W						Google Earth View-Rohn structure on roof.
VRF_Eagle Ranch	32 52 44N	97 25 34W		X		Water Tower	150 ft.	Omni antenna.
Eagle Ranch Center Point	32°51'46"N	97°25'33"W						Google Earth View-multiple structures observed in the area.
VRF_Decatur SE	33 10 7N	97 32 48W			X	Free Standing	130 ft.	Sectored antennas. 5.6GHz
Decatur SE Center point	33°10'17"N	97°32'16"W						Google Earth View-towers distant from center point.
VRF_New Hope	32 58 23N	97 32 48W		X		Water Tank (tri pod mnt)	60 ft.	Sectored antennas.
New Hope Center point	32°59'25"N	97°35'28"W						Google Earth View-no structure observed in immediate area.
								No RF or structure association for VRFuturenet identified.
Old AT&T Center Point	33°1'22"N	97°58'33"W						Google Earth View-old AT&T microwave tower structure.
								No RF or structure association for VRFuturenet identified.
Slusher Center Point	33°7'51"N	98°1'27"W						Google Earth View-no structure observed in immediate area.
								No RF or structure association for VRFuturenet identified; Identified Digital Passage in proximity.
Bridgeport Center Point	33°13'7"N	97°46'49"W						Google Earth View-multiple towers in the area.
								No RF or structure association for VRFuturenet identified; Identified Digital Passage in proximity.
Alvord N Center Point	33°23'31"N	97°43'37"W						Google Earth View-no structure observed in immediate area.
								No RF or structure association for VRFuturenet identified. Identified Digital Passage in immediate area.
Decatur NE Center Point	33°17'7"N	97°27'30"W						Google Earth View-communications tower.
								No RF or structure association for VRFuturenet identified.
Strawn Center Point	32°34'1"N	98°30'57"W						Google Earth View-no structure observed in immediate area.

Exhibit I: VRFuturenet Composite Coverage



ZULU INTERNET, INC.

As part of its ongoing broadband mapping efforts, Connected Nation has developed a series of processes with the goal of submitting mapping data to NTIA for every known and qualifying broadband provider, regardless of whether the provider has chosen to support and participate in the SBI program.

The following narrative provides detail regarding the recent data collection and coverage estimation activities related to Zulu Internet, Inc., a wireless Internet service provider (WISP), located in Paris, Texas, with a service area within Fannin and Lamar counties. The narrative will include information regarding how and where CN obtained publicly available data and the on-the-ground validation techniques that support the underlying data.

October 2012 Submission Commentary

Connected Nation created this coverage estimation document during the April 2012 submission period as a result of the ongoing non-participatory status of the provider. In addition to the 14 instances of e-mail and/or telephone communication leading up to the April 2012 submission period (as previously reported), CN made 4 additional attempts to contact the provider during this mapping cycle. On August 12, 2012, the estimated coverage map **(Exhibit I)** which was produced during the April 2012 submission cycle was forwarded to the provider requesting review and comments. As of August 27, 2012, no replies were received from the provider.

CN closely monitored the provider's website to identify any changes in the coverage area or maximum advertised speeds but did not locate evidence of any recent changes. To that end, CN is resubmitting this coverage estimation narrative, substantially in its original format, and will continue to monitor the provider's website as well as ensure ongoing outreach until either the expiration of the SBI grant or until such time as the provider voluntarily contributes data.

Background

CN staff members have continued trying to obtain the participation of the provider with 18 instances of communication via telephone and e-mail sessions from May 26, 2011, through August 27, 2012. The owner of the company was non-responsive to all telephone and e-mail outreach activity. Additionally, a CN staff member attempted to arrange an office meeting with the owner of Zulu Internet, Inc. to discuss the project firsthand and assist with gathering data for the access points. There were no return replies to the requested meeting.

The Issue

Zulu Internet, Inc., by its lack of responsiveness since May 26, 2011, has predicated its unwillingness to participate in the Connected Texas broadband mapping initiative.

Identification of Provider's Service Plans, Service Area, Legal Name, d.b.a., FRN, and Licensing

CN has built a file based on research information and, as time progressed, enriched the file with information obtained through the public domain and on-the-ground verification activities. For example, CN reviewed the provider's website (http://www.zuluinternet.com/index.html) to determine the residential service plans **(Exhibit A)** and the service area **(Exhibit B)** of the provider's wireless network. A search for a Federal Registration Number (FRN) on the FCC **CO**mmission **RE**gistration **S**ystem (CORES) system yielded the following FRNs of 0021125265 and 0021129457 **(Exhibit C)** with contact information relative to the owner of the company. Also, to support field validation of access points, the FRN was referenced against the FCC Universal Licensing System (ULS) to identify any spectrum authorizations that may be held by the provider that could supplement the dataset of estimated coverage by isolating and identifying active wireless access points for the service area. This process yielded license WQOR870, under FRN 0021125265 **(Exhibit D)**, Radio Service: NN-3650-3700 MHz with 0 active locations.

Preliminary Identification of Provider's Coverage Area

CN extracted the Zulu Internet, Inc. service area map directly from the provider's website. Information from that website was utilized to create a Google Earth image overlay **(Exhibit E).** The image overlay was positioned to match the Google Earth base map's roadways, county boundaries, and water bodies. The degree of accuracy of the image overlay was maintained at less than .1 mile (528 ft.) to establish a minimum search criteria of a given wireless access point. The provider's service area depiction is represented by polygons as shown in Exhibit B. Using the Google Earth overlay each location was examined via an aerial zoom and street level observation to identify possible wireless access point structures at the center points of the polygons. This process provided a means of establishing coordinates for 17 validation points to identify structures with operational equipment. All 17 locations were entered into the Microsoft *Streets & Trips* mapping application **(Exhibit F)** to develop a route for the validation process.

Exhibit E: Google Earth: Provider's Service Area Image Overlay

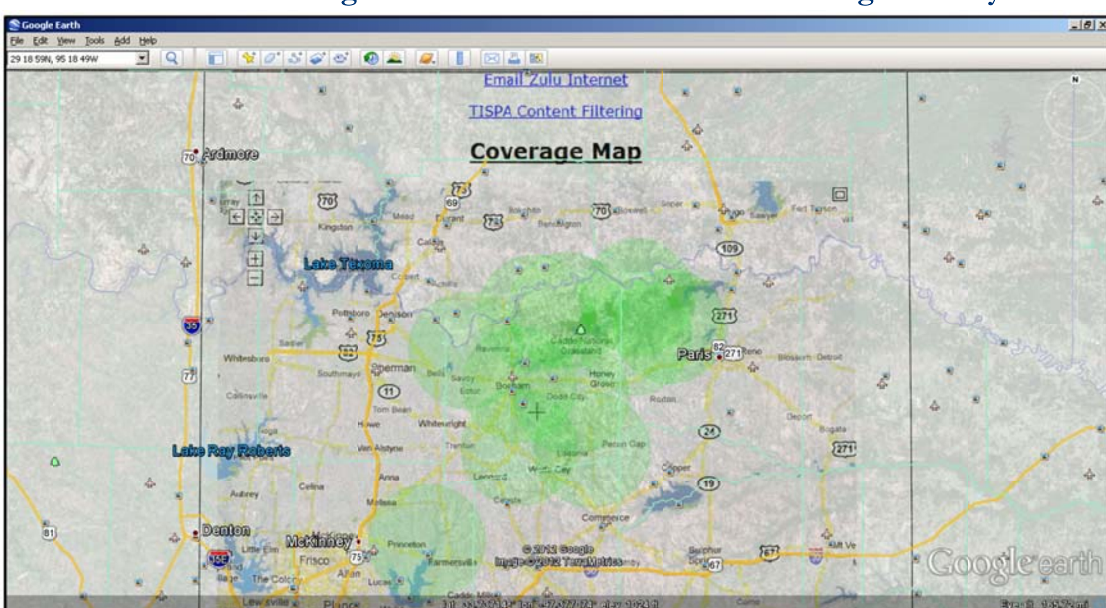

Exhibit F: Validation Points for AP Structures

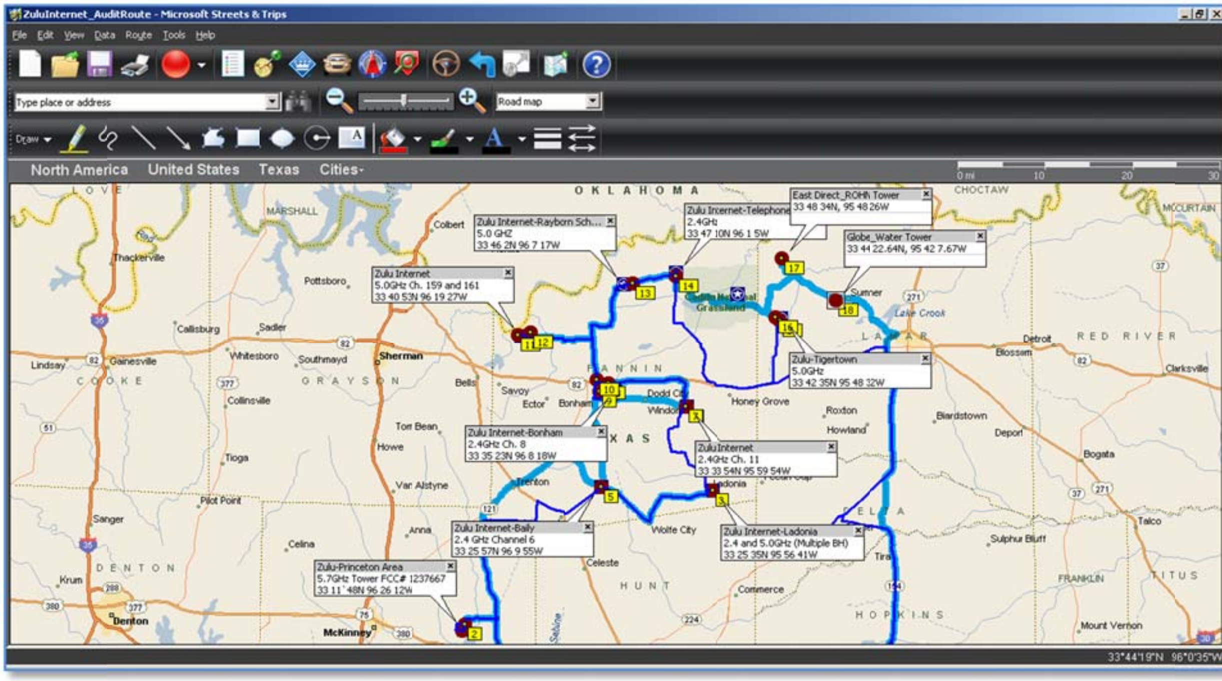
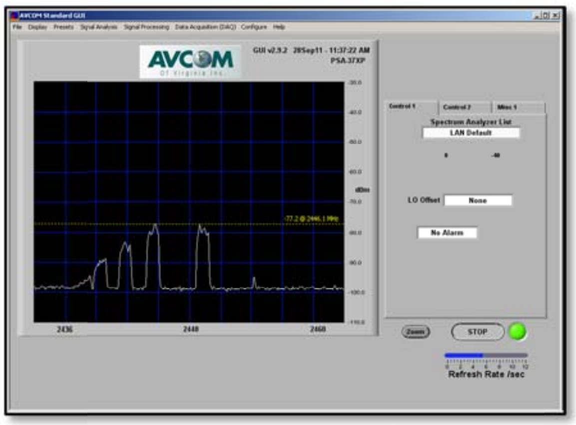
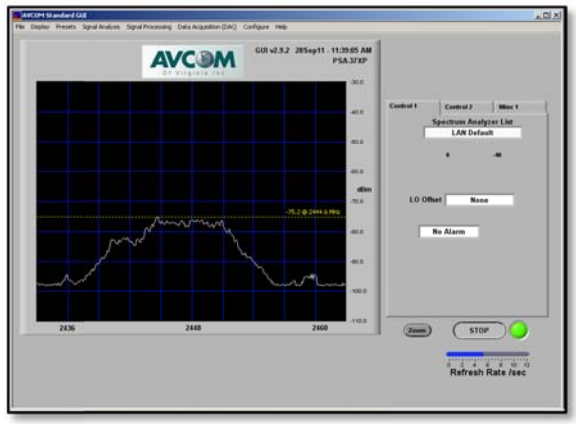


Testing Techniques

CN staff developed a data collection and site validation route based on information derived from the Google Earth image overlay of Zulu Internet's publicly available coverage on its website. The CN wireless engineer was equipped with an AVCOM PSA-37XP analyzer with RF detection from 1 MHz to 6 GHz and an array of antennas tuned specifically for the 900 MHz, 2.4 GHz, 3.65 GHz, and 5 GHz frequency bands **(Exhibit G)**. Each validation point was scrutinized for frequency of operation. A screen image of the operating frequency (or frequencies) was captured; general notes were recorded for each location-approximate antenna height, frequency of operation, antenna type (omnidirectional or sectored), and photographs were taken of the access points.

Exhibit G: Field Data for Zulu Internet, Inc.'s Access Point/ Backhaul Hub Location





Provider	Location	Latitude	Longitude	Frequency Availability				Structure	Approximate Antenna Height	Notes
				900MHz	2.4GHz	3.65GHz	5.0GHz			
	Ladonia Rohn Tower	33 25 35.96N	95 56 41.38W		X			Guyed Rohn	160ft.	Actual AP location identified. Serving AP with multiple BH.
ZuluInternet	Ladonia	33 25 35.96N	95 56 48.35W							GE-identified water tower structure.
										RF snapshot and site photos on file.

Results and Submission for October 2012

Of the 17 locations previously visited during the coverage estimation and validation point route, 11 access points were identified and relative information was logged into the Zulu Internet, Inc. field validation notes file **(Exhibit H)**. The field and the publicly available data were transferred to the CN Provider Information file. A composite propagation study was completed based on the field data **(Exhibit I)**. Both documents were forwarded to Zulu Internet, Inc. as courtesy copies and the provider was advised that the estimated coverage information would be submitted to Connected Texas and to the NTIA unless the provider notified CN, within 48 hours, of discrepancies of the estimated coverage. The provider did not respond to CN and, as of this date, CN believes the information to be an accurate estimation of the service area of Zulu Internet, Inc.

Exhibit H: Field Validation Notes

Location	Latitude	Longitude			Structure	Approximate Antenna Height	Notes
			2.4GHz	5.0GHz			
Ladonia Rohn Tower	33 25 35.96N	95 56 41.38W	X		Guyed Rohn	160ft.	Actual AP location identified. Serving AP with multiple BH.

Appendix B: Broadband Provider Log

Broadband Provider Log

Complete	275
Non-Responsive/Refused	27
In Progress	3
Count of Datasets by Status	**305**
Total Unique Providers Represented	**198**

Provider Name	**Platform**	**Status**	**NDA Execution Date**	**Notes**
Speed of Light Broadband, Inc.	Fixed Wireless	Approval for Update Not Received - Data Still Submitted	11/3/2009	[AUG-29-12 Sarah Finne] Change: Network expansion (provider added 2 new towers to existing coverage).
Alenco Communications, Inc.	DSL	Data Added to Statewide Inventory	11/17/2009	[AUG-13-12 Sarah Finne] Change and Correction: Provider upgraded infrastructure and can now offer tier 5 download speeds in areas previously reported as tier 3, and Donie exchange should have been reported as FTTH only (therefore, this area has been removed from DSL coverage).
AT&T Communications of Texas, Inc.	DSL	Data Added to Statewide Inventory	12/16/2009	[AUG-30-12 Sarah Finne] Change/Correction: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
AT&T Communications of Texas, Inc.	Mobile Wireless	Data Added to Statewide Inventory	12/16/2009	[AUG-22-12 Sarah Finne] Change and/or Correction: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Big Bend Telephone Company, Inc.	Fixed Wireless	Data Added to Statewide Inventory	3/10/2010	[SEP-02-12 Sarah Finne] Change: Network expansion (provider added 12 new towers to existing coverage).
Burcham Solutions, LLC	Fixed Wireless	Data Added to Statewide Inventory	8/2/2012	[SEP-03-12 Sarah Finne] Correction: Burcham Solutions was previously non-responsive but provided data this round.
Cap Rock Telephone Cooperative, Inc.	DSL	Data Added to Statewide Inventory	3/4/2010	[AUG-31-12 Sarah Finne] Change: Network expansion (provider added an additional 3 remote terminals).
Central Texas Telephone Investments, LP	Fixed Wireless	Data Added to Statewide Inventory	4/22/2010	[AUG-30-12 Sarah Finne] Change: Network expansion (provider added 11 new towers to existing coverage).
CenturyLink	DSL	Data Added to Statewide Inventory	12/4/2009	[AUG-28-12 Sarah Finne] Change and/or Correction: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Charter Communications, Inc.	Cable	Data Added to Statewide Inventory	12/15/2009	[AUG-29-12 Sarah Finne] Change and/or Correction: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Cobridge Communications, LLC	Cable	Data Added to Statewide Inventory		[SEP-17-12 Ashley Hitt] Change: Fidelity acquired some of the former Cobridge service areas in early 2012; as of June 2012, the former Cobridge areas have been rebranded as Fidelity.
Coleman County Telephone Cooperative, Inc.	DSL	Data Added to Statewide Inventory	3/10/2010	[AUG-31-12 Sarah Finne] Change: Network expansion (provider added one new remote terminal).
Colorado Valley Telephone Cooperative, Inc.	Fixed Wireless	Data Added to Statewide Inventory	3/9/2010	[AUG-29-12 Sarah Finne] Change: Network expansion (provider added a tower to existing coverage).
Comcast Cable Communications, LLC	Cable	Data Added to Statewide Inventory	12/7/2009	[AUG-29-12 Sarah Finne] Change and/or Correction: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Cumby Telephone Cooperative, Inc.	Fiber	Data Added to Statewide Inventory	3/5/2010	[AUG-30-12 Sarah Finne] Change: Network expansion.
Digital Passage, Inc.	Fixed Wireless	Data Added to Statewide Inventory		[AUG-30-12 Sarah Finne] Correction: Digital Passage was previously non-responsive but provided data this round.
Digitex.com	Fixed Wireless	Data Added to Statewide Inventory	5/25/2010	[SEP-05-12 Sarah Finne] Change and Correction: Provider installed new towers, and propagations were recreated for existing towers to more accurately portray provider footprint.
East Texas DSL	Fixed Wireless	Data Added to Statewide Inventory	5/25/2010	[AUG-29-12 Sarah Finne] Change: Network expansion (provider installed an additional fixed wireless tower).
Eastex Telephone Cooperative, Inc.	DSL	Data Added to Statewide Inventory	6/20/2011	[AUG-31-12 Sarah Finne] Change and Correction: Provider decommissioned some DSLAMs, added some new ones, and corrected the coordinates of some others.
Eastland Internet Inc	Fixed Wireless	Data Added to Statewide Inventory		[AUG-29-12 Sarah Finne] Correction: TXOL was previously non-responsive but provided data this round.

ERF Wireless	Fixed Wireless	Data Added to Statewide Inventory		[AUG-30-12 Sarah Finne] Change: Several towers were decommissioned and/or sold to other WISPs. New propagations were created to better represent current ERF service area.
Gtek Communications	Fixed Wireless	Data Added to Statewide Inventory	5/24/2010	[AUG-29-12 Sarah Finne] Change: Network expansion (provider added 4 fixed wireless towers to existing coverage).
Guadalupe Valley Communications Systems	DSL	Data Added to Statewide Inventory	11/23/2009	[SEP-07-12 Sarah Finne] Change: Network expansion.
Guadalupe Valley Communications Systems	Fiber	Data Added to Statewide Inventory	11/23/2009	[SEP-06-12 Sarah Finne] Change: Network expansion.
GVEC.net	Fixed Wireless	Data Added to Statewide Inventory	2/25/2010	[AUG-30-12 Sarah Finne] Change: Network expansion (provider added 3 new towers to existing coverage).
Hometown Computing	Fixed Wireless	Data Added to Statewide Inventory		[JUL-10-12 Amanda Bentley] Correction: Hometown Computing was previously non-responsive but provided data this round.
JAB Wireless, Inc.	Fixed Wireless	Data Added to Statewide Inventory	6/14/2010	[JUL-10-12 Dwayne Goodman] Change: JAB Wireless, Inc. acquired KeyOn Communications' assets and is now operating KeyOn's old fixed wireless towers.
James Cable LLC	Cable	Data Added to Statewide Inventory	1/11/2010	[AUG-31-12 Sarah Finne] Change: Provider decommissioned area south of Possum Kingdom Lake and increased the maximum download speeds in some areas to tier 6.
Leap Wireless International, Inc.	Mobile Wireless	Data Added to Statewide Inventory	4/6/2010	[AUG-13-12 Sarah Finne] Change and/or Correction: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
LVWifi.com	Fixed Wireless	Data Added to Statewide Inventory		[AUG-27-12 Sarah Finne] Correction: Initial submission of provider's coverage, but they were in service previously.
MegaPath Inc.	DSL	Data Added to Statewide Inventory	2/15/2010	[AUG-30-12 Sarah Finne] Correction: Provider has proven they offer residential broadband services, therefore October 2012 is the initial submission for this provider.
MetroPCS Wireless, Inc.	Mobile Wireless	Data Added to Statewide Inventory	2/10/2012	[AUG-24-12 Amanda Bentley] Change: Network expansion and provider upgraded infrastructure and can now offer tier 4 download and upload speeds.
Mexus Communications	Fixed Wireless	Data Added to Statewide Inventory		[AUG-30-12 Sarah Finne] Correction: Mexus was previously non-responsive but provided data this round.
Millennium Telcom, LLC	Fixed Wireless	Data Added to Statewide Inventory	8/26/2010	[AUG-29-12 Sarah Finne] Change: Network expansion (provider added 4 additional fixed wireless towers to their existing coverage area).
Peoples Communication, Inc.	Fixed Wireless	Data Added to Statewide Inventory	3/4/2010	[AUG-30-12 Sarah Finne] Change: Provider launched new fixed wireless services (700 MHz LTE).
Poka Lambro Telephone Cooperative, Inc.	DSL	Data Added to Statewide Inventory	2/15/2010	[JUL-18-12 Amanda Bentley] Change: Network expansion (new DSLAMs added); provider also can now offer speed tier 7 and 8 download speeds.
Poka Lambro Telephone Cooperative, Inc.	Fiber	Data Added to Statewide Inventory	2/15/2010	[JUL-18-12 Amanda Bentley] Change: Network expansion.
Ridgewood Cable	Fixed Wireless	Data Added to Statewide Inventory		[SEP-05-12 Sarah Finne] Change and Correction: Provider added towers to existing coverage, and propagations were recreated for all existing towers using updated software.
Rock Solid Internet & Telephone	Fixed Wireless	Data Added to Statewide Inventory	2/14/2011	[AUG-30-12 Sarah Finne] Change: Network expansion (provider added 6 new towers to existing coverage).
Skynet Country, LLC	Fixed Wireless	Data Added to Statewide Inventory		[AUG-30-12 Sarah Finne] Change: Network expansion (provider added 6 new towers to existing coverage).
SOS Communications LLC	Fixed Wireless	Data Added to Statewide Inventory		[AUG-13-12 Sarah Finne] Correction: SOS Communications was previously non-responsive but provided data this round.
South Plains Telephone Cooperative, Inc.	Fiber	Data Added to Statewide Inventory	3/15/2010	[SEP-02-12 Sarah Finne] Change: Network expansion.
Southwest Texas Telephone Company	DSL	Data Added to Statewide Inventory	3/3/2010	[AUG-13-12 Amanda Bentley] Change: Network expansion.
Spacenet Inc.	Satellite	Data Added to Statewide Inventory		[SEP-05-12 Sarah Finne] Correction: Initial submission of provider's coverage, but they were in service previously.
Sprint Nextel Corporation	Mobile Wireless	Data Added to Statewide Inventory	1/14/2010	[JUL-19-12 Sarah Finne] Change and/or Correction: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
T-Mobile USA, Inc.	Mobile Wireless	Data Added to Statewide Inventory	1/8/2010	[AUG-24-12 Sarah Finne] Change and/or Correction: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Texas CellNet, Inc.	Fixed Wireless	Data Added to Statewide Inventory	2/17/2011	[AUG-30-12 Sarah Finne] Change and/or Correction: Provider submitted entirely new dataset, with more precise coordinates, for the October 2012 submission.

Time Warner Cable LLC	Cable	Data Added to Statewide Inventory	12/21/2009	[AUG-29-12 Sarah Finne] Change and/or Correction: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
United States Cellular Corporation	Mobile Wireless	Data Added to Statewide Inventory	2/15/2011	[AUG-13-12 Sarah Finne] Change: Provider submitted additional data with increased speed offerings.
Verizon Southwest, Inc.	DSL	Data Added to Statewide Inventory	12/14/2009	[AUG-28-12 Sarah Finne] Change and/or Correction: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Verizon Southwest, Inc.	Fiber	Data Added to Statewide Inventory	12/14/2009	[AUG-28-12 Sarah Finne] Change and/or Correction: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
Verizon Southwest, Inc.	Mobile Wireless	Data Added to Statewide Inventory	12/14/2009	[JUL-19-12 Sarah Finne] Change and/or Correction: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
ViaSat, Inc.	Satellite	Data Added to Statewide Inventory	1/8/2010	[AUG-15-12 Sarah Finne] Change and/or Correction: Possible service expansion or corrections to previous dataset; entirely new dataset provided for October 2012 submission.
WEHCo Video, Inc.	Cable	Data Added to Statewide Inventory		[JUL-17-12 Amanda Bentley] Change: Network expansion.
West Texas Rural Telephone Cooperative, Inc.	DSL	Data Added to Statewide Inventory	3/31/2010	[AUG-30-12 Sarah Finne] Change: Provider upgraded infrastructure and can now offer tier 7 download speeds in Friona and Bovina. Rural telephone area now upgraded to qualify as broadband, with download speeds of 6M, therefore network expansion since last submission.
XIT Telecommunications & Technology, Ltd.	DSL	Data Added to Statewide Inventory	3/2/2010	[AUG-07-12 Amanda Bentley] Change: 6 DSLAM locations were removed due to network being upgraded to FTTH.
XIT Telecommunications & Technology, Ltd.	Fiber	Data Added to Statewide Inventory	3/2/2010	[JUL-24-12 Amanda Bentley] Change: Network expansion.
Alenco Communications, Inc.	Backhaul	Backhaul Provider Only Processing Complete	11/17/2009	
Burcham Solutions, LLC	Backhaul	Backhaul Provider Only Processing Complete	8/2/2012	
Conterra Ultra Broadband, LLC	Backhaul	Backhaul Provider Only Processing Complete		
MegaPath Inc.	Backhaul	Backhaul Provider Only Processing Complete	2/15/2010	
Verizon Southwest, Inc.	Backhaul	Backhaul Provider Only Processing Complete	12/14/2009	
Alenco Communications, Inc.	Fiber	Speed Only Update; Data Processing Complete	11/17/2009	[AUG-13-12 Sarah Finne] Change: Provider upgraded infrastructure and can now offer tier 4 download speeds in the exchange that was previously submitted as tier 3.
Baja Broadband Holding Company	Cable	Speed Only Update; Data Processing Complete		[SEP-10-12 Sarah Finne] Change: Provider upgraded infrastructure and can now offer tier 10 download and tier 7 upload speeds in all four TX markets.
Colorado Valley Telephone Cooperative, Inc.	DSL	Speed Only Update; Data Processing Complete	3/9/2010	[AUG-29-12 Sarah Finne] Change: Provider upgraded infrastructure and can now offer tier 5 download speeds.
Our-Town Internet Services, LLC	Fixed Wireless	Speed Only Update; Data Processing Complete	3/31/2010	[AUG-29-12 Sarah Finne] Change: Provider upgraded infrastructure and can now offer tier 6 download speeds.
Valley Telephone Cooperative, Inc.	DSL	Speed Only Update; Data Processing Complete	11/24/2009	[AUG-13-12 Sarah Finne] Change: Provider upgraded infrastructure and can now offer tier 5 download speeds.
West Texas Rural Telephone Cooperative, Inc.	Cable	Speed Only Update; Data Processing Complete	3/31/2010	[AUG-31-12 Sarah Finne] Change: Provider upgraded infrastructure and can now offer tier 7 download speeds.
West Texas Rural Telephone Cooperative, Inc.	Fiber	Speed Only Update; Data Processing Complete	3/31/2010	[AUG-31-12 Sarah Finne] Change: Provider upgraded infrastructure and can now offer tier 7 download speeds.

THE STATE OF UTAH
BROADBAND PROJECT

The State of Utah Broadband Project
State Broadband Data and Development
(SBDD) Grant Program
October 1, 2012

Data and Mapping Methodology

Data Submission Methodology Update (Round 6, June 2012)

The Utah Broadband Project communicated with 43 of 44 previously identified broadband providers that offer services within Utah. Of the 44, 29 providers updated their data, 12 confirmed no updates this round, 2 didn’t meet the deadline to send us updates, and no correspondence, in response to repeated email and telephone attempts, was returned by the remaining provider, HNS License Sub.

This round, the Utah Broadband Project invited broadband providers to submit designated commercial service. We used the NTIA Data Model Guidelines to determine when to mark census blocks and road segments service with an end user category of “Governmental, Small Business, Medium, or Large Enterprise”.

In addition to the 44 broadband providers, we identified 7 new providers this round to the project. Three providers are WISPS- TKS, Rapidwave, and Txox. Two providers are satellite providers that the NTIA asked us to reach out to- Starband and Skycaster, We didn’t hear back from either. The last three are business only providers that we are including for the first time this round and using the ENDUSERCAT field to distinguish them from residential providers. The business only providers new this round are Zayo and Syringa. Of the 7 new providers, data was received data from only TKS and Rapidwave before the deadline. We expect data for the next submission round from Txox, Zayo, and Syringa. Utah now has a total of 51 broadband providers.

Utah Community Anchor Institutions (CAIs): Numerous records have been removed to eliminate duplicates stemming from overlap between datasets such as Schools, Libraries, the Utah Education Network (UEN), the State of Utah’s Wide Area Network (WAN) etc. In all over 840 records have been removed from the original 4080 records. The library records’ CAIID field was updated to contain both the “FSSCKEY” and “FSCSSEQ” values. Also many school and school district records CAIID field have been populated with their “NCES” codes. Previously submitted records with no associated point geometry have been removed or have had the correct geometry assigned to them. For many records the broadband speeds and Technology of Transmission have been populated and updated. Where possible, address record values have been normalized. All CAI records now have the “Full Census Block ID” codes.

All data was edited to match the 2012 TIGER Census Utah State Boundary. This change mainly affected satellite provider’s coverage areas.

Update October 18, 2012: Due to issues discovered during validation and verification, Frontier Communication's data was not updated this round. We are currently working with the provider to determine a process to map their service area most accurately and this issue will be resolved by the Spring 2013 data submission.

Map Disclaimer

Broadband service availability and characteristics are depicted as derived from data assembled by the Utah Broadband Project. Data sources include biannual broadband service provider submissions and publicly available sources. Data has been modified, where necessary, to meet broadband mapping standards set by the National Telecommunications and Information Administration (NTIA).

Broadband service availability is displayed per NTIA specifications which include technology and speed categories and the generalization of non-wireless service availability information to either U.S. Census blocks (where smaller than 2 sq. miles) or road segments.

Speeds shown are the 'maximum advertised' for the geographic features depicted, and must exceed 0.768 Mbps download and 0.2 Mbps upload (NTIA minimum definition of broadband) to be included. Actual speeds may vary within and along census blocks and roads due to the granularity and currency of the data, technological limitations, and service plan limitations. Users of this data and associated map visualizations are encouraged to inquire directly to providers for current service availability and speed.

All information presented on the Utah's interactive broadband map is for general reference purposes only and may contain errors and omissions. The State of Utah makes no warranty with respect to information available, express or implied, including but not limited to the fitness for use for a particular purpose.

The Utah Broadband Project welcomes comments: broadband@utah.gov.

Map Data Description

All broadband mapping data either is sourced directly from a broadband provider, or from working directly with a provider. Utah has 100% participation from the 51 providers identified to date.

Wireless broadband internet data is mapped using coverage area footprints derived from analyzing antennae location, signal strength and terrain. Wireline broadband internet data is mapped using 2010 census blocks for blocks less than two square miles in area, and road segments in cases of larger census blocks.

Once a provider's broadband coverage is initially mapped, data updates take several forms including GIS files, written descriptions, provider created maps, and verbal and written discussions.

Community Anchor Institution locations are mapped using supporting resources from Utah's State Geographic Information Database (SGID). Broadband Internet subscription information comes from a variety of sources including the Utah Education Network, the State of Utah Department of Technology Services, and the Utah Telehealth Network.

Confidential data not shown on the map is also collected by the Project, and submitted to the NTIA. This information includes middle and last mile broadband infrastructure points.

Validation

The Project's data submission is compliant with the December 2011 SBDD Data Transfer Model and the State Broadband Data and Development NOFA. All broadband data that does not agree with the allowable values and ranges in the Data Transfer Model is studied and adjusted to agree with the data model or noted as exceptions as appropriate.

Another important part of data validation is the project's data intake and processing flow. In summary, our data flow consists of:

- Initial evaluation of data submission and initial documentation.
    - Recordation what was submitted by provider.
    - Verification that the data update is usable.
- Make data submission updates and put the data in the NTIA data model.
- Detailed evaluation and documentation.
    - Document details of the data and the data processing steps.
    - Review the provider's changes from previous submissions for consistency between what is in the data and what discussions have been made with providers.
- Create data feedback for provider to review.

Aerial photography, address location services, census block geometry, and road segment geometry used for broadband service mapping and for quality control of the broadband data are from public domain resources in the SGID.

Verification

All Broadband data received by the project is reviewed for overall verification. Besides our initial verification, other sample verification methods are listed below.

- The project maintains archives and documentation of a given provider's data over time, and changes are noted and verified as to their plausibility. All data related interaction with a provider since the project began in June 2010 is also documented. This provider submission history is periodically referred to in order to guide correspondence needs and special handling of the submission data.
- For each provider's geographical extent, examination of areas that are not served or are underserved is completed and discussed with the provider for accuracy.
- Every time the project receives updates from a broadband provider, data feedback is sent to the provider for them to verify that the data or updates have been prepared accurately. The biggest source of feedback for providers is being able to interact one on one with their specific data on the Utah Broadband Interactive Map. Providers can do this on their own or with the project during a scheduled conference.
- Local telecom territories are used to verify reported DSL coverage areas.

- Wireless Drive Test: In July 2011, the Utah Broadband Project contracted with Isotrope LLC, a Massachusetts-based company, to perform a drive test to assess wireless broadband services and capabilities throughout the state. The drive test data, collected by traversing over 6000 miles of the state , provides a snapshot in time of mobile broadband speeds, signal strength and technologies. After being collected, the drive test data was used to assess broadband provider data and was used in verification discussions with wireless providers. It was also provided to all wireless providers for their own use.
- Prior to July 2011, commercial wireless data such as the American Roamer data was used to verify reported wireless coverage areas.
- In order to map the wireless data more accurately, whenever possible the project mapping team has worked with providers to acquire wireless coverage areas based on signal propagation modeling. If a provider does not have the capacity to submit a propagated coverage area, the project encourages providers to provide tower locations and antenna locations and specifications to the project mapping team that are then used for a viewshed to create a propagated coverage area.

Additional Utah Broadband Maps and Data Resources

The Utah Broadband Project maintains additional maps beyond the online interactive map. These are available on request and include maps of broadband coverage availability, best available speed, and highest order technology in Utah. The project is also willing to work on other specific mapping requests.

About the State Level Broadband Map

The Utah Broadband Interactive Map was developed and is hosted by the Utah Automated Geographic Reference Center (AGRC) utilizing data complied by the Project from broadband providers and public sources, including Utah's State Geographic Information Database (SGID) which is utilized extensively for locating addresses, locating geographic places, and displaying background maps.

Goals

- The map attempts to provide consumers, community leaders, and broadband providers with a comprehensive map-based view of non-confidential data complied by the Utah Broadband Project.
- The map is also meant to be used by policy makers or policy maker supporters, such as the Utah Broadband Advisory Council.
- The map serves as a basis of discussion with Broadband Providers to verify accuracy of data.
- The data on the map is used in our twice yearly submission to the NTIA.

Commonwealth of Virginia

Virginia Center for Innovative Technology

Virginia Information Technologies Agency
Virginia Geographic Information Network

Virginia Tech
Center for Geospatial Information Technology

NTIA STATE BROADBAND DATA DEVELOPMENT
ROUND 6 - Fall 2012 SUBMISSION

Summary of Virginia Submission

The Virginia Center for Innovative Technology (CIT) was designated by the Governor of Virginia as the primary point of contact for all Commonwealth of Virginia participation in the National Broadband Mapping Project. The CIT worked in conjunction with the Virginia Information Technologies Agency's (VITA) Virginia Geographic Information Network (VGIN) to review, process, normalize and submit the information outlined in the National Telecommunications and Information Administration's (NTIA) Notice of Funding Availability (NOFA) establishing a Virginia iteration of the National Broadband Map.

The fall 2012 submission to the NTIA includes data from 56 broadband service providers with unique federal identifications delivered in various formats ranging from GIS shape files to text files detailing broadband availability. To provide a complete snapshot of broadband availability in Virginia, the spring 2011 submission data was carried forward for several remaining broadband providers while some carry over providers were reworked for the 2010 census block request.

A summary of the Fall 2012 submission data includes:

Address point data	0
Census Block polygons provided with coverage information	397868
Street Segments provided with availability information	64787
Wireless polygons with coverage	27
Middle Mile points with availability information	596
Community Anchor Institution points with availability information	4075

All broadband providers participating provided advertised speed information for wireless polygons, census block, road centerline segment, or addresses.

There are a total of 174 broadband providers that have been identified through various sources within the Commonwealth of Virginia as of April 1, 2012. There are 68 providers who are participating in the national program and 106 who have not responded to a call for data. Virginia has an on-going effort to contact the providers who have not responded to offer any assistance needed for them to participate.

As of the fall 2012 NTIA SBDD submission, Virginia has elected to no longer submit addresses as point data. All address data has been geocoded to the VA road centerline locater and road segments were then selected by location and loaded to the NTIA data model. This change in processing procedure creates a redistribution of the total record counts by feature class.

Virginia Broadband Data Verification and Validation

Verification Techniques

In the fall of 2010, the Virginia broadband mapping team subcontracted with Apex-CoVantage to provide the following one-time broadband data verification techniques using standardized questionnaires for the Commonwealth of Virginia:

- Telephone interviews
- Field (door to door) interviews
- Direct mailings
- Drive Testing
- GPS data collection at field interview sites

A total of 2,421 surveys were conducted, with 616 in-person and 1,805 by telephone.

Validation Methods

Using the NTIA definitions for served/under-served/unserved combined with Census demographics and Virginia broadband availability data, the Virginia Tech mapping team produced an estimated Broadband “serve-ability” Census Block map for Virginia. From this the Apex team then identified a geographically stratified (rural/urban) statistically significant sample size for which to apply the above data verification techniques.

Results

The effort resulted in the following findings:

- Surveys confirming Wireline Provider access: 97.3%
- Surveys confirming Wireless Provider Access: 99.7%
- Surveys confirming Internet Service Provider: 91.1%

In addition, the survey questionnaires confirmed valuable location information (lat/long & address) along with details about internet service provider and demographic information.

Percentages as of April 1, 2012.

Base Map Data

VGIN maintains statewide imagery, road centerline, and address point feature classes. a VGIN also maintains a series of statewide base map data sets, or partnerships with commercial entities which allow the granularity of data necessary to support the National

Broadband Mapping Project. The following Virginia and Federal data sets are used in SBDD data processing.

Road Centerlines (RCL) – VGIN maintains a statewide road centerline feature class that is updated quarterly using locality centerline submissions. This road centerline database contains address range information when it is provided by the locality. The RCL database is used to generate a geocoding service which is an interpolated point along a centerline that is fed into the Virginia statewide composite geocoding web service.

TIGER 2010 Census Blocks – 2010 Census geometry that is available to the broadband mapping project for location and presentation of broadband data.

Selection Set Feature Classes

Before any provider information was processed, a geodatabase of selection set feature classes was created and individual feature classes were created for use in the fall 2012 data submission. In order to support the processing of broadband data based on select by location, feature classes were set up into a selection feature database which allowed subsets of provider information to be joined spatially or by attributes and schema to be used seamlessly from the processing environment to the transfer data model. Each feature class of interest was an import of the most recent iteration the NTIA SBDD data model schema (June 2012). Features from Virginia base map data were ETL'd using appropriate field mapping. The following are layers used in the Selection Set geodatabase:

Road Centerlines - Virginia RCL data has address ranges in the form of four fields; from left, to left, from right, & to right. Two fields were added in the VA State RCL output for address high and low and calculated based on several selection queries. A blank schema feature class of the roads was added and the field V_LEID (VA RCL unique ID) was added to the feature class. This customized statewide data set from the Virginia RCL Quarter 2 of 2011 was then loaded to a selection set feature class which cloned the schema of the NTIA SBDD model feature class called BB_Service_RoadSegment. Unique IDs from the VA centerline were loaded to the selection set road centerline feature class. All Broadband related fields (DBA, FRN, TransTech, etc.) assumed default values of the NITA data model and were <Null> or blank.

2010 Census Blocks Less than 2 Square miles - A field in a staging feature class for the 2010 TIGER census blocks called SQ_MI_VA_LAMBERT was added to the selection set feature class and was created in the NAD_1983_Virginia_Lambert (Meters) projection and calculated to the WGS_84 data set. This process was used in Square Mile QC. All blocks greater than two square miles were removed from this feature to ensure all joined data sets would yield a match from a provider spreadsheet to a block in the selection feature class and the match would be less than two square miles only. 2010 Tiger blocks were loaded into the NTIA model directly using the schema of the NTIA SBDD data model for the feature class BB_Service_CensusBlock. GEOID values in the 2010 data were mapped to the FIPS values in the NTIA schema and other related block data was matched with its appropriate field name. Broadband related fields assumed default values of the NTIA data model.

Broadband Provider Processing Environment

To support the processing of broadband provider information separately, a broadband provider specific staging geodatabase was created. Each broadband provider participating in the fall 2012 NTIA submission had its own geodatabase and data was processed completely independent of all other broadband providers, allowing providers to move through the process at different rates. This procedure also allowed the correction of any data problems specific to broadband providers without affecting the entire submission database.

A naming convention for each selection set feature class was used and called "NTIA_" and the feature class type. "NTIA_Roads" were loaded to the transfer data model feature class BB_Service_RoadSegment, "NTIA_Census_Blocks" were loaded to the transfer data model BB_Service_CensusBlock feature class, and depending on provider category "NTIA_Wireless" was loaded to the transfer data model BB_Service_Wireless. Once the broadband provider data was processed to a point in its native feature class in the staging geodatabase which fully conformed to the NTIA specifications, it was included in the Virginia submission for quality control and subsequent delivery.

Generalized Broadband provider Data Processing

Broadband provider processing was accomplished using selection set feature classes and the appropriate geometry. Data was reported in many different categories and each of these reporting formats was handled differently. While there were other NTIA SBDD data sets that were provided differently from providers (pricing, speed by region), they were considered separate use cases than base layer data since the output of these secondary data sets was not primarily geospatial. The following are GIS data layers reported in the SBDD data model.

Wireless Service Area Polygon Reporting – Service Area Polygons were reported by Wireless Broadband providers and required little processing to be included in the NTIA SBDD data model. Typical inclusion processes included attribute validation and use of the ESRI Simple Data Loader or Copy and Paste.

Census Block Reporting – Broadband providers reporting broadband availability on a census block basis submitted it in list form a majority of the time. These lists came in the form of spreadsheets and text files. These lists were normalized into spreadsheets and then imported into a provider staging geodatabase table. An attribute join using the full census block ID was completed to the Selection Set census block feature class. Census blocks less than 2 square miles were exported to a separate feature class to use in processing address and/or road centerline data also sent by the provider.

Address Reporting – Some providers reported data in census blocks less than two square miles but also included customer addresses for blocks greater than two square miles.

The majority of wireline providers reporting broadband availability on a service address basis submitted data which DID NOT differentiate where their addresses fell within blocks less than or greater than two square miles. In order to convert the provider's data to the NTIA spatial parameters of block and centerline differentiation, all lists were converted to spreadsheets and were incorporated into the SBDD submission in a two tiered approach using the NTIA and VGIN's understanding of broadband coverage:

1) Geocoded to VGIN's address point locator, then blocks less than two square miles were selected where a geocoded point fell within.

2) Addresses that did not achieve a result from the address point geocode or were outside of blocks less than two square miles were re-geocoded to VGIN's Road Centerline locator and point results were spatially joined to the selection set RCL data providing a centerline feature output. Addresses were first geocoded against the statewide address point database.

Road Segment Address Reporting – Broadband providers reporting broadband availability using road address ranges submitted the data in a non-spatial list in a majority of cases, although several providers did send in TIGER lines or VA RCL data. These lists were normalized into a series of spreadsheets when processing the individual provider. The data was either used in joining to census features by Tiger Line ID (TLID) and then selecting by location from the selection set RCL data or used raw in geospatial format and selected.

Community Anchor Institutions –
Virginia's CAI data has additional attribution beyond the NTIA data model due to the source of the VA data set. VGIN and Virginia Tech both house CAI data although the record counts for tables are not identical. The master VGIN geospatial feature class is used in submission to the SBDD project while changes from Virginia Tech are generally conflated.

Virginia Tech held speed tests in 2009 and this information was applied to the NTIA SBDD transfer data models of the past. With the inclusion of attribute values for subscriber upload and subscriber download speeds with the most recent NTIA model for the Spring

2012 submission, Virginia Tech provided VGIN with an export of its most recent database to include speed testing held in 2011 in the SBDD Transfer Data model CAI feature class. Included were a subset of features based on CAI category and were not the entire CAI feature class so features in the VT data were then applied to the VGIN submission feature class.

In order to apply changes from the Virginia Tech update to the VGIN NTIA submission data, the VGIN CAI point feature classes as well as the VT point feature class update were imported into a staging file Geodatabase. The VT update was buffered 5 feet and output to a buffer feature class which included the same attribution as the point feature class. The point was spatially joined to the buffer feature class and values were calculated within the point data to include updates to speeds and transmission technologies where captured by VT. Of the total features, approximately 100 features did not fall within the buffers and were not spatially joined. These values were either features which the VT feature class contained and the VGIN feature class did not, or the geometry locations were different for the same feature. These remaining buffered features were exported to a separate feature class to use in manually adding changes to the VGIN point data. For each feature not available in the VGIN CAI features, the data was copied from the Virginia Tech data and placed in the VGIN CAI feature class. For each feature that were in both databases but spatial location was different, the ESRI ArcGIS Attribute Transfer functionality was used to conflate speed values.

In order to represent the data with 2010 census geography as requested by the NTIA for the Fall 2011 SBDD submission, data was then spatially joined to the 2010 census block data and output in the working Geodatabase feature class. The resulting feature class was calculated for the full FIPS ID and this was loaded to the transfer data model in the NTIA SBDD format.

Middle Mile – The majority of providers do not send middle mile data. When it is received it is converted into a geodatabase table in the broadband provider's staging geodatabase. An add XY function was performed in ArcMap and XY events were exported as a new feature class. Inside the provider's staging geodatabase, the NTIA SBDD data model feature class named BB_ConnectionPoint_MiddleMile was imported and renamed NTIA_middle_mile. Data was either loaded to this feature class and all appropriate fields were calculated based on the XY event in order to load data spatially or if only a handful of points were provided the data was manually edited in an edit session.

Pricing - If nominal weighted subscriber speed was available from a broadband provider, the data was placed into an excel spreadsheet for the spring 2012 submission which followed the format of requested text output information from NTIA. It was then output to a requested tab delimited text file for the release. All providers who had previously sent in pricing data but had not submitted an update for the spring 2012 release were carried over into the spring 2012 pricing spreadsheet.

Speed based on CMA/MSA/RSA - If speed was available by cellular market area or MSA/RSA and provided to CIT and VGIN, this information was placed into a newly created SDE feature class which tracked the most current speed from a provider. If the provider was a new or updated submission, the feature class was updated with the most recent speed data. All archive speed data was located and custom areas of interest were added as polygons in this feature class.

Processing QC, Batch Calculation, & Loading

While some provider data imported directly, where information for 2010 census geography was needed (Census Blocks, Middle Mile, Address Points) the feature of interest was imported and processed differently depending on the type of geography stored. Not all providers submitted census blocks to the NTIA but those who did were validated with a field in the selection set census block layer which contained square mileage calculated on the VA Custom Lambert projection.

For data reported as service addresses, several fields were required that could be calculated in batch. The FULLFIPSID was calculated to the address points by spatially joining points to the census blocks. Latitude and Longitude were calculated in ArcCatalog using the calculate geometry function.

Only a few broadband providers who participated in the fall 2012 NTIA submittal provided Middle mile data. Resultantly, the processing and aggregation of a middle mile data set was done outside of standard broadband provider data processing.

Address Points, Road Centerlines, Census blocks, and Wireless Service polygons were processed as broadband provider data was received although middle mile information was a post processing step. To create middle mile event data, the broadband providers that provided the information to CIT and VGIN generally included latitude and longitude of the facility and these values were used in ArcGIS with the add XY function. After points were brought into ArcGIS, data was exported into a separate feature class and values were calculated based on information the broadband provider provided.

Specific Broadband Provider Processing Methodology

The following Broadband Providers submitted data for the fall 2012 NTIA submission. It is assumed that the participating Broadband providers provided entire coverage as opposed to update only data sets unless otherwise noted. Included are the methods used in updating the Virginia Broadband map data:

Broadband Provider	FCC Registration Number
AT&T Wireless	0004979233
BIT Communications	0002031698
CenturyLink	0018626853

Verizon Wireless	0003290673
VSAT Systems, LLC. (Skycasters)	0001875615
XO Communications	0006275945

AT&T Mobility, LLC

AT&T wireless provided geospatial data in the form of three polygon shape files. No Middle mile data was included as no updates had occurred, so the spring 2012 submission was carried over to the fall 2012 NTIA data model.

Inside the shapefiles (3G, 4G, and LTE) provided by AT&T were over 2300 polygon records with no meaningful attribution, and gridded for internal use. Each shape file was copied for editing into a staging database and all were attributed appropriately. The 4G and LTE polygons were then merged into a single record due to having identical attribution. The records were then loaded into the VGIN NTIA transfer data model.

Address Point features:	0
Road Centerline features:	0
Middle Mile features:	1
Community Anchor Institutions reported:	0

BIT Communications

BIT Communications provided a hand drawn map overlay over a street map. A matching polygon shapefile was created to create the overlay drawing in ArcMap. Using the select by location tool, the road segments within the overlay that had broadband data where selected and exported into a shapefile. This shapefile was then edited and loaded to the NTIA Transfer data model.

Road Centerline features:	1
Middle Mile features:	0
Community Anchor Institutions reported:	0

CenturyLink

CenturyLink provided geospatial data in the form of road centerlines and census blocks and reported to CIT that the census Geography was in 2011. Middle mile and subscriber weighted speed were not included this round and were carried over from the most recent data submission into the speed SDE layer and pricing spreadsheet.

Census blocks less than two square miles were joined to the Selection Set Census block data using the FULLFIPSID. The joined block data was output to new features, and attribution corrected as needed, and then the records were appended to the Transfer data model.

In order to provide the Road Centerline data in Virginia's geometry (VBMP RCL Quarter 2, 2011), the road lines provided by Century Link were used in a select by location analysis. The Virginia Road Centerline Selection set was selected if the lines provided by CenturyLink were within 100 feet and then exported to a new feature class. This was done on a unique attribution grouping basis, such that each exported record set could be calculated identically – and then all were remerged together. This iteration of the roads was loaded into the NTIA transfer data model.

Community Anchor Institutions reported:	0

Charter

Charter provided Geospatial data in the form of road centerlines and 2010 census blocks (< 2 square mile) for two different transmission types, as well as middle mile data. All were in a shape file format. No new subscriber-weighted nominal speed data was sent therefore that data was carried over from the fall 2011 submittal.

There were no changes to the middle mile data from the last submission and the data was carried over to the October NTIA data model.

The census block shp file contained only a portion of the attributes needed to meet the NTIA standards. A select by location was performed using the census block feature class in the VA Selection Set and all identical polygons matching the census blocks from Charter were exported to a shape file. All attributes were populated in the exported shape file and then loaded into the VGIN NTIA transfer data model.

In order to provide the Road Centerline data in Virginia's geometry (VBMP RCL Quarter 1, 2012) and eliminate the bulk of ancillary roads from TIGER lines, the road lines provided by Charter were used in a select by location analysis. A select by location was performed using the road centerline feature class in the VA Selection Set to select road lines that were within 2 meters of the lines submitted by Charter. The selected data was then exported to a shape file and the NTIA attributes were populated before loading into the VGIN NTIA transfer data model.

Community Anchor Institutions reported:	

Comcast

Comcast provided census block and address number spreadsheets. Speed data was provided by region in a spreadsheet and the values inside were checked against the SDE Speed by region polygon feature class. A staging file geodatabase was created for this provider and the census block spreadsheet information was imported as a table.

The spreadsheet for blocks less than two miles was imported to the staging database and joined to the census block feature class in the VGIN VA Selection Set. The joined data was then exported to a new feature class. The features in this new layer were selected by location to the SDE speed feature class in order to apply maximum down and upload speeds which were reported in the speed spreadsheet.

Address level data was geocoded to the VGIN Road Centerline address locator. Point results were then spatially joined to the selection set Road Centerline features in order to obtain a centerline feature class geometry. Select by location was performed to the SDE speed feature class in order to apply speed information to the resulting centerline features. Additional fields were populated.

To date, middle mile features or community anchor institution data has not been provided by Comcast.

Covad Communications Company

Covad provided Census Blocks, Address ranges, Middle Mile, subscriber pricing, and speed by region as text files. This data was normalized to spreadsheets. A staging geodatabase was created and the spreadsheets were imported as feature class tables. The pricing information was added directly from the imported spreadsheet to the provider aggregate pricing spreadsheet while the Middle mile and speed data were checked and no updates were necessary to make in the Middle mile point and Speed polygon feature classes so values were carried over from the fall 2012 submission.

Covad provided different transmission technology speeds within the same geometric features so the output product need was stacked geometry. In order to geographically represent the data this way, for Census Block and Address Segment data, transmission type was selected and a separate geodatabase table was exported for each. There were 3 tables for Census Blocks created; 10, 20, & 30. There were 3 tables for address ranges created; 10, 20, & 30. Each of these were joined to the appropriate feature class individually, exported as a separate feature class, and then loaded to a single feature class per geometry.

The census block text file contained varying transmission technologies. It was checked against the spring 2012 submission and changes were present in the blocks for Transmission Technology of 10. Since it was assumed there could potentially be changes for all three types, all blocks were reprocessed for fall 2012. Three output tables created for each Covad Transmission Technology Type and each table was individually joined to the selection set census block layer to verify record number counts. The joins all were successful, signifying that the data was indeed in 2010 geography so they were exported to a separate feature class per table. The three feature classes were populated based on table attributes and were then loaded to the NITA transfer data model.

Address Ranges were checked against the spring 2012 submission and records were identical. Since this information was the same, the centerlines were exported from the spring submission to the Covad staging database and then loaded to the fall 2012 Transfer Data Model.

Cox

Cox provided census block, address number, middle mile, and speed text files that were converted into spreadsheets. Speed data was provided by region in a spreadsheet and the values inside were checked against the VA SDE Speed by region polygon feature class. A staging file geodatabase was created for this provider and the census block spreadsheet information was imported as a table.

The spreadsheet for blocks less than two miles was imported to the staging database and joined to the census block feature class in the VGIN VA Selection Set. The joined data was then exported to a new feature class. The features in this new layer were selected by location to the SDE speed feature class in order to apply maximum down and upload speeds which were reported in the speed spreadsheet.

Address level data was geocoded to the VGIN Road Centerline address locator. Point results were then spatially joined to the selection set Road Centerline features in order to obtain a centerline feature class geometry. Select by location was performed to the SDE speed feature class in order to apply speed information to the resulting centerline features. Additional fields were populated.

Middle mile features were checked against the spring 2012 NTIA SBDD submission and not apparent changes were noticed. The point information was reused.

HughesNet

HughesNet is a satellite provider and sent data in the form of census blocks. When previewing the data and joining the data to Virginia's statewide block feature class, all blocks were added to the join. This signified that Hughes covers the entire Commonwealth of Virginia. Since this was the cases, the Virginia boundary was copied and provided as the geospatial footprint. Attributes for Provider Name, DBA, FRN, transmission technology, and advertised speeds were included in a communication e-mail. Spectrum was assumed Satellite due to Transmission Technology type. A staging database was created and used, data was then loaded into the NTIA transfer database.

Lumos

Lumos (Formerly NTELOS Wireline) provided an update of spreadsheets for census blocks less than two square miles and customer addresses for blocks greater than two square miles. For each geography type, a spreadsheet was available for their DSL and Fiber product locations. The data in the blocks less than two square miles had a latitude and longitude field (XY) so this was used in finding a location for both transmission technology types. Blocks from the selection set feature class were selected by location from the centroid of the point for each transmission technology type and the attribute information was processed to the individual block feature.

The addresses in blocks greater than two square miles were geocoded against the VGIN Road Centerline address locator. These points were spatially joined to the selection road centerline feature and output to a new feature class for both DSL and Fiber tables. Attributes were available from the spatial join in the newly created centerline feature classes.

All Census Block and Road Centerline feature classes were loaded into the transfer data model. Middle Mile was not reported for the fall 2012 submission so the last received middle mile point information was updated for Lumos (formerly NTELOS Wireline) in the provider's staging database and loaded to the transfer data model.

Mediacom

Mediacom submitted address data in a spreadsheet. The address data was scrubbed and geocoded. The matched and tied records were overlaid on 2010 census blocks for review. All address points except one fell inside census blocks less than two. Census blocks less than 2 square miles that contained address points were exported to a new feature class in the Mediacom staging database. The NTIA census block attributes were populated from the provider's data. The address point that fell outside blocks less than two square miles was used to select the corresponding road segment. The road segment attributes were then populated from the provider's data and exported to a new feature class.

The Mediacom Census Block and Road Segment feature classes were then loaded to the VGIN Transfer data model.

MetroCast Communications

MetroCast provided census tracts in the form of a spreadsheet where they claim they can provide service. Since the tracts were not Geospatial, the data was selected from 2010 TIGER census tract features and then imported into MetroCast's staging geodatabase. Census blocks in the selection set feature class were selected by location where a selection set census block centroid was within a MetroCast census tract. All census block polygons were exported to a feature class for loading.

Road centerlines from the selection set feature class were used in select by centroid to the MetroCast census tract feature class. Features that fell within the polygon area were extracted to a separate staging feature class within the provider staging database and the staging centerline features were selected by the polygons. Any centerline that fell outside the census block features were kept and exported a new feature class used for loading to the transfer data model.

The census block and centerline feature classes used for loading were then edited and calculated appropriately for the attributes submitted by the provider. After all features were updated, both data sets were loaded into the NTIA Transfer Data Model.

RCN Telecom Services LLC

RCN provided a spreadsheet of address availability and middle mile points for the spring 2012 submission. A provider staging geodatabase was created and both files were imported as tables for normalization. The Address availability import table was geocoded and matched records were kept, while unmatched and tied results were exported to a separate table in the geodatabase. It was determined that all matched address points were within census blocks less than two square miles. A spatial selection of the census blocks containing the address points was performed and NTIA attributes were populated from the providers address data. The census block feature class was then loaded into the VGIN NTIA Transfer data model.

The middle mile data provided this round was reviewed and had not changed from the spring 2012 submittal so the spring 2012 data was loaded into the VGIN Carry Over data model.

Scott County Telephone Cooperative (SCTC)

SCTC provided an update for the fall 2012 release as a polygon coverage area to signify where their Fiber and DSL technology information is located. The polygon data was in several feature classes and was imported and worked into a single feature class which represented both technologies. It was confirmed by SCTC that the tech types did not overlap and also that the provider did not have middle mile information to provide to NTIA.

Census blocks in the selection set feature class were selected by location where a selection set census block centroid was within a SCTC polygon feature based on Transmission Technology type. All census block polygons were exported to a feature class for loading; the feature class contained both DSL and Fiber optic.

Road centerlines from the selection set feature class were used in select by centroid to the SCTC polygon feature class. Features that fell within the polygon areas were extracted to a separate staging feature class within the provider staging database and the staging centerline features were selected by the polygons and calculated by Transmission Technology. Any centerline that fell outside the centroid of a census block feature was kept and exported to a new feature class used in loading to the transfer data model.

The census block and centerline feature classes used for loading were then edited and calculated appropriately for speed information based on Transmission Technology types. After all features were updated, both data sets were loaded into the NTIA Transfer Data Model.

Skyline Telephone Membership Corporation

Skyline Telephone submitted data for the first time this round in the form of an address spreadsheet. This provider is located in a rural area on the border with North Carolina and the majority of their customers and all middle mile infrastructure is located in North Carolina. Less than twenty customers are served in Virginia.

The address table was imported into a staging database and overlaid with census blocks less than two square miles. All of the address points were within census blocks less than two square miles. A selection of the census blocks containing the address points was performed and NTIA attributes were populated from the providers address data. The census block feature class was then loaded into the VGIN NTIA Transfer data model.

T-Mobile

T-mobile provided geospatial data in the form of three coverage area shape files. In the supporting documentation, T-mobile explained attribute values for each polygon feature class. Middle mile and subscriber-weighted nominal speed data was included in tabular format.

The shapefiles provided by T-mobile were named UMTS, HSPA21, & HSPA42 and inside each shapefile were several thousand records with every single record in each feature class containing identical attribution. The data appeared to be gridded for internal use. The three shp files were imported into the provider's staging geodatabase. The polygons were merged into a single coverage polygon in the individual staging feature class and then each was copied and pasted into the VGIN NTIA transfer data model. Attributes were populated to match supporting documentation provided by T-mobile.

The middle mile and subscriber-weighted nominal speed data was unchanged from the last submittal.

TDS Telecom

TDS Telecom provided geospatial data as well as source data of availability by csv files. The provider submitted data consisted of addresses and middle mile feature classes. A provider staging database was created to review each feature class. Due to inconsistencies between their address point locations and VGINs own address data, the source csv files were used in their entirety in compiling this dataset. The data was imported into the staging database for geocoding and all matched records were translated into VGIN road segments by an attribute join from the road name – and the spatial intersection to Census blocks < 2 square miles was used to retain the final delivery of road segments and Census blocks, respectively. All attributes were applied and reviewed for completeness and the census block and road segment based feature classes were loaded into the VGIN NTIA transfer data model.

Comparison of the middle mile data to the spring 2012 release, revealed no changes so values were carried over from the fall data set.

Time Warner Cable (TWC)

TWC provided Geospatial data in the form of road centerlines and 2010 census blocks < 2 square miles. The provider also included a document stating that no middle mile data had changed; and, subscriber- weighted nominal speed would be sent as soon as it was available.

The TWC data included only one transmission technology type for the fall 2012 submission. Working in the provider staging database, census blocks < 2 square miles were joined to the Selection Set Census block data using the FIPS number text fields. The joined block data was output to a new feature class. Fields were calculated in the selection set export to match Time Warner fields and then the feature class was loaded into the NTIA transfer data model.

In order to provide the road centerline data in Virginia's geometry, the road lines provided by Time Warner were used in a select by location analysis. The Virginia Road Centerline Selection set was selected if the lines provided by Time Warner were within 5 meters and then exported to a new feature class. The values for all road segments by Time Warner were the same (Max Advertised Down =9, Max Advertised Up = 5) so values from the selection road centerline set were manually calculated to match the provided roads. This iteration of the roads was loaded into the NTIA transfer data model.

Verizon Wireless

Verizon Wireless provided two service area coverage shape files and sent the associated broadband attributes in an email. No middle mile carry over or subscriber-weighted nominal speed data was submitted. Each shape file contained a different footprint, one of Verizon's 4G LTE area and the second of their 3G area.

The shape files were imported into a staging database. A merge was performed in each file as each contained multiple polygons with identical attributes resulting in a single polygon for 3G and one for 4G. Fields were created in the 4G shape file to match the NTIA BB_Service_Wireless feature class document. The 4G shape file and the 3G Shapefile were then loaded to the VGIN NTIA transfer database.

Attributes were populated in the VGIN NTIA transfer database using the email attribute information with each of the 3G records having a different spectrum. The final geometry was three stacked polygons for the 3G coverage area and one polygon for the 4G area.

Verizon Wireline

Verizon Wireline provided text files for census block availability, address range availability with TLID. No Middle Mile information was supplied, and was carried over from the previous submission. The text files were exported to dbf and respectively joined to Census Blocks (by full FIPS) or to TIGER lines (by TLID). This was done as a separate process by a selection of each Technology type – this approach was used, as in previous deliveries, to ensure features with multiple Technology types were appropriately duplicated in the resulting data. The joins were exported to new feature classes and values were calculated based on joined features, and then remerged into a single feature class to complete the process. Blocks were then verified for appropriate square mileage (per the source projection), and the TIGER joins were output to new feature classes and they were used in a select by location analysis against the VGIN street segments. The blocks less than two square miles and (selection based) conflated road segments falling outside blocks less than two square miles were then loaded to the NTIA transfer data model.

ViaSat

ViaSat Communications Inc. is a satellite provider and sent Geospatial data in the form of a coverage area shape file to represent its coverage of their Exede 12 product. A staging geodatabase was created to calculate attributes for polygons that were included and excluded by this provider.

There are several areas of the Commonwealth of Virginia that are not covered by Excede 12 yet are covered with the Exede 5 product so a separate polygon of the entire state was added to the providers staging data. Attributes for all pertinent features were populated to match the original shape file as well as additional fields needed in the NTIA database which were not present. The data was then loaded to the NTIA Transfer data model.

XO Communications

XO Communications last submitted data in the spring of 2010 in the form of a census block spreadsheet. The provider was recently contacted to confirm the status of their data and found no changes and additions had been made in the intervening years.

The data was reviewed and it was discovered that one census block was greater than 2 square miles. XO provided an address for the customer within that census block. The address was geocoded to the VGIN RCL locator to select a road segment. The selected road segment was spatially joined to the road feature class in the VGIN Selection data model and then exported to a separate feature class. Road attributes were populated and the data was loaded to the VGIN Transfer data model.

The census blocks from the 2010 submittal were imported to the staging database and the census block greater than 2 square miles was deleted. The census block data was then loaded to the VGIN Transfer data model.

Carryover Providers from Spring 2012

Many providers did not submit updates for the Fall 2012 so their data from the Spring 2012 SBDD transfer model was carried over. A new staging geodatabase was created which represented providers who did not send updates and the schema matched the transfer data model. Providers who did not submit an update were selected by FRN from the Spring 2012 NTIA SBDD submittal.

Several providers that did not send updates for the Fall 2012 submission were reworked to meet the NTIA data model definition of broadband availability. They were reprocessed for data accuracy purposes.

The following broadband providers are participants in the VA SBDD project but did not indicate having updates:

Broadband Provider	FCC Registration Number
BVU OptiNet	0006823991
Buggs Island Telephone Cooperative	0002031698
Citizens Cablevision Inc.	0009485343
Citizens Telephone Cooperative	0004381422
FairPoint Communications	0002071116
Level 3 Communications	0003723822
Mid Atlantic Broadband Cooperative	0019765304
Nelson Cable	0000900287
New Hope Telephone Cooperative	0002071579
Nextlink Wireless	0014286934
Roadstar Internet, Inc.	0013445358
Shentel Service Company	0013393988
Shentel Cable Company	0018024075
Sunset Digital Communications	0000826322
The Wired Road	0020153854
Virginia Mountain Micro	0018713800
XO Communications	0006275945

The following broadband providers were reprocessed to match the NTIA data model:

BVU

BVU data was provided to Virginia before the NTIA deliveries but was carried over and used in the spring 2012 SBDD submission. After a quick review of BVU's data, it appeared the data was customer addresses only. The addresses were geocoded against the VGIN Address point locator and point results were used to extract census blocks. Blocks where an address fell within were selected and exported as a new feature class for loading to the NTIA data model.

All addresses outside of the blocks were then selected as well as unmatched addresses were then exported as a non-spatial table and re-geocoded to the VGIN Road Centerline address locator. These points were spatially joined to the selection road centerline feature and output to a new feature class.

Both the census block and road centerline feature classes were updated with BVU's information and then loaded into the transfer data model.

Citizens

Citizens data was provided to Virginia before the NTIA SBDD project to include it's two FRN/provider name companies for DSL and cable and was carried forward and used in NTIA submissions due to its data type. The original Citizens submission was customer address information only along with a spreadsheet which showed speeds in relation to an access point using distance. For the first NTIA submission, a polygon data set was created which showed based on a buffer distance from the access point, the potential speeds a customer would receive based on address point location. This buffer polygon data was used in associating speed information to the data using the NTIA speed tiers. To date, Citizens has not submitted any additional updates to the NTIA project to include blocks less than two square miles or addresses / ranges outside of two square miles. Citizens has also not provided middle mile information.

The address spreadsheets for each FRN were geocoded against the VGIN Address point locator and point results were used to extract census blocks. Blocks where an address fell inside of were selected and exported as new feature classes for each FRN to be used in loading to the NTIA data model.

All addresses outside of the blocks for both spreadsheets were then selected as well as unmatched addresses were then exported as a non-spatial table and re-geocoded to the VGIN Road Centerline address locator. These points were spatially joined to the selection road centerline feature and output to a new feature class.

Both the census block and road centerline feature classes were updated with Citizens speed information based on the buffer polygon feature class in a select by location where the centerline or block feature's centroid fell within a buffer polygon. Information for Advertised and Typical download and upload speeds were used based location and were calculated within the staging database. The processed information was then loaded to the transfer data model.

FairPoint Communications

FairPoint Communications' data was provided to Virginia for the first round submission in the Spring 2010 to the NTIA. After a quick review of the data, it appeared the data was customer addresses only. The addresses were geocoded against the VGIN Address point locator and point results were used to extract census blocks. Blocks where an address fell inside were selected and exported as a new feature class for loading to the NTIA data model.

All addresses outside of the blocks were then selected as well as unmatched addresses were then exported as a non-spatial table and were re-geocoded to the VGIN Road Centerline address locator. These points were spatially joined to the selection road centerline feature and output to a new feature class. Centerlines were removed where they fell within blocks less than two square miles (caused by unmatched data in the Address Point geocode).

Both the census block and road centerline feature classes were updated with BVU's information and then loaded into the transfer data model.

Mid-Atlantic Broadband Cooperative (MBC)

MBC is a backbone provider and has 3 stimulus grants for build-out projects. They submitted middle mile data in a spreadsheet in the spring of 2012 which was processed and submitted in that round.

No data was received for this round so the data was carried over from the spring submittal and loaded to the VGIN Transfer data model.

Nelson Cable, Inc.

Nelson Cable provided Virginia a list of census blocks for the first NTIA data submission as well as addresses. These blocks were evaluated when NTIA requested the 2000 census blocks be converted to 2010 blocks. Address Points and centerlines were provided in archive releases.

The original block data was kept but for the Fall 2012 processing, gaps were filled in with the 2010 selection set census block data. Where addresses and Road Centerlines were available for blocks greater than two square miles in past NTIA SBDD releases, only centerlines were selected from the selection set Road centerline data for the Fall 2012 data.

Both Census Block and Road Centerline features were calculated for this provider using the last submission speed information and were loaded to the Transfer data model.

New Hope Telephone Company

New Hope Telephone Company originally provided Virginia address range information for spring 2012. The address range information did not include segmentation based on TIGER streets or the VGIN RCL data set so there were many GIS features used to represent one record in the range information. Data was manually selected from the VGIN RCL to include all segments covered within the ranges that New Hope telephone cooperative service area could potentially cover. This data was provided to NTIA for several releases.

After evaluating the submitted centerline data, there were many census blocks less than two square miles which lay underneath the segmentation. A new Staging database was created for the Fall 2012 NTIA SBDD submission for New Hope Telephone Cooperative. Census blocks were selected where the carried over centerline data was within distance of 1 feet and of those selected, blocks were removed where a centerline was on the edge of a line. The final block selection was exported as a feature class and used for loading to the NTIA transfer data model. For the polygon edges, roads which were on boundaries were then selected from the centerlines. This was exported a new feature class used to load to the NTIA transfer model.

Both Census Block and Road Centerline features were calculated for this provider using the last submission speed information and were loaded to the Transfer data model.

Level 3 Communications

Level 3 data was provided to Virginia for the Spring of 2011 submission. Their data was address level information as well as middle mile points so in order to reprocess the data for the Fall of 2012 release, a staging database was created and the addresses were geocoded against the VGIN Address point locator. Point results were used to extract census blocks. Blocks where a geocoded address result was located inside it were selected and exported as a new feature class for loading to the NTIA data model.

All addresses outside of the blocks as well as unmatched addresses were selected, exported to a new table, and were then re-geocoded to the VGIN Road Centerline address locator. The resulting points were spatially joined to the selection road centerline feature and output to a new feature class. Roads that were within distance of 1 foot to census blocks were removed from the reporting feature class and blocks were added to the census block feature class instead of the lines.

Both the census block and road centerline feature classes were updated with Level 3's information and then loaded into the transfer data model. Middle Mile points were carried over from the Spring 2012 submission and also loaded to the transfer data model.

Sunset Digital Communications Inc

Sunset Digital was a first time provider for the fall 2011 SBDD submission and provided Geospatial data in the form of road centerlines and census blocks. The provider reported to CIT that the census Geography was in 2010 and VGIN provided them a road centerline data set for usage in reporting. Middle mile was included this round as text files although there may be potential to receive future middle mile submissions in a geospatial format. A new personal geodatabase was created to represent the staging of this provider for the fall 2011 release. Selection Set Feature Classes for Street Centerlines and Census blocks were used.

Census blocks less than two square miles were joined to the Selection Set Census block data using the FULLFIPSID text. Inspecting the join, all features seemed to successfully pass through, signifying that the provider did in fact submit data in 2010 geometry. The joined block data was output to new features. Since the data associated to the blocks were named similarly to the NITA model data, they were calculated in the selection set export and then into the NTIA transfer data model directly.

Sunset Digital provided road centerline segments to CIT and VGIN in the Virginia Road Centerline geometry. The submission data included the VA unique ID for road segments. The V_LEID was joined to the selection set road centerline data V_LEID and only matching records were used. After records were verified, a 100% match rate between the two data sets was achieved. Road centerlines were then output to a staging feature class and then calculated. The staging feature class was then loaded to the transfer data model.

Sunset Digital did not provide and new data for the Fall 2012 submission so the census block, road and middle mile data from the previous submission was loaded to the VGIN Transfer database.

Post Processing Validation and Quality Control

The data included in the NTIA SBDD data model was quality controlled using the topology included in the model as well as the python script provided by NTIA. The topology was validated using ESRI ArcGIS Topology validation tools within ArcCatalog and no errors were reported.

The spring 2012 SBDD data submission was also quality controlled using the latest python script made available by NTIA on March 23, 2012. The script produced both warnings and failures and the data was scrubbed to correct as many as possible. A few items were noted and skipped due to inconsistencies in the NTIA GP check model as described in the March 23, 2012 conference call for all SBDD states with NTIA. The final run of the script resulted in speed tier warnings and failures which have been documented in detail in the READ ME_NTIA_SPRING_2012_SCRIPT_ERROS included in the data submittal.

Table of Contents

OVERVIEW

This white paper highlights the **Submission Summary** for this deliverable, as well as describes the **Data Gathering**, **Data Integration**, **Data Validation and Verification** and **Quality Control** processes used to create the Broadband Mapping Project's October 1st, 2012 data submission. To support varying levels of technical and program knowledge, both a **high-level summary** and a **detailed process review** are supplied.

SUBMISSION SUMMARY

PROVIDER DETAILS

PROVIDER PARTICIPATION

- Provider Participation Statistics Summary

Summary	Count
Total Providers Researched/Contacted	11
Total Valid Broadband Providers	8
Business-only/New Researching Providers	0
Non-Responsive Providers	0
Non-Cooperative Providers	0
Number of Providers – Represented in Data Submission	8
Number of Providers - Supplied Updates for this Submission	2
Number of Providers - Confirmed No Updates	6

- New Providers Since Last Data Submission
  - No new provider coverage areas added
  - Completed provider transfer to new vendor, including complete NDA execution with all providers

- Existing Providers – No Updates
  - HughesNet (DirectWay)
  - Starband Communications Inc/ Spacenet

- Providers Included
  - AT&T Mobility
  - Broadband VI
  - Choice Communications
  - HughesNet (DirectWay)
  - SmartNet
  - Sprint
  - Starband Communications Inc/Spacenet
  - Innovative PowerNet

- Non-Responsive Providers
  - None

- Non-Cooperative Providers
  - None

COVERAGE AREA CHANGES

- Provider Projection Issue
  - Sprint
    - The data supplied by Sprint is projected incorrectly nationwide. We have noticed the impact mainly in the Virgin Islands coverage.
    - To improve the layout of the footprint, we utilized the previous data submitted for alignment comparisons, updated all attribution, and included the additional census blocks to reflect the expansion they communicated for this round.
    - Sprint has been called and e-mailed, without response as of yet. We will continue to outreach to them to gather data in the correct projection and update the broadband map.

- Coverage Footprint Reductions/Map Refinement - Resulting from Validation (Provider Portal)

  - **Coverage Footprint Expansion –**
    - AT&T expanded their TT-80 coverage footprint

  - **Attribution Changes –**
    - Broadband VI increased their speeds for this round

SERVICE OVERVIEW

- For this data submission a service overview has not been included. We are continuing to work closely with the service providers to update their average weighted nominal speeds (AWNS) to ensure a comprehensive Service Overview layer in the next data submission.

DATA CORRECTIONS

- There were no data corrections required for provider coverage in this data submission

COMMUNITY ANCHOR INSTITUTION (CAI) DETIALS

OVERALL STATISTICS

Community Anchor Institution - Categories	Overall Count	CAIID Counts	Transmission Technology	Advertised Speed Down	Advertised Speed Up
Category 1 - School K through 12	82	36	33	33	33
Category 2 - Library	8	6	0	0	0
Category 3 - Medical/Healthcare	20	0	2	2	2
Category 4 - Public Safety	42	0	3	3	3
Category 5 - Universities/Colleges	4	2	3	3	3
Category 6 - Other: Government	133	0	21	21	21
Category 7 - Other: Non-Government	37	0	0	0	0
Total	**326**	**44**	**61**	**61**	**61**

CAI CHANGES

- The CAI changes consisted of the following:
  - Added 1 new CAI, under the Medical/Healthcare category, for this data submission

- The CAI inventory was review again against the database mentioned below for the following categories: Category 1: K-12 Schools, Category 2: Libraries and Category 5: Colleges
  These databases are as follows:

  - For K-12 institutions (CAI type 1) please add the NCES ID CCD ID value found here: **http://nces.ed.gov/ccd/bat/**

  - For Higher Education (CAI type 5) please add the NCES IPEDS ID value found here: **http://nces.ed.gov/ipeds/datacenter/**

  - For Libraries (CAI type 2) please. Combine (do not add) “FSCSKey” and “FSCs_SEQ” from the “puout08av2000” file and place them here: **http://harvester.census.gov/imls/data/pls/index.asp** (FYI the LIBID is your state’s unique ID for libraries)

SUBMISSION RECEIPT

SUBMISSION RECEIPT RESULTS

- Attached are the results from the NTIA data submission receipt quality script.

VI_2012_9_21.txt

- Error Report
  - There were no items targeted as failures or warnings in the submission receipt

HIGH-LEVEL SUMMARY

DATA GATHERING

BROADBAND SERVICE AREAS, MIDDLE MILE AGGREGATION POINTS AND BROADBAND SERVICE OVERVIEW

The collection of Broadband Service Areas, Middle Mile Aggregation Points and Broadband Service Overview information is handled through the following Provider Outreach Process:

- Build and maintain an inventory of Broadband providers through currently known providers and research.
- The inventory and everyday interaction with providers is tracked using the Provider Catalog (PCat). Below are some examples of the web application, which has a shared access between our team and mapping partner (BroadMap).

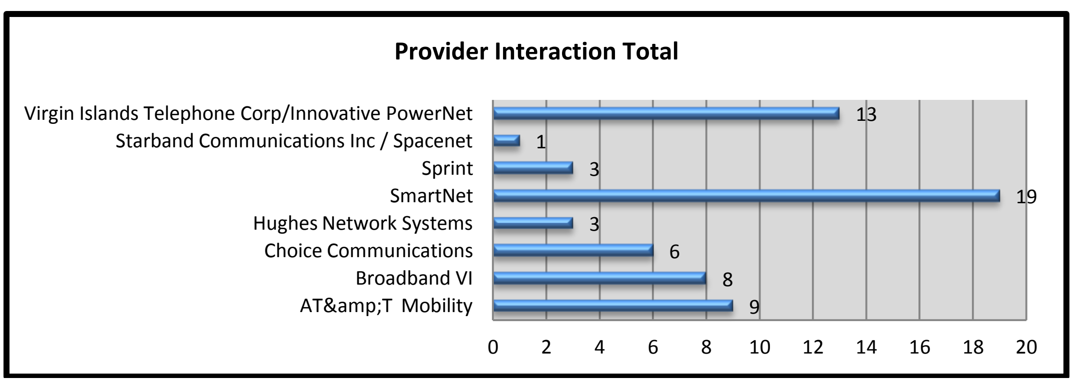
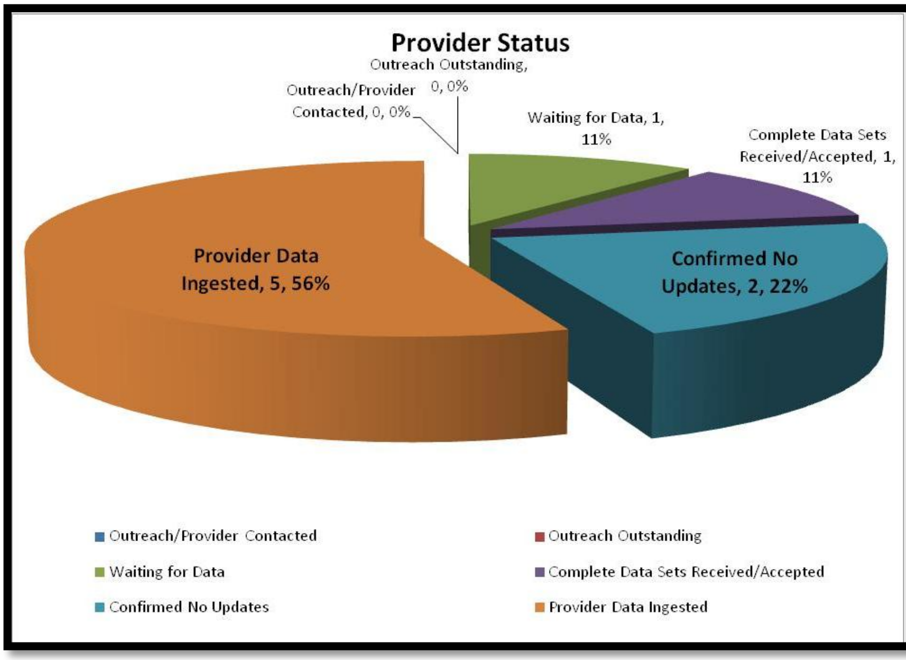
In order to encourage participation throughout the life of the program, we feel it's important to foster relationships with the providers and encourage a collaborative team effort between all parties for each data submission. The chart below represents that interaction count with each provider.





- Update provider material that describes the data requirements and logistics for data transfer.
- Update Non-Disclosure Agreement (NDA) for use in the project, where applicable.
- Maintain multiple protocols for the provider to submit data, including Secure File Transfer Protocol (SFTP) technology when desired.
- Conduct one-on-one informational discussions with each provider to communicate the following:
    - Requirements of this project;
    - Broadband data required to support the product data model;
    - Submission protocols available;
    - Capability to validate how the supplied data is aggregated.
- Download/receive provider data.
- Establish a repeatable process with provider. Maintain provider communication, transaction and data handling records throughout the project (dates contacted, data received, etc.).

COMMUNITY ANCHOR INSTITUTION (CAI)

The collection of CAI information is handled through the following CAI Collection Process:

- Collect and maintain inventory of CAIs through currently known CAIs, data mining, and research.
- Maintain web-based CAI portal for institutions to add or confirm attribution, location and enter broadband-specific information.
- Upload web-based data to Core Database for standardization.
- Perform internal cleansing, such as removing duplicate records, identifying gaps in broadband attribution and verifying category.
- Geocode CAI locations.
- Translate Core Database data to deliverable-ready format.
- Continue engagement with non-responsive institutions.

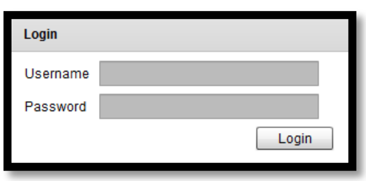
DATA INTEGRATION PROCESS

The data integration and processing mechanisms currently used allows for multiple types of inputs and result in a standardized output that meets the NTIA deliverable requirements. This flexible process supports data model changes and project-requested enhancements.

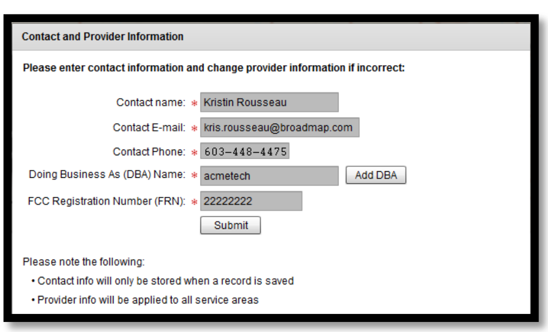
- Receive inputs from providers via submission protocols; upload into Sourcing Database and catalog with provider information.
- Review provider-supplied data for completeness and for potential discrepancies that require resolution prior to processing and flag as necessary.
- Categorize input into data-type category (addresses, block lists, paper maps, etc.).
- Standardize input based on data type within Staging Database.
- Create Compact Polygons (CP)—(internal methodology for generating area-based feature for coverage in Staging Database).
- Apply broadband attribution to CP; apply metadata to CP.
- Perform quality analysis of the CP against the source supplied to identify any completeness or accuracy issues.
- Request additional information from the provider if elements of coverage are missing or contain discrepancies. This is a second manual quality check to ensure data is complete.
    - Process coverage area to build the required NTIA data model layers.

With the deployment of the Provider Portal this round, the data collection and later validation process was streamlined allowing both activities to occur within a secure web application. The majority of the providers used this methodology as it supplies them with more visibility into how their data is being represented and gives them knowledge and ownership of their coverage representation. Below are some bullet points and supporting screen shots on how the portal is used.

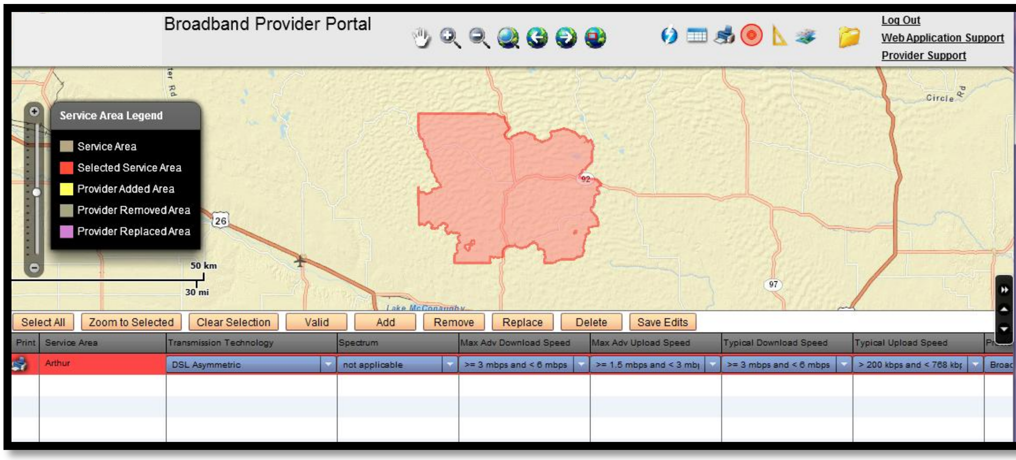
- Each provider is assigned credentials with a strong password to ensure security measures are taken into consideration



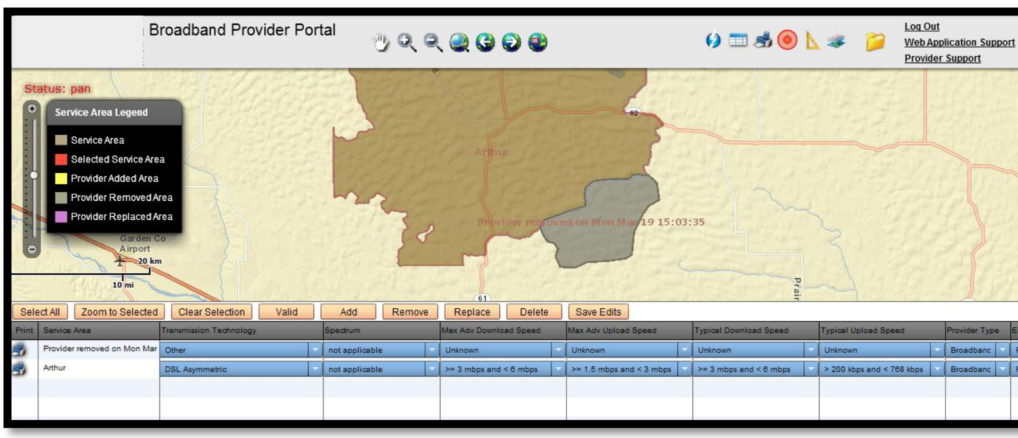
- Collection and confirmation our contact, as well as the company's DBA Name and FRN accuracy



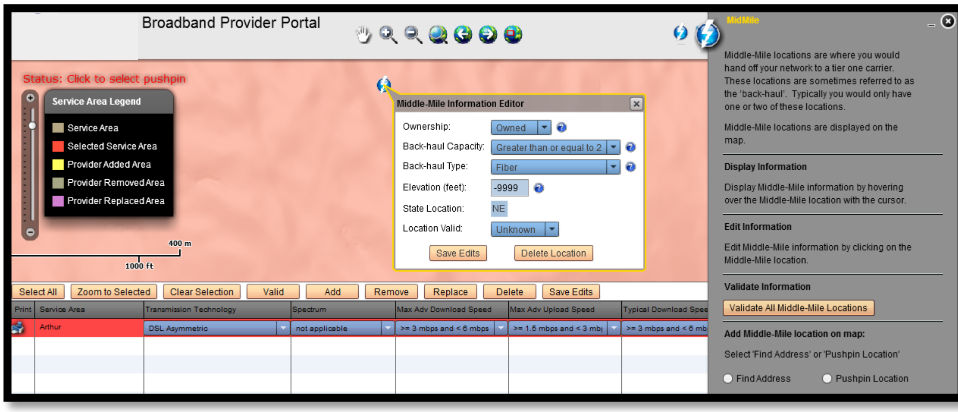
- Capability to review and request changes to the coverage footprint

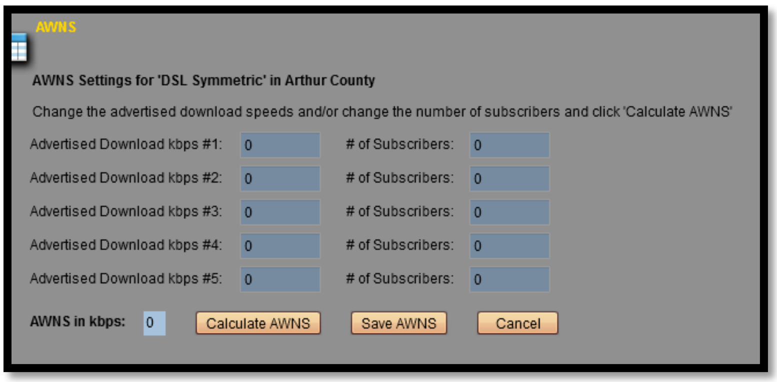


- The provider can Add/Remove portions, or all, of the footprint requesting that their footprint be increased or refined.

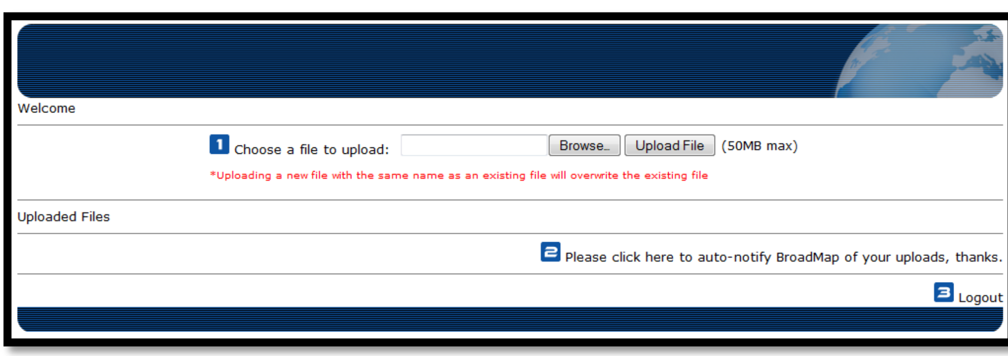


- Middle Mile and Average Weight Nominal Speed (AWNS) collection and validation





- File upload functionality to support providers that would prefer a shapefile, spreadsheet, PDF, KMZ/KML file be used to reflect changes for the data round



- Once the provider has review completed changes to their coverage, middle mile and AWNS, then can validate them all by signing off that everything is accurate.

DATA VALIDATION AND VERIFICATION

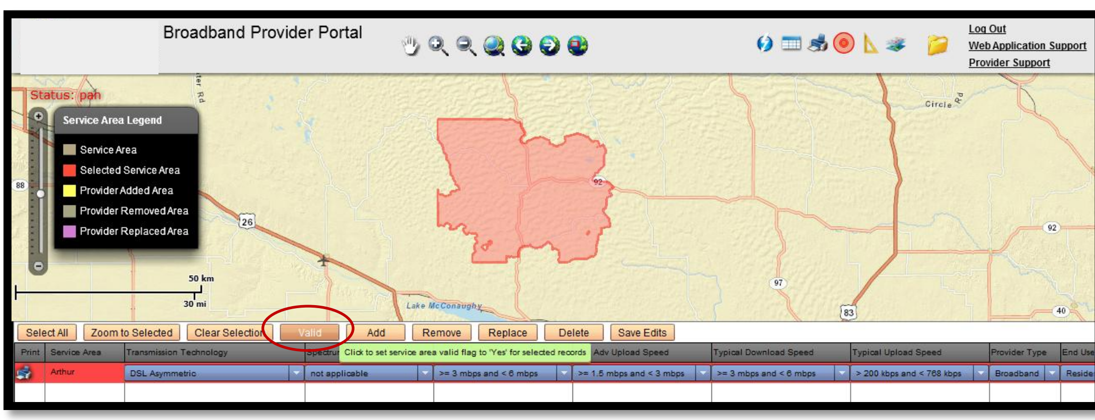
Following the creation of the product, process steps within Data Validation and Verification occur. To ensure the data collected and processed is as accurate and comprehensive as possible, provider validation and internal verification activities are employed. After the initial mapping of providers' coverage areas and serviceability claims, additional reviews are performed using the methods described in the subsections below in order of action (**Broadband Provider Validation**, **SME Verification, Public Verification, Third-Party Data Verification and Confidence Values**).

BROADBAND PROVIDER VALIDATION—PROVIDER PORTAL APPLICATION

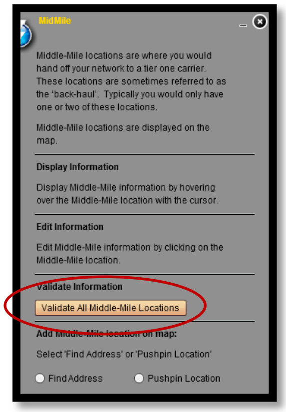
Providers are trained on and requested to use a secure interactive web application to review their current coverage area(s) and supporting broadband attribution and validate their data or submit change requests to update their data. All provider change requests go through the **Data Integration Process** and are reviewed with the provider to complete validation.

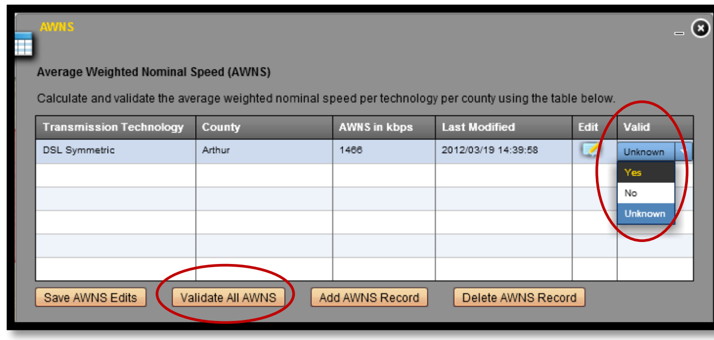
With the latest released of the Provider Portal, validation on the coverage area, middle mile and average could be completed individually. Validation examples are as follows:

- Coverage validation can be done on one record/footprint at a time or by selecting footprints and selecting the 'Valid' button. The provider could also print off or download their coverage for their own tracking purposes.



- Middle Mile & AWNS Validation





All validation results are tracked internally through our Validation Table, which also improves the overall **Confidence Value** as mentioned below.

CROWD SOURCING

The broadband interactive map has been released to the public, which includes functionality to collect feedback on the provider's coverage areas, as well as running a speed test. The feedback and speed results have been collected and reviewed prior to our outreach for this data submission. All discrepancies were reviewed with the providers to identify if any map refinement is required.

The public website can be viewed at the following hyperlink:

https://usvi.broadmap.com/PublicMap/

THIRD-PARTY DATA VERIFICATION

Since this was the first data submission to NTIA from the new vendor, focus continued to be placed on implementing an improved process methodology and integrating provider's coverage areas into a new internal model. This included ensuring all providers had fully executed NDAs and a chance to validate their data prior to submission.

We also review this data submission against the previous two data submissions to ensure all changes were expected and within the NTIA data model requirements.

We are currently in the process of reviewing 3rd party data to extend our verification efforts.

CONFIDENCE VALUES

All verification, validation and manual quality review results are tracked by provider/technology type and stored and maintained within a **Validation table**. A confidence value is assigned, based on internal assessments of the collected information, to highlight the provider coverage areas and/or attributions that would benefit from further investigation and/or enhancements.

With the continued efforts on provider validation, 3rd party verification and the release of the public interactive map with feedback collection functionality, the confidence values will be utilized further to identify specific areas in need of attention. We're currently at the initial stages of this initiative, but will have a more complete picture in time for the subsequent data submissions, as we will use the lower values to identify areas where further testing or provider interaction is required.

QUALITY CONTROL

Following collection, processing and analysis of the provider and CAI data, the product is checked manually and algorithmically against the NTIA data model. Some of the items included within these checks are:

- Format correctness;
- Table and field structure;
- Valid values, including default values, where applicable;
- Geographic extent and topology errors.

Prior to data submission, another quality control script supplied by NTIA is run. This script, SBDD_CheckSubmission.py, creates an output in text form that is required to be submitted along with the final deliverable. All errors must come up clean, unless otherwise specified by NTIA.

DETAILED PROCESS REVIEW

To review the detailed process, please review the attached object:

BMap_ProcessDetails_2012_10_01.docx

Project History: Vermont's Broadband Mapping Initiative (BMI) is a collaborative broadband data collection and verification effort involving partners from the public, private and academic sectors participating as the Vermont Broadband Mapping Team. The BMI is supported by grant funds provided under the National Telecommunications and Information Administration's (NTIA) State Broadband Data and Development Program (SBDD).

In November 2009 the Vermont Broadband Mapping Team (BMT) initiated the creation and development of a comprehensive and verified geographic inventory of broadband service availability in the State of Vermont. Landline and wireless services (fixed and mobile) were mapped using information from the providers and other sources. The broadband mapping information collected and verified through this effort is supporting the broadband development objectives identified in the RUS Broadband Initiatives Program (BIP) and NTIA's Broadband Technology Opportunities Program (BTOP) in Vermont. Most importantly, the geographic inventory will further refine our understanding of the location of "unserved" and "underserved" areas in the state, thereby supporting targeted future investments in these areas.

The BMT includes the following organizations: Vermont Department of Public Service, the Vermont Telecommunications Authority, the Center for Rural Studies at the University of Vermont, Vermont's Enhanced 9-1-1 Board and the Vermont Center for Geographic Information. The BMT is also supported by private sector contractors.

Summary of Deliverables: The BMT's broadband data submission (October 1st, 2012) includes broadband information as of June 30th, 2012 (VT_SBDD_20121001.ZIP). The data complies with the NTIA NOFA requirements and SBDD data model (FGDB) specifications as of 6/30/2012. A detailed description of each dataset is available in the ./metadata folder included with the deliverable package.

Listed of Providers Contacted: The BMT reached out to the following list of providers for the 6/30/2012 update.

Data Development Methodology: A variety of data source and data collection methods were used to identify the characteristics and geographic extent of broadband service in Vermont. Here is a quick breakdown

- **Cable:** Mapped to street/street-segment level
- **DSL:** Mapped as polygons (usually Exchange areas) or address points (list of addresses submitted by provider).
- **Fiber Optic:** Mapped as address points (list of address submitted by provider)
- **Fixed Wireless (WISP):** Mapped as polygons (propagation maps prepared by independent contractor using data provided by WISPs)
- **Mobile Wireless:** Mapped as polygons (data submitted by provider)
- **Satellite:** Mapped as polygons (data submitted by provider). Providers of satellite-based broadband services claimed that they covered the entire state.

The cable, DSL, fiber optic, and fixed wireless (WISP) layers were "intersected" with Vermont's E911 address point layer to determine broadband availability at the address-level. This information was then intersected with Vermont's 2010 Census Block layer to calculate availability at the block level. The October 1st, 2012 deliverable includes Census block-level data for Census Blocks less than or equal to 2 sq miles, and address level data for Census blocks greater than 2 sq miles.

Mobile wireless and satellite-based broadband polygons were submitted by providers to VCGI. They were formatted to match NTIA specification, but otherwise forwarded as-is.

Vermont's broadband providers submitted data which was used to populate a table listing maximum advertised and typical speeds by Metropolitan Statistical & Rural Service Areas (Cellular Market Areas). This information was used to populate the speed information contained in the submitted broadband, including speed information at the census block level. In numerous cases providers did not submit typical speed information.

The initial list of Community Anchor Institutions (CAIs) was derived from existing data sources including the VT Critical Facilities Database and Public Libraries Survey from the Institute of Museum and Library Services. Community Anchor Institutions include schools, libraries, medical facilities, public safety facilities, universities and colleges, and other community facilities such as town halls/offices. An email and hard-copy mailing was sent to every institution in the list. They were asked to fill out an online survey. Follow-up emails and phone calls were made to increase the response rate. The data delivered to the NTIA includes all CAIs, but only includes broadband information for a subset. Additional broadband institutions will be added as their information becomes available.

Data Review: No formal confidence interval for provider data submissions has been established. Vermont is waiting for clarification from the NTIA on this. However, each provider submitted dataset is evaluated against a minimum standard or expectation of quality. If the data submission is identified by the VT Dept of Public Service as not credible based upon their experience, it is not included in the inventory. If a provider creates a data submission that cannot be parsed or, resolved, we contact the provider to try and work out a method of submission that can be used. Vermont had 100% participation from all 38 broadband providers for the 6/30/2012 data submission. However, many of these did not have any updates to report.

Feedback Loops: Each broadband provider that supplies broadband service data in some manner to the VT broadband data inventory is given the option to view a final version of their data submission as it will be represented in the NTIA delivery. However, very few providers have asked for a copy of the final version of their data submission for review. Some smaller providers have asked for, and received, a hardcopy map or digital map graphic (PDF) of their coverage area. All of the providers that requested to see what was being submitted to NTIA representing their coverage area received either a copy of the data, a hardcopy map or digital map graphic in accordance with their preference.

Data Verification Methodology: The BMT used two primary data verification methods: 1) a phone survey conducted by the UVM Center for Rural Studies (CRS) to verify the broadband maps, and 2) wireless-drive testing to evaluate mobile wireless propagation maps submitted by providers.

Conclusion: Vermont's Broadband Mapping Team is pleased to deliver a robust broadband availability inventory to the NTIA. We are confident that it meets the specifications outlined in the NTIA SBDD NOFA. The broadband data and maps will help Vermonters refine their understanding of "un-served" and "underserved" areas of the state, thereby supporting targeted future investments in these areas.

Washington Broadband Mapping

Data Submission Methodology Report

October 1, 2012

SANBORN

320 Miller Avenue
Suite 80
Ann Arbor MI 48103

Olympia, WA 98504-2525

Data Submission Report (October 1, 2012)

Table of Contents

1 Introduction

This report is submitted along with the sixth data submission for the Washington Broadband Mapping Project. This submission includes all data collected so far per the requirements of the National Telecommunications and Information Administration (NTIA) State Broadband Data and Development Grant Program (Docket No. 0660-ZA29) Notice of Funds Availability (NOFA) and formal and informal clarifications to it. Specifically, it includes broadband data collected from broadband providers and community anchor institutions data compiled from various sources for the State of WA. The State of WA has retained a mapping contractor, The Sanborn Map Company to perform the work related to the Mapping Grant for this project. Data from the previous submission is now publicly accessible via the WA Broadband Program (http://wabroadbandmapping.org/).

This document is a supplement to the five previous reports submitted with previous data submissions on May 1, 2010, October 1, 2010, April 1, 2011, October 1, 2011, and April 1, 2012 respectively. Therefore, it builds on the documents provided with those submissions. Rather than repeat the contents of the previous report, this document makes incremental updates on various topics where changes have been made in the methodology or reiterates the methodology used. Please refer to the previous documents for further details.

2 Overall Project Status

2.1 DATA COLLECTION

This section details data collection related to NTIA deliverables which include broadband data and community anchor institution data.

2.1.1 Broadband Data

For this submission, Sanborn started data collection efforts on July 3rd, 2012 by sending out data update requests and technical data specifications. These were sent to a large list of companies which were compiled from multiple lists (FCC 477 list (dated June 30, 2011), a list provided by the Washington UTC, Wireless Internet Service Providers Association (WISPA)) and from any providers that were identified through other sources such as web research, planning meetings, State outreach, etc. Sanborn also uploaded the final data for each provider in NTIA format from the previous submission on the Sanborn Provider Portal. The providers were encouraged to use the provider portal and update their information on it.

We followed the same contact and follow-up protocols as the previous submissions. In brief, this involved following up with already participating providers after sending them a letter requesting data updates. For newly identified providers, we contacted them three additional times and offered any/all support to make this as easy as possible. We provided a due date for submission but worked with providers who needed more time. If providers did not submit updated data and did not respond to our efforts to contact them, we reused their existing data.

The following are some of the important changes or no changes:

1. We continued to request all providers to provide us their speed information in mbps rather than as a speed tier. We did this in order to better validate the data, analyze served/underserved, and identify the breakdowns in speeds within a given tier. For this submission, 53% of the participating providers in WA have given us their speed in mbps rather than speed tier.

2. Like the previous submission, we also requested fixed wireless providers to provide us appropriate information to do propagation analysis. We had more success with this in the current submission. For those WISP providers that provided us the data to accomplish propagation, we used Radio Mobile to do propagation analysis and iterated with the providers until the parameters were suitably selected to get appropriate output. Propagation analysis results were provided to the providers for review through our provider portal and google kmz file formats to ensure validation. In WA, we were able conduct propagation analysis for 5 providers (Benton Rural, Cascade Networks, Columbia Energy, Infinity

Internet and Skynet Broadband) and collect propagation results from Link Technology for 2 providers (CresComm and Douglas PUD)

3. We continue to not collect data from resellers.

4. Due to our NDA restrictions, last mile infrastructure points, if submitted by providers, are not being submitted to NTIA.

5. We continue to submit data for satellites in this submission based on NTIA clarifications. We were able to add an additional satellite provider, identified by NTIA (Skycaster) in this submission.

6. Due to NDA restrictions, address points are not included in this submission to NTIA for any commercial provider.

7. Some providers did not submit middle mile elevation or backhaul capacity, particularly when they asked us to reuse previous submission data. Wherever possible, we went back to providers to obtain that information, but it is not available for every record. In this submission, we have improved the elevation of middle mile data substantially. Some providers were providing elevation above sea level – we were able to work with the largest of these providers to resolve the issues and will continue to work on improving this over the next submission.

8. If a cable based wireline provider provides both DOCSIS 2.0 and DOCSIS 3.0 service to the same area, the block or road was listed only once with a technology code of 40.

9. Providers were only willing to indicate on a general level if they served business, residential or both, so we did not get any providers that broke down the type of service by block. Only if the provider stated they only serve business to business customers did we fill in the "category of end user" with a code of 2, otherwise this field was left blank. There are five providers in WA who are identified as serving business customers only. These are:

    1) Capacity Provisioning, Inc.
    2) Integra Telecom of WA
    3) Level 3 Communications, LLC
    4) TW Telecom of WA, LLC
    5) XO Communications, LLC

10. This submission is being made based on the NTIA data model as of 08/09/12 provided by NTIA on the SBDD site.

    We have added five new providers in this submission:

    1) Infinity Internet (fixed wireless)
    2) Iron Goat Networks (fixed wireless)
    3) Skycasters (satellite)

4) SkyNet (fixed wireless)
5) WindWireless (fixed wireless)

In this submission:

1) We have contacted a total of 289 providers in WA of which 45 providers were contacted for the first time.
2) We have identified 111 potential providers, of which 86 are participating in this map to date and 25 have refused to participate. In addition, 28 providers have not responded to our efforts to contact them and we are not sure whether any of these providers are actual providers or not. A list of the non-responders, resellers and non-providers is provided at the end of the document and all of these potential broadband providers were contacted. Even if some providers were identified as non-providers or resellers in previous submissions, we continue sending out data request letters to these providers in case their status has changed in any way.
3) 37% of the providers submitted new or updated data whereas for the remaining providers, we reused data from their previous submissions. This is in contrast to 47% providers submitting new or updated data during the previous submission.
4) We do not report areas of service for providers that have refused to participate or have not responded to our requests for data. In some cases program office staff are aware of approximate service areas for non-participating providers, but to date we have reported only areas that meet our validation criteria. If estimated service areas are desired we would collaborate with other states and NTIA to develop and disclose a workable methodology.

During this submission period, we had the following changes in providers:

1) OrbitComm has been removed from the data as they informed us that they are a reseller.
2) 360 Networks was bought by Zayo Group
3) Wildblue changed its name to Viasat

2.1.2 Community Anchor Institutions Data

The community anchor institutions data continues to be crowd-sourced through the online data gathering application created by the Sanborn Team. Following discussions with NTIA on ways to improve the CAI IDs via email and guidance on what datasets to use for IDs, we have incorporated IDs for libraries and schools where possible. The numbers of community anchor institutions that have responded so far is provided below – please note that due to removal of duplicates and data cleanup, the numbers have decreased marginally in some cases.

The data model from NTIA needs some changes in the CAI feature class where only TransTech = "All Other" is related to the domain but no other subtyped TransTech is related to the domain. Hence the values are displayed as Y, N, or U for most of the records for BBService field but is being spelled out as Yes, No, and Unknown for all records where TransTech = "All Other".

Category	Name	Total	Total with Broadband Information in Submission 6
1	School - K through 12	2295	1769
2	Library	350	350
3	Medical/healthcare	131	50
4	Public Safety	1705	105
5	University, college, other post-secondary	219	179
6	Other community support - government	343	32
7	Other community support - nongovernmental	344	11

2.2 DATA PROCESSING

We started with the following base data:

Census Blocks:

For this submission, Census 2010 data was utilized. The data was set up as follows:

- Block size (AREA) is calculated combining the 2010 land area (ALAND) and water area (AWATER)
- AREA is converted from square meters to square miles to calculate square mileage (SMI).
- If the SMI of a block is less than or equal to 2, then the less than or equal to 2 square mile indicator (LE2SMI) is set to true.

Road Segments:

2010 Tiger Line IDs (TLID) were used for data processing for this submission. The data was set up as follows:

- The GT2SMI (Greater Than 2 Square Mile) indicator is set to True when:
  - The 2010 road segment <u>is completely within</u> a block that is NOT less than 2 square miles
- Only minimum and maximum address ranges and a single zip code for each road segment is maintained.

All data received went through the following processing steps:

1. **Triage:** All new data were quickly reviewed to understand what was received, and in what format. We also made sure we had all the required components for NTIA's data model, such as their FRN and advertised speed information. We also screened for any known issues that we might have seen before (such as Excel 2003 spreadsheets that cut off at 32k row).
2. **Ingest:** At this time the data is actually brought into our systems. Each provider is set up with a unique file geodatabase to store their information. Record counts of what was received are logged so that we can validate that we did not drop anything in processing.
3. **Data Processing:** In this step, the data goes through a number of ETL routines to convert the raw proprietary information into a format similar to the NTIA format. The exact routine utilized depends on how the data is received.
   1) When a wireline provider submits a service boundary, we select all the blocks and roads inside that shape.
   2) If a wireline provider submits a customer address list, the points are geocoded, and then the appropriate block or road segment is selected.

3) If a wireline provider submits block and road information using Census data, we just make sure everything is formatted to the appropriate specifications.
4) If the wireline provider submits any type of road or line data that does not directly correlate to the TIGER data set, we convert the lines to TIGER by selecting the road centroid and spatially selecting the closest segment in our data set. If the road is in a block less than 2 square miles, then the block is selected. Some manual cleanup is also applied to make sure we do not accidentally drop any road segments that should have been processed.
5) Wireless provider data is formatted to ensure that there are no overlapping polygons with the technology type and spectrum. In addition the data is cropped to the state boundary.
6) After each round of processing, we make sure that we only keep unique records. A unique record is defined as having a unique combination of FRN, Block/Road ID, and technology type. If there are multiple records with different speeds, but all else is equal, than we select the maximum of the advertised speeds.

4. **QC Review:** All data are then sent to a different analyst to perform a thorough quality control review on the processed data set. Record counts are compared to what was submitted. The QC staff also make sure the ETL scripts and routines populated all of the right fields.
5. **QA Review:** Data is then sent to another team for Quality Assurance Review. In this step the data is not only double checked against what was originally submitted, but it is also brought up inside standardized ArcMap templates that allow us to make sure our results make sense. This often involves comparing the new data set with prior submissions, as well as looking for any possible technology or speed anomalies and verifying against third-party datasets (as discussed in more details in the next section).
6. **Provider Review:** Processed data is all posted to a customized web-mapping tool we commonly refer to as the Provider Portal. All providers were notified once their data was available on the site, and most were given five business days (with the exception of a couple who were provided three business days) to review the data and respond. In this site, providers can log on and visually see their processed data in a map format. It also allows them to overlay their raw data to help them validate that we did indeed process things correctly. The provider portal also has a suite of markup tools that will allow the providers to edit their data, including adding or removing service areas, and making changes to the data attributes.
7. **Comment Processing:** All comments and feedback received from the provider portal is then reviewed and applied to the processed data set. This updated data set goes back through our QA and QC processes, and if time allows, back out to the Provider Portal, for the provider to review and sign off.
8. **Data Append:** After all of the individual data sets are processed and approved, we run an append process which merges all of the individual provider data sets into one geodatabase. This is also the point where our

team will do any final transformations to get our working data model into the latest NTIA publishing format.

9. **Submission Comparison Check:** Starting with this submission an additional check was added to our quality review process. An application was written that compares the individual provider's unique data that is stored in their unique file to that which is stored in our final appended file and the NTIA submission data. Any variation in each of these data files in thoroughly investigated and resolved. This was done to assure no data loss or data transformation issues. We also compare the submission 5 dataset to the submission 6 dataset, review any variations and assure that the changes found can be documented as being requested by the provider.
10. **Final QA/QC:** A series of quality checks are run on the final appended data sets to ensure it is ready for submission to NTIA. We also run the latest version of the NTIA receipt tool at this time. If any issues are flagged as failing they are reviewed and corrected. All warnings are also reviewed and either corrected or documented in the attached document which explains that we have validated this data and it should be accepted. Any last issues are corrected.
11. **Submission to NTIA.**

2.2.1 Submission 6: NTIA Submission Data Model Schema Changes

The latest data model released was released on August 8, 2012 was very similar to the previous data model. No substantive changes were noted and changes related to allowable speed and technology of transmission combinations. Most of these combinations have exceptions to them and hence were not being completely disallowed by NTIA.

2.3 DATA VALIDATION

Sanborn has continued to perform the same validation on the data as the previous four submissions (details in previous reports and a summarized version provided below). Some minor updates to the validation process are discussed below. We also publish our validation methodology online at http://wabroadbandmapping.org/MapValidation.aspx

1) QC of the data at various steps – this includes when data is received (triage), when it is processed through the various processing steps discussed above, etc.
2) Spatial checks against public and commercial datasets

   a. For WA, we continued to use the following datasets for validation:
      i. Exchange Boundaries: for DSL boundaries
      ii. MediaPrints: for Cable and Fiber boundaries
   b. We did not use speedtest.net speed data that we used previously for validation as we had our own speed test data that was more current and pertinent.
3) Speedtest data and other data collection for verification
   a. We continue to use speedtest data collected through our interactive map and community anchor data crowd-sourced for validation purposes.
   b. For this submission, we added an additional dataset to check against – FCC speed test data. We geocoded the data, used the IP to reverse engineer the provider name and used it to check speeds where possible.
   c. We also incorporated any feedback we received through the interactive map – this included feedback such as incorrect speeds, incorrect boundaries, missing provider or areas of no service, etc.
4) Verification by providers – processed data are uploaded on our Provider Portal for providers to review both the outcome of data processing and any issues that we found in the third-party and crowd-sourced validation. Issues pertaining to a particular provider are highlighted and shown in the portal for those providers only. Issues that are global and cannot be assigned to a particular provider are shown to all providers (e.g. there are no providers in this area, or we tried to get service here and heard x from A provider, y from B provider, etc.). Previously, we were highlighting these issues through a letter but in this submission, we have integrated the feedback through the Provided Portal. We make additional calls to providers who have issues. Planning workshops and local validation – we have looked into any issues that the State Planning team has identified and brought to our attention.

2.4 UNIVERSE OF CONTACTED PROVIDERS/NON-PROVIDERS

We have identified 111 potential providers, of which 86 are participating in this map to date and 25 have refused to participate. In addition, 28 providers have not responded to our efforts to contact them and we are not sure whether any of these providers are actual providers or not. A list of the non-responders, resellers and non-providers is provided at the end of the document and all of these potential broadband providers were contacted. Even if some providers were identified as non-providers or resellers in previous submissions, we continue sending out data request letters to these providers in case their status has changed in any way.

State Broadband Initiative Mapping Methodology

For the State of Wisconsin
Revised September 30, 2012

CostQuest Associates

LinkAMERICA Alliance

Contents

Overview

This document provides an overview of how the sixth required data set was collected and processed for the State Broadband Initiative (SBI) in the state of Wisconsin.

This submission builds upon prior efforts to increase in state broadband mapping and planning capacity. Although each state has taken a slightly different path to building in house capacity, this cross-state partnership helps the LinkAMERICA team focus on comparable outcomes across the four states, where appropriate and support each state based upon the State's elected transition path. Our intent is not to make the states look and be the same, rather it is to leverage economies of scope and scale among the business processes while at the same time pursuing the longer term goal of transitioning sustainable program leadership to the respective states.

As our team completes the third year of the SBI program, more work has shifted to in state partners. Much of this work focuses upon the capacity building, planning and technical assistance components of the program. One immediate result of this is that in some of our states in-State partners have taken direct responsibility for the survey, validation and development of Community Anchor Institution information. The methods by which CAI data were developed are included as Appendix One. During this third program year we also anticipate at least one in State partner taking over the state web presence, both in terms of content and hosting. We also have States hiring in dedicated resources to support the program.

As expected, this document rests heavily on the prior drafts but has also been updated and expanded.

Significant changes include additions covering:

1. Trends in provider inputs
2. Modification to internal provider tracking
3. Increases in the amount of WISP coverage using propagation estimates
4. Requested changes based upon NTIA guidance
    a. Review of submitted speed with respect to NTIA supplied frequency table
    b. Review of NTIA speed guidelines and provider documentation
    c. Inclusion of Provider Universe Table (Appendix 4)
    d. Expansion of verification methods summary table
5. Transition planning with respect to capacity building within the State for Broadband map development (even while the technical data development components of the program continue to rest with CostQuest and the LinkAMERICA Alliance).

Treatment of the following subjects has been expanded:

1. Verification and validation
2. Data production methods

3. Provider advertised speed and coverage validation

As anticipated, the SBI program continues to mature and evolve. Technical leadership and strong program office guidance has been appreciated. We continue to focus resources on establishing stable business processes to track submissions, verify received and processed data, test for temporal stability and provide reporting deliverables consistent with NTIA expectations.

In our view, the mapping deliverable reflects (1) a good faith effort, which results in a reasoned response to the NOFA, Technical Appendix A, as well as supplementary program office guidance and modifications offered in phone calls, emails, and webinars, (2) a stable foundation for improvement and prioritization of both NTIA and state needs and interests , (3) a valid data processing model to support online mapping, consumer feedback, provider verification and reporting, and finally, (4) a valid use of the evolving data transfer model and its intrinsic validation methods. More importantly, the resulting data and online coverage maps that follow from this work are providing good input and context for the Broadband planning teams working across the states we have the pleasure to serve.

We also note that the mapping deliverable is increasingly important to state policy makers as each of the states we work with continues to assess the policy ecosystem that supports the advancement of broadband access and adoption.

We close this methodology document with 4 appendices. Appendix 1 refers to efforts related to Community Anchor Institutions. Appendix 2 describes data collection challenges. This section describes some of the open issues, challenges and questions we are exploring. Our hope is to receive clarification and counsel from NTIA in how best to confront some of these issues, which are likely common across states. Appendix 3 describes the confidentiality framework explained by NTIA. Appendix 4 details the provider universe, those providers found to be non-NOFA compliant and those providing data.

Purpose of This Manual

This technical document was developed to provide transparency in our data production process.

Our goal is to illustrate a thoughtful process designed to meet the intent of the submission. Our hope is that we have developed a process that is reasonable, with respect to the data it deals with, as well as flexible enough to change with evolving NTIA requirements and lessons learned from the Broadband mapping community.

Data Sources

Developing the Provider List

Broadband provider lists for all states were developed from the following sources:

- Prior comparable mapping/research efforts
- State lists of regulated telecommunications, cable and wireless service providers
- State and national industry organizations (i.e. cable associations, wireless service provider organizations, telecommunications associations)
- FCC Form 477 respondents
- Third party data sources such as Warren Media, Media Prints, American Roamer Coverage Right, GeoResults Wirecenter Boundaries.
- Independent web searches
- Interviews with key state staff members and important community influencers

As one would expect in a dynamic marketplace, provider identification is an ongoing and important component of our work. Mergers and acquisitions, the use of multiple regional DBAs, the lack of any universal identity management attribute, and the generally complex parent-subsidiary structure of many telecommunications companies, make provider identification and tracking very challenging. Because of this dynamic environment, the Provider list is reviewed on an on-going basis and changes are made as necessary to ensure that the list remains current.

At the start of each round, email and telephone contact is made to all known providers. This time consuming, but necessary, process ensures that the list of contact persons remains current, and that providers are aware of data request changes and deadlines associated with each round. Where necessary, we execute new NDAs with providers. We maintain this communication with providers throughout the Data Collection period, providing multiple paths and opportunities for participation in the program. Providers that respond too late to be included in the final dataset are flagged for inclusion in the next submission. Unresolved data concerns are also flagged and tracked so that we can begin working on a plan for resolution prior to the next data collection round.

As contact is made in each round, we qualify each provider by asking a series of questions regarding the type of service and speeds offered. If the provider does not meet the minimum specifications for a

Broadband provider (as defined in the NOFA) we make a note of the change in status.[1] Providers remain on our list and are included in program communications so that in the event that their service is upgraded or expanded their status can be updated accordingly.

Provider Outreach

To meet the program's aggressive deadlines and participation goals, LinkAMERICA believes it is critical to maintain rapport with providers. To do this we reach out to providers with regular project communications, including a program newsletter and links to the various State mapping websites. In several states we have participated in trade association and policy summits.

As described above, individual e-mails and/or telephone calls are made to all providers explaining the status of the program and requesting their continued support. In some instances we've also had the opportunity to support providers in their BTOP / BIP applications. Through these collective outreach initiatives, and our engagement with various industry associations, we continue to enjoy a healthy and appropriate relationship with Broadband service providers.

NDA

To provide protection for all parties involved, LinkAMERICA continues to honor the terms of our NDA. If providers did not execute the NDA in previous rounds they were offered the opportunity to do so in this collection round. New providers were of course also supplied with a copy of the NDA.

To facilitate the execution of NDA's, LinkAMERICA continues to use the DocuSign online document management solution. This system allows providers to review and digitally sign the NDA in a legally binding manner, and has been instrumental in achieving rapid approval and execution of NDAs with the majority of providers. In some cases, NDA's were individually negotiated to address specific provider concerns. In all cases, minimum standards established by the NOFA are honored. In other cases, providers chose to submit data without executing an NDA.

Provider Survey

Since five prior rounds of data collection have been completed, the LinkAMERICA team has a solid base of coverage and speed information with which to begin Round 6. This allowed us to provide flexible response options to participating providers. One option allowed them to review check maps of their coverage and speed data – submitting only corrections and additions to the existing dataset. (For provider convenience the check maps were created in both PDF and Google Earth (.KMZ) formats.) The second option was to allow submittal of completely new datasets, either in tabular form or in multiple other digital formats. For those without CAD or GIS systems, we continued to allow the submittal of printed/scanned maps and other written materials.

---

[1] As with other Grantees, we struggle with appropriate and consistent classification for service providers who opportunistically provision Broadband services. In this submission we continue to bring them into the analysis as a provider type "other". As the inclusion of this category isn't our primary goal, we are working to process data as we can. We are similarly categorizing and retaining reseller information. Appendix 4 illustrates the categorization of non Broadband providers within our provider tracking and verification systems.

Survey Methods

Once again, we used a secure digital survey process (via our provider portal websites) to collect and display information for providers. The Round 6 survey process was designed to accommodate both new and returning providers, and the different types of information they would be submitting. The following is a summary of the process encountered by each group:

New providers: New providers were routed directly to our standard survey where they were provided with templates for uploading data in tabular NTIA-compliant formats. As in previous rounds, if providers could not supply information in the requested format, alternatives were offered. These alternatives included uploading service-area boundary maps, exchange area maps, CAD drawings or customer address lists. From that information, the LinkAMERICA team developed a geographic representation of coverage and was able to build coverage features for each provider.

Returning providers: For Round 6 we continued to work with participating providers to improve their datasets. Check maps continue to be a useful tool to show providers how their area would be displayed on the resulting interactive state map and to get constructive feedback regarding corrections and changes that need to be made to their coverage and speed data. Generating these customized documents in each round is an extremely time consuming verification process, but it allows us to close many of the gaps that might have otherwise persisted.

Follow Up

After the release of the Round 6 survey in early July 2012, LinkAMERICA launched an extensive effort to encourage responses. Every known provider was contacted at least twice during the months of July and August. The initial data submission deadline was set for mid-August, but we continued to accept "straggler" submissions into September.

No Response Policy

As mentioned above, every effort was made to contact each provider who appeared on our initial list. However, if no current information could be found on the company (i.e. no website, no valid phone number, and no contact person identified) they were removed from the list of "known providers". We believe the vast majority of those we were unable to reach were providers who have simply ceased to exist[2]. If we verify that a company is a broadband provider still doing business and are not able to get a response to our request for data, we make note of that in our datapackag.xls, and continue to reach out to encourage participation.

Summary

In summary, an intensive 45-60 day provider outreach and data collection process is initiated at the beginning of each round. In Round 6, given the data vintage of June 30, 2012, we began this process in June and the last submissions were accepted in September, 2012.

While we continue to successfully engage the majority of providers in each round, the amount of manpower required to solicit complete and timely responses should not be underestimated. This process is one of the most costly and complex within the entire SBI program.

[2]The list of known providers and important submission statistics are contained in the datapackage.xls file.

Third Party Data Used

We acquired the following commercial/restricted use data products:

- American Roamer, Coverage Right Advanced Services (tabular). This data served two purposes. The first was to verify the provider list and help find Broadband service providers not on other lists. The second was to verify the reasonableness of the Broadband service provider's submission.
- GeoResults Wirecenter Boundaries. This data was used in the verification of 'telephone' Broadband provider data. Where a public domain exchange boundary wasn't available, the boundary was used for coverage containment tests.
- Media Prints Cable boundaries. This data was used in the verification of Cable/HFC Broadband provider data. It was used to research valid providers and discover if that provider was offering Internet service. FCC 477 restricted use data were analyzed to find valid providers within a given area.
- Proprietary Provider Serving Areas. Since the first survey, a number of providers have supplied their engineering, serving area and/or franchise boundaries. We have maintained and enhanced these proprietary data sources.

We have included third party data sources which touch on each of the three major technologies analyzed within the SBI program. Each of these data sources tie back to a public domain data source, which provides a cross-verification mechanism for the commercial data product.

Although there are a large number of third party licensed data sources available, we remain conservative in our acquisition plans. From our limited analysis we are concerned about the ability to cross-verify additional third party licensed sources against public domain data. Further, we are unsure of how we may be able to integrate another data provider's view of valid Broadband providers within the definitions used by the NOFA (e.g. Are they using an FRN/DBA identity view or a marketing view? Can the provider supply in a 7-10 day window? Are they facilities based or not?). This leads us back to a statement we made in a 'lessons learned' Webinar (April 2010) about exploring a consortia to lower the cost of data acquisition and allow multiple entities to peer review the quality and methodologies behind licensed data products.[3]

Beyond these commercial data sources, we used a number of public domain sources. These included:

Geographic Data Files

- US Census TIGER data[4]

Sources that helped isolate providers, identity management or provider service areas

- NECA Tariff 4
- State produced exchange boundaries
- Carrier produced wirecenter boundaries (sometimes proprietary to provider)

---

[3] We also suggested forming a technical standards committee and a consistent system for confidence reporting.
[4] Census data were derived from < http://www.census.gov/cgi-bin/geo/shapefiles2010/main>, Census 2010 files. Roads were derived from the county faces and edges file downloaded at the same location and tiled for a full state.

- FCC Coals reports (321/325)
- FCC FRN API lookup tool
- FCC/FAA Antenna Registration System
- FCC FRN Lookup Tool (plain text search)
- USAC High Cost FCC Filing Appendices

Sources that helped isolate anchor institutions

- USAC Grant lookup tool
- USAC High-Cost FCC Filing Appendices
- HRSA data warehouse
- NCES data lookup
- State managed lists of schools (K-12), post-secondary institutions and libraries
- List of museums, conventions, and visitors bureaus from www.onlineatlas.us
- In state relationships to key stake holders.

Finally, challenges exist when dealing with the inevitable conflicts between provider-submitted data and third party sources (public or commercial). There is no guarantee third party sources are more accurate or timely than the providers' own reports. Indeed, some third party sources are based upon different standards than those specified in the NOFA, perhaps making them less reliable than information collected directly from providers. At the very minimum, provider data has a lineage and temporal status that we can identify. A concern we have with increasing use of third party data is that we have no way to verify its quality or development methodology. Particularly in rural areas we are concerned about what third party data may reflect based upon what we assume to be a small sample of information.

In other words, we may hit a wall in which we can't determine how the commercial source derived its coverage conclusion. To us this means that third party data sources are beneficial, but represent a supplementary view, not an authoritative one, of the NOFA defined Broadband market.

In short, we have chosen to use provider data as the baseline. We will challenge provider reports when third party data shows major anomalies, when submitted data conflict with prior submissions or when a consistent volume of consumer feedback points to a potential error.

Confidentiality and the Use of Licensed Materials

As a mapping vendor, we are reliant upon the cooperation of Broadband service providers. In large part, what underlies this cooperation is trust that we will not violate the proprietary and confidential nature of the data provided to us.

We are thankful for the confidentiality clarification that NTIA shared with us (included as Appendix 3). We use this as a guiding document to help us communicate with providers about what information NTIA considers to be confidential. Our suggestion is that NTIA publish this, or something comparable, to ensure a consistent interpretation of the NOFA and how it guides NDAs.

As some providers are non-responsive to requests for information, or lack resources necessary to put data into NTIA compliant formats, we have fallen back to the use of commercial data sources in several places.

For incumbent telephone providers we have used commercial wirecenter boundary products to filter Census Blocks and segments that are clearly out of their exchange areas. For cable providers we will use an estimate based upon Census Designated Places within MediaPrints named areas.

Public Engagement: Crowd Sourcing, Surveys and Social Media

Crowd sourcing (i.e., an intentional and carefully designed effort to tap into the collective intelligence of the public at large to expand our knowledge base) continues to be an important element of our data collection and validation process. An expanding use of social media is also an important strategy in our efforts to promote the state programs overall and engage more citizens in the work at hand. In addition to the various opportunities the public has to provide input via the online service coverage maps and the related 'Broadband story' process, our crowd sourcing efforts are grounded in a time tested telephone survey approach focused on the consumer market. In addition, we continue to advance our process to include certain initiatives centered in two social media outlets – Facebook and Twitter. These initiatives are discussed below.

Consumer Surveys

Working under contract for the state of Alabama in 2009, our initial consumer survey was performed before the NTIA SBI grant was in place. Subsequent consumer surveys funded by the SBI grant were hosted in 2010 for the states of Idaho, Wisconsin and Wyoming and then again in 2011 for Alabama (as noted below). These surveys will be repeated after two years to establish and evaluate trends. These primarily telephone based surveys include two distinct and carefully scripted tracks: one for Internet users and one for non-users. The telephone survey approach allows us to reach the non-Internet user group as well as the current Internet user. A secondary online approach is also used to augment input from current Internet users. In the most recent Alabama survey we added a third tier to our approach as we equipped local field survey teams with an iPad-based survey tool and targeted their time to reaching the younger market. For non-users, the surveys help determine why they don't have or don't use Broadband. For current Broadband users, the survey helps determine the nature of their Broadband access and how they use that connectivity in their daily lives. In addition to our state-specific surveys a nation-wide survey was also hosted to provide a broader view of consumer views for comparison purposes. State-specific surveys are, where possible, framed to match the state's regional Broadband planning structure (e.g., the updated consumer survey in Alabama was designed to produce results relevant to the state's twelve Broadband planning regions).

The resulting data is helpful on a number of fronts in the SBI's mission to advance the access and adoption to Broadband. Survey data provides an important, albeit broad, gauge for assessing coverage information obtained by providers. For example, areas with widely available coverage (according to provider information), but lower consumer subscription levels (according to survey results), or perhaps where survey results suggest Broadband is not available, can be examined in more detail. Survey results

are also very important to the broadband planning (and capacity building) components of the SBI program in that they help inform and formulate Broadband advancement priorities. Survey results also help inform Broadband policy discussions on both the local and state levels. Finally, survey results provide important information to the service provider community regarding market demand and specific Internet use in specific communities (i.e., regions).

Our ongoing consumer survey process adheres to a consistent process. For example, consistent with prior practice the 2011 Alabama survey was launched in June 2011 with a test number of survey calls to confirm (and adjust as needed) the structure of the survey and the underlying survey process. Our surveys typically run for three to four months. All telephone surveys are completely random beginning with the acquisition of a list of state-specific, randomly selected landline telephone numbers. Mobile phones are not typically included in the surveys. Upon evaluation of the survey statistics, auxiliary surveys are executed to ensure appropriate representation is achieved on both demographic and geographic fronts. For example and as noted above, the recent Alabama survey was augmented with a field effort to ensure the younger demographic (i.e., age 18 – 25) was adequately represented. This secondary step is required because of the continued migration (by younger markets) to non-landline based communications. This younger market is also surveyed by reaching out through social media outlets (primarily Facebook and Twitter) to encourage their participation in an online survey process.

As noted above, our telephone survey process is augmented by providing online access to the survey. Participation in the online survey is promoted on all of our state-specific public web sites and selected social media.

As a final relevant point with respect to the consumer survey process the length of the survey is noteworthy. By survey standards, these tend to be long surveys. The surveys typically average just over fifteen minutes. While this clearly contributes to the number of survey call attempts that were required to reach the level of statistical validity, it is not insurmountable.

Social Media

The phenomenon of social media is widely documented and yet still emerging as an effective access point for public engagement. We continue to explore appropriate ways to use a variety of social media venues in our SBI efforts. All of our efforts are informed by and consistent with relevant state statues and guidelines. Different states have different perspectives on if and how the state will participate in the use of social media. Some state requirements are well defined and some are still being formed. Where appropriate, we use LinkedIn, Facebook and Twitter to support our work. A central focus is on promoting awareness of the program and seeking to expand engagement. In some situations we find that sub-program initiatives (e.g., regional planning teams) are making very effective use of Facebook to help inform and engage citizens impacted by the SBI program. As noted above, we are able to promote additional input on the consumer surveys through a social media outreach program aimed at our younger market segments.

In addition, we continue to evaluate how Facebook and Twitter can be used to drive public input on two important crowd sourced issues: online speed tests and input on map accuracy. Based on data obtained

through our web site traffic monitoring process and readily available social media tracking processes, results are promising.

Capacity Building and Transitioning to State Partners

A fundamental goal of LinkAMERICA has always been to transfer knowledge and capacity to our in-State partners.

Within each State, transition planning and responsibility for specific activities is on a slightly different timeline. Much of this is driven by resource availability and partner identification within the State. For example we began transitioning the responsibility for Community Anchor Institution data to the State of Alabama in Round 3, starting with the use of interns to validate Community Anchor Institution data. In Round 4 the state's responsibility expanded to include collection of all CAI data, and in Round 5 the effort culminated with Alabama assuming responsibility for the CAI submission. LinkAMERICA supported this process with detailed transition documents and technical support.

Alabama plans to continue the transition process though the end of year 3 assuming more responsibility for the interactive State maps and website. In Idaho the SBI Framework Coordinator took on the responsibility of reaching out to CAIs in round 5. In round six the outreach became more relationship based and face to face. Other States are looking more towards program year 4 and/or the in-State hire of a Broadband Coordinator as the initiation point to support their transition efforts. Broadband Coordinators were brought on board in both Idaho and Wyoming in year three. An open position was recently filled in Wisconsin. Alabama has had a broadband coordinator in place for nearly two years.

Data Sharing With Other States

Where possible, LinkAMERICA works to share data with other state mapping entities. This data exchange tends to take two routes.

First for wireless providers if we find a fair amount of coverage that crossess into an adjacent state, we will ask the provider's permission to convey this information to the neighboring states. If the permission is received, we send the data to the mapping agency.

Second, in circumstances where we receive a speed that is outside of the technology speed 'norms' and this provider offers service in another state we try to check with other covered states to find out if the service is comparably marketed.

Trends in Submitted Data

Overall we note several important trends in this data submission. The list below represents general trends and not a scientific survey.

We note the following trends:

The coverage of advertised speeds is increasingly important. More and more providers are specifically concerned about where the submitted NTIA footprint shows available of 4 x 1 Mbps or 6 x 1 Mbps service.

Large national providers are beginning to submit block level speed information. In round 6 AT&T submitted block level coverage and speed. Other national Wireline providers, such as Frontier improved their submission based upon the completion of system conversion of acquired properties.

xDSL speeds are increasing. More and more xDSL is likely ADSL 2+, VDSL, shortened loops, pair bonded or some combination of these. As we talk to providers who trigger speed/technology tripwires, we receive more and more feedback about the presence of these new technologies to enable speeds comparable with DOCSIS systems.

DOCSIS 3 is becoming the norm. Most cable systems are becoming DOCSIS 3.0. Over time we are seeing the DOCSIS 2.0 areas diminish. In some DOCSIS 3 areas there tend to be pockets of non DOCSIS 3 in predominant DOCSIS 3.0 markets.

There seems to be an increase in acquisitions among fixed wireless providers. A large consolidation with respect to T6/Digis/Skybeam/JAB has changed the provider landscape in several of our states. As much of the system consolidation has not yet taken place our coverage remains largely in tact but we anticipate changes in the next submission.

Fixed wireless providers are offering broadband services approaching 1 Gbps. This is occurring both in terms of licensed and unlicensed spectrum. Part of this is driven by where a provider has fiber or high capacity wireless backhaul but we are receiving more and more information from providers and radio manufacturers specific to very high speed wireless services. Although the service can be deployed within the 7-10 day NOFA window, these higher speed services tend to be purchased by high capacity customers. It may be worth reconsidering the speed norms in this category as well as adding a field in the datatable to indicate when a speed value is geared toward a specific end-user class.

There is less and less of a distinction between fixed wireless and mobile wireless. As firms market LTE and/or WiMax as home DSL alternatives we are a bit unsure how these two classes are to be established-what is the operating distinction between Transtech 80 (mobile licensed) and Transtech 71 (fixed licensed) when both are used as in in-home Broadband service?

Satellite providers are advertising broadband services exceeding the speed ranges in the data model. Further the spectrum used isn't available in the NTIA data model.

We continue to see a number of national Broadband providers who do not show broadband coverage within pockets of otherwise covered areas. In the figure below, the orange represents Census blocks which are NOFA broadband covered. The transparent areas have no NOFA broadband coverage from the same provider.

Figure 1--Uncovered pockets within urban, covered areas

This coverage drop-out appears to be happening in urban Census blocks typically with schools, shopping malls, universities and large businesses. We don't know what his is happening, but it could be an impact of the NOFA restriction on 7-10 provisioning. This is a noticeable artifact in the data and does challenge the notion of some who see NOFA compliant Broadband coverage as a uniform surface across an area.

Data Production Process

To support our objective of transitioning the data development process to our State partners, we continue to model, refine and document our data production process. We find this to be a very beneficial step for two purposes.

First, it helps us understand why (and if) a task is being done, and if it is being done efficiently. Much of this program started so quickly that it was difficult to plan logical integration and hand off points among the various workgroups. Further, we are currently in the process of consolidating much of the process data (check-ins, check-outs, metadata) and we can use this process model to efficiently plan cohesive information architecture.

Second, our process documentation and modeling helps explain why resources are being consumed in a particular way. This helps our State partners plan for in-sourcing specific tasks as their time and

budgetary constraints allow. It also helps our LinkAMERICA team better plan and cross-train members to deal with the work surge that occurs 30-45 days prior to submission.

Finally, documenting and modeling our process helps us to take advantage of increasing specialization and proficiency with certain types of data and management responsibilities. In submission 3, we had identified data “czars” responsible for check-in and check-out of data. That data czar helped to bridge the gap among receipt functions, provider feedback, production and DBA. In round 5 the data czar was also tasked with alerting on speed/technology tripwires. This individual was responsible for taking the initial review of each submission and determining if an NTIA speed/technology warning would be triggered.

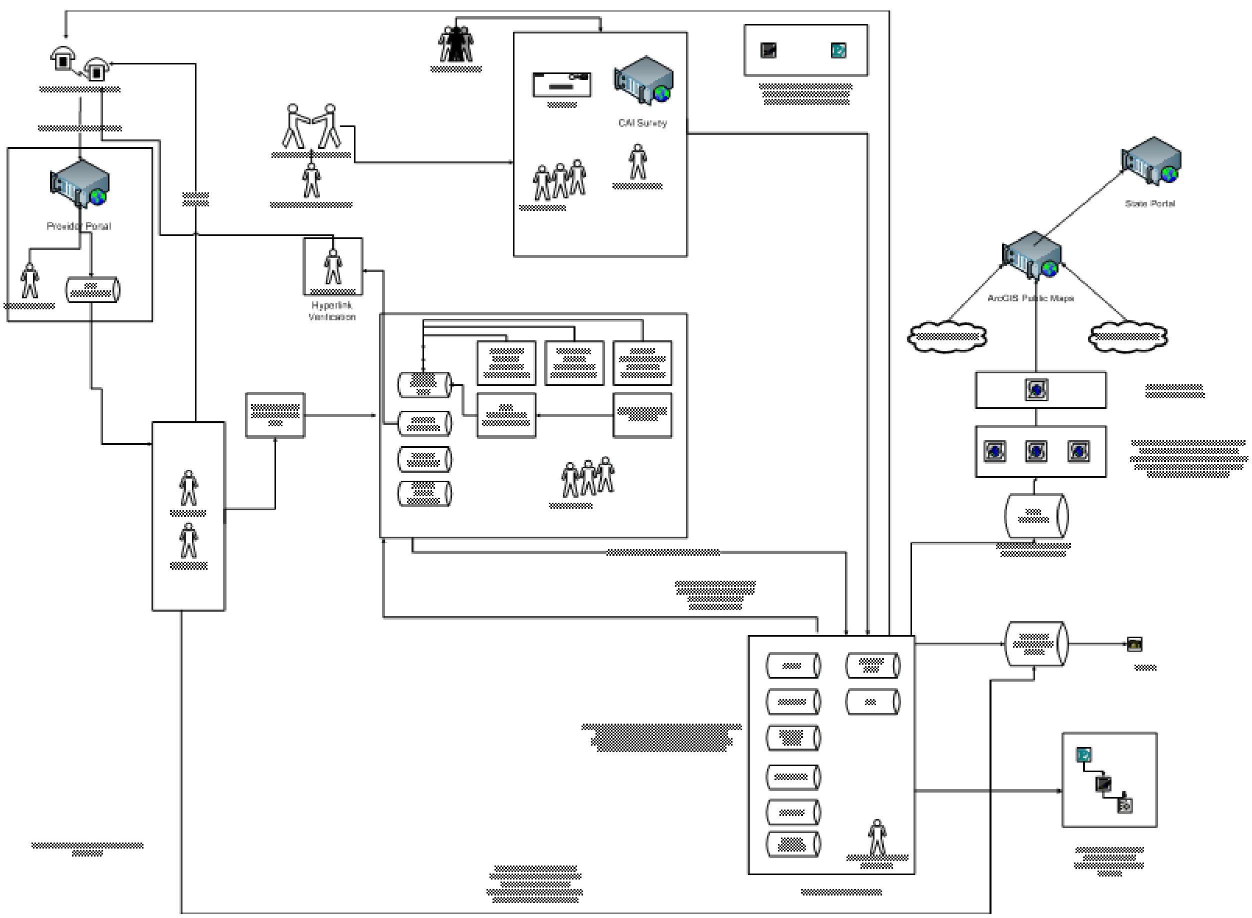

Figure 2—SBI Data Development Business Process Diagram

Provider Tracking In the Cloud

Prior to initiating the Round 5 survey, LinkAMERICA transitioned in house provider tracking systems to a Cloud based application, TrackVia.

The movement away from desktop solutions was based upon several factors. First, the architecture these systems were designed under no longer met the program realities. For example, deliverables like

Datapackage.xls were not contemplated when the original provider tracking system was developed. Second, the ability to share data across multiple geographic areas and organizations was becoming increasingly important as the program evolves and responsibility moves to in-State partners. Third, portions of this data need to securely transition back to State resources who may or may not be able to support a specific IT infrastructure. These factors combined to make the Cloud applications a valuable alternative.

As with any IT transition, the process has not been without challenges. Nonetheless the investment in time and resources has proven to be effective and worthwhile. We anticipate further movement away from desktop oriented architecture to a more open, Cloud type solution.

Data Production Methods

As raw data were received from the provider community, attention turned to normalizing the disparate submission formats[5]. The team considered each submission with respect to the following criteria. These criteria are important because they perform the basis for our verification and quality assurance process. In other words, we have to appropriately scale our data verification efforts to match the scale or ambiguity of the following:

- Locational certainty
- Speed certainty
- Temporal certainty
- Provider and network ownership certainty

The team's goal was NOT to quantify a particular degree of precision with respect to any of these criteria. Rather, we are working to attribute the above "certainty attributes" to each submission, and will continue to implement quality assurance and verification mechanisms that are resource-appropriate for each.

Deriving Broadband Coverage Information

Broadband Coverage[6] was normalized into four formats:

1. Coverage in Census Blocks (2010) of 2.00 or less square miles
2. Covered Street Segments (2010) in Census Blocks greater than 2 square miles[7]
3. Address Level Coverage (point data)
4. Wireless Service Areas (SHP file format)

---

[5] In line with NTIA Best Practices we continue to request and receive a large number of data input formats. This ranges from tabular Block lists to hand drawn maps.

[6] Speed, Anchor institutions and Middle Mile facilities are discussed in later sections.

[7] To help clarify issues relating to Census block area and vintages in use, our team published a technical paper to the Grantee workspace. Because we were unsure if this standard should be implemented uniformly, this document was never distributed to the provider community.

With each submission, the team went through a series of steps to normalize and categorize the data. Since data arrived in many different formats, and at many levels of granularity, the following normalization procedures were used:

- Determining the nature of service being provisioned (who is providing service and what technologies are in use)
- Planning an attack strategy for the submission –understanding the data and assigning team members to various tasks
- Alert provider relations staff if the received data trigger an NTIA speed/coverage tripwire.
- Geo-referencing the data; QA the geo-referenced data
- Geoprocessing the geo-referenced response
- Segregating the submission into the correct NOFA-compliant submission formats.
- Apply appropriate source metadata[8]

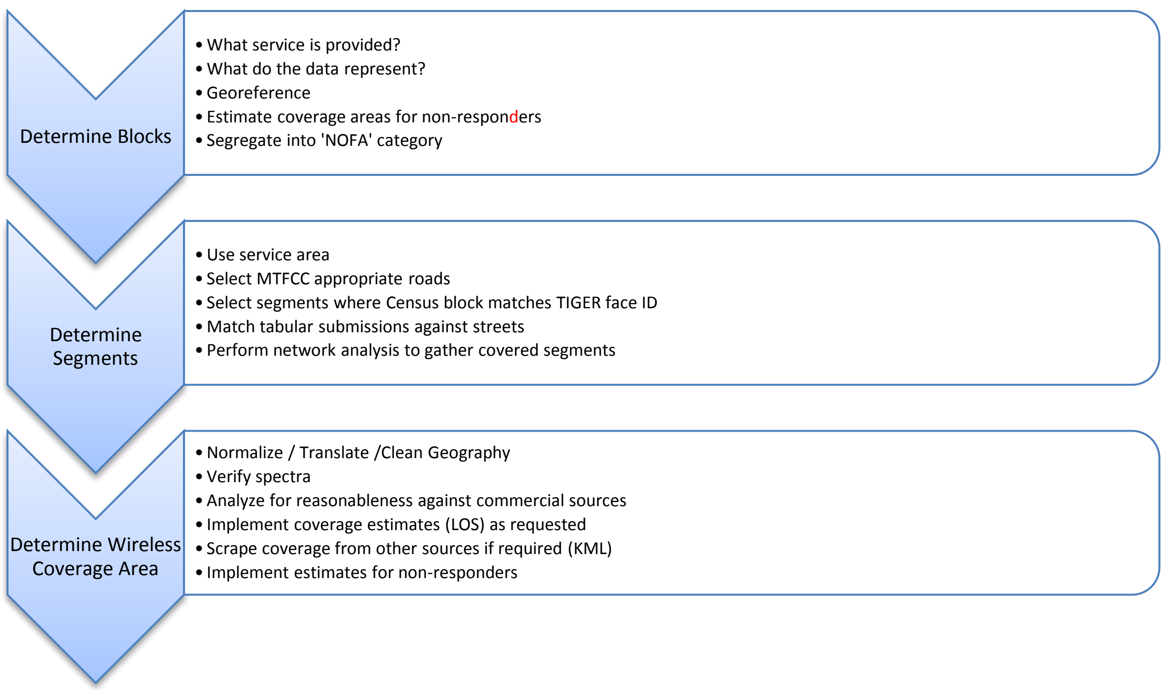

Figure 3-Components of Broadband Coverage Process

Impact of Program Change

There were several important program changes that impacted how Broadband coverage was developed and submitted to NTIA in Round 6.

[8] When our team logs a submission into the staging database we record at least two attributes. One records the method used to derive the coverage, the other records the method by which speed was attributed to that object. Other attributes carried to NTIA carry source meta values as well.

Speed Examination

Given recent concerns about the depiction of speed and what that mapped speed represents, LinkAMERICA invests considerable time requesting detailed information on speed which appeared to be beyond normal speeds for a given Technology of Transmission given the NTIA supplied frequency tables.

Based upon these conversations we learned

A) For incumbent telephone providers; the speeds beyond the normal xDSL range represent significantly shortened copper loops, as well as upgrading DSLAMs and modems to support ADSL2+ or VDSL.

B) For cable providers the intermixing of DOCSIS 3.0 and non 3.0 systems in a market area is typical and sometimes reflects a circumstance where segments of plant cannot be upgraded to DOCSIS 3.0. This variance can be at a level below the Census block. In these cases the maximum advertised speeds remain to represent the market area but the plant variance is typical. We also have one 'cable' provider who is delivering DOCSIS 2.0 over fiber plant.

C)There exists a fundamental disconnect between some providers reporting a service qualified speed--the maximum speed available at a structure versus other providers submitting their maximum speed at the market (MSA/RSA level). Both submission paths are available to providers but the likelihood of providing a speed incompatible with a technology is much greater for providers submitting market level speed.

D)Fixed wireless provides are using new radio technology to quickly deploy services which rival and sometimes exceed those of wireline service providers. These speeds are being advertised, sometimes on public facing websites as well as using direct field sales staff to target specific high demand customers. These services are actively marketed but they challenge the data model in that the speed is marketed and available within 7-10 days of request but the nature of the fixed wireless submission forces attribution of this speed within a potentially large geographic area.

E) There exists a minority of providers who submit a theoretical speed that is unmatched by their web advertising. In these cases we request clarification from the provider on the inconsistency. Our experience has been that providers will modify the speed to be consistent with their marketing and advertising.

F) The maximum advertised speed offered is not always clear. Sometimes the speed is described in advertisements in terms of a combination of video and data. Other times it is data not video. Some providers allow a customer to select how much bandwidth they want to allocate to their data stream versus video stream. In other words the bandwidth available to a household is constant but how it gets allocated among the data versus video becomes a customer or service directed choice. This makes getting Maximum Advertised Downstream speed very difficult because it is not just a product of the broadband network which we are mapping but also the customer's selected service package.

Provider Definitions

Within our provider verification process we work to derive a state level provider match against third party data sources. As discussed in the early pages of this manual, there is no guarantee that a third

party data source is any more accurate than submitted data, nor does it necessarily reflect the provider ecosystem specified in the NOFA, Technical Appendix A. We devote significant resources to matching our submitted data against outside data sources. In many cases this becomes a judgment call trying to match provider names across systems. It is a difficult and somewhat arbitrary process. Nonetheless we do believe it has value because it forces a re-examination of who we believe is an appropriate provider within a non-NOFA context[9].

The use of a provider match system, as well as the webinar comments (3/17/11)[10] directing grantees to estimate, wherever possible, non-participating providers have made us back away from one of our fundamental assumptions in data collection. As discussed in prior versions of this manual, we had developed a certain "hold-out" class of data when a provider's data wasn't of sufficient quality to verify, or we were unable to put it into the data model (e.g. address points submitted for fixed wireless). In submission four, much of this hold-out data was included[11]. In some cases this involved using simple polygons to capture a wireless ISPs serving area. Other times, if we are confident in the coverage, but can get little clarification on the submitted speeds or frequencies, we release the coverage and note in our internal metadata the source issues with the other attributes.

In the weeks leading to submission 5 we received a request from NTIA to clarify the presence of unusual shaped wireless polygons. Our interpretation of this was a request for information relating to the source of these data which do not appear as propagated coverage. Although the 'unusual shapes request' represents a very small portion of the submitted data, it begs an important question about the expectations with respect to wireless coverage patterns. We look forward to working with NTIA to address these issues in a fair way across States and providers. We would not want to create a coverage dichotomy where advertised coverage was disallowed from the NTIA submission because of an expectation about how advertised coverage should appear. One concern we have when we develop a coverage estimate which differs from a providers advertised coverage pattern, which should we submit?

Finally, we use the provider type classification of 'other' to bring specific aspects of certain provider's data into our submission. There still seems to be confusion on how to handle provider types where a provider offers multiple paths to provision Broadband for typically business customers. Rather than waiting for certainty on the answer, we bring the provider in and list them as provider Type "other". Our sense is provider Type "other" will continue to expand in subsequent submissions.

Clearly one challenge is the data, but an equally significant challenge is appropriate messaging around this "other" provider type category. We do not want to leave consumers with the impression that they

---

[9] We have requested from NTIA information on how provider matching is done within their QA process; beyond the relatively short whitepaper posted with the national map <http://www.broadbandmap.gov/blog/wp-content/uploads/2011/02/DataComparison_Methodology2.pdf>, we have not received any more detailed information on how providers are cross verified between submitted and third party sources at the national level. Our understanding is licensing concerns are holding the release of this information.

[10] Clarifying comments from Akins Lawl indicate the Program Office does not want Satellite providers estimated if the provider is non-responsive to data requests (email 9/12/12).

[11] We continue to process older submission data looking for information and methods by which we can estimate coverage information. This will be an ongoing process.

can get a high capacity fiber or microwave link despite the fact that the hospital next to them or in a nearby Census block can get this service.

After the April 2011 Grantee conference, LinkAMERICA submitted a paper describing our provider classification system[12]. It is our feeling that understanding the type of provider is essential to appropriate verification methods.

Coverage Geoprocessing Methods

The next section discusses how data were georeferenced and geoprocessed given a particular submission format. We have yet to find a particular method that works across all submissions. Rather we tend to tailor our geoprocessing to meet the specifics of the service provider and data submitted.

In most cases, in Round 6 we were not provided with street segment geographic objects for Blocks greater than two square miles (large Blocks). This necessitated subsidiary geoprocessing. As stated before, our first goal was to derive block level coverage. Then, for Blocks greater than 2.00 square miles, we moved to a segment gathering processing. The segment process will be described in the last section.[13]

Block Level Coverage Derivation Using Service Point Data

A number of providers submitted point level customer data.

In some cases the submissions themselves were not internally consistent. For example, in the image below, unprojected points are shown, while the Census block polygon to which the points are supposed to "belong" is highlighted. In this case, one of the following scenarios has occurred: block attribution is wrong, the points are not in the location to which they are attributed, or different block shapes were used than what is assumed.

[12] https://sbdd-granteeworkspace.pbworks.com/w/file/42309493/provider%20ClassificationFINAL.docx

[13] As has been discussed previously, we note inconsistency in how providers are supplying information at the block and segment level. Beyond the temporal differences, we see that providers are computing area differently, as well as including or excluding water areas. This provides an inconsistent measure across providers for the 2.00 sq mile cut off. Our preference would be to provide guidance to service providers within our states, but our concern is that we will inconsistently message this with grantees in other states. We would appreciate consistent guidance from FCC/NTIA on this topic.

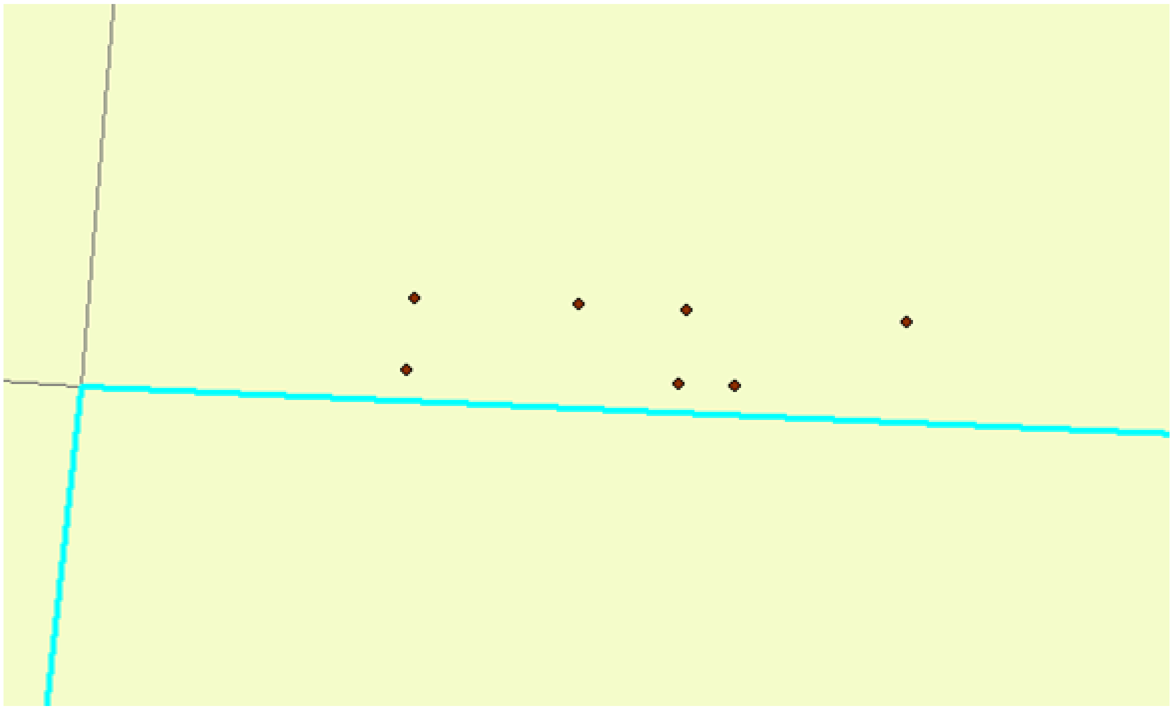

Figure 4-Internal inconsistency in submitted data

In other circumstances, we found that inconsistent geocoding standards may produce misleading results. The next image shows point level data, and the Blocks are colored based upon the counts of points intersecting Blocks. The challenge this presents is that if geocoding was performed on a different dataset than the block boundaries (the road traces are not coincident with block boundaries) and/or geocoding was done without an offset, it becomes problematic to assign coverage to a Census block based upon only the point locations.

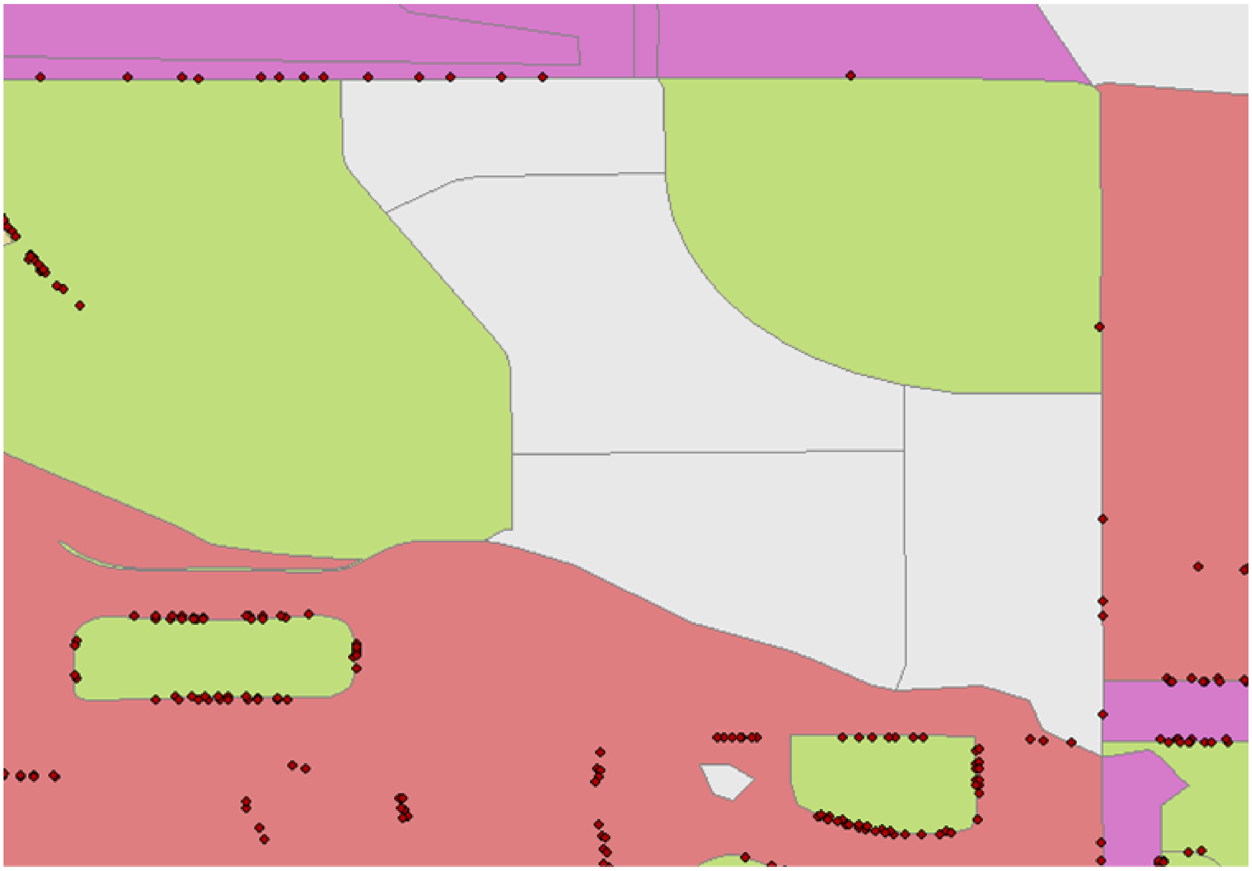

Figure 5-Block Coverage

For this reason, where we were provided address point data and asked to generate covered Census blocks, we elected to use a 200-foot buffer to select Census Blocks that intersect our points.

We also see a number of providers submit customer data and facility data. Their intent is to allow us to have two primary sources from which to derive the most accurate coverage. In these cases we tend to look for clusters of customers in areas where we see no facility based coverage.

With respect to deriving Block level speed from sub-Block data, we have instituted a business rule where the predominant speed in a Block is the speed we attribute to the Block.

Block Level Coverage Derivation Using Customer Facing Plant Level Point Data

In other circumstances, providers submitted point level plant data. From what we could gather, these points tended to be customer-dedicated terminals. Typically, these providers were high speed Broadband producers—which may somewhat strain the definition of Broadband as other providers supplying comparable services specifically disclaimed the ability to provide high-capacity Broadband services in the required 7-10 day interval. In these plant point data submissions, we had similar concerns to the point level customer data, but two factors tended to make us use a more conservative intersection buffer. First, we tended to have far fewer points to work from, so our concern was grabbing too many covered Blocks as the Blocks tended to be much smaller in these urban areas.

Second, these plant points tended to be dedicated to distinct customers, but it was difficult to know which element of the customer's campus to attach coverage to.

In the case of the image below, given a small shift to the left, it would be easily possible to gather 1 to 3 Census Blocks from this point. Although orthoimagery is helpful in a circumstance such as this, it is still indeterminate.

Thus, in the circumstance of plant level point data, we used a 100-foot intersection buffer.

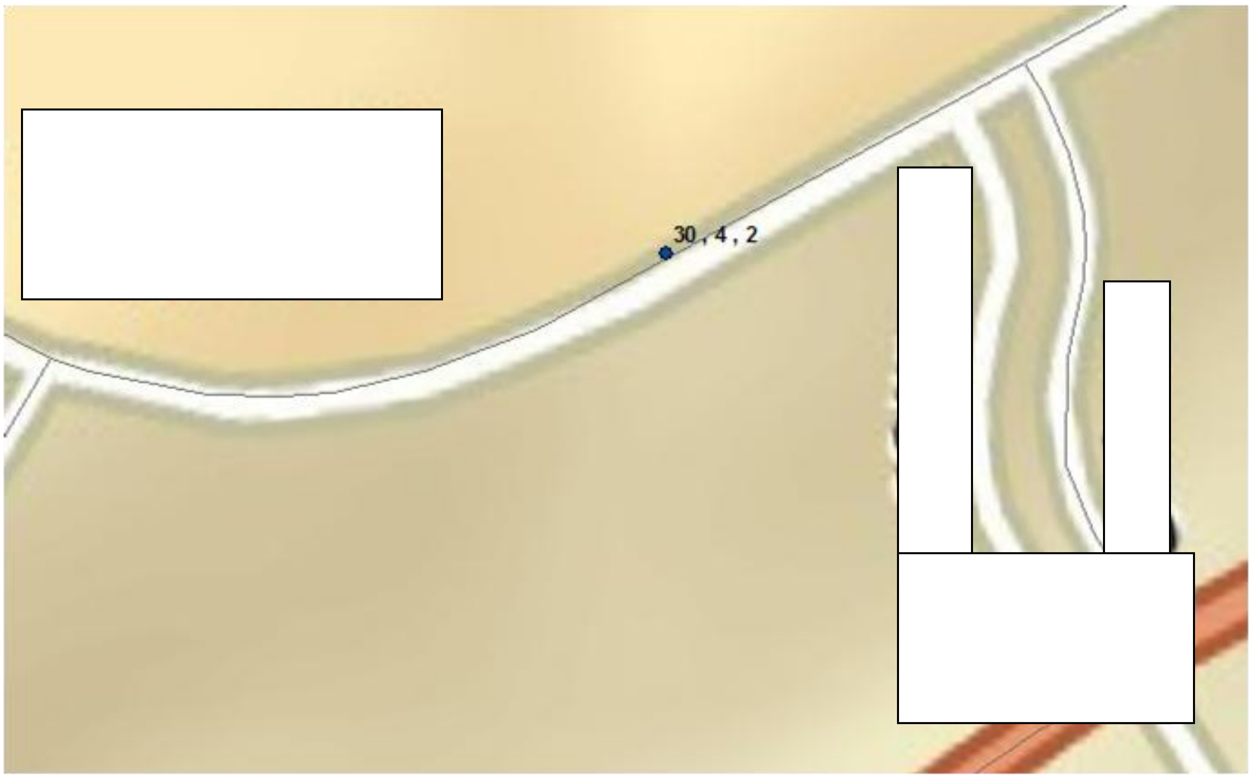

Figure 6-Plant Point level data

Coverage Derivation Using Linear Facilities Data

A number of providers submitted facilities data. We handled this data in different ways depending upon what we believed the facility data represented.

Most telecommunications networks are divided into two components. Feeder - supplies higher capacity nodes (eg. DSLAMs, Fiber Nodes). Distribution - usually supplies customer premises (NIDs, Pedestals, Taps, ONTs). Where we could discern what facilities we were provided, we used different methods.

The next image demonstrates a geo-referenced CAD image as given to us by a service provider. Note the light and dark green shading. We would infer that the lighter segments represent distribution and the dark green represents the feeder network.

In the case of a combined strand map, we used a relatively tight buffer of 200 feet to gather covered Census Blocks. Our intersection tolerance is based upon an assumption that our data likely represent a

situation comparable to customer point level submission in that we have most of the network footprint captured.

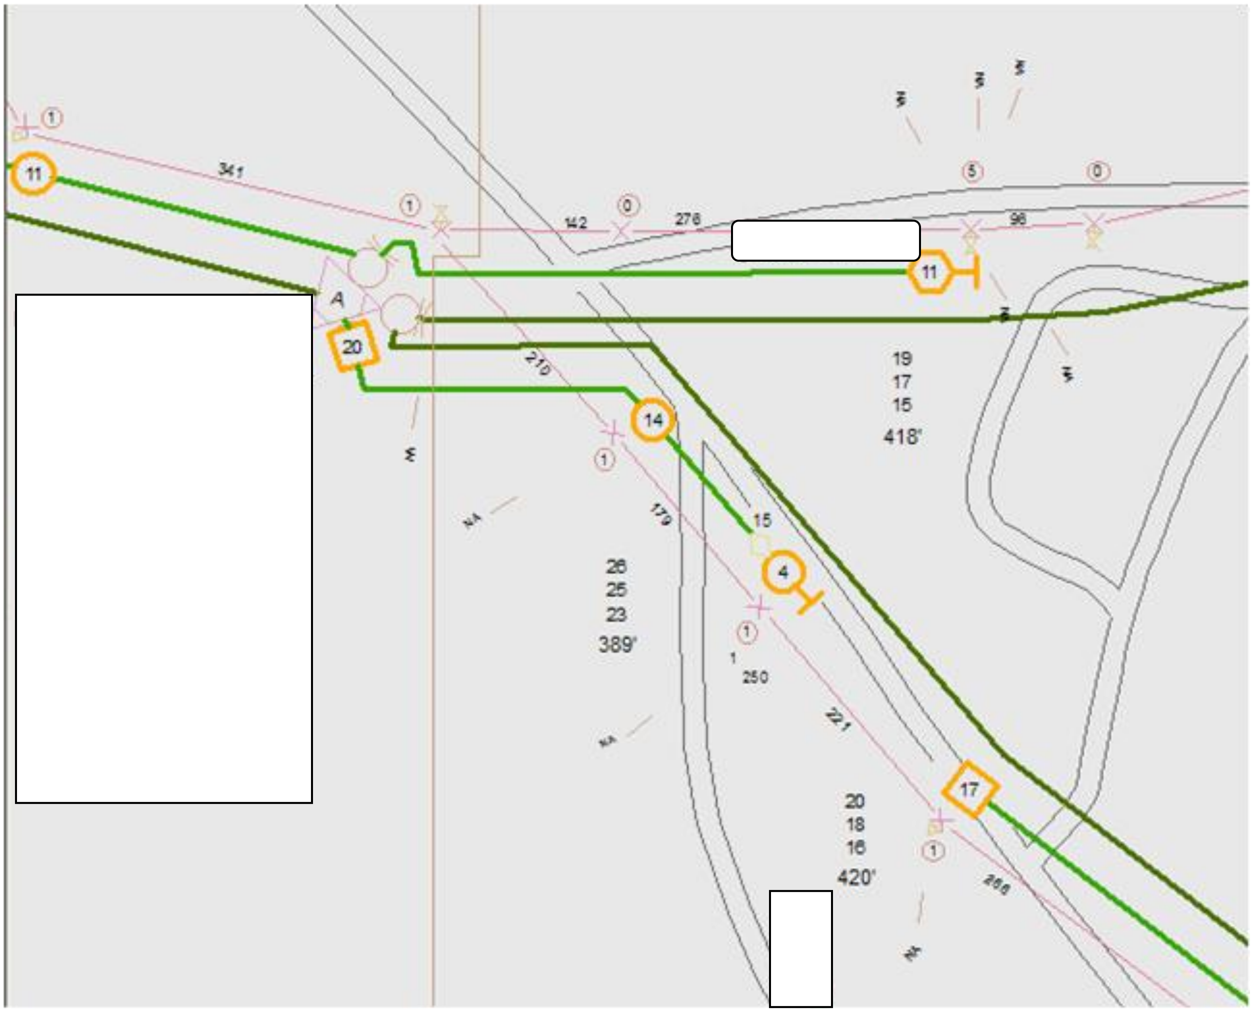

Figure 7-Georeferenced CAD information supplied by Broadband provider

In other circumstances, we were provided engineering information that we inferred to be feeder only. This inference was typically based upon the presence of fiber optic equipment only. In these cases, we used a more generous 2,000 meter Census block intersection. The 2,000 meter criteria was based upon an informal survey of population in proximity to the geo-referenced strand data, but it could be varied based upon a more complete survey.

Coverage Derivation Using Covered Street Segment Data

In some cases we were provided with covered street segment data. Covered segments tended to come from two sources.

In some circumstances, providers gave us CAD data, which was not drawn in a projected manner. This is relatively common for older engineering data derived from hand drawn records. This meant that our

team geo-registered the image into an approximate position. In this case, the boundary streets were selected, and an enclosing polygon was derived. The intersection of this polygon and the Blocks within became the geoprocessing method to derive Blocks.

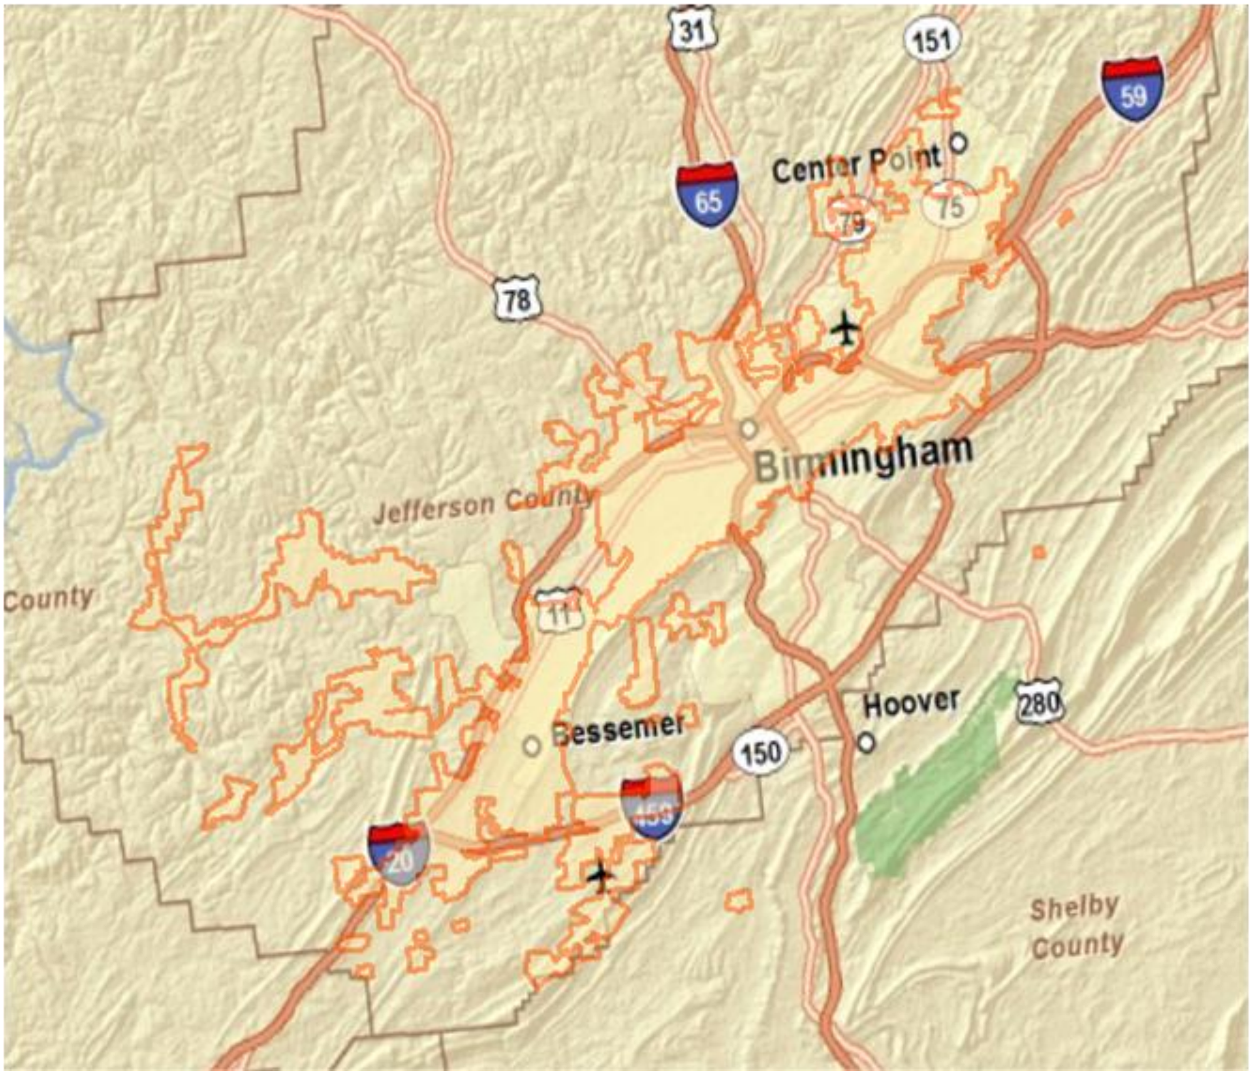

Figure 8-Coverage derived from street segments

In a second circumstance, street segment data was developed during coverage estimation. Handling the estimated data is discussed below.

Coverage Derivation Using Serving Area Point Submission Data

In other cases we worked with providers to derive service areas based upon point plant data. In these cases we were given a serving node and an appropriate road length service boundary. There is an important distinction from the plant data discussed above. In this specific case, the data submitted was a node that served many locations--such as a Central Office or DSLAM. This is contrasted with the earlier example in which the point represents a node serving only a few customers.

When trying to derive coverage from Central Office or DSLAM nodes, the team used ESRI Network Analyst to derive covered road segments honoring these road engineering parameters.

The figure below shows street level coverage derived from Central Office and remote DSLAM point data.

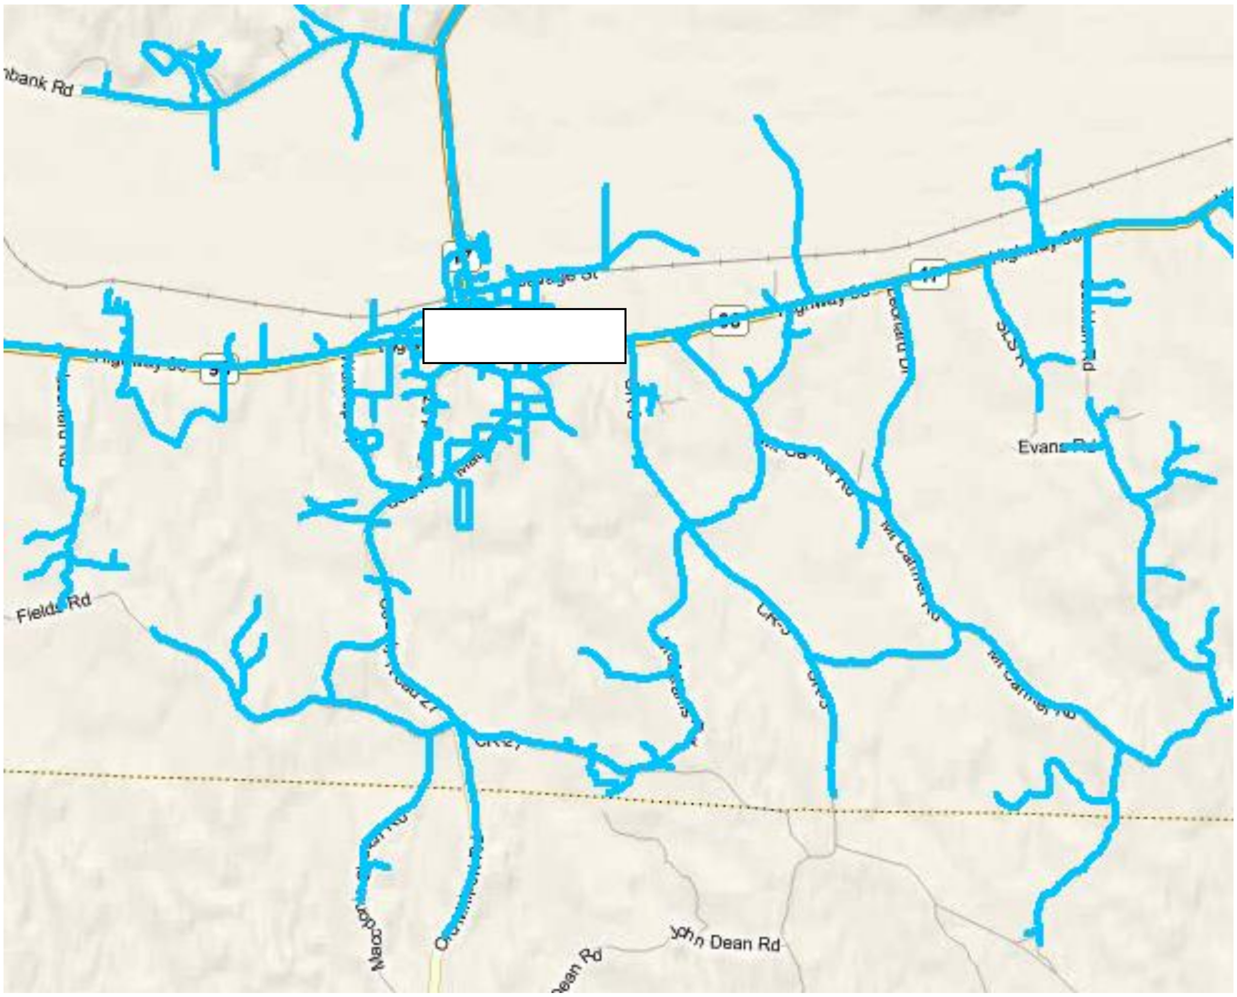

Figure 9-Coverage derived through road paths

In response to Provider feedback we revised this process to include a larger variety of TIGER road types. In Round 1, unimproved roads were not used. In the current submission -- particularly to improve estimates in areas bordering parks and public lands -- a wider class of TIGER roads was used.[14]

The segment level coverage is easily extendable to derivations of Census block level speed. The figure below shows the attributions of block level speed based upon the Maximum Advertised Speed available from a DSLAM. Although the methodology isn't perfect, it does provide insight into the value of granular infrastructure data.

[14]Only TIGER features of MTFCC type S1100 and S1200 were excluded from use.

Over time we have seen an increase in the number of providers submitting this type of data for our use. Our sense is some providers find plant level data easier to generate and are satisfied with the results of derived coverage.

Coverage Derivation Using Polygon/Polyline Serving Areas

Broadband service providers sometimes submitted coverage in terms of served areas. This was either in direct geospatial formats, CAD files, or paper maps. The image below reflects a carrier's service area. Within that service area, there are variations in technology of transmission and served speeds. When polygons with speed data and technology of transmission were available, we used a spatial intersection to gather covered Census Blocks. In many cases, using covered Census Blocks resulted in a loss of the speed variation (sometimes the speed variation was at a level smaller than a Block and did not get picked up within a spatial query).

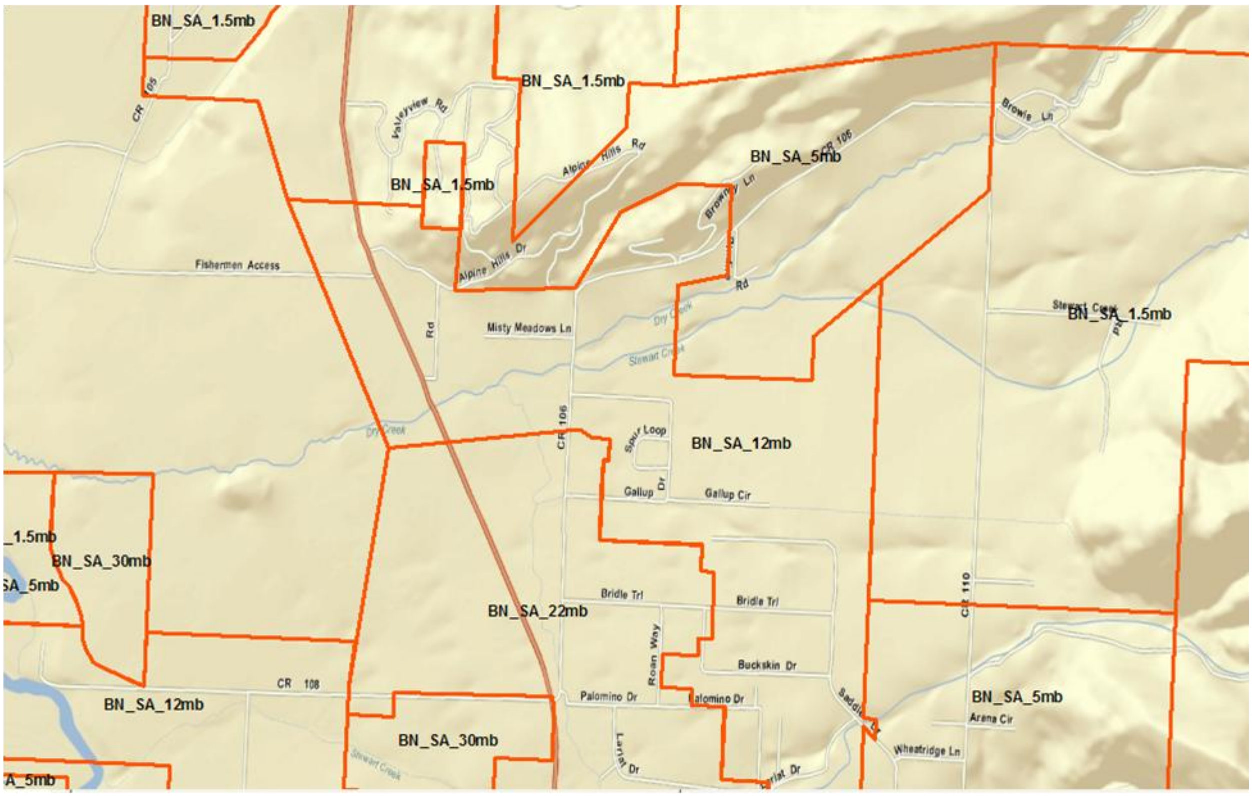

Figure 10-Coverage derived through serving area polygons

Although we cannot directly solve the loss of speed granularity due to Block shapes, we honor a business rule wherein we always select Blocks from the highest speed areas first, and then allow the lower speeds to select from the remaining Blocks. This is an arbitrary rule, but our feeling was that it should be a consistent selection, rather than an unordered selection.

Street Segment Derivation, Large Blocks

For those calculated Blocks greater than 2.00 square miles (large Blocks), we provided coverage in terms of covered street segments and corresponding geography.

With respect to segments we had four sources of data:

1. Covered large Blocks
2. Tabular street segments and address ranges for large Blocks

3. Geographic segments either with street attributes or without
4. Service area boundaries

A few providers only provided a list of covered large Blocks without corresponding segment information beneath the block. This provided the choice of either selecting all segments in the block, or none. Because we had little information from which to make the selection, we elected to be conservative and did NOT pass any covered segments to NTIA from this submission format.

Some Broadband providers submitted covered street names and street ranges. In these cases we performed a manual analysis trying to link to specific segment names and address ranges within covered Blocks. Sometimes this was a simple process because a provider used a TIGER derived street database. In other cases we could not determine the source of the provider's street data. Street and Address matching tended to yield a relatively good result (typically between 30% and 100% of possible segments in the Block), but was very time consuming. Where yield rates were low, our result was a shredded

segment coverage pattern, like the image shown below.[15]

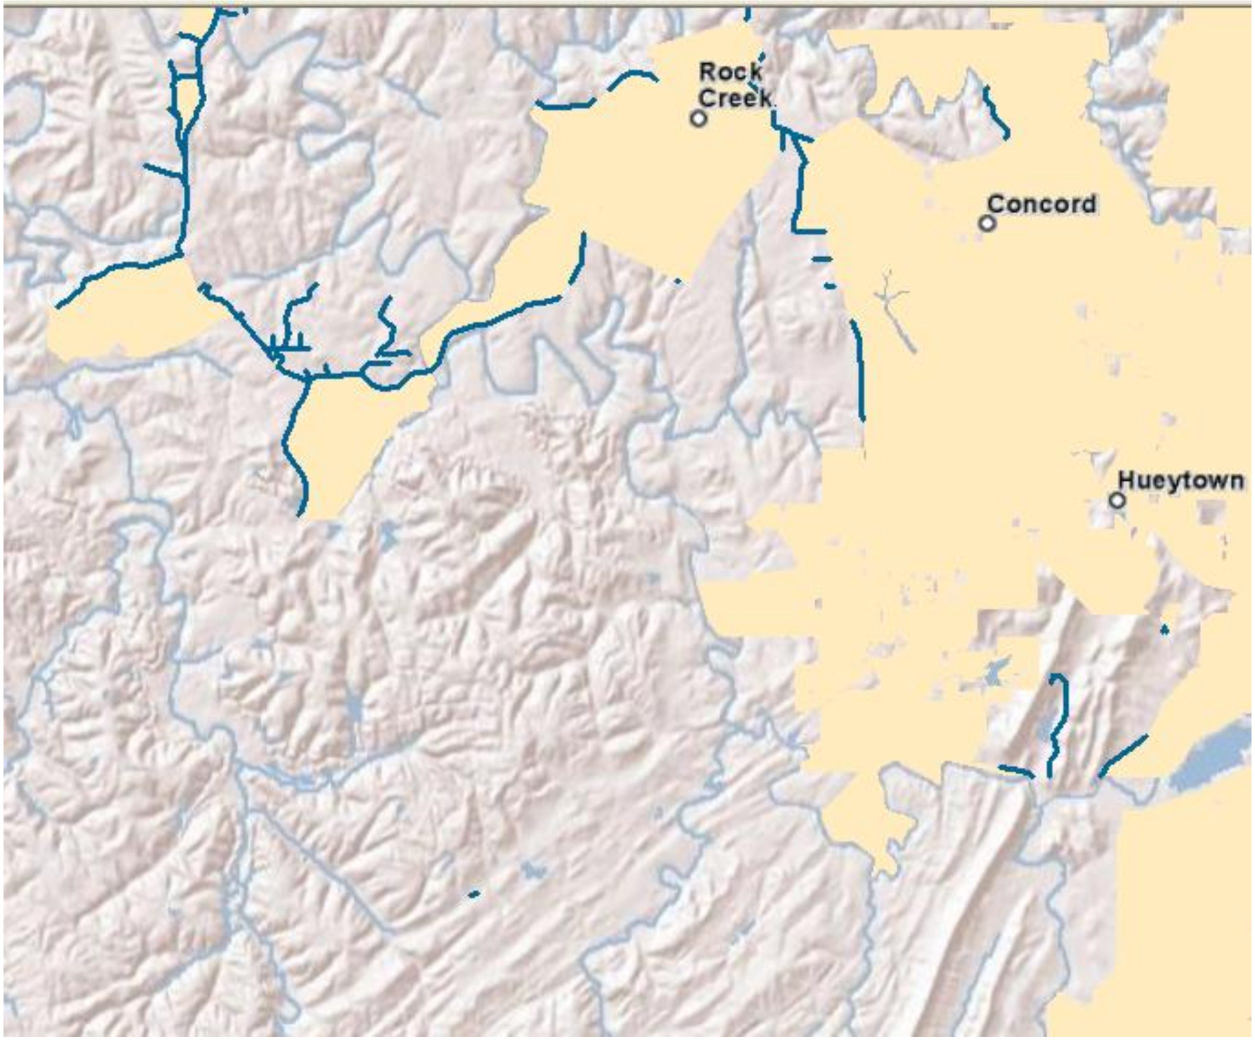

Figure 11-Blue road segments adjacent to peach covered small Blocks

A number of providers submitted geographic objects. In this case, our manual process was directed toward a conflation of data sources. The goal was to take provider submitted segments and put these segments in terms of our TIGER 2010 basemap. Although there is a trade-off in the accuracy using non-provider submitted segments, we felt it was more important to have a license-free road set that would edgematch our Block features, the TIGER state boundary and remain consistent with the block size standards we used for other providers. This is important for the appearance of the online maps, as well as potential verification work where we are attempting to judge a feature based upon its attachment to a covered small Census block. The figure below shows street segment input data.

[15] We continue to hear providers expressing concern that our request for either a geographic object or TIGER Line ID is beyond the scope of the NOFA clarification. Therefore, they cannot supply additional information to us.

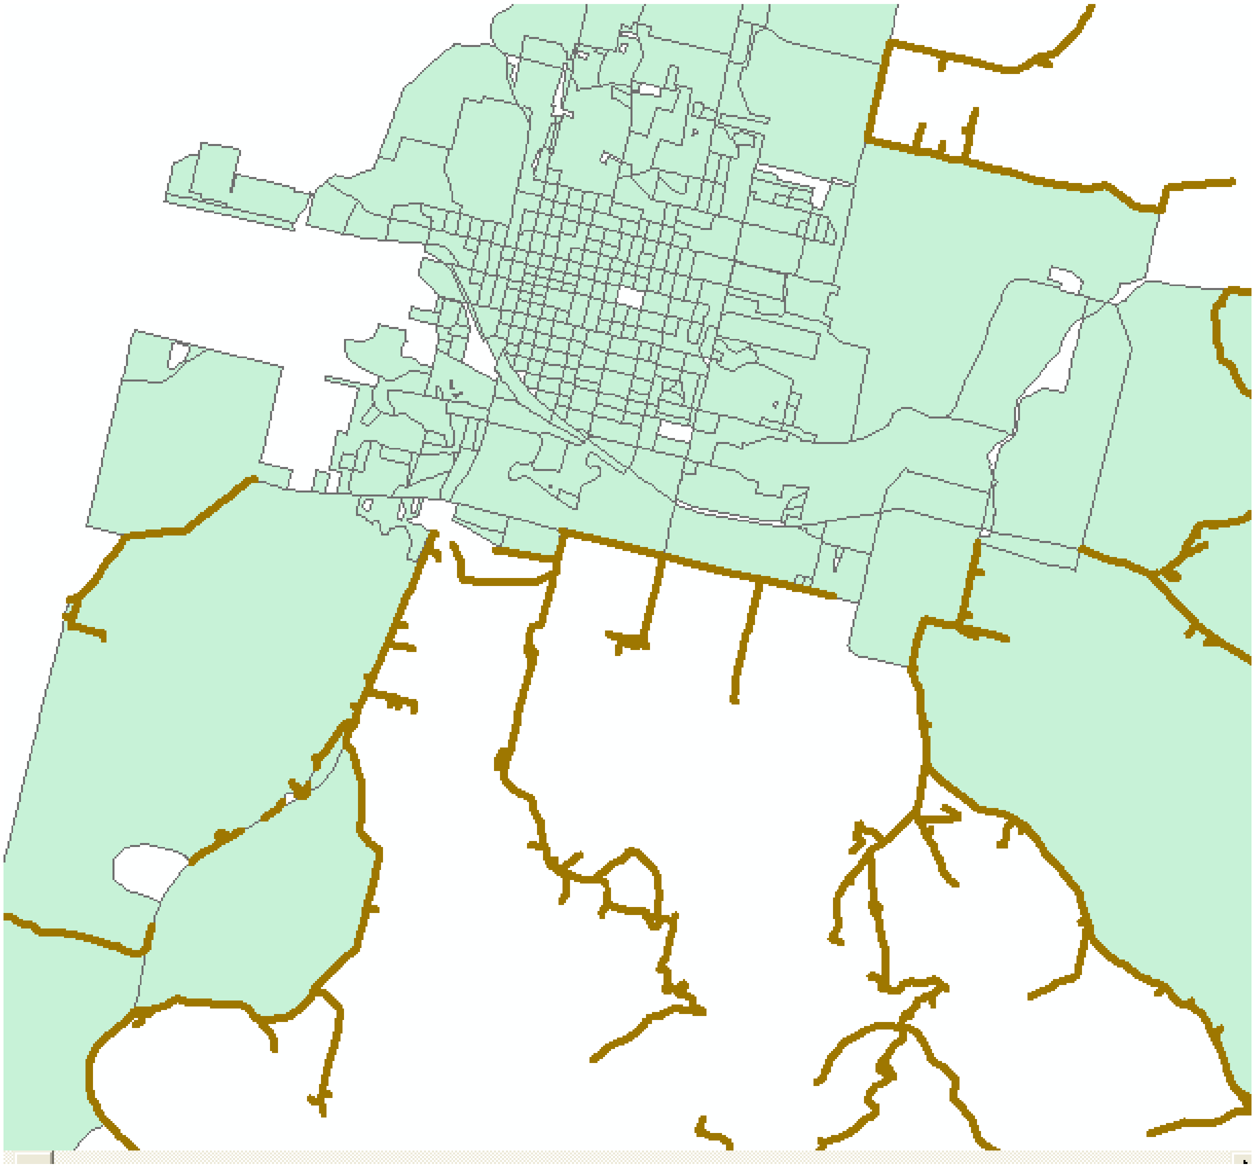

Figure 12-provider Submitted Street Segment Objects. The segments don't edge match the Blocks nor are they continuous.

The figure following demonstrates the same area after the conflation process. Blue segments are the conflated TIGER roads which will be passed to NTIA.

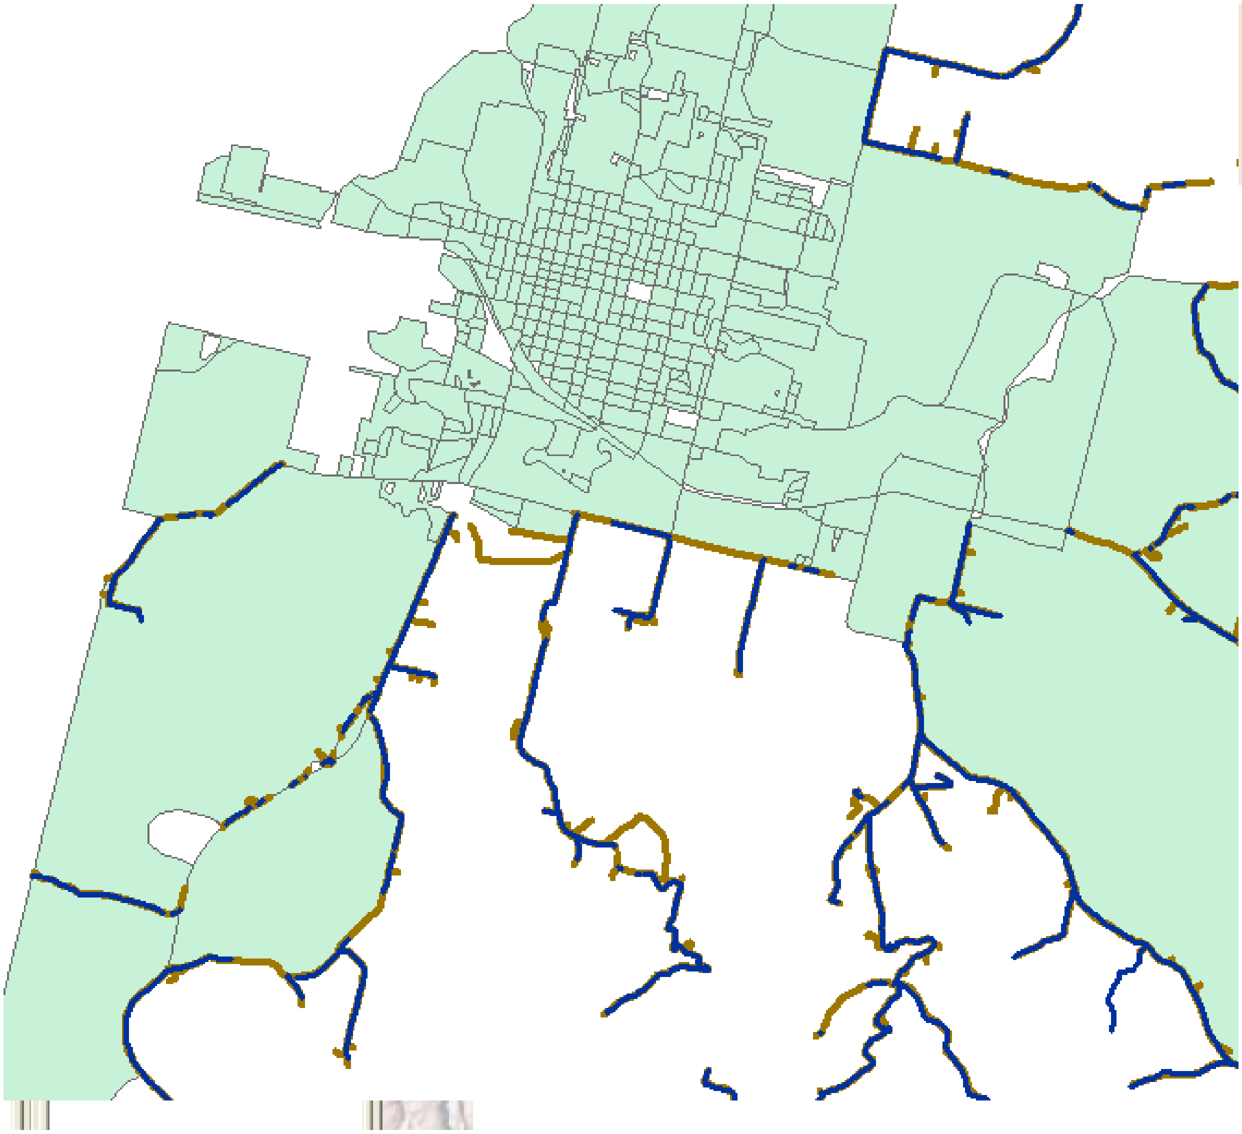

Figure 13-provider submitted segments in gold, selected TIGER in blue—Conflation result; in many cases what was a continuous segment is made discontinuous because even with a distance buffer the TIGER segment doesn't always intersect the provider segment

The final segment process was used when we were supplied with a Broadband covered area polygon. In this case, we found the segments within covered areas and eliminated those segments inside of Blocks less than or equal to 2.00 square miles.

Because there was more control over the format of the inputs (we knew we had a boundary and were working with TIGER segments), this was an automated process that followed this general format:

- Select large covered Blocks by provider ID (from updated Large Block table)
- Select TIGER 2010 road segments (MTFCC like 'S%') that face (CB = CBLeft2010 or CB = CBRight2010) covered large Blocks for provider

- Select segments as distinct records, max speed with corresponding technology, join in feature names, export selected records to temporary DBMS table
- Join TIGER roads feature class to temporary table on TLID
- Select covered segments (Python script)
- Select service area polygons for provider
- Clip selected facing segments with selected service area
- Export clipped segments to staging feature class, keyed by providerID

In this figure, orange represents covered small Blocks; black lines are covered segments in large Census Blocks (light blue). The service area boundary is shown in grey. Based upon feedback from providers, we have elected to clip segments at the end of a coverage boundary.[16]

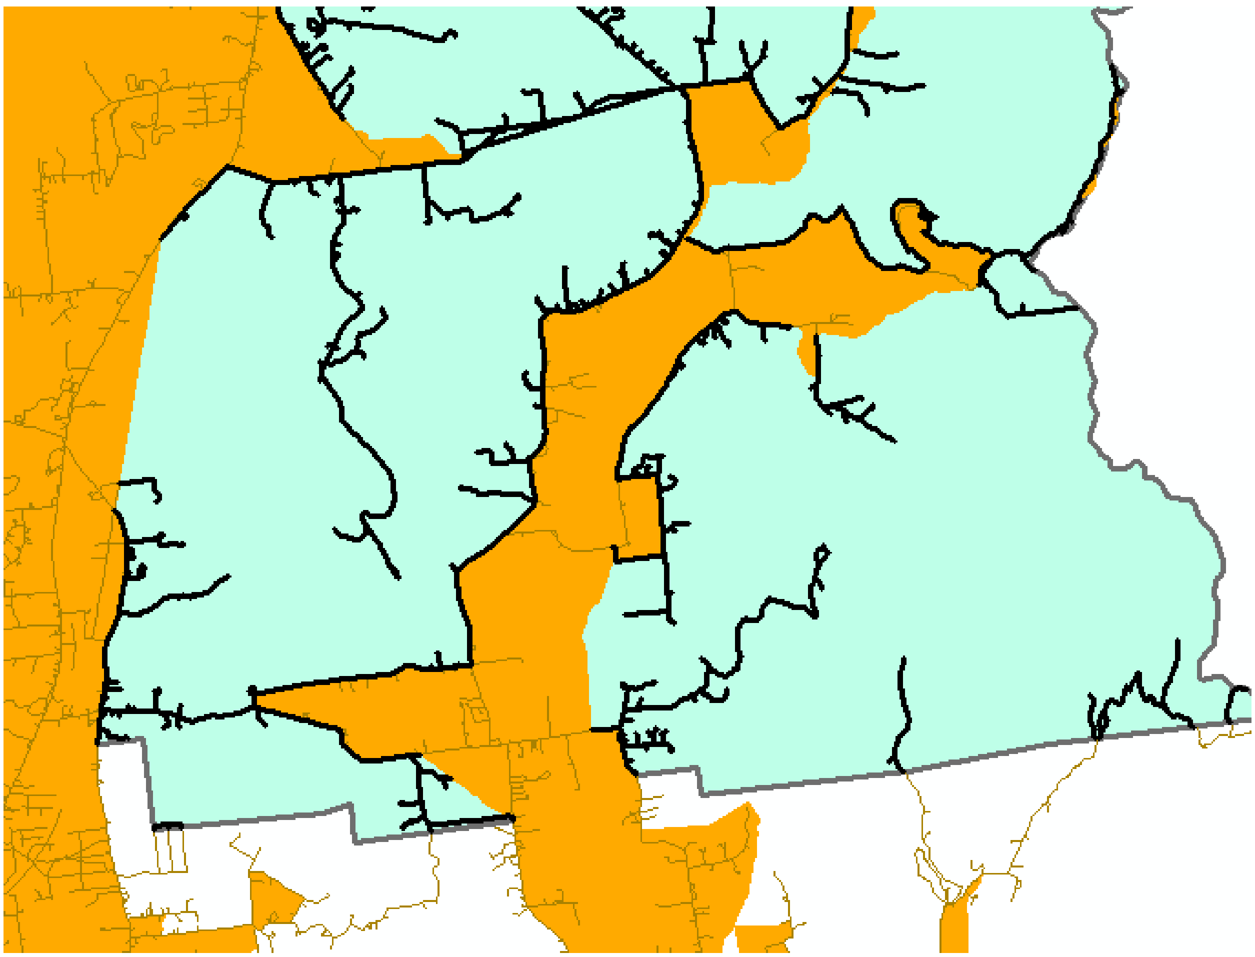

Figure 14-Output of the Segment Process

Wireless Coverage Process

In general, most providers of mobile Broadband submitted coverage information in a NOFA-compliant format. Other than attributions for spectrum and speed, little was done to this coverage.[17]

---

[16] An outcome not discussed here is how to handle address ranges on segments. As NTIA has asked for a Min and Max on the segment, deriving theses values for clipped segments is very problematic. Also the prevalence of alphabetic characters in addresses makes the min/max selections very arbitrary. We are grateful that addresses are nullable data elements.

Per Program Office direction, LinkAMERICA followed up with wireless providers where we determined that submitted data did not edgematch TIGER 2010 state boundaries. For the most part providers were unable to submit coverage data that edgedmatched as requested. In this case, we left the submitted data alone and did not perform any adjustments.

LinkAMERICA continues to make aggressive efforts to bring additional WISP coverage into the NTIA dataset. For the most part, our outreach was with providers who were unable to supply sufficiently granular data in the past or those that could only submit wireless address points which is no longer a valid submission format.

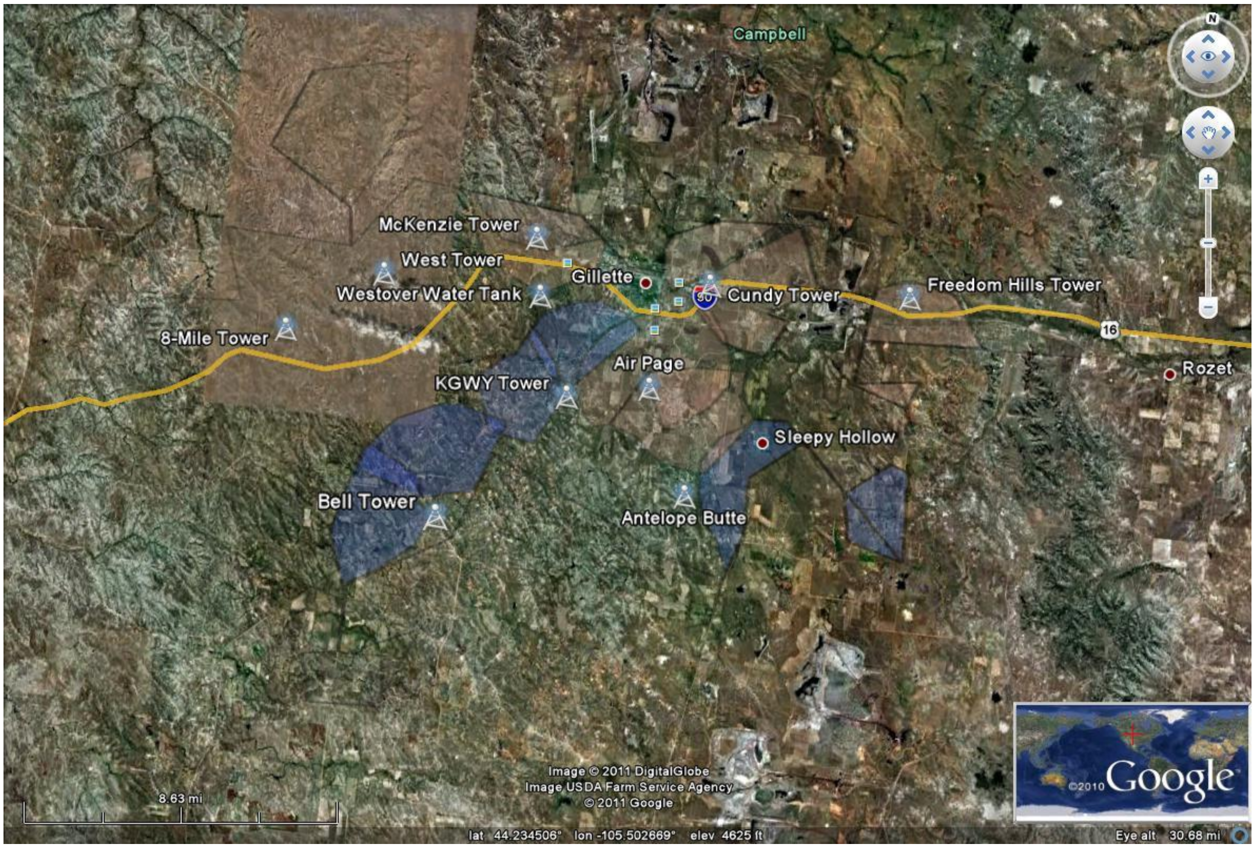
In Round 6 fixed wireless providers generally either supplied coverage information or infrastructure from which coverage estimates could be derived. Many allowed us to use their tower locations, antenna heights and direction/spread of coverage to derive a line of sight coverage estimate. In our experience, this is a conservative and reasonable derivation of coverage.

Some wireless providers submitted RF propagation studies. When this was done, there was a request that the signal strength be removed from coverage data. The request was honored. We note that some providers are very careful in that their coverage is an estimate of the probability of receiving an upstream link to their network. It is not intended as a depiction of any particular speed availability.

Other fixed providers were able to supply us with hand drawn maps or polygons/polylines drawn in Google Earth format. In these cases we did our best to georeference and verify the coverage areas with the WISP.

When we received coverage information in KML format, like the image below, we accepted the data as it was presented to us as the submitted coverage patterns were used in the provider advertising.

[17] Some polygon data did exceed the node count threshold. In these cases, data was rasterized to 100m cells and then converted back to polygons. The polygons were dissolved to multi-part geometry. This addressed the node count concern.



As the image above shows, in some cases we were provided hand-drawn coverage, as well as infrastructure. Instead of estimating their coverage using a line of sight or RF study, we elected to stick with the provider's supplied information. Our decision was guided by two primary factors:

If the provider is advertising using this coverage they must have specific confidence in its accuracy.
If the provider can supply coverage, as well as infrastructure that reasonably supports the coverage, there is a very high likelihood in the accuracy of the information.

The downside, of course, is the polygon shown on the map may not represent our notion of how wireless coverage should appear.

In general we note several interesting trends in the wireless data. First, we can be successful in increasing the amount of WISP coverage when we aggressively pursue WISPs. This means we have to be willing to accept data on their terms and convey it into SBI formats. Some of our WISP submissions have taken over 12 hours to normalize into SBI formats. Second, we have to accept that some WISPs will not be able to supply FRNs. Third, there appears to be some variation on how the NOFA coverage definition is met. In other words, there seems to be a disparity on the necessary link budget necessary (e.g. -80 dB, -98 db, -120 dB, etc) to provide the appropriate quality of service for data services to be provided at a location/inside a location.. Fourth it was very difficult getting providers to identify spectra used for

Broadband data services[18]. We are unsure if this is a competitive concern, or if the same coverage pattern is yielded for multiple frequencies. Typically, the spectra returned were those that a provider was licensed for. At this point, we have no reliable way to locally determine what set of frequencies are used to provide Broadband data services in a local area at a specific point in time.

Service Address Point Process

A handful of providers have requested that customer level, service address point data be submitted to NTIA. In these circumstances we have done minimal processing to preserve the provider's intent with this deliverable and not bias downstream NTIA use.

Our verification included checks against commercial or Public Utility/Public Service Commission exchange boundary maps. Points not contained within three miles of a boundary are not submitted to NTIA. The percentage of excluded data varies cross providers, but it tends to be under 1% of the total submission.

We retain from the provider the provided latitude and longitude, as well as Census block. For some coverage data, if a provider is unable to supply a longitude, latitude or Census block, we fill in these attributes. In those circumstances where we do not have a Census block, but we do have a longitude and latitude, we accept the given longitude and latitude and use that as the basis for our Census block assignment.

With point data we have tested for comparable geocoding success rates but do not overwrite provider information.[19] From this type of analysis we note the amount (usually little more than 10%) of addresses that seem to locate with less than street segment certainty. Deriving a thematic representation of the points on speed also illustrates some of the locational certainty issues in this point level data.

Coverage Estimation Process

Although the derivation of Broadband coverage into Census Blocks, street segments, or wireless coverage files is, in itself, a bit of an estimation process, there was an explicit estimation process required in cases where a Broadband provider either refused to participate in our survey, or provided such a threadbare submission that no carrier-based coverage information could be gleaned[20].

We typically resorted to three possible estimation paths.

---

[18] One provider responded by email, "This mapping program is to provide the coverage area for Broadband provided by a company. Not to keep a detailed account of every aspect of a companies (sic) network."

[19] We will make a second geocoding pass on locations with no longitude or latitude from provider. We typically pick up ~5% from our second geocoding pass. Typically the issue is address quality but also difficulties in geocoding in very rural areas.

[20] We report estimated submissions to NTIA as a non-responsive provider but we have data in the submission for them. This is the reason for datapackage.xls entries which are non responsive but contain submitted data.

For Cable (HFC) providers who did not provide any coverage information, we fell back to Media Prints data. Rather than using the entire Census Block Group gathered by Media Prints, we used only those Census Designated Places carrying the same or similar names to the Media Prints p_com field. Our reasoning was that Cable systems tend to be franchised on a municipal or at least administrative basis so the coverage will likely follow a governmental boundary. As a general rule, cable infrastructure is not available in the public domain[21] and what could be found was poor in quality and difficult to ascertain for validity.

For DSL providers who did not provide any coverage information, we estimated road-based coverage from their Central Offices[22]. We only used Central Offices that showed evidence of DSL or fiber-based services in the NECA 4 tariff. Road-based engineering areas were derived via ESRI Network Analyst to 18kft. These segments/boundaries were clipped to commercial wirecenter boundary edges.

For fixed wireless providers who provided no coverage information, we relied on their public websites to derive coverage maps. When these maps were available, we georeferenced them and tried to use the outer polygon boundary to represent their serving area. In other cases, when only a tower could be provided, we used a view shed analysis and estimated line of sight coverage at 10mi per tower[23]. Because much wireless propagation is driven far below the Census Block and much engineering information isn't known (frequency in use, polarization of the signal, coverage pattern of antenna(s), local terrain/land cover) this was the most complicated group to estimate.

Speed

Speed attributes are reported both at the block (typical) and higher levels (maximum advertised and subscriber weighted). We note that in many cases, providers did not supply typical or subscriber-weighted speeds. In some cases, it appears--although we cannot verify--that their maximum advertised speeds were used to populate typical speed columns.

We do have limited testing data on reported speeds, but we have been careful to not use our typical reported values with carrier-provided information. If we do not have a speed value from a provider, we report an empty value.

Several service providers claim they do not have data on typical speeds available, but estimate a 20% overhead factor between the advertised speed and what may be experienced by an end user.

We continue to request advertised speed at the block level. Nevertheless we appear to be getting speeds that do not vary over a large geographic area – leading us to believe that providers may still be submitting the maximum speed advertised in local media for the entire market. For the most part, we

[21] The team tried to use data from the FCC Coals system and 321/325 fillings but this seemed to be a bit non-uniform in quality.
[22] Central Office location was derived from GeoResults. Wirecenter boundaries also came from this commercial product.
[23] In some cases we had an approximate radius of coverage but no height. In this case we used a 50' height estimate and then clipped the coverage to the provided coverage range. We also clipped wireless coverage to honor state boundaries but did not look for providers serving coverage with out of study state facilities.

have been unsuccessful in messaging that advertised speed should not correspond to a market area, but instead, the maximum speed, which can be provided to a household—what some may describe as a 'qualified speed.'[24]

As a general rule, in circumstances where a provider supplies a range of speed attributes, we assign NTIA categories based upon the midpoint of the range. We follow this rule unless we can determine other grantees are handling the same submitted information differently.

To support NTIA program office requests, we have also modified the structure of the Service Overview table. Even if Maximum Advertised Speed is supplied at the market or county level, we push that speed down to the contained Blocks. The only records that remain in this table, will be those wireline records with either a non NULL nominal weighted speed or ARPU value.

Middle Mile

Middle Mile information was collected directly from providers via survey or interview. Middle Mile is a "chicken or egg" type of challenge in that it is possible to verify that the infrastructure exists, but extremely difficult to know what the site is doing without engineering level assistance. Although most providers submitted "something," there was a significant variance in what that "something" represented.

The purpose of this section is to record some of the comments and questions we have received about Middle Mile. We hope this provides better context for our data submission.

Within the NOFA, Middle Mile was defined as (a) a service provider's network elements (or segments) or (b) between a service provider's network and another provider's network, including the Internet backbone. (Collectively, (a) and (b) are "middle-mile and backbone interconnection points.")[25]

Given the existence of the "or" in this definition, providers submitted a variety of information. Based upon the NOFA example, several fixed wireless providers interpreted Middle Mile in terms of the connection points from their towers to their own serving backhaul location. The topology was commonly Microwave from their distribution towers to their NOC. The NOC and towers were listed as the Middle Mile points. This seems to be consistent with the first definition clause (a).

Telephone, Mobile Wireless, and Cable providers tended to remain either silent on the question, or would provide a single location in which Internet peering occurred (clause b). A number of participants explained that the NOFA was quite ambiguous with data traffic moving back and forth over both TDM

[24] As an example of a response to our request for Block level advertised speeds, we received the following comment from one anonymous provider, "This is and of itself does not require anything new of us – just states the NTIA supports efforts focused on getting that information on the CB level." It would be helpful to have broader messaging so that providers understand this new direction.

[25] From http://broadbandusa.gov/files/BroadbandMappingNOFA(FederalRegisterVersion).pdf at 54, visited March 28, 2010

and IP networks--it was unclear where the distinction should be drawn. As a general rule it seemed like many providers listed a single location where Internet Peering occurred.

A number of providers refused to answer the question on grounds of confidentiality[26]. Others would not disclose as their Middle Mile points are not owned--another company provides the physical and electronic connection to their network. In other words, the entity providing Broadband is not the entity providing Middle Mile.

Additionally, based upon the new Provider Type classification of "other," we have started to integrate points provided by Broadband service providers not meeting the NOFA definition. This includes POP locations and aggregation points for public / private networks.[27] Within a given submission there were two final attributes that tended to concern respondents. First, speed should be measured in terms of only data capacity and what exactly is "data" (e.g., can/should you segregate out voice or video), and is the relevant capacity of the physical connection, channelized to a specific virtual circuit on their network.

Finally, a number of other providers were unsure of the height above grade measure (is this their floor, the street outside, etc). We seem to have a combination of height above or below grade, as well as heights above mean sea level (AMSL).

To the extent possible in our timeframe, we verified the location of a sample of Middle Mile points. Where we could see infrastructure that appeared to be consistent in location with other provider infrastructure, we felt that the location was accurate. In some cases, the point provided seems sensible (is on a road, near other equipment), but using imagery, we couldn't find a place where this type of connection could occur. This wouldn't be unforeseen, in that Middle Mile connectivity likely takes place in a protected environment much smaller than a standard Central Office installation.

Mobile Wireless Coverage

We have received mobile wireless coverage from most mobile Broadband providers in each state. At this point we have cleaned the geometry of the data and attributed it with spectra, NTIA speed categories and FRN as required.

Where possible, provider derived coverage has been reviewed for consistency against the commercial licensed product.. To a limited extent we also use licensing locations and tower infrastructure to spot-check supplied coverage. This mode of verification remains complex, given the lack of facility-based information with mobile wireless.

---

[26] As received in email 9/30/10, "Due to security concerns and the risk of public disclosure of highly sensitive data, whether inadvertent or otherwise, ***REDACT***response to the Middle Mile and backbone interconnection request is limited to publicly available information available on {remainder not included}"

[27] As discussed in our readme.txt file, a number of middle mile points were lost in validation due to their location in adjacent state. This will cause a decrease in some providers relative to prior submission.

Finally with respect to mobile Broadband services, we note several trends.

First LinkAMERICA used the NTIA supplied frequency tables to report speeds consistent with other grantees. In circumstances where a provider supplied a range of experienced speeds, we used the portion of the range consistent with the most frequently reported Grantee value.

Second where a provider reports multiple frequency bands in use but doesn't distinguish these bands by submitted SHP file, we submit identical geometries but attribute one geometry to each submitted spectrum value.

Third we are seeing a trend toward increasing Broadband speed. As of this writing, there is not consistency across providers in how they attribute the advertised 4G speed values. In other words, for some providers 4G means advertised speed categories increase. For other providers the speed value did not change.

Fourth, we have requested providers submit SHP files that are consistent with the TIGER 2010 boundaries. For the most part, providers have not done this. As the request came late in the round six submissions our hope is this request will be honored for round 7. We have not modified the submitted data to impose the TIGER 2010 state boundary.

Verification

Data verification is an ongoing and evolving process. Clearly, with each new data submission there will be a validation process at hand and at the same time, our team continues to expand and improve the efficiency and effectiveness of our data verification routines. Consistent with the movement toward an fGDB export database and use of a data receipt script, much of our validation effort is spent in supporting the ETL processes into the required formats. In future data submissions we will continue our work to stabilize and improve the business process that normalizes provider submissions into NOFA formats and expands in more depth on the confidence analysis within the data.

Verification Methods Summary

Our overall verification standard is focused on the level at which we supply processed data to NTIA. This means that the vast majority of our verification process and resources will be focused on verifying provider identity, coverage, advertised speed and appropriate metadata for Census block's less than or equal to 2 square miles.

We believe three broad verification themes are important to consider

a) The first step of broadband service verification is a consistently applied market definition—we call this provider identity verification.

b) There is probably not a single dispositive method of verification. Rather, a number of verification approaches are needed to appropriately classify confidence in data submitted to NTIA.

c) Verification approaches tend to meld together. As an example a web survey is complimented by a phone survey but expert review and external data may be necessary to reach a final informed judgment.

The table below demonstrates the various methods used across each feature class submitted to NTIA.

	Data Types			
Verification Method	**Census Block, Road segment or, address specific service availability**	**Mobile wireless service availability**	**Middle mile infrastructure locations**	**Community anchor institutions**
Provide/Subscriber Identity Verification	METHOD USED	METHOD USED	METHOD USED	METHOD USED
Internal data consistency check	METHOD USED	METHOD USED	METHOD USED	METHOD USED
External data consistency checks	METHOD USED	METHOD USED		
Carrier confirmation	METHOD USED	METHOD USED	METHOD USED	
Public review	METHOD USED	METHOD USED		METHOD USED
Anchor institution review				METHOD USED
Expert review	METHOD USED	METHOD USED	METHOD USED	METHOD USED
Telephone sampling	METHOD USED			METHOD USED
Purchased Datasets	METHOD USED	METHOD USED	METHOD USED	METHOD USED
Developed Datasets	METHOD USED			
Web-based surveys	METHOD USED	METHOD USED		METHOD USED
Field Surveys	METHOD USED	METHOD USED		METHOD USED

The following table defines each of these methods and provides a summary of why this method is used, and the value we gain from it.

	Definition	Methodology	Purpose	Benefit
Provider Verification	Provider verification is the process of assembling a broadband provider database, determining which providers are properly classified into SBI eligible providers and developing contact information.	Provider verification involves combining multiple data sources, interviewing providers and classifying the broadband provider type.	Without a consistent understanding of the provider 'market' it is impossible to appropriately classify the coverage data. It is also impossible to explain to consumers of the data why a given provider is or isn't available in the submitted data.	The main benefit of this verification process is understanding who is providing broadband services, are the broadband services NTIA compliant and how do you 'contact' this provider (Name, DBA, FRN, Holding Company)
Internal data consistency check	An internal data consistency check is a validation measure across at least two dimensions. First is the provider data consistent with prior submissions. This would be an examination of this submission relative to a prior submission. Second is this submission	Most of this validation is performed using our spatial databases and running queries that compare submissions. We also use a similar set of queries to isolate transmission of technology outliers. These would be data sets which offer speed technology combinations	The purpose of this type of validation is to understand how things change over time and why. It also helps inform us for circumstances where we have data points which appear to be outside of the norm. If these outliers are	The main value is understanding why something changes and providing an opportunity to engage with the provider to understand why there has been a change.

	consistent with the technical specifications of the service offered.	which are unusual relative to other data received across all states.	detected, they can be pursued directly with the provider.	
External data consistency checks	An external data consistency check is a measure of the provider data against external sources (not from the Provider). The distinction between internal and external isn't pure, but our typical experience has been that External checks involve the acquisition of additional data sets and a comparison across multiple sets.	External validation can be performed by verifying supplied coverage against third party data sources. An example would be to test provider claimed DSL Census blocks against a commercial source of exchange boundaries. Wireless coverage is also compared to tower locations.	We don't believe a single, exhaustive third party data set is available for validation. We do believe a combination of external datasets can be used to inform and help filter out the false positive cases from provider data. We also note that the external data appears to diminish in accuracy as the area of analysis becomes less urban.	External validation provides an external measure of data quality assessment not influenced by internal data sources. It can be one of the more effective means of isolating false positives in submitted data.
Carrier confirmation	Carrier confirmation is the process of sending processed data back to the service provider	We use two techniques to accomplish this. First a provider's data is summarized in a tabular format. This lets the	One of the more critical steps in broadband mapping is translating carrier	Carrier confirmation gives the provider information on how their data will look when submitted to NTIA. It also helps short circuit complex problems like

	to ensure that translation into NTIA formats is fair and appropriately accurate.	provider quickly verify firm information (FRNs, DBAs, counties served). We also develop two sets of check maps. One is a PDF version and the second is a Google Earth (KMZ) version. Both versions display the NTIA reported coverage and speed. A different map is developed for each technology of transmission	supplied data into NTIA formats. Providing verification deliverables to the service provider (carrier) isan important external feedback process. Several providers also ask us to repeat this process before data are submitted to NTIA so they can see what will be submitted to NTIA.	online map display problems—which tend to come from FRN issues or incorrect data entry. This process also helps to strengthen the sense of ownership and participation with providers.
Public review	Public review is the process of collecting structured feedback from the general public in a manner which can be analyzed and used to improve/validate the submitted data.	Currently we use an online map 'layer' which provides consumers the ability to feedback about the coverage and provide in depth information about their concerns. The maps are also discussed within the context of planning teams within each state. We receive	As with other crowd-source approaches the intent is to allow the general public to feedback and improve the displayed and submitted data.	The benefit is to provide feedback and also display real time the comments of the general public. As a mechanism for validation the key is to develop feedback data which is structured in way that informs the mapping process.

		feedback from these meetings.		
Anchor institution review	Anchor institution review is targeted surveys intended to better understand the Anchor Institution broadband market.	We have used three methods to verify anchor institution data. The first is a targeted series of telephone calls. The second is specifically targeted mailers. The third is direct interviews with stakeholders. Schools for example, may have someone at the state level who maintains information about broadband connectivity.	As Anchor Institutions represent a different class of coverage information as well as a very different type of end user, a focused stakeholder management, data acquisition and data review process is advantageous.	Because CAIs represent a very distinct stakeholder community, building identifiable connections between the SBI program and the anchor institution community is important. Tailoring a specific data acquisition/ data review process helps Anchor Institutions establish a reliable set of infrastructure benchmarks which they can use to fulfill their mission.
Expert review	Expert review is the process of using subject matter experts to review submitted or processed provider data.	The method of subject matter review will be dependent upon the type of data in question. In the past this has taken the form of conversing with a wireless engineer to ensure that the coverage pattern appears plausible for a given technology. It may also involve a cross check on data from a second source—	The purpose of expert review is to get a second opinion regarding some aspect of submitted or processed data. Given the large number of submission formats and innovative ways to supply broadband, it is always	The most significant benefit is to have a secondary source for back checks and verification. For the most part expert review is from an engineering or deployment resource. Expert review also helps support process transparency so there isn't a closed GIS driven process making all the decisions.

		can this type of middle mile infrastructure support the maximum advertised speeds in this area? SME validation is also helpful trying to understand ambiguous information in submissions.	helpful to have multiple sets of eyes available to reduce errors from misunderstanding.	
Telephone sampling	Telephone sampling is the process of using targeted phone calls to verify aspects of submitted or processed data.	Telephone methodology tends to be consistent across the type of data being verified. A subject location or individual is identified. The phone number for that location is identified and a call is placed. The person performing the survey asks a scripted set of questions and records the responses in a database. For example, our team produces a survey to develop and monitor access and use trends at a regional level.	The purpose of a telephone survey is to gather in depth information from a targeted respondent. We would likely use telephone survey for targeted purposes--either clarifying anchor institution data or randomly polling consumers to better understand attitudes.	The primary benefits are to develop in depth information as well as surveying a large number of respondents regarding opinions or behavior. Phone surveys tend to be more helpful to survey attitudes or to find out location specific information. Telephone sampling is used in our consumer surveys.

Purchased Datasets	See external data consistency checks.			Also note that not all external data checks must be purchased. For example Census data could be used for an external consistency check but it is freely available for download.
Web-based surveys	Web based surveys can involve three dimensions. First a web survey (a form available to be filled out on the Internet) can be used to supplement and better understand consumers. A web survey could be a compliment or a substitute for a telephone survey to target a specific demographic (a web survey can also be part of a social media campaign). Further web surveys can be used to verify provider information.	In the case where a web survey is a compliment to phone or in person, a survey,instrument is developed and then respondents are invited to complete the form. In the case where a survey is a mechanism to gather additional information from provider web sites, this could take the form of manual queries (looking for address listed in a Census block) or automated scraping where information is pulled from a website via a specific web application. We currently use both approaches depending on our goal.	The purpose in all cases is to gather additional information via the Web.	The benefits of web survey are its relatively low cost as well as the ability to gather specific information into a form that can be easily used by downstream work processes.

Field Surveys	A field survey is sending a team of skilled participants into the field to verify submitted data or sample some aspect of the environment in a given area.	Field survey methods involve assigning a field team, equipping them with data acquisition hardware, ensuring they have a consistent skill basis and recording observations. To date most of our field survey work has been in engaging CAIs into the process. We have performed limited wireless testing and infrastructure verification.	Although expensive, field surveys are sometimes the best way to verify information such as provider equipment presence or the strength of a wireless broadband signal.	The benefits to field work are significant. They can help us better understand the exact phenomenon in a particular area.

Verification Standard

Verification is a broad term, but in our definition it boils down to determining if broadband coverage is in the right place. For a given provider, the question is whether the coverage is assigned to appropriate Census Blocks, road segments or area features. Coverage verification can be further broken out into two distinct classes:

- Technology verification, which is determining if the provider is listed with a technology consistent with their marketing information.
- Speed verification, which is determining if the speed supplied for that block, road segment, point area file or market area is consistent with the technology and the marketing information received.

The final verification dimension is consumer feedback and crowd-source verification. This is a dynamic set of steps we are beginning to implement. One side of this is responding to consumer concerns. The second is using the crowd sourced data to validate provider claims and, if appropriate, update the map and the underlying data.

At this stage, our working hypothesis (confirmed by our experience) is that there will not be a single measure to indicate broadband coverage availability in a Census block or along a segment. From prior work, and examining our current provider submissions, we believe that there is too much variation below the submitted record to make a single binary yes/no indication. Rather, there will be a series of measures that combine to provide qualitative confidence (a classification scheme) in our indication of Broadband availability at the block, segment, or wireless polygon level. We believe such a qualitative classification scheme is both relevant to and supportive of NTIA interests, as well as the interests of our end-user community – that is, the states and citizens we serve through this program.

The intent of this section is to illustrate why our team is moving toward a particular verification methodology. Our team is learning as we go along, and will adjust and improve this thinking. But given our experience to date, this is our path. As stated above:

- First, coverage verification is at the level of data submitted to NTIA.
- Second, coverage verification is enhanced when there is a secondary measure of availability (such as infrastructure presence or serving area boundaries)
- Third, given the limited resources of this effort, the most important coverage verification process to implement is the erroneous dispersion of coverage. These are the "islands" of coverage isolated by significant distance from other covered areas. In other words, Broadband Internet likely doesn't exist far away from other areas with Broadband Internet access supplied by the same provider.
- Next we present several examples which illustrate the complexity of coverage verification.

The first example is taken from a gentleman who requested a map change in Alabama. His home is near the yellow dot. The darker grey Blocks are covered Census Blocks. The black lines are covered road segments. He cannot receive DSL from his incumbent provider, although his neighbors can. The incumbent carrier does have at least one structure in that block from which Broadband services can be provided; unfortunately his home is not served.

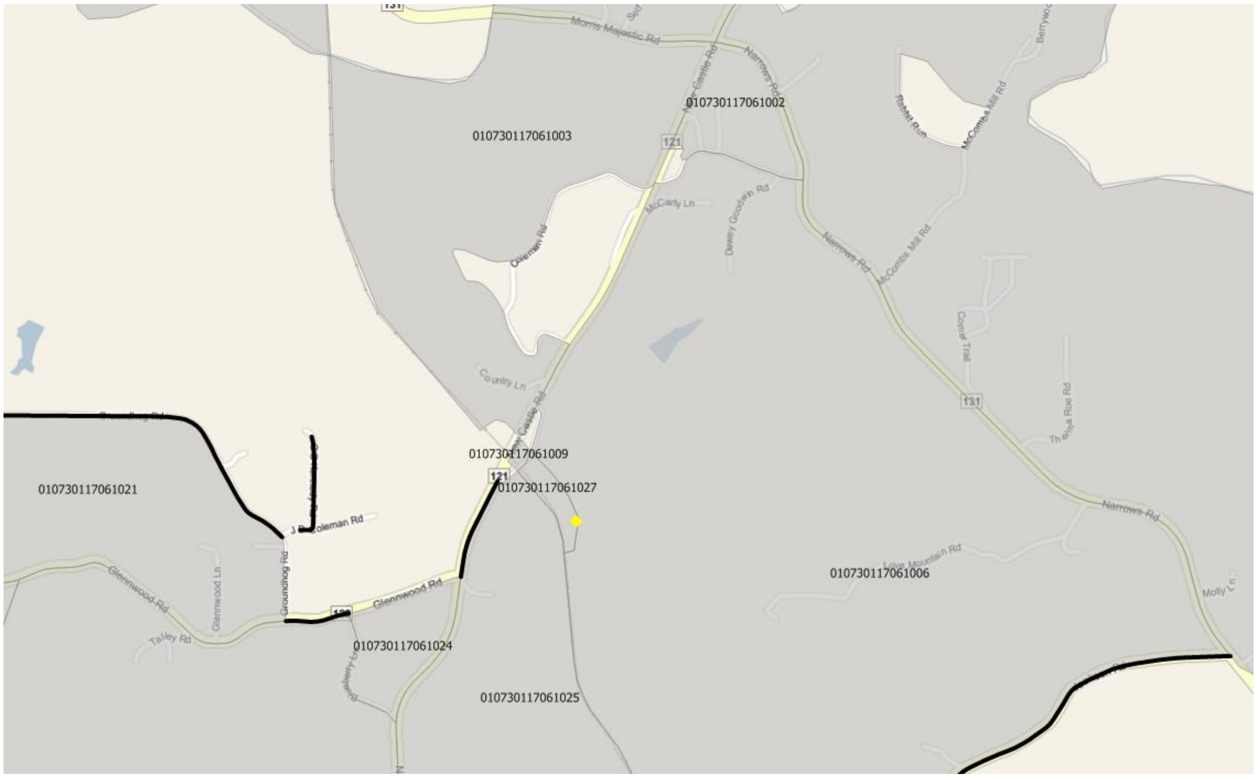


Figure 15--Sub block variation

Because the SBI program requires the depiction of coverage at the block level, the above map has been correctly generated. However, from the customer's point of view, the map is inaccurate. This requires us to explain that the maps are not intended to be a structure-level qualification, at which point some consumers question the value of the maps when seeking service information.

Beyond this type of one-off structure-level qualification, sometimes, as shown below, we have even larger gaps in provided coverage. The image here shows an "outlier" block that could be an error, or it could indicate missing Blocks along a major road that should have been filled in. In this figure, the outlier block is highlighted in turquoise.

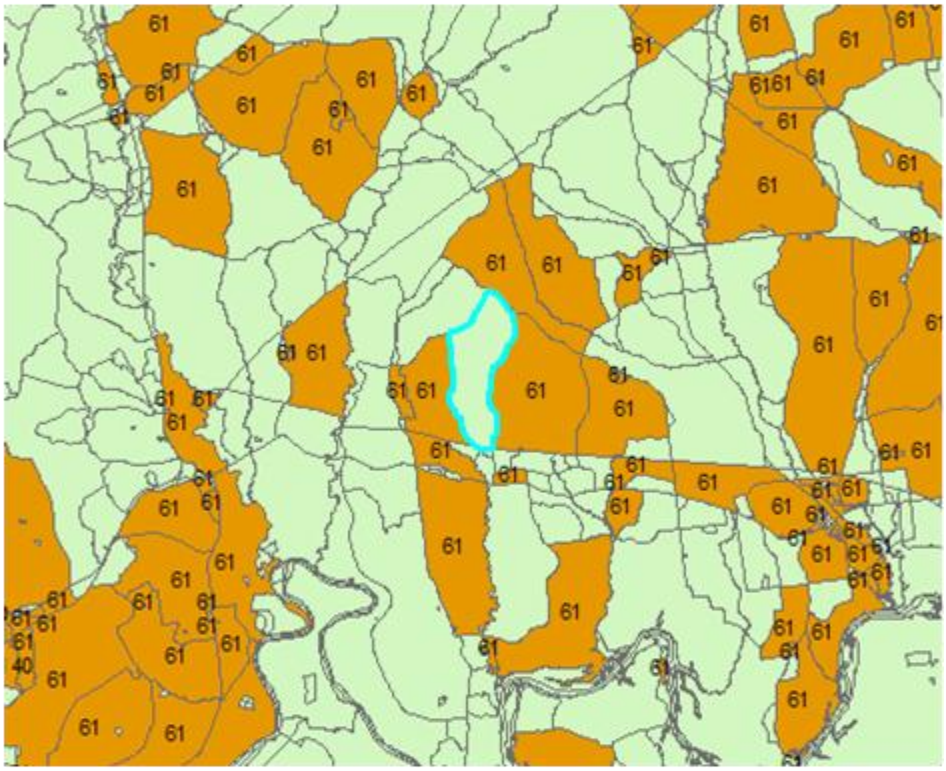

Figure 16--Dispersion in Submitted Data

In this particular case, we are faced with a different verification question. Based upon the properties of the neighbors, we believe this block should likely be covered (coverage interpolation,) but supplied data from the incumbent says otherwise.   Although we don't have information to know how much of the data submitted to us is generated, our sense is that geocoded customers or plant are used. In this case the block dispersion could be the result of a side of the street assignment rather than an availability assignment. In other words the data may speak to where is working plant rather than where could service be provided in 7 to 10 days.

The next example shows where an interpolation process could require some adjustment. The figure below shows a town level view. There are some smaller Blocks that are likely covered by interpolation logic, but we also do not want to extend coverage beyond a franchise boundary as in the areas shown in a box on the bottom of the map.

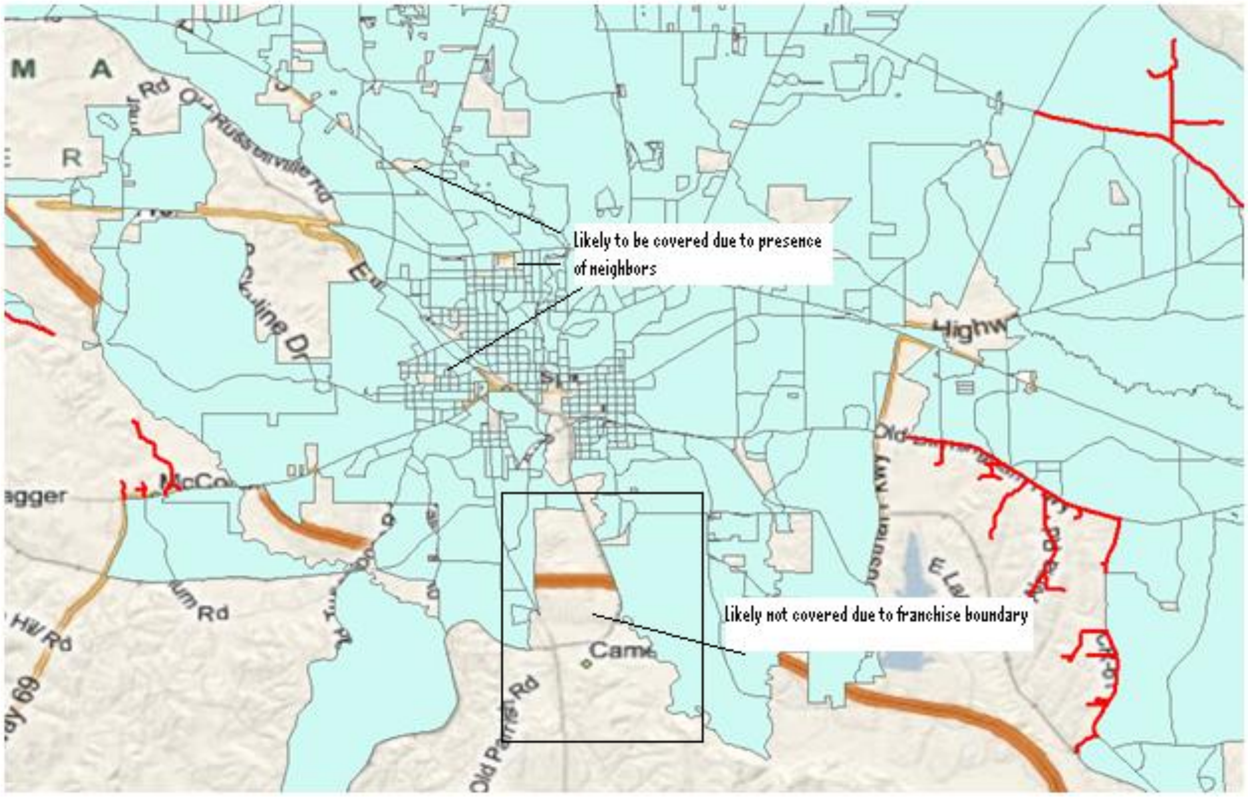

Figure 17-Where do you stop interpolating?

From what we can gather from some providers, the submitted data—data with consistently high degrees of dispersion or coverage holes—tends to come from geocoded billing records. In this paradigm, this means where there are no billing address points; service is not identified on a map. The interpolation verification question then takes on three dimensions.

First, if a provider has no customers in an area, how can we know if they would be able to provide service in a 7-10 day interval?

Second, if we use the properties of neighboring Blocks to interpolate coverage, when should we stop (e.g., at a franchise boundary, at a certain distance, etc.)?

Third, if we are comparing to a data source that examines coverage at a higher level (such as 477 Tract) do we use the Tract information to assign information block level coverage or do we use the tract coverage to filter out dispersions in coverage.

We continue to work with providers to get additional information to help us better understand and contend with this type of circumstance. However, we have not been entirely successful at getting franchise/service area boundaries that would address much of the issue.

The final map shows this dispersion problem, but to an even larger degree. This solitary large block is likely the result of a bad geocode, but we don't know, given the data that has been submitted by the provider and the "single customer in a block standard" set by the NOFA clarification.

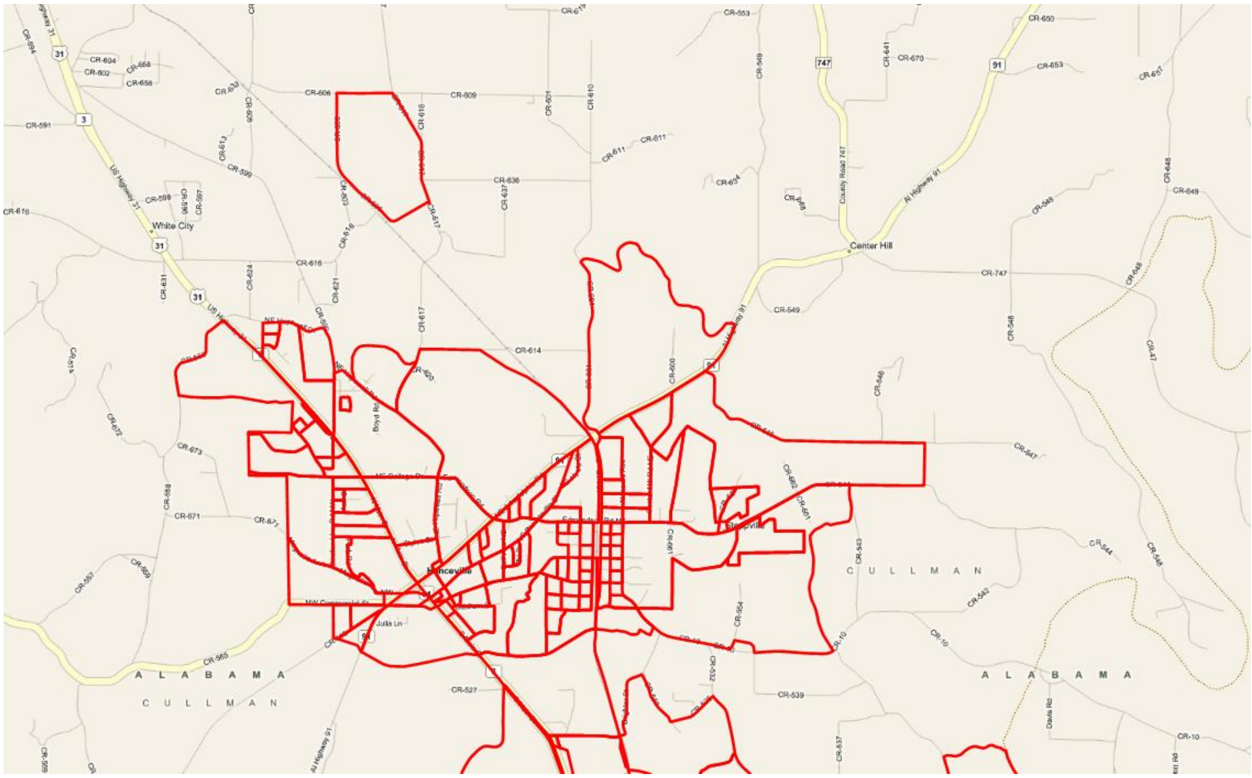

Figure 18-Dispersion in covered Blocks

Due to the fact that this situation is quite obvious in display, this type of problem is one that we are more aggressively trying to resolve. Where a single block has no neighbor offering comparable coverage and is a specified distance beyond an exchange boundary, our approach has been to filter these Blocks out. As of now, this filter is limited to incumbent xDSL providers because we have a good source of exchange boundaries.

The exchange boundary dispersion verification method breaks down when examining providers who are more likely to CLEC into neighboring territory. In the figure below, the black line represents the exchange boundary, while the continuity in the DSLAMs likely points to coverage extending along a road into another provider's territory.

Figure 19--DSL Coverage outside of exchange boundary

In sum, the variability in our source data continues to suggest that our dynamic verification process is relevant, appropriate and evolving in a manner consistent with the overall program. And, as noted above, we believe the more meaningful outcome of our verification processes will likely be a series of qualitative indicators or expressed confidence levels. Our concern, as with the development of any sort of classification process, is how rigid we should make this classification given the variation in our input data and the varied perceptions of service providers, map viewers and down-stream data consumers.

Verification Work Process

To support our dynamic multi-factor verification process, we have implemented the following steps.

Between submissions our provider relations team works to analyze our current broadband provider ecosystem and capture any changes such as acquisitions, mergers or cessation of operations. They also remain in touch with providers who have indicated when follow-up is necessary. The team confirms that the providers who submit data are NOFA compliant. Given these steps they begin a survey and awareness campaign to get data submitted for the program.

When data is received, an analyst reviews the submission and any immediate questions or concerns are sent back to the provider as quickly as possible. We have found this gatekeeping step very helpful in making sure we understand the intent of the submission.

For all providers who submitted data to us in the prior round, the provider received both a tabular data summary and mapped output[28]. Prior to releasing the “check maps” to providers, we inspected each provider’s coverage area. After this in-house review, we solicited a second level of feedback from providers and received a number of requested changes and corrections used in the development of the current dataset.

For those providers who submit only block or segment level coverage (i.e., in those cases where we have no infrastructure to test with) we test for coverage containment within known service boundaries. The intent of this validation step is to remove Blocks that are obviously erroneous.

We have also begun to perform a mechanical test against wireline providers. This is an examination to ensure that each feature submitted has some neighbor within 1 mile. We are testing this process to try to understand what the neighbor distance should be. This has proven to be a difficult process.

We also verify the submitted speeds against the typical speed ranges in the NTIA frequency tables. If we note a value outside of typical range, we ask the provider for clarification. These responses are recorded.

As mentioned in the sections above, we have implemented a check on dispersed Blocks, but we have implemented less with respect to coverage interpolation (holes in coverage). We continue to work on a

[28] For the verification of round 3 data, we submitted both PDF and KMZ (Google Earth) format check maps. Some providers prefer to work with the Google format as it supports easier modification. Others continue to submit marked up PDFs.

series of mechanical tools to assist with the inspection process but have run into challenges related to geographic basemap and timing.

As our submissions have moved online, we have also begun to benefit from crowd source feedback. In some cases this has helped us identify and fix errors in our underlying data. In other cases, as we have shared with NTIA, we have encountered some perceptual issues rooted in how the data are developed and modeled to comply with the NOFA. Depiction of uniform coverage in small Census Blocks continues to be a challenge. Despite our best efforts to explain the full block coverage requirement, we continue to receive complaints that the coverage shown on the map is not accurate for a particular location within that block.

Consumer and Provider Responses to Deliverables

Here, we segue from internal verification to external verification. We view responses to our work product as a form of validation and verification. On the one hand, this gives us the opportunity to fix mistakes and then generate QA steps to make sure that the problem does not reoccur. We also learn how to improve what we are doing or better explain what we are doing to a community not always familiar with the NOFA and program office framework. On the other hand, listening and learning from this feedback helps us better target our mapping deliverable to meet the needs of our external customers. In this second case, external feedback not only provides feedback on perceived qualities (or lack of quality) in the data, it helps us to learn if we are developing data that is truly helpful to downstream users across a wide range of usage and intent.

At this point, our external deliverables take three forms: State Broadband Maps, data transfer to NTIA used for the National Broadband Map, and text format data requested by outside parties.

Online Map Experiences

With our State maps online, we continue to harvest viewer feedback and comments. Because an online map allows someone to zoom in far below the scale of the data, a large number of comments reflect sub-Census block concerns. While important to the citizens reporting these issues and to our Broadband planning teams, this level of data is outside the scope of our core validation process, which as noted above, is focused on the level of data submitted to NTIA.

There are several other themes that our team believes are important to share. These comments are actually quite helpful because they also improve our data processes to better meet the needs of map viewers. For example, we have invested significant time in harvesting more segments from provider data. Because the appearance of segments is so important, we are putting time into ensuring a visually appropriate edge match between the roads we harvest and the Blocks/roads we will show online. On a technical level, we also believe that a good segment process will help us understand more about dispersion in the data, and what is valid versus what is not valid.

Online Display of Consumer Feedback

We have completed development of a consumer feedback layer for our online maps.

The intent of the new layer is to show viewers the feedback of other map viewers. This layer went live after the Round 4 data was posted.

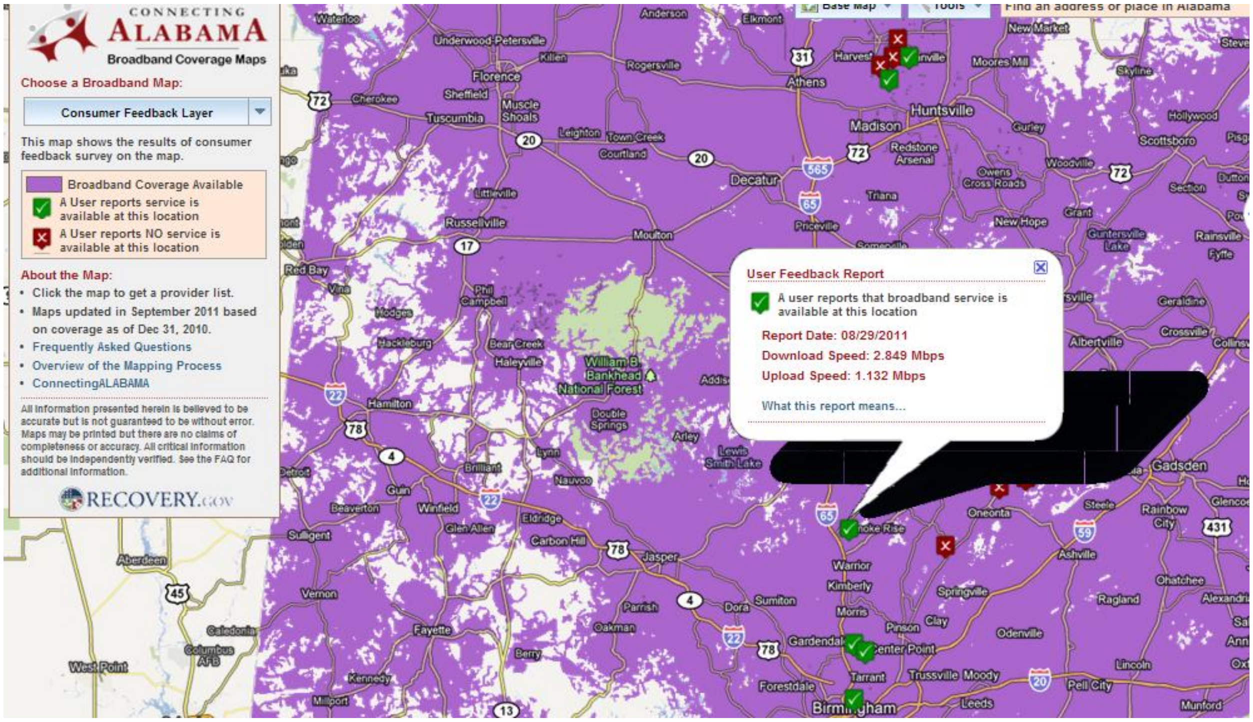

Figure 20--Consumer Feedback Layer

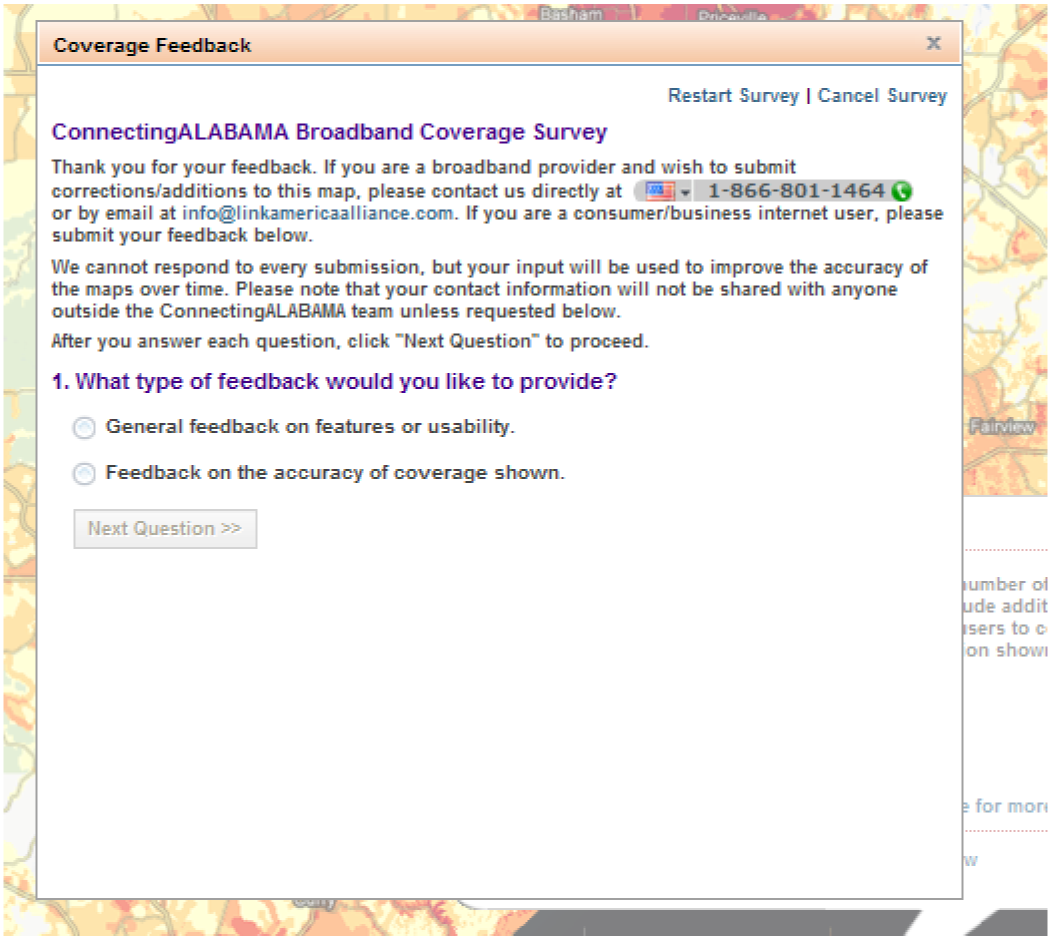
To gather feedback, we use a survey wizard which asks the end users to categorize their concerns. The survey went through several iterations of design and usability testing. Our experience has been unless we get a way to constrain the user feedback into manageable categories, it becomes very difficult to act upon.



As mentioned by other Grantees we struggle with how to use all of the feedback we receive. The qualified data points seem to fall below a volume in which we can infer significant modifications to the map data. Nevertheless, we believe it is important to gather structure and display the feedback to support project transparency.

Perception of Unfair Treatment Across Technologies

Several Broadband service providers have expressed strong concerns regarding how wireline services are displayed, as contrasted to how wireless coverage is displayed. This is an artifact of the SBI data model. As an example, consider the figure below.

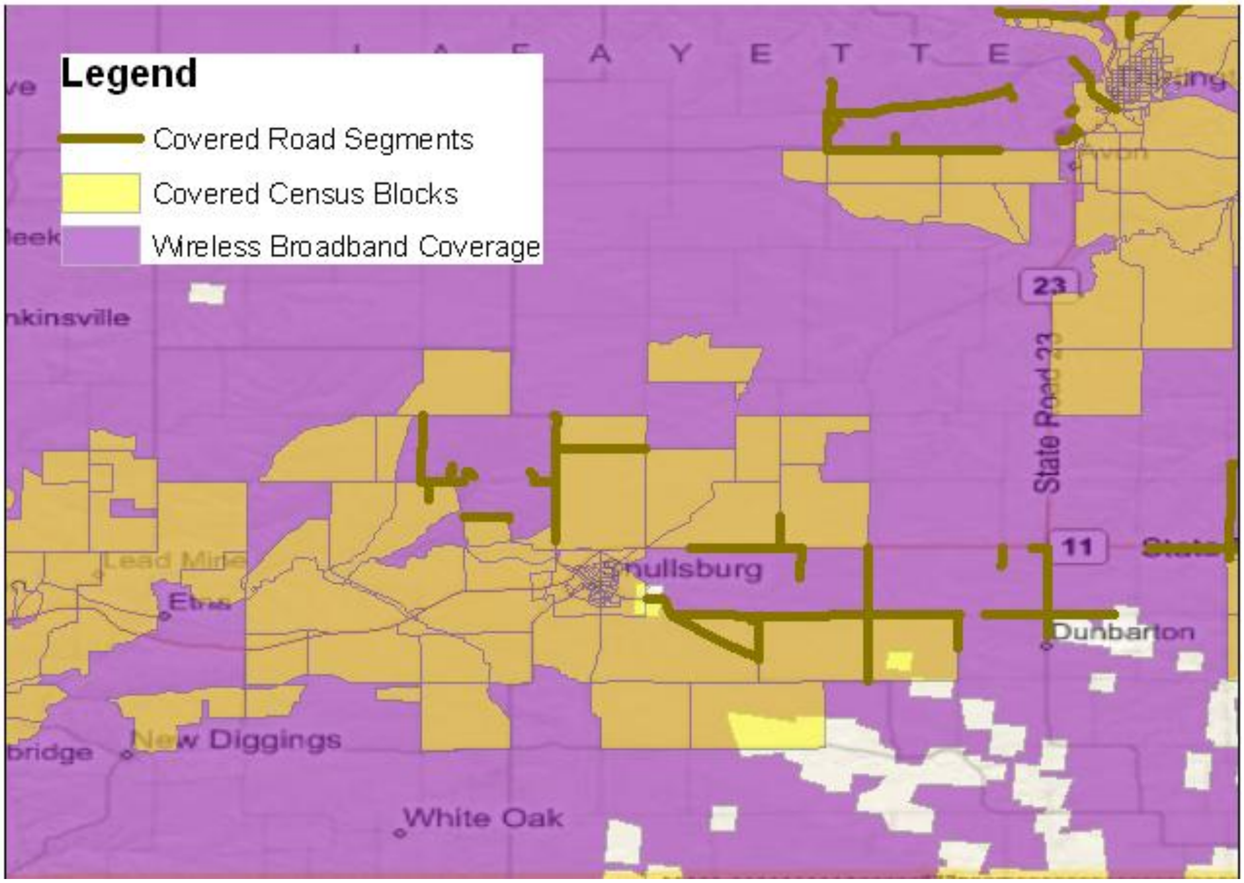


Figure 21--Multi Network Coverage portrayal

In this image, covered Census Blocks are light gold. Covered road segments are a darker gold and wireless coverage is purple. The concern seems to come down to how a wireline provider's coverage is shown in the large Census Blocks (greater than 2.0 sq mi). Some wireline providers have expressed dissatisfaction because their coverage is only tied to road geography, which leads to a visual "hole" in their coverage map. At the same time, they feel that it is unfair that the wireless provider's coverage is shown to be uniform in the same area. Put another way, if our maps show wireline in terms of Blocks and segments, why don't our maps show wireless the same way?

Loss of Geographic Granularity

Some providers particularly those who submitted facility level information are disappointed when we have to roll the derived data up to Census blocks or road segments as this changes the appearance of their service areas. This is especially important in rural areas where the larger blocks represent more of the service territory.

Perceptions of Carrier of Last Resort (COLR) Obligations

Some wireline providers have also expressed dissatisfaction because online maps limit the distance of coverage from a road segment. In our current online maps we buffer a wireline carrier's service 300' from road centerline. A number of providers have expressed that they are mandated to provide voice coverage (which Broadband will accompany) anywhere in the Exchange. There seems to be many

dimensions to this argument, but the basic concern comes down to not being able to accurately reflect the scope of their COLR obligation within the mixed block/segment view. Their ability (or lack thereof) to actually provision such services for new users within a 7-10 day period adds yet another level of complexity when attempting to fairly portray their coverage capabilities.

Intentions of Coverage Mapping

When a viewer of an online map clicks on the map (or zooms to an address), they are provided with a pop-up of service provider coverage in the area. The critical question is this: what is the area to which that pop-up window responds to? In the past, we reported back to the specific Census block, or buffered road segment intersected by the user click. As far as the map was concerned, once we move off of that road, or out of that segment, we have a new area to examine.

Our sense, given feedback received, is that our provider view should be a bit more tilted toward finding providers in a general area, rather than finding providers at a single-click location. If the goal of the map is to get someone to call a provider for service, our bias should be to include all of the potential providers in the general area, rather than giving potential customers a method to self-disqualify. That is, we want to cast a wider coverage net, rather than one too narrow. The problem with this approach is that it will create a number of false positive Broadband reports. As of this date we cannot determine if the claims of inaccurate coverage in online maps are due to the looser provider view standard or not. We keep this looser standard in place to minimize the likelihood of self-disqualifications.

Appendix One--Wisconsin

Community Anchor Institutions

In earlier submissions, the Community Anchor Institution (CAI) process was referred to in terms of a learning curve. This continues to be an appropriate metaphor. The mapping team continues to focus on data that will support and help inform policy makers and the SBI planning process. Obtaining connectivity information for CAIs continues to be a significant challenge. In general we have found that one of the primary obstacles is identifying the correct person in the CAI organization that can provide the information we seek.

In the first submission, the team gathered information on what data was available and what resources will be required to engage these categories of important institutions. In subsequent submissions we have focused our efforts on obtaining connectivity information for CAIs through direct outreach to the specific institutions as well as through central sources within the state or institution associations. In the current submission we had the following objectives:

Identify the correct person in the organizations that can provide connectivity data for the institution. For schools we focused on district level contacts.
Raise awareness of the broadband mapping program to organizations associated with the CAI categories with special emphasis to relevant local and, state government agencies.
Continued outreach to unresponsive CAIs to invite them to become engaged with the SBI program by participating in the online survey.
Verify the available connectivity information based upon new survey information
Update the physical addresses of the CAIs, with the goal of eliminating P.O. Boxes from the dataset

CAI Philosophy

Our work with CAIs is guided by three principles.

First, CAIs are important stakeholders within the planning process. Our goal is to engage participants in regional planning that have strong ties into the CAI categories identified by NTIA. This has a direct benefit of engaging an established stakeholder community. It also allows broadband planning to tie into existing organizational and planning networks. In each of our states, key relationships with education, public safety, libraries, and economic development sectors are being identified and developed.

Second, we believe that CAIs will likely be one of the primary beneficiaries of targeted broadband funding. Our belief stems from the sense that many of the benefits of Broadband will extend from these community 'anchor points'. In other words, it isn't solely the existence of Broadband at a library that provides a benefit. It is people using applications that work only on a Broadband network to upgrade their skills (e.g., online training) and gain access to online content (e.g., job postings, goods and services), etc. The targeted use of a specific application--that can only take place with Broadband networks-- is what produces the priority benefit. Put another way, there seems to be a realization that things are less about pure connectivity (for the sake of connectivity) than about connectivity in terms of an application (for the sake of the benefit obtained through the application).

Third, we continue to use a rational and targeted approach to derive information. This means we will utilize our planning teams for as much field work as possible. This also means that a goal of our CAI process is not an exhaustive Census of anything that could be a CAI; rather, it is the discovery, inventory and integration of Broadband planning activities into those CAIs that stand to produce the greatest synergies with the SBI planning process.

The above implies two significant points. First, the team's goal is to document community anchor institution connectivity within a broader context of regional and statewide planning objectives. Second, if a particular category of CAI has an independent Broadband planning effort underway, we will encourage that organization to take the lead, and we will provide relevant expertise and support as warranted. For example, in one of our states, the public safety community was engaged in a mobile Broadband survey effort. We aligned our CAI data collection process with that effort and shared information and expertise (e.g., hosting a survey) to support their mission. In another state we attempted to glean connectivity information from a municipal government survey. There may be some downside to this collaborative approach in that we may have to work with data spanning different times or we may not have all of the location-specific information we need, but this does prevent the same user from receiving multiple inquiries.

Anchor Institution Survey

During the third submission period we designed and developed a simple on-line survey system called CAVS (Community Anchor Verification Survey). The intent of the survey was to both verify received connectivity information and garner additional connectivity information from CAIs. The link for the survey is housed on the Home Page of the State SBI website, thus providing the added opportunity for responding institutions to learn more about broadband activities in their state. The survey remains open between collection periods so that the Regional Planning Teams can update information as they engage with the community, and to allow responding institutions access to update their data as necessary.

Although we have found that reaching out to central contacts, for specific institution groups, is the most fruitful way of collecting connectivity data we find value in inviting individual anchor institutions to participate through means of a survey. In each round we reach out to CAIs using an adaptive approach that consists of: 1) Emailing individual institutions inviting them to participate in the on-line survey; and, 2) Follow-up phone calls, when appropriate, to the CAIs to obtain/confirm contact information and encourage participation in the survey. From our perspective, although this method is very time consuming and work intensive, it allows the opportunity to personally explain the objectives of the program and answer questions. It also provides an opportunity for the individual institutions to become engaged in the broadband planning process.

Anchor Institution Trends

To date we have focused our CAI attention on schools, libraries, and hospitals with respect to connectivity. We benefit from strong relationships throughout the education sector, (K-12 and Post-Secondary), and have found excellent resources with State librarians. In addition, we have formed organizational relationships with the major hospital associations and other key health organizations within each state. Our goal with these relationships is to cull information from their planning process and partner with them on outreach.

As in the prior submissions, we rely on public domain sources of information for the public safety-category. Collecting connectivity data for this group continues to be one of our most significant challenges. We continue to look for ways to reduce the size of this category and connectivity information specific to root nodes of the public safety network--such as County Emergency Operation Centers.[30] At this point we have had minimal success gaining this information.

Further, because we have a wide ranging population of CAIs in our data set we have a variety of Broadband services that don't always fit NOFA parameters. Services like PRI or T1 are classified into "other copper," We also had difficulty obtaining both the upstream and downstream channel capacities. In most instances, when it was logical to do so, we made the speeds symmetrical, but this is an assumption on our part. If a site records bandwidth across several services (eg. video and data), we record the total bandwidth to give a picture of available site bandwidth. We are also working to standardize our response to NTIA in circumstances where an entity shares a Broadband connection among a campus. In this case we use the total campus bandwidth and use the primary campus Internet connection. In this regard, we have also received strong comments that for many school districts the problem is less about connectivity to a central node then connectivity from the central node out to served buildings.

As a final verification step, we attempt to screen the CAI data for duplicate values. Because many CAI are closely clustered together and may even share the same building (physical address) we perform the de-duplication manually.

[30] Within the public safety category, it is also very difficult to derive precise locations as many CAI are addressed to PO boxes . This is further complicated due to the many Volunteer Fire Departments used in Rural Communities which often do not have a physical location.

Appendix Two

Data Collection Challenges

This section summarizes some of the challenges we have experienced with data collection and processing. The team believes it is important to categorize these challenges as they help inform the geoprocessing and verification methods used. It is also our hope that some of the more global issues can be discussed and decided within the Grantee community.

We begin with several global issues and then continue toward more granular challenges.

Global Data Collection Issues

Maximum Advertised Speed is Not Reported Consistently

As has been discussed in webinars and also within the context of NTIA data assessments, much reported speed information continues to be reported at the market level (MSA/RSA) and then uniformly pushed down to the Census blocks. This has a tendency to create a problem with NTIA speed tripwires since the technology is reported by block but the maximum advertised speed is reported at a regional level.

This challenge gets further amplified at a block level when comparing to a third party data provider. It can create a mismatch between third party data generated at an area larger than block level versus block level generated speed and vice versa. To minimize the potential confusion, it might be helpful to be able to provide a flag at the submitted record level which indicates the geographic basis by which the Maximum Advertised Speed is reported.

Census Block and Road Standards are not clear

There seem to be several methods by which providers are calculating the Census block area. So the distinction at 2.00 square miles can be uniform, it would be ideal to articulate an operational area calculation definition.

Providers Not Wishing for Block Level Aggregation of Their Data

For providers who submit address point data, we do minimal additional processing. Our main test is to ensure that points are contained within 1 mile of exchange boundaries; the only other processing was normalization into NTIA formats.

Broadband providers not Meeting the NOFA "provider" Definition

Comments on PBWorks appear to reflect a concern among a number of grantees about what a Broadband provider is--and how that definition impacts mapping.

If the 7-10 day provisioning rule is to be strictly enforced, it could seem to eliminate a number of prominent Broadband providers[31]. Further, the need for clarification around a facilities-based provider, versus the reseller, has injected even more uncertainty. Right now we are unclear on how strictly to interpret either of these important distinctions, but we are concerned that we are beginning to create an NTIA exclusion criterion that is going to confuse downstream consumers of the data.

Given mergers and acquisitions in the CLEC space we are noticing a drop off in participation in this program by several national CLECs. We hope this is an artifact of the mergers and resource constraints rather than a long term trend.

Again, we do not want to exclude a service provider, but we believe there needs to be further clarification around the "7-10 day rule," the definition of a "reseller," and better interpretation of facility-based providers, versus equipping UNEs, SpA or leased lines.

We have used the provider Type of "Other" to classify a number of providers who offer Broadband services, but we do not offer them in a manner consistent with Technical Appendix A definitions.

To What Extent Should We Begin "Classifying" the Data and Maps?

The question immediately preceding gets to the intent of a Broadband provider. This question gets to the intent of the Data and Maps.

Earlier in this document we discussed the question of what type of bias we should introduce to our online map messaging. In an online environment, do we want to more likely create an overstatement of coverage for a provider than an understatement? In other words, is the larger problem allowing a consumer to self-disqualify, versus calling a number of neighboring providers? There is a related issue to this. Clearly in our maps there is a lot of scatter in data that we believe should be more continuous. These are the islands of coverage from an incumbent provider[32]. There are a number of processes that could be put in place to deal with this type of scatter, but without more information from the service provider-- essentially the last mile facilities-- it will be difficult to perform this clean up in an informed manner. On the one hand, we can aesthetically clean the maps up and reduce the scatter, but we have little sub-block engineering information upon which to make this decision. Right now our preference is to put out a somewhat aesthetically messier deliverable and work with providers to get better

---

[31] By email ***REDACT*** informed us they could not provision in 7-10 days, but they also supply information on qualified locations to the address point level. Therefore, we draw a distinction between an incumbent provider owning the facility--which terminates at a customer premise--who cannot turn up service at a qualified location, versus a provider not reporting any specific qualified locations in which they cannot turnup service in the 7-10 day window. In the first case we have a sense of where service can be offered and verified. In the second, we have no evidence that a service could exist there until a specific location becomes a customer.

[32] For a provider who sells opportunistically (not within a franchise area) it becomes even more problematic to classify their coverage because the points are more related to the type of consumer purchasing the service than a bounded offering. In a matter of speaking, the ProviderType is more determined by the technology and/or location than a type of business. The core intent of the NOFA and our grant application was centered around the 7-10 day providers but we believe maintaining information on provider Type "Other" and "Reseller" is important to assist in validation and market segment analysis as resources are available.

information to clarify their submission. If that isn't forthcoming, we are limited in what can be done given the lack of facility level information. In summary this yields two questions

In our online maps should we error on overstating coverage to prevent consumer self-disqualification? In our online maps should we work to clean up a lot of the scatter that we see without having facility-based evidence from which to remove it?
As we examine results from third party data assessments, it appears that this scatter is something that is also problematic with the assessment results. It also appears to be evident that different third party data sources treat water areas differently. When we are developing data based upon Wireline facilities, we exclude water blocks. We do not filter out water blocks from provider submitted data. We are unsure if there is or should be a standard in how water covered blocks are treated for Wireline broadband providers.

Community Anchor Institution Surveys
Over time the base of participation in CAI surveys has broadened. Our teams are interacting with more organizations interested in broadband planning. This is a benefit because it helps integrate the importance of Broadband mapping, planning and capacity building within their organizational framework. But it also begins to create challenges in data collection. There are two noticeable trends in this area.

First, CAIs are organizationally diverse. For a school, you expect to have a centralized entity that can answer and support questions about Broadband services. For a rural, volunteer fire department answering questions about broadband may go to the Chief. The way that he/she answers about Broadband is probably specific to her experience and context.   The implication is two-fold. First saying that some percentage of CAIs in a state have access to broadband can be misleading because the formality of a school or government building is much different than the formality of a volunteer fire department. Second, that volunteer fire department may get broadband via a 3G mobile hotpsot when they need it…but the presence of *this* type of broadband is a very different thing than the presence of a responder who has mobile LTE broadband.

Second, technical knowledge of the survey respondent differs within each organization. This complicates our data collection. It is not uncommon for someone to say yes we have Broadband, I just don't know how we get it or how fast this is. So in response we report they are broadband served but unknown speed or technology. This doesn't mean they haven't been surveyed, it just means the response was unknown. As there are now a large number of people collecting this data, it would be helpful to have some consistent national business rules from which we can answer questions about the meaning of any particular data element. As an example, when should "no" be used versus when should "unknown "be used. In other words, what is the standard for the difference between never made contact with the CAI versus a respondent didn't know/couldn't answer. We have guidelines internally but are unsure if this is consistent across states.

Granular Data Collection Issues

Non-Uniform Submission Standards

It is clear among providers that there isn't a consistent method used to derive Broadband coverage. Some providers appear to be use a geocoding approach and then point in polygon or point on segment process. Others may be using GPS locations. In some cases, it is difficult to infer what reference data was used to georeference plant (is it the carrier's roadbase?). This leads to uncertainty regarding the input data scale or accuracy relative to other base layers. Although we may be trading off absolute accuracy, our standard has been to conflate submitted data to TIGER 2010 Blocks and TIGER 2010 roads. We perform our verification against this conflated data product.

Temporal

We are unsure of how well the data are temporally consistent. Some providers gave us their best effort to control to June 30, 2012. We note that some providers were clear that the submission was as of extract date without any way to move back in time. They have no means to control for time and cannot provide any audit support beyond when the data are released to us. Some data-especially loop qualification data-may change from day to day. It will be very difficult to clarify why something was changed from a given point in time.

Perceived Inaccuracy with Respect to Internal Standards

The NOFA is clear on submitting a list of Blocks in which a provider delivers Broadband service. This is a different objective than perfectly reflecting service territories. If a firm's accuracy standard is a reflection of their service area, then the data created under the NOFA will not meet their perception of accuracy. This leads to two other issues: First, using Census Blocks rather than serving area may overstate or understate a particular provider's Broadband serving area. This was a significant concern of ***REDACT*** who specifically required us to submit only address-level qualification data. The second issue this brings up is how or if, there should be some standard on how much of a Census Block needs to be covered to call it covered.

Confidentiality

Several providers have noted concerns with CPNI-related issues and have stated this as a reason for non-participation. We have also heard expressions of comparable concern regarding identifiable responses to Anchor Institution information.

Unclear on Definitions

As discussed earlier, several providers claimed confusion on several key terms involved in Middle Mile. We note a consistent stream of questions around the interpretation of Maximum Advertised Speed. Some providers understand this to be the most common speed package bought within the mass market, while others view this as a speed that can be purchased for an additional cost above a mass market offering (e.g. a Turbo option for an additional fee per month). Others interpret this as the fastest speed that is available for that particular location--in terms of xDSL, a structure qualified speed, for example.

Perception of Data Use

There seems to be some hesitancy releasing speed information because no one is sure of how the information will be used, or what the speed is intended to reflect. A number of providers have verbally indicated that typical speed will be about (on average) 80% of purchased speed due to overhead. But there are many other factors (such as a user's home network) that influence speeds measures. Providers are concerned about introducing statistics without a clear understanding of how those statistics are derived and will then be used. Also, as advertised speed is pushed down to a block level, we sense more trepidation to report speed values. This quickly begins to touch on parity across network types (why is wireline down at the block when wireless is half the state, etc.). Finally we note a significant increase in speed values reported to us. This may be due to network upgrades or competitive concerns to match the theoretical network speed.

Location Uncertainty In Source Data

Within this document we have noted concerns about the impact of source data accuracy. Our geoprocessing methodology provided what we believe is a relatively conservative tolerance to account for the scale issue in the source data, but we are unsure of how this may impact downstream users. Clearly, it also impacts the verification process because we can't attempt to verify received data beyond a scale at which it was developed.

Covered Segment Process

Deriving Broadband covered segments in Census Blocks greater than 2 square miles has proved to be a challenge. Moving from a NOFA specified tabular deliverable to a requested geographic deliverable also increases the complexity of the effort.

Record Level Metadata

It would be helpful to have one or two additional fields in each feature class transmitted to NTIA. One User Defined field could be helpful as an expression of record level confidence. The second field could be used as a Key between the transfer geodatabase and our systems. Ideally, both fields could be large text fields (50 char) so the Grantee can use them to express a variety of attributes.

Miscellaneous Data Collection Notes

We note the following important observations regarding our data submission:

There are Middle Mile plant records for providers who are not present in the Census block, segment or wireless area feature classes. This is due to classification as non-NOFA Broadband providers.
In some cases, we have trimmed wireless coverage estimates to honor state boundaries.
We believe some providers are trimming their coverage to honor license area boundaries.
Where a provider submitted Middle Mile points out of state, we are no longer passing those points to NTIA as they fail the validation script.
In tables with mandatory Street and Zip5 attributes (Service Address), if the value is unavailable we fill the default value.
As before there remain some differences between the Data Model, Data Model Default Values and the Python Validation Script.
We have a significant amount of VDSL, ADSL 2 and ADSL 2+ coverage categorized into the xADSL category. This introduces large variance in speed availability as some providers are using VDSL, shortened loops and/or pair bonding to increase speed to levels nearly 30 Mbps.

We note a few providers who have speeds seemingly inconsistent with their technology of transmission. This is either very low speeds with optical fiber, or very high speeds with non DOCSIS 3.0 systems. We have verified on provider websites that the reported speeds are available in the area but these speeds will fall out of the NTIA frequency table analysis.

We have a small number of providers who serve an area with both a residential and business speed tier. In cases where we cannot distinguish which speed tier offering to use, we use the higher of the speed tiers.

Per NTIA request we have modified the manner in which we handle Wireless coverage polygons. If a Provider submits a single geometry but specifies multiple spectrum codes in use in that polygon, we duplicate the polygon for each spectrum code. In other words the geographic object is identical but the attribute data for the object is unique.

In point level data submissions (Service Address and CAI) we note points that are spatially coincident. With respect to Service Address points our thought is these represent multi-unit dwellings or businesses but we don't have enough address detail to determine if these are multi-unit structures or duplicated customers. Because we cannot determine the reason for the duplication we leave spatially coincident records in our submission. We also leave in our CAI submission points which may be the same physical structure but have slight variations in addressing.

In point level middle mile data, we are finding a variance in the quality of the geocoded longitude and latitude returned. Given the data received we are unsure if this is an issue where the plant address is difficult to geocode or if the longitude and latitude provided to us is different than what would be returned in geocoding.

For Block and Segment level data which we produce based upon provider facility or service area boundaries, we remove Census blocks which are entirely water covered. This results in a drop of Census block counts for a number of providers.

Appendix Three

This appendix contains the confidentiality clarification supplied in a series of emails between CostQuest and NTIA.

Feature Class	*Metadata*	*NOFA Confidential?*	*Online Map*	*Public Disclosure*	*Exemption*
Last Mile	Constraints on accessing and using the data	Yes	No	No	None
	Access constraints: None				
	Use constraints:				
	This data is confidential as defined in the NOFA.				
Middle Mile	Constraints on accessing and using the data	Yes	No	No	None
	Access constraints: None				
	Use constraints:				
	This data is confidential as defined in the NOFA.				
Service Address	Constraints on accessing and using the data	No	No	Yes	
	Access constraints: None				
	Use constraints:				
	There are no restrictions on distribution of the data by users.				
CAI	Constraints on accessing and using the data	No	Yes	Yes	NO attributes on any record in this feature class are considered confidential

	Access constraints: None				
	Use constraints:				
	There are no restrictions on distribution of the data by users.				
Census Block	Constraints on accessing and using the data	No	Yes	Yes	NO attributes on any record in this feature class are considered confidential
	Access constraints: None				
	Use constraints:				
	There are no restrictions on distribution of the data by users.				
Service Overview	Constraints on accessing and using the data	No	Yes	Yes	The only provider who may not show up on this table is a provider who has provided only confidential data (last mile, Middle Mile,

					address point with provider name)
	Access constraints: None				
	Use constraints:				
	There are no restrictions on distribution of the data by users.				
Road Segment	Constraints on accessing and using the data	No	Yes	Yes	NO attributes on any record in this feature class are considered confidential
	Access constraints: None.				
	Use constraints:				
	There are no restrictions on distribution of the data by users.				
Wireless	Constraints on accessing and using the data	No	Yes	Yes	NO attributes on any record in this feature class are considered confidential
	Access constraints: None				
	Use constraints:				

	There are no restrictions on distribution of the data by users

Appendix Four-Wisconsin

This appendix details our analysis of the potential and actual broadband provider market. We include both our internal tracking description document and then our categorization for each provider. As this extract was made prior to final submission, there may be differences between provider categorization and the attributes on the day of submission to NTIA.

Provider Categorization

Provider Type and Status Definitions

The Provider Type is based upon categories provided by NTIA, while the Provider Status is based upon categories developed internally for tracking purposes. It should be noted that the Provider Status discussed here relates to the provider's overall status within the program.

Provider Type Codes and Definitions:

NTIA code	Code	Name	Definition
1	P	Provider	This code applies to all confirmed providers of broadband service per the SBI program NOFA. A provider is given a "P" designation if we have determined that the company does indeed exist and appears to be providing broadband services.

2	R	Reseller	This code applies to all broadband entities that have been confirmed as pure resellers – meaning they do not own their own facility/equipment and simply resell services under their own brand name or the brand name of an actual Provider.
3	O	Other	The code applies to entities who were originally placed on the SBI provider list, but whose status is still in question or has been determined to be non-NOFA compliant.
4	N/A	Not applicable	This code applies to entities who appeared on the original state provider list or a third party list (such as the FCC 477, American Roamer, or Warren Media lists) but who have been confirmed as NOT providing broadband services.
	X	Inactive	This code applies to entities that may have appeared on an early provider list but whose identity and existence we subsequently have been unable to verify. This code may also apply to providers who have since been acquired or simple gone out of business and for which no FRN appears on the FCC list – These no longer need to be reported to NTIA. This is an INTERNAL category used to remove entities completely from the list of entities submitted to NTIA.

Once the proper Provider Type has been assigned to an entity, an overall Provider Status must be established. The Provider Status codes are specific to the Provider Types, and are not interchangeable. The following table lists the status codes associated with each Provider Type.

Provider Status Definitions

Provider Type Code	Provider Status Code	Name	Definition
P	D	Declined	A provider is given a Status of "D" if they have officially stated verbally or in writing that they will not participate in the SBI program.
	P	Participating	A provider is considered to be "Participating" if they have submitted USABLE data in at least one data submission round. The data does not need to be 100% complete for a provider to be assigned a "P" code – they simply have to have provided a level of data that is sufficient to submit to NTIA.
	NR	Non Responsive	A provider is considered "Non Responsive" if they have either failed to respond to any of our correspondence, or they have submitted insufficient data that makes inclusion of their data in the NTIA submission impossible.
	V	Submitted under other ID	A provider whose data is submitted under another Provider ID, but is operating under their own FRN.
	E	Estimated	A provider is marked as "Estimated" if they have not submitted usable data, and would otherwise be considered non-responsive, BUT for whom we are able to submit data by using estimation techniques and/or third party sources. This designation applies only to providers whose data is 100% estimated.
R	R	Reseller	"R" is the only status code for Resellers and it simply reconfirms their status as a reseller –data may not be submitted but name of provider is included in NTIA data package.
O	U	Unknown	The status of Unknown is assigned to an entity whose name has appeared on a list (or been submitted as a new possible provider) and is currently under investigation. It has not been determined yet if this entity is indeed offering broadband services or not.
	NC	Non-Compliant	This status is assigned to entities who appear to be in the broadband industry, but who do not meet the formal definition of a BB provider under NOFA requirements. Examples may be entities who cannot provision service within 7-10 days.

	P	Participating	These are providers who do not meet the formal definition of a BB provider under NOFA requirements, but are participating in the program and submitting data.
	NP	Not a Provider	This status applies to entities who may appear on a third partly list of valid providers, but who have been proven to either no longer exist, or simply no longer provides broadband services.
N/A			No status codes associated with this Provider Type
X

West Virginia Geological and Economic Survey

State Broadband Mapping Methodology

For the State of West Virginia, October 2012

Contents

Overview

This document gives a summary of the data collection, normalization and verification processes used by the State of West Virginia (State) up to the sixth data submission, in October 2012, to the National Telecommunication and Information Agency (NTIA) in accordance with the State Broadband Data Development (SBDD) program. While most of the processes used in this data submission remained the same as ones for the previous submissions, there were additional adjustments made to continue to refine the process to receive 2010 census geography from the providers in more efficient ways. The State of West Virginia interactive broadband map continues to provide the broadband coverage information to the public and is able to receive comments and feedback from consumers and citizens of the state.

Purpose

This documentation was developed to illustrate the processes used during the data collection, normalization and verification processes. The information within this document will provide a background to the development of the provider list and data request, and specific issues encountered by West Virginia regarding data collection, normalization and validation.

Data Sources

Provider List

The provider list for this sixth round of data collection started during the first round of data collection. For this round, the list was regenerated to include any new providers within the state. The list was created by contacting the West Virginia Cable Telecommunications Association, the West Virginia Public Services Commission (PSC) and the West Virginia Broadband Deployment Council. The state receives an updated provider list from the PSC every six months. This information was compiled and compared against the list from the Federal Communications Commission (FCC). Providers were then contacted using information provided by the FCC's public information search Web tool. Providers who were contacted during the first round of data were contacted again through the same name and address. If a provider contacted during the first round had given more detailed contact information for a specific individual, those individuals were contacted instead of the contact provided by the FCC.

The provider list is updated every six months to reflect any mergers or acquisitions that have occurred. There are some legal issues when a merger occurs, but the data integration does not occur until up to a year later. In those circumstances, the data is kept separate until a full merger occurs.

Data Gathering

Provider Data Request

This component of the project was heavily reliant on working with service providers to obtain data. Each identified provider was mailed a standard data request outlining the elements identified in the Notice of Funds Availability (NOFA) Technical Appendix that were requested from providers. This request included information regarding the availability of broadband services, technology used to provide them, the location of certain broadband infrastructure and the speed of the service. Data was requested to be submitted in the form of census block lists and service area boundaries, including address level and street segment data. If a provider was unable to fulfill such requirements, the West Virginia Geological and Economic Survey (WVGES) worked with those providers to gather the necessary data in an alternative approach. For the last round of data collection, an updated guide for broadband data submission was developed for the providers. Along with this guide, a letter outlining the continued overall goals of the broadband mapping program and the objectives of the new updated guide were sent to each provider. The guide was developed to continue to standardize the data received from providers, including modifications and updates that have been made to the requirements by the NTIA since the original Technical Appendix.

Examples of the letter and guide are provided in Appendix A and Appendix B in this document. This same letter and guide were sent out again for this round of data submission requests. All of the providers that submitted census block information for this submission provided census 2010 geometry or census block numbers. However, once again, no providers submitted TLIDs for roads as described within the guide. Without TLIDs, roads need to be hand selected or geocoded, which can lead to some additional processes and inaccuracies because of the limitations described in the Geocoding Issues section.

After the initial data request was mailed, follow up phone calls and emails were made to remind providers of due dates and to collect any missing or unclear data. As of this submission, the response rate from providers continues to be over 90 percent. After data was received, the data was normalized per NTIA standards and placed into the provided geodatabase. WVGES continued to operate under the same assumption as used in the first round of data gathering. WVGES let the data "speak for itself" and did not make any grand assumptions or estimates in the interest of maintaining clean and accurate data.

Providers submitted only maximum advertised speed data. Providers have not been very willing to submit typical speed data as the typical speeds are generally lower than the advertised speeds. Advertised speed data was given by all providers and then pushed to typical speeds as per NTIA's advice in the Round 3 data review conference call.

In addition to the data request, each provider was required to sign a Nondisclosure Agreement (NDA) between themselves and WVGES. The NDA outlined how provider data would be handled and what portions of that data would be considered confidential, which would be shared with the NTIA and which were to be made publically available.

Coverage Information

Data was derived and normalized into four formats in accordance with the data model:

- Census blocks (2010) of two or less square miles
- Street segments (2010) of census blocks greater than two square miles
- Address level (geocoded point data)
- Wireless area (shapefile)

The normalization procedures were as follows:

- Determine service being provided – what technologies are being used to provide the service
- Understand data/determine how to process – determine which feature class in the geodatabase data belongs
- Georeferencing/geocoding necessary data – georeferencing data for wireless area coverage and other service area maps, as well as geocoding address level data
- Segregating data into NOFA compliant formats – completely filling in geodatabase fields, as well as making sure topology is correct
- Quality assurance/quality control (QA/QC) – verification and validation of data

Typically there were two main types of data supplied for normalization – service area maps and flat Excel tables.

Service areas were georeferenced, digitized and then intersected with the master blocks and roads files. These blocks and road segments were then loaded into the geodatabase and the additional company specific data was appended to those records.

Flat Excel tables were exported to a database and then joined with the FIPS ID for the block files and the TLID for the roads files. The joined fields were exported and then imported into the database. NTIA has not required this information and in cases where a TLID was not given by the provider there was much greater difficulty and inaccuracy as roads had to be geocoded and hand selected.

Geocoding Issues

The West Virginia Statewide Addressing and Mapping Board (SAMB) information is not yet completed across all of the counties in West Virginia, leaving areas within the State without complete or verified address information. This led to low geocoding match rates of provider supplied information, especially in rural areas, throughout the data normalization workflows. For some of these areas, additional broadband coverage processes were used to derive coverage estimates described in the next section.

Other Issues

Another issue of incomplete broadband coverage was due to the acquisition of Verizon by Frontier. When Frontier submitted digital subscriber line access multiplexer (DSLAM) locations for the April 1, 2011 deadline it did not include the entire Verizon infrastructure. Frontier has since re-submitted its DSLAM locations for the October 1, 2011 deadline, which now should include those missing Verizon DSLAMs and the coverage map has been extended into certain areas that were not previously included.

Additional Data Processing Techniques

Because of geocoding inconsistencies in certain areas of the State, some provider address information could not be mapped and other data processing techniques had to be implemented to create broadband coverage estimates. In cases where DSLAM points were able to be provided, broadband coverage was mapped by loading the DSLAM points into Environmental System Research Institute's (ESRI's) Network Analyst. For this processing, the West Virginia State SAMB street centerlines were used as the source roads. DSLAM points were loaded into the facilities point feature class of the service area template using a 1000 foot snapping tolerance to help locate points to nearest roadway. Any points still not connecting to the road network were viewed and manually linked to the road network. Processing was run to create segment lines for each point and to create a detailed polygon area around each street segment area for each point. A 15,000 foot distance parameter was used and no impedances were placed on the streets.

Once the process was run, the created segment lines and polygon areas were linked to the original DSLAM point attribute table and exported from the analyst dataset into standalone polygon and line feature classes. These two feature classes were clipped to the provided wire center boundaries. These coverage areas were used to select covered census blocks and street segments for the data submission. Final broadband coverage estimates were reviewed with the provider prior to final submission.

One of the foremost issues of the fourth round of data collection, submitted in October 2011 was converting to 2010 Census Blocks. NTIA's decision to switch to 2010 Census Blocks did not leave much time during that data collection window to notify providers of the change. Many providers submitted 2000 Census Blocks, not 2010 Census Blocks. The conversion led to multiple inaccuracies between Round 3 and Round 4 submissions because of the problems intersecting 2000 Census Blocks with 2010 Census Blocks and errors of commission. Many block boundaries had been redrawn and the crosswalk file provided by the Census was in a very unwieldy format and not much help. For this sixth round submission, most of the providers submitted 2010 Census Block information and with the previous submission base data having been already converted to 2010 Census Block information, the processing techniques for 2010 Census Blocks has become integrated into the long-term maintenance process.

Prior to this sixth submission, another unique processing issue occurred when providers submitted address-level fixed wireless data which would produce error through the new data model. As per discussion with NTIA, the unlicensed fixed wireless points were plotted and then buffered out to 800 feet. A shapefile was created and moved to the wireless feature class within the geodatabase. For this October 2012 submission, computerized radio propagation studies were used to predict coverage for StratusWave service areas. Site location information as well as equipment and antenna system data was provided by StratusWave engineers. This information was utilized in wireless network engineering software to create propagation prediction models using the Anderson 2D propagation model and 10 meter digital terrain elevation data. Median signal levels (50% time & 50% location variability) are predicted and then an additional margin (Prediction Confidence Margin) is incorporated to account for performance objectives and environmental losses. The propagation prediction models were then exported to map data which indicates StratusWave predicted coverage areas to include in the data submission.

FRN Number Discrepancies

Discrepancies between Round 2 and Round 3 data submissions were noticed concerning FCC Registraton Numbers (FRNs). Effected providers were contacted directly to clear up these issues. FRNs that were loaded into the database come from direct contact with providers. FRNs are verified as a continued validation process during each data collection period.

Community Anchor Institutions

The process used to identify the Community Anchor Institutions was based on the information provided by NTIA. This included the categories of schools K-12, libraries, medical/healthcare, Public Safety, higher education and other community support consisting of either government or nongovernmental facilities.

All public schools in West Virginia were used for the K-12 category. Libraries consisted of all public libraries throughout West Virginia. Medical/healthcare included hospitals, nursing homes and primary care centers. The primary care centers are made up of main locations of the primary care centers along with satellite clinics and school-based health centers. Public Safety consisted of West Virginia police departments along with the correctional facilities and juvenile centers, fire departments and 9-1-1 centers. Higher education consisted of public and private universities located across West Virginia. The community support consisted of courthouses, regional development centers and workforce locations.

There was a cutoff created to focus on identifying main facilities as Community Anchor Institutions (CAIs). However, if there is a need to go and include more facilities, the State is open to adding those facilities for future updates.

The following agencies were contacted for information: West Virginia (WV) Department of Education, WV Library Commission, Hospitals located throughout the state, Nursing Homes located throughout the State, WV Division of Primary Care, WV Primary Care Association, WV 9-1-1 Center Directors, WV Emergency Management Directors, WV Regional Jail Authority, WV Higher Education Policy Commission, WV Courthouse Facility Improvement Authority, WV Workforce, WV Regional Development Centers and county addressing coordinators.

Data was collected and verified by the West Virginia Division of Homeland Security. Surveys were sent out to various facilities and included a section where their primary city-style address could be filled in. For those facilities that returned the survey, the statewide addressing and mapping data that the counties provided was used as a way to verify the address. Once the location was verified the latitude and longitude coordinates were added. In cases where surveys were not returned, the statewide addressing and mapping data was used to determine if the information could be matched. If this wasn't possible, then the Internet was used to find a Webpage with additional information. If this method was not successful, attempts were made to contact the facility directly. At this point in time, there is approximately a 90-95 percent match rate for the location of the CAIs.

Since the October 2011 data submission, additional surveys were sent by mail to healthcare facilities and fire, police and ambulance locations throughout the state. This amounted to approximately 1,500 surveys that were mailed out. Based on the information that was received back from the surveys, the primary city-style address, broadband technology, speeds and other attributes associated with the community anchor institution feature class were verified and updated where necessary. An on-line survey was released since the last data submission with the objective of receiving further updates and also getting the survey, via email address, to those locations where the survey sent by mail was returned by the United State Postal Service due to invalid address information or a facility having changed location. The survey was successful in collecting additional missing attribute information for some of those CAI locations but there are still locations where attributes are missing that did not respond to the survey. Additional methodologies to collect this final missing information will be reviewed and another approach to communicate with these specific CAIs will be undertaken prior to the next data submission. For the April 2012 submission, there were additional community anchor institution locations that are included in the map due to the NTIA allowing some 'unknown' classifications for attributes within the community anchor institution feature class.

Validation and Verification

Throughout the data gathering and data preparation processes for each data submission, the data verification has been continuous and has evolved based on the evolution of the data model. The focus has been on getting complete data from all providers and assuring that all data can be processed into the required data model for submission. Where providers did not submit data in acceptable formats for data normalization into NOFA formats or where they did not submit complete data or any data, there has been continued focus on working with the providers by WVGES to continue to improve the source information being provided. Data verification and validation is an on-going, long term process that will continue to evolve throughout the broadband data development program. With the fourth data submission in October 2011 being a much more complete broadband coverage across the State because of additional data supplied by providers, additional data verification methods, beyond what has been implemented to date, continue to be evaluated to refine the map, where applicable. This sixth submission incorporated further refinement to validate the provider supplied information against the Census 2010 geographies. Limited research was performed for specific areas of the map where any user feedback points to a gap in coverage or an over-estimate in coverage. The research was limited due to a small sampling of user feedback at this time. Plans to advertise surveys and the interactive broadband map continue to be executed and are described further in other sections of this document.

Validation Processes

Data validation begins within the data collection process to determine if the data submission by providers is formatted in a way that can be normalized into the required NOFA formats. Where data is deemed incomplete or in non-conforming standards, WVGES staff reached out to providers as necessary to improve the data submissions. After each round of data preparation the format for the updates being collected has improved.

Quality assurance and quality control has been a big focus of the data validation of the submittals assuring that the required data fields are populated properly and that data fields are populated with values that follow the data model rules. As the data model has evolved over each round of data submission these QA/QC checks have been modified to include the changes in fields, values, domains, etc. that are being required for submission.

Validation methods employed include the following:

- Assuring all applicable providers' datasets are propagated forward to each round of data collection
- Verifying that all required fields are populated with valid values and default values are used when appropriate. This includes:
    - Speeds valid for the technologies reported
    - Latitude/longitude coordinates fall within an acceptable range, given the state boundaries
    - The relationships between maximum and typical, and downstream and upstream speeds are valid
    - Service reported at the block level is done using blocks of the appropriate size (less than two square miles)
    - Speeds and technologies reported per provider are consistent between blocks and segments

- Administrative information (provider name, doing business as [DBA] Name, FRN) is consistently reported per provider in each populated feature class.

Outreach to Providers

To further assure the providers' broadband footprints would be accurately represented in data submissions, "check maps" depicting each respective provider's served small census blocks and segments located in large blocks were distributed back to providers. Providers were requested to either approve their check maps as-is, or submit additional changes if their coverage was not accurately represented. Any modifications received as a result of this effort were incorporated into the broadband coverage maps. WVGES plans to incorporate future data reviews with providers using web collaboration tools.

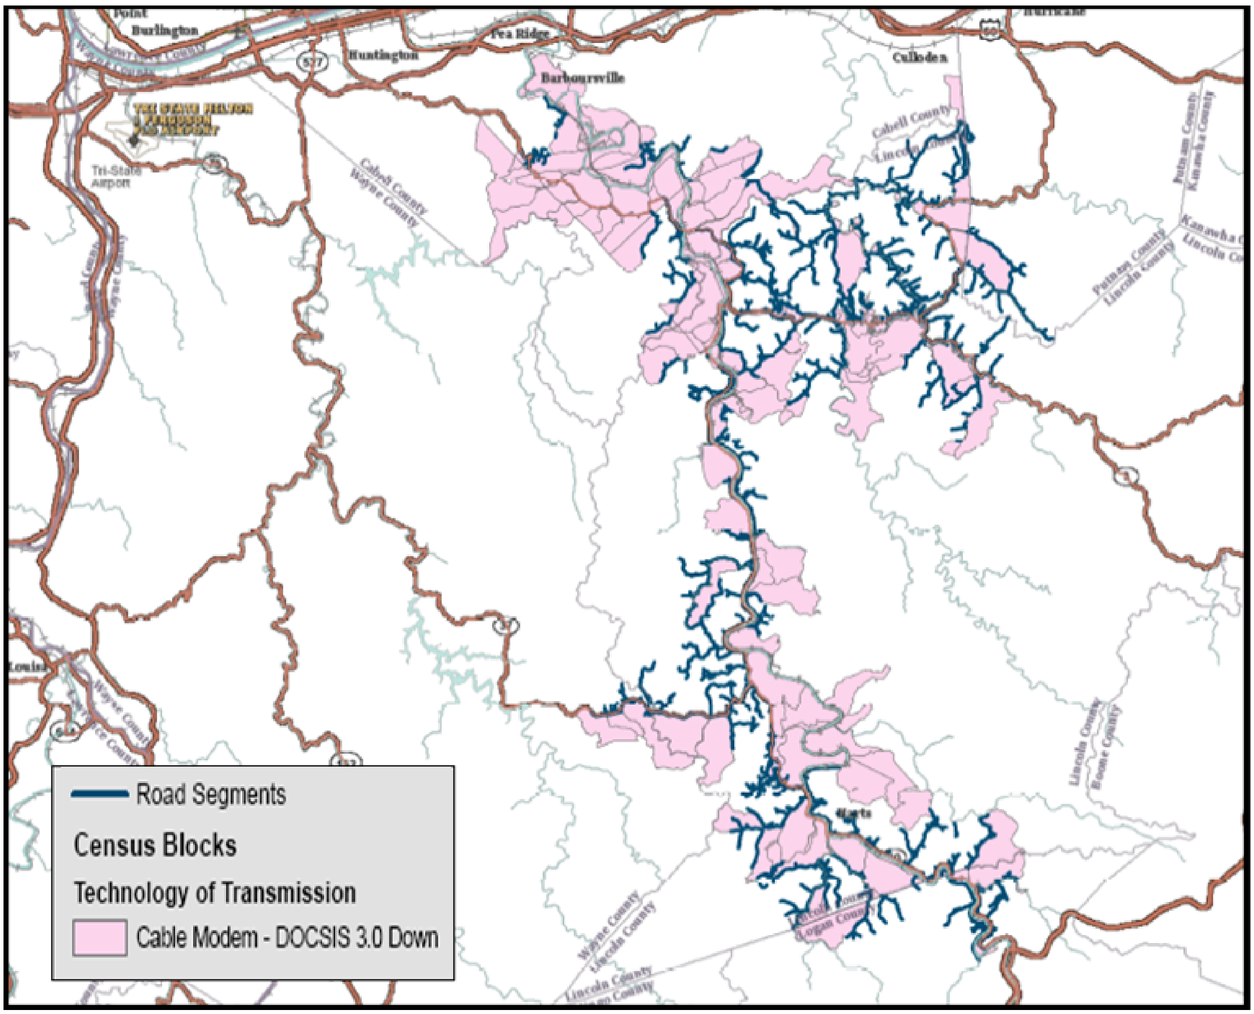

Figure 1—Example of a portion of a provider check map

The validation process for the October 2012 submission includes the use of the Python scripts for validation provided by NTIA.

Third Party Datasets

As data collections and data normalization processes progressed, additional validation was conducted using commercially available datasets. The following commercially available datasets were used as a reference for the specific technologies that their data represented.

- American Roamer datasets

- TeleAtlas Exchange boundaries
- Media Prints Cable boundaries

These datasets were used primarily as a validation source for provider service coverage.

State Broadband Interactive Map

The State of West Virginia released its interactive broadband mapping Website to the public in May 2011. The Website address is www.wvbroadbandmap.org. The Website provides consumers the opportunity to review broadband availability across the State.

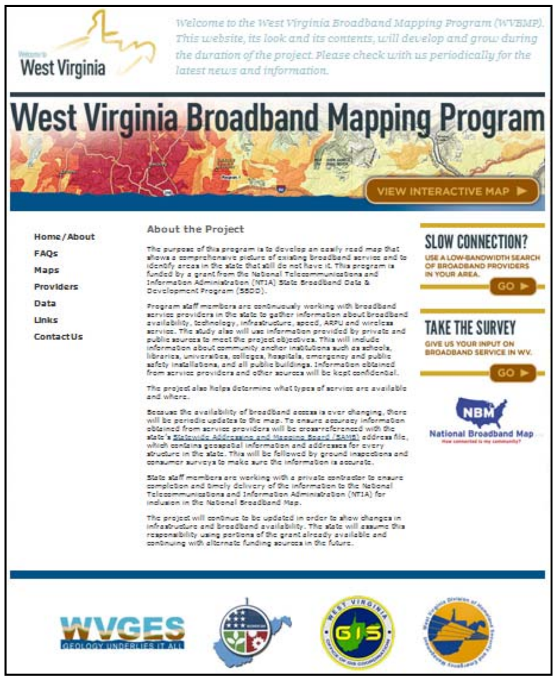

Figure 2—WVBMP main landing page

The main landing page for the West Virginia Broadband Mapping Program (WVBMP) provides background information on the program, contact information and a frequently asked questions section. The landing page has the main link to the broadband coverage map and a link to an address lookup tool for users with slow internet connections. This will allow them to view what coverage is available around their address or zip code without needing to view the entire map, which might not be feasible for users who might still be on dial-up connection speeds. By having this slow internet connection coverage tool, it allows feedback from those consumers even if they do not have the capabilities to bring up the interactive map application.

The Web application has the functionality for consumers and citizens using the State broadband map Web application to submit comments and feedback. The information gathered from that feedback is being reviewed as more potential source information for validating and determining confidence levels of the broadband coverage across the regions of the State. By comparing comments supplied by consumers about broadband availability to the broadband coverage, trends could be recognized where potential inconsistencies in the existing broadband map could exist. This could delineate the need for further focused validation or verification in specific areas that could refine the broadband coverage information for future data submissions.

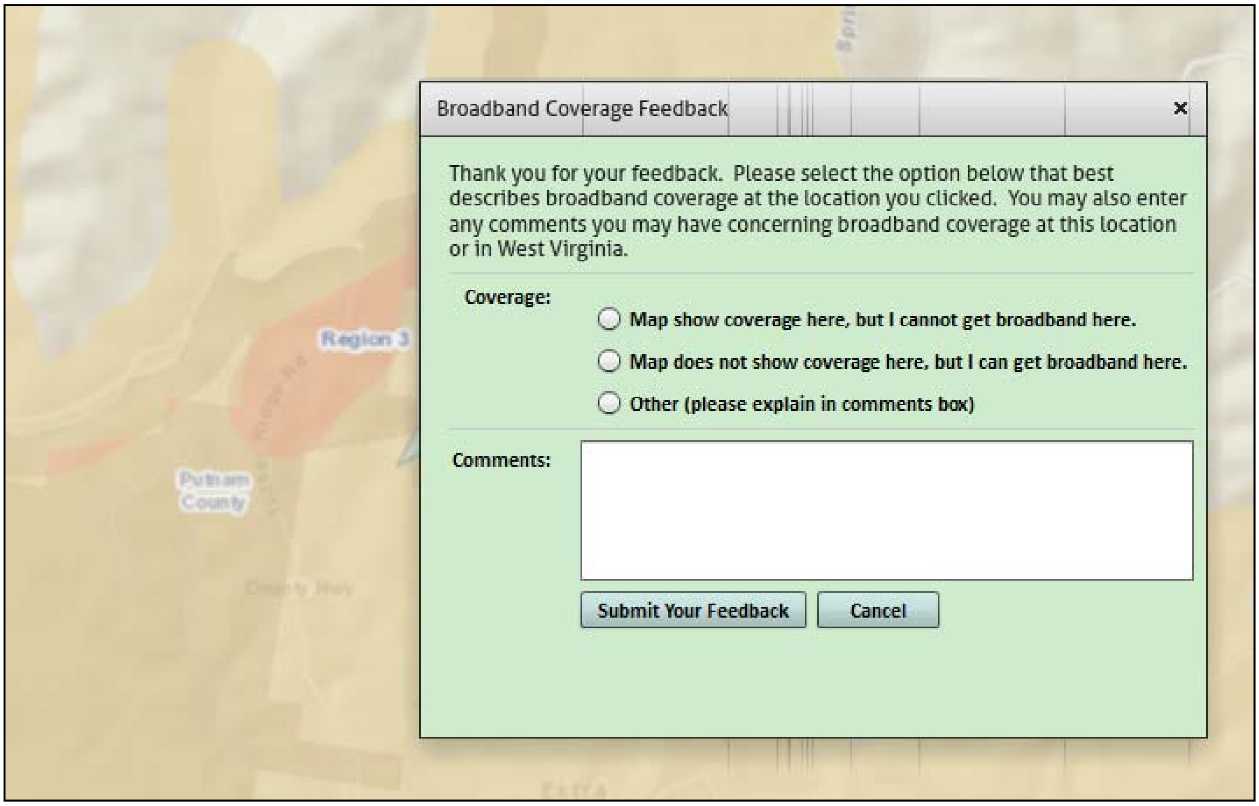

Figure 3—Example of feedback tool interface

For users that can browse the interactive map, they can click on any location on the map and choose to provide specific feedback for that location. This will store the coordinate information of the location that they selected allowing them to choose from a couple of coverage categories for their comment or choose other. Within the feedback tool, they can type in more specific details about their broadband coverage.

After the initial release of the broadband map, there was some initial feedback and comments mainly pertaining to a few areas that were not showing coverage. The feedback indicated that there should be coverage or scenarios where we were showing coverage. One resident made a comment that there was not cable service on a particular road or area. Some of the missing coverage was due to the acquisition of Verizon by Frontier as discussed above.

The State continues to implement plans to incorporate more advertising to the interactive broadband map and feedback tools. Continuing to work more closely with the regional planning councils to review coverage in their communities, a plan to include an advertisement of the interactive broadband map into local phone bills is being developed.

A speed test has been developed within the WVBMP interactive Website. The design of the Website includes links to the speed test developed using the Ookla broadband speed test tools. The speed test is embedded within a broadband survey wizard that allows consumers to provide specific information that will help the State analyze information about use and demand for broadband within the State. To get more users to take the speed test to obtain more results for analysis over the next six months, the speed test will be advertised along with the interactive Website. Speed test results and statistics will be leveraged to compare against the existing broadband coverage and help validate speed information. As stated previously, this could assist in determining if there are any trends or patterns in the information that could be an additional tool for prioritizing areas where more refined verification and validation might need to occur. To date there is still a lack of substantial data collected via the speed-test or surveys to be able to detect patterns or trends and continued planning within the regional planning councils could provide more exposure to the web sites and speed test at the grass roots level. Links to the speed test and the interactive map have also been added to additional web sites, including a new West Virginia Broadband Deployment Council web site (www.broadband.wv.gov) that was launched at the end of 2011.

Future Steps for Validation

Future plans for data validation continue to include establishing confidence levels to assign to broadband coverage based on comparisons with other source information collected, such as feedback from crowd sourcing results from the State broadband map and the national broadband map. Confidence rankings will be used to prioritize any areas where additional verification techniques might be used (consumer and business surveys).

As part of continued broadband planning activities and future validation of data, a third party dataset from Infogroup has been purchased. For broadband map validation, the Infogroup datasets provide consumer broadband use information including coordinate based location information along with provider name and technology that is being used by that particular consumer. The Infogroup data will allow the consumer information to be plotted on the map and compared against existing coverage maps to determine if there are any trends within the Infogroup data that help to determine where additional validation needs to occur. For example, there may be clusters of consumer points for a particular provider that exists in an area of the State where there is no coverage for that provider. The goal would be to identify the major patterns or trends that might need to be re-visited with a provider, if data appears to be missing.

During the summer of 2012, as part of the data verification tasks, a comparison was performed between the State broadband coverage area from the State's last data submission to the National Telecommunication and Information Administration (NTIA) in April 2012 with the third party information from Infogroup purchased by the State. An Excel spreadsheet was provided by Infogroup and contains customer location information for cable, digital subscriber line (DSL), fiber optic (fiber), and wireless subscribers and can be converted into a spatial geographic information system (GIS) dataset. The findings were used to indicate whether or not there are any areas in the submitted broadband coverage data that may need to be updated or verified.

Also present in the spreadsheet table is customer location information for dialup subscribers. This dataset can be converted into a spatial GIS layer and used to identify areas that may not have broadband services, but can still access information through a dialup service.

When comparing the current broadband coverage area and the new XY point layer from the Infogroup records, only a small percentage of points fell outside of the coverage area. Table one highlights the key results that were found.

Type of Service	Total Number of Points	Number of Points Outside of Coverage Area	Number of points Within 50 ft of Coverage Area	Number of points Over 500 ft of Coverage Area
Cable	108503	303	60	92
DSL	63462	268	69	64
Fiber	428	4	1	1
Wireless	4962	54	2	25
Total	17,7355	629	132	182

Table 1—Points Outside of Coverage Area by Technology

In conclusion, the analysis of the dataset indicates that no immediate changes need to be made to the existing broadband coverage area because of the low percentage of points that fell outside of the current coverage areas. The few clusters of points that fell outside of the current coverage area should be reviewed and potentially discussed with providers in those areas to determine if any existing coverage needs to be expanded in those areas. This will be incorporated within data submission request period for the next data submission.

Another dataset that is being considered for purchase for broadband planning activities and broadband demand analysis is Telogical's broadband statistical datasets that provide pricing information. Included in the datasets is information on broadband maximum advertised speed by providers which could help validate some of the speed data within the broadband mapping datasets.

Throughout the broadband data development program, as addressing information from the State Addressing and Mapping Board's addressing datasets are continually updated, address point information from providers will continually be re-verified prior to each submission to NTIA to improve geocoding results and refine the broadband coverage areas.

Specific Verification Tasks- Fourth Quarter 2012

The West Virginia Broadband Mapping Program has outlined specific objectives for data verification through the end of 2012. These objectives are focused on five main components:

1. Begin development of a plan for integration of Public Data Sources for verification activities
2. Begin development of a plan to compile free wireless broadband services offered and operated by a government, business, or community entity
3. Continue verification activities by revisiting contacts for each anchor institution and developing verification strategy for data with which we are less confident
4. Continue to refine a confidence scale that indicates the level of confidence for each record
5. Obtain speeds at the block/segment level

To continue to achieve these objectives as outlined to the National Telecommunications and Information Administration (NTIA) in the West Virginia Broadband Mapping Program activities for 2012, the West Virginia Office of GIS Coordination (WVOGC) will finalize the planning and implementation of the following tasks in 2012.

- Receive the current FCC Form 477 data from the WVOGC and provide comparisons to the round 6 submission data to determine if there are additional build out by providers that need to be requested for the round 7 submission.
- Use service availability query tools published on providers' websites to compare to what has been submitted
- Begin compilation of free wireless broadband services offered and operated by a government, business, or community entity. Research information on web sites and applications that list free Wi-Fi hotspots. Further field verification of these hotspots through a pilot test is described in a separate section of this document.
- Work with WVOGC and the West Virginia of Department of Homeland Security and Emergency Management (WVDHSEM) to launch an outreach campaign to have community anchor institutions take the speed test and take a specific survey developed for community anchors beyond what has already been surveyed and collected so far by WVDHSEM.
- Review submitted wireline attributes (Central offices, remote terminals, etc.) and compare locations as submitted by providers to any visible location information on orthophotos or against of any facilities coded in the State Addressing and Mapping Board (SAMB) data. Additional field verification would be completed in pilot area testing described in this document.
- Launch another outreach campaign to resellers to determine if they want to be included on the state web map in some capacity and determine the best approach to adding those resellers.
- Refine a confidence scale to provide a level of confidence for records in the database. A matrix would be developed to rank quality metrics for each provider to develop a weighted score that could then be applied by to the database. The quality metrics and matrix would be developed with WVOGC.
    - Rank 1-5 on:

- Consistency/cohesiveness of their coverage – if their coverage pattern is consistent with what is expected given their technology, or if isolated blocks/address points exist
- Quality of data supplied – customer address points instead of qualified address points, solid wireless coverage patterns instead of propagation-style, street segments that can't be mapped, generalized data, etc.
- Completeness of data – missing field values, etc.
- Cooperation of the providers – e.g. whether they are responsive to the data requests each round, if they submit data on time, etc.

- Obtain speeds at the block/segment level. Research the currently available options for obtaining more detailed speed information, including third-party source data, and providing recommendations to WVOGC.
- Continue to mine information from the speed tests and develop new campaigns to encourage the use of the speed test.

Field verification pilot test:

To achieve the long-term success of specific verification tasks outlined above as the project continues into 2013 and 2014, an initial field verification pilot test will be conducted during the fourth quarter of 2012. Field verification will be performed in specific areas of the state as determined by WVOGC. This pilot test will involve the following activities:

- Using mobile applications on smart phones or laptops to test wireless broadband availability and speeds. Verify location of Central Offices, Remote Terminals, etc.
- Collect and verify location of Wi-Fi hotspots and free public broadband to help compile of map of these locations

Once the field verification portion has been completed, analysis of the results will be performed and an overall report developed outlining the activities and recommendations on expanding these verification activities beyond these pilot areas in 2013. A determination will be made as to whether or not the results for the specific activities returned data and information that are beneficial in the development of a more accurate broadband coverage map and valuable for the continued broadband planning activities. If these results indicate that these activities should be expanded beyond the pilot test area, an implementation plan will be developed for the specific field verification activities that should be expanded to a large geographic area.

Use of Broadband Mapping Datasets for State Broadband Grant Program

The West Virginia Broadband Deployment Council launched a state grant program in the summer of 2012 to help bring affordable broadband to unserved areas of West Virginia. One of the most important ways it does this is by providing grants to help fund broadband deployment projects. Broadband deployment projects can be of two types – infrastructure and demand stimulation. Infrastructure projects are those that bring affordable broadband service to people and businesses that do not currently have it and may never have it without some sort of public funding. Demand stimulation projects are those that help people and businesses understand and value the benefits broadband service would bring to them, and cause them to want to use that service. To help delineate specific potential project areas, as described in the West Virginia Code 31-15C-1, the broadband mapping coverage that has been developed as part of the NTIA's broadband mapping program was used to generate maps that depicted Type 1, 2 and 3 areas outlined in that statute.

A Type 1 un-served area is an area in which broadband may be deployed by service providers in an economically feasible manner. A Type 2 un-served area is an area in which broadband may be deployed by broadband service providers and other entities in an economically feasible manner, provided some form of public money is made available. A Type 3 un-served area is an area in which, at present, cable or wireline broadband cannot be deployed in an economically feasible manner and an intermodal approach employing other technologies, such as satellite and wireless, is required to provide that area with high-speed internet access.

Broadband service providers each have unique processes for determining when it is economically feasible to deploy broadband service to a given area. The process varies from provider to provider and depends greatly on the technology being deployed. Because no consistent formula exists and the definition of a Type 1, 2 or 3 un-served area is not strictly defined, an objective means to classify un-served areas based upon known metrics for populations more likely to have broadband service today. Metrics regarding current broadband deployment were obtained from Federal Communications Commission (FCC) reports. Factors including structure points, population density, median income, age, distance from existing networks and terrain were considered in classifying un-served areas as Type 1, 2 or 3.

The known areas currently served by broadband service providers were documented from the state broadband mapping program through the geographic information systems (GIS) coordinator's office and the West Virginia Geological and Economic Survey (WVGES). Areas currently served by broadband service were excluded from the determination. Un-served areas were then subdivided based on proximity to structure points and road segments. Each area was then correlated with 2000 and 2010 census data for population density, income and population age to determine likelihood for deploying broadband service.

Criteria used to determine the likelihood of a given area receiving broadband service was based on metrics provided by the Broadband Adoption and Use in America, OBI Working Paper Series No. 1, by John B. Horrigan for areas where broadband is currently deployed. Specific categories considered in the determination included population density, population age, income and proximity to existing networks. Each category was weighted on a scale of one to five, with a score of five indicating a high likelihood to receive broadband service and a score of one indicating a low likelihood to receive broadband service. Based on the average of the four considered categories, each subdivided area was classified as Type 1, 2 or 3.

Based on the determination, a map was developed which depicts the Type 1, 2 and 3 classifications across the state. A 1,000 foot boundary was included within the documented area around each structure point to reflect the area that a wireline provider may be willing to lay cable from a roadway in order to provide broadband service. Served areas are reflected with a yellow color. Each un-served area is color classified according to the Type 1, 2 and 3 determinations.

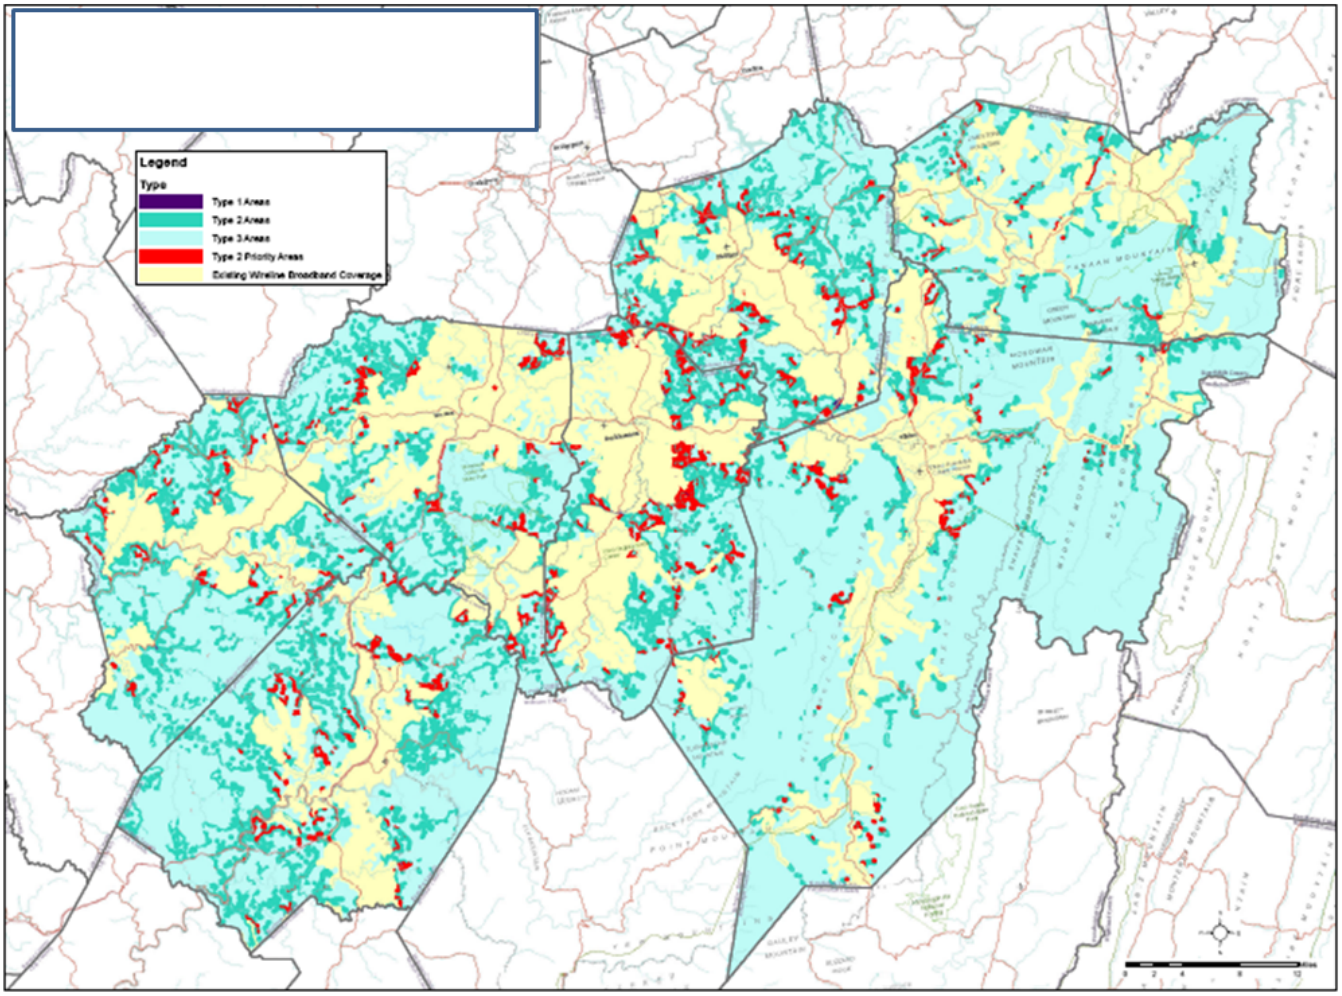

Figure 4 - Sample of a Type 1, 2 and 3 Map

Providers

Non-Responsive Providers

Names of providers who were non responsive will be passed along to the WV Geographic Information Systems (GIS) Coordinator's Office to be contacted again.

Atlantic Broadband LLC
DBA: Atlantic Broadband, LLC
FRN: 0009596883
This provider was contacted eight times. Data was not provided by the October submittal date. Further attempts at data gathering will be made in the next round of data collection.

**Skyweb, Inc
DBA: SKYWEB Inc.
FRN: 0018516799

**Tower locations were provided along with additional information for each tower site. Two computerized propagation studies were performed to approximate coverage for a local provider supplying broadband data. The two studies were predicted in the 900 MHz and 2.4 GHz bands that are utilized at these locations. The data was received from the provider that defined the tower sites currently utilized to provide coverage. Parameters provided include site locations, ground elevation, transmit power, antenna height above ground, and antenna gain. All of these components were compiled into EDX Signal software program which calculates the associated link budget and in which the program takes into account terrain and land use land clutter (LULC). Propagation studies show potential coverage throughout the area. Additional assumptions made include a predicted reliability of 90 percent for any signal received by a device and no additional signal loss was taken into account for signals received inside buildings which may further impact the coverage predictions. Coverage areas based on the propagation studies do not seem to represent realistic coverage patterns and will need to be reviewed again with SkyWeb in the future.

Satellite Providers

Data requests sent to Satellite providers were met with the response of "We provide to the entire state." Attempts made at gathering more detailed data sets were unsuccessful for this round of data collection. Further attempts will be made for the next round of data collection.

Hughes Communications, Inc.
DBA: HNS Licensuse Sub, LLC
FRN: 0018483073
Detailed data was not provided by the October submittal date. Further attempts at data gathering will be made in the next round of data collection.

StarBand Communications Inc.
DBA: StarBand Communications Inc.
FRN: 0005087457
Detailed data was not provided by the AprilOctober submittal date. Further attempts at data gathering will be made in the next round of data collection.

WildBlue Communications, Inc.
DBA: WildBlue Communications, Inc.
FRN: 0007843766
Detailed data was not provided by the October submittal date. Further attempts at data gathering will be made in the next round of data collection.

(Address of Recipient)

Re: Data Request in Compliance with the State Broadband Data and Development Grant Program and the Broadband Data Improvement Act

Response Requested by March 1st, 2012

Dear < >:

The West Virginia Geological and Economic Survey (WVGES) must collect certain data regarding the availability of broadband services, technology used to provide them, and the location of certain broadband infrastructure. The WVGES is required to provide the collected data to the NTIA every six months beginning March 2010 until October 2014. Entities that provide broadband service, as defined below, on either a commercial or noncommercial basis within West Virginia are subject to this request.

WVGES was designated as the single West Virginia entity eligible to receive a grant under the Broadband Data Improvement Act of 2008 (BDIA), 47 U.S.C. §§ 1301-04. In 2009, the WVGES successfully applied to the National Telecommunications and Information Administration (NTIA) for such a grant, pursuant to the NTIA's Notice of Funds Availability (NOFA).

The NTIA's State Broadband Data and Development Grant Program Notice of Funds Availability, Docket No. 0660ZA (July 8, 2009) (NOFA), defines broadband as follows:

> …two-way data transmission to and from the Internet with advertised speeds of at least 768 kilobits per second (kbps) downstream and at least 200 kbps upstream to end users, or providing sufficient capacity in a middle mile project to support the provision of broadband service to end users…

Please note that the broadband inventory maps derived from these data may result in government-subsidized broadband deployment in unserved and underserved areas. Providers that do not respond may face subsidized competition in areas they already serve.

Attached to this request are the Technical Appendix to the NOFA and a technical appendix written by the WVGES to clarify the data that needs to be collected. **Please note this appendix is new as of January 1, 2012.** These documents outline the broadband availability information WVGES is required to collect. Every broadband service provider within the state of West Virginia is expected to provide the information specified in the attached documents to WVGES **<u>no later than March 1st, 2012</u>**, in the format WVGES has specified.

Six Month Update:
Pursuant to the BDIA and the NOFA, WVGES must collect updates on broadband data on a six month rolling basis. **If you had submitted adequate information during the 2nd collection period of 2011 and there are no changes to your infrastructure, the WVGES requests a letter stating such**. If infrastructures changes have been made in the interim period, submissions of the changes are required.

Contact Information:
Please submit the requested data **<u>no later than March 1, 2012</u>** by CD or DVD to Michael "Ty" Clifford, West Virginia Geological and Economic Survey, 1 Mont Chateau Rd. Morgantown WV 26508-8079.

If you have questions about this request, contact Michael "Ty" Clifford by email at mclifford@geosrv.wvnet.edu, or by phone at (304) 594-2331.

Nondisclosure Agreement:
Data submitted to WVGES in response to this request will be protected under the confidentiality requirements set forth in Section 106 (h)(2) of the BDIA. This section states that, "[n]ot withstanding any provision of Federal or State law to the contrary, an eligible entity shall treat any matter that is a trade secret, commercial or financial information, or privileged or confidential, as a record not subject to public disclosure except as otherwise mutually agreed to by the broadband service provider and the entity." Further, the NOFA states that "[a]s a measure to protect the confidential or proprietary nature of the information received from broadband service providers and other organizations during the data collection phase, awardees may execute nondisclosure agreements (consistent with applicable law) that require awardees to treat any matter that is a trade secret, commercial or financial information, or privileged or confidential, as a record not subject to public disclosure except where mutually agreed upon by the information provider and the awardee, provided, however, that any such nondisclosure restriction a) will not restrict the providing of all data collected under this Program to NTIA, nor b) restrict NTIA's use of such data as contemplated under this Notice (including sharing such data with the FCC or other federal agencies)". NTIA expects awardees to enter into such agreements upon the request of the service provider. WVGES believes that these provisions will protect the confidentiality of information that broadband providers submit pursuant to this request and intends to enter into a nondisclosure agreement with any provider that wishes to do so.

Michael Ed Hohn
Director and State Geologist

West Virginia Geological and Economic Survey Guide to Broadband Submission

Purpose:
Several changes in submission guidelines have been made by NTIA since the writing of the original Technical Appendix. This document clarifies what is preferred and required for submission and the original NTIA Technical Appendix no longer adequately describes what is required.

Broadband definition:
Broadband Service is the provision, on either a commercial or noncommercial basis, of data transmission technology that provides two-way data transmission to and from the Internet with advertised speeds of at least 768 kilobits per second (kbps) downstream **and greater than 200 kbps upstream** to end users, or providing sufficient capacity in a middle mile project to support the provision of broadband service to end-users within the project area.

2010 census requirements:
Beginning in June 2011, all census block and road information **must be derived from 2010 Census Data**. All block and road data submitted **must have a unique identifier present**, such as census block # or **TLID.**
The WVGES has created two shapefiles which contain all census blocks in West Virginia less than 2 square miles and all roads contained in census blocks greater than 2 square miles. All census and road data must correspond to these master files.

The shape files are located at:
https://dssfm.kimballdata.com

```
Username: censusdata
Password: censusdata#1
```

Data preferences:
The WVGES prefers data to be submitted in the following order of preference:

- ESRI shapefile format with all required fields submitted.
- Service area boundary with defined speeds and fields that can be converted to blocks and roads.
- Flat Excel or comma-delimited files that contain all data field and unique identifiers.

Data Types and required fields:

Wireless Services not Provided to a Specific Address – Shapefile

Facilities-based providers of wireless broadband service that is not address specific (e.g., nomadic, terrestrial mobile wireless, or satellite), may provide WVGES with GIS-compatible shapefiles depicting areas in which broadband service is available to end users.

For this purpose, an "end user" of broadband service is a residential or business party, institution, or state or local government entity that may use broadband service for its own purposes and that does not resell such service to other entities or incorporate such service into retail Internet-access service. Internet Service Providers (ISPs) are not "end users" for this purpose. An entity is a "facilities-based" provider of broadband service connections to end user locations if any of the following conditions are met: (1) it owns the portion of the physical facility that terminates at the end user location; (2) it obtains unbundled network elements (UNEs), special access lines, or other leased facilities that terminate at the end user location and provisions/equips them as broadband; or (3) it provisions/equips a broadband wireless channel to the end user location over licensed or unlicensed spectrum.

For this purpose, "broadband service" is "available" at a location if the provider does, or could, within a typical service interval (7 to 10 business days) without an extraordinary commitment of resources, provision two-way data transmission with advertised speeds of at least 768 kilobits per second (kbps) downstream and greater than 200 kbps upstream to end-users at that location. The data shall be submitted to WVGES as an ESRI Shapefile such that the associated data contains the following fields:

- Instructions for providers needing to obtain a FRN can be accessed at https://fjallfoss.fcc.gov/coresWeb/publicHome.do.
- All map areas must be closed, non-overlapping polygons with a single, unique identifier.
- Any variation in any of the required fields necessitates the creation of a separate closed, non-overlapping polygon.
- In the area covered by each polygon, subscribers must have broadband service with the speed characteristics shown in the data record 95% of the time to within 50 feet of the polygon's boundary.
- The technology of transmission should be entered as an integer based on the coding scheme shown below.
- The speed tiers should be entered as integers according to the reference in below.
- The data must be expressed using the WGS 1984 geographic coordinate system.
- Maps must be accompanied by metadata or a plain text "readme" file that contains a comprehensive explanation of the methodology employed to generate the map layer including any necessary assumptions and an assessment of the accuracy of the finished product.
- Since ESRI Shapefiles typically consist of 5 to 7 individual files including the associated metadata and geodatabase, data for the entire state or territory should be submitted as a single, zipped file containing all the component files. The file should be named "area_availability_XX.zip" where XX is the two-letter postal abbreviation for the state or territory.

Record Format for Availability Area Data for Each Provider – Use Only in Connection with Wireless Services not Provided to a Specific Address

Field	Description	Type	Example
Provider Name	Provider Name	Text	ABC Co.
DBA Name	"Doing-business-as" name	Text	Superfone, Inc.
FRN	Provider FCC Registration Number	Integer	8402202
Technology of Transmission	Category of technology for the provision of service (see details following Part 1(a) for codes)	Integer	41
Spectrum Used	If technology of transmission is wireless, is Cellular spectrum (824-849 MHz; 862-869) used to provide service (Y/N)?	Text	Y
Spectrum Used	If technology of transmission is wireless, is 700 MHz spectrum (698-758 MHz; 775-788 MHz; 805-806 MHz) used to provide service (Y/N)?	Text	Y
Spectrum Used	If technology of transmission is wireless, is Broadband Personal Communications Services spectrum (1850-1915 MHz; 19301995) used to provide service (Y/N)?	Text	Y
Spectrum Used	If technology of transmission is wireless, is Advanced Wireless Services spectrum (1710-1755 MHz; 2100-2155) used to provide service (Y/N)?	Text	N
Spectrum Used	If technology of transmission is wireless, is Broadband Radio Service/Educational Broadband Service spectrum (2496-2690 MHz) used to provide service (Y/N)?	Text	N
Spectrum Used	If technology of transmission is wireless, is Unlicensed (including broadcast television "white spaces") spectrum used to provide service (Y/N)?	Text	N
Spectrum Used	If technology of transmission is wireless, but the spectrum used to provide service is not listed above, please identify as one of the following: Specialized Mobile Radio Service (SMR) (817-824 MHz; Spectrum Used 862-869 MHz; 896-901 MHz; 935-940 MHz), Wireless Text SMR Communications Service (WCS) spectrum (2305-2320 MHz; 2345-2360 MHz), 3650-3700 MHz, Satellite (L-band, Big LEO, Little LEO, 2 GHz).	Text	SMR
Maximum Advertised Downstream Speed	Speed tier code for the maximum advertised downstream speed available (see details following Part 1(a) for codes)	Integer	8

Maximum Advertised Upstream Speed	Speed tier code for the maximum advertised upstream speed that is offered with the above maximum advertised downstream speed available (see details following Part 1(a) for codes)	Integer	8
Typical Downstream Speed	Speed tier code for the downstream data transfer throughput rate that most subscribers to service at the maximum advertised downstream speed (above) can achieve consistently during expected periods of heavy network usage (see details following Part 1(a) for codes).	Integer	8
Typical Upstream Speed	Speed tier code for the upstream data transfer throughput rate that most subscribers to service at the maximum advertised upstream speed (above) can achieve consistently during expected periods of heavy network usage (see details following Part 1(a) for codes).	Integer	8

Middle Mile and Backbone Interconnection Points

In addition to the information shown in the tables below, awardees shall provide NTIA with a list of interconnection points of facilities in their state that provide connectivity between (a) a service provider's network elements (or segments) or (b) between a service provider's network and another provider's network, including the Internet backbone. (Collectively, (a) and (b) are "middle-mile and backbone interconnection points").

Middle-mile and backbone interconnection points typically enable relatively fast data rates, are built to handle substantial capacities, and may be service-quality assured.

Examples might include: points of interconnection enabling communications between an incumbent local exchange carrier central office and the Internet, between a cable aggregation point (headend) and the Internet, or between a wireless base station and the provider's core network elements that connect to other networks including the internet.

These data shall be submitted to NTIA as a tab-delimited text file in which each record has the following format:

- Instructions for providers needing to obtain a FRN can be accessed at https://fjallfoss.fcc.gov/coresWeb/publicHome.do.
- The capacity of the serving facility should represent the capacity as currently configured and be expressed according to the following reference:
- Coordinates must be expressed using the WGS 1984 geographic coordinate system.
- Data for the entire state or territory should be submitted as a single, tab-delimited plain text file named "middlemile_XX.txt" where XX is the two-letter postal abbreviation for the state or territory.

Record Format for Middle-Mile and Internet Backhaul Connection Points Data for Each Provider

Field	Description	Type	Example
Provider Name	Provider Name	Text	ABC Co.
DBA Name	Doing-business-as name	Text	Superfone, Inc.
FRN	FCC Registration Number	Integer	8402202
Ownership	Is the facility owned (0) or leased (1)?	Integer	0
Serving Facility Capacity	Serving capacity of transport facility (see details below)	Integer	1
Serving Facility Type	Type of transport facility (1=Fiber; 2=Copper; 3=Hybrid Fiber Coax (HFC); 4=Wireless)	Integer	1
Latitude	Latitude in decimal degrees	Float	38.88456
Longitude	Longitude in decimal degrees	Float	-77.028123
Elevation	Elevation relative to grade to the nearest foot (positive integers indicate above grade, negative below grade)	Integer	-10

Serving Facility Codes

Data Rate Code	Interconnection Point Data Rate
1	Multiple T1s and less than 40 mbps
2	Greater than 40 mbps and less than 150 mbps
3	Greater than 150 mbps and less than 600 mbps
4	Greater than or equal to 600 mbps and less than 2.4 gbps
5	Greater than or equal to 2.4 gbps and less than 10 gbps
6	Greater than or equal to 10 gbps

Service Address Service Associated with Specific Address

For each facilities-based provider of broadband service to specified end-user locations in their state, awardees shall provide NTIA with a list of all addresses at which broadband service is available to end users in the provider's service area, along with the associated service characteristics identified below.

For this purpose, "broadband service" is the provision, on either a commercial or noncommercial basis, of data transmission technology that provides two-way data transmission to and from the Internet with advertised speeds of at least 768 kilobits per second (kbps) downstream **and greater than 200 kbps upstream** to end users, or providing sufficient capacity in a middle mile project to support the provision of broadband service to end-users within the project area.

For this purpose, an “end user” of broadband service is a residential or business party, institution or state or local government entity that may use broadband service for its own purposes and that does not resell such service to other entities or incorporate such service into retail Internet-access services. Internet Service Providers (ISPs) are not “end users” for this purpose. An entity is a “facilities-based” provider of broadband service connections to end user locations if any of the following conditions are met: (1) it owns the portion of the physical facility that terminates at the end user location; (2) it obtains unbundled network elements (UNEs), special access lines, or other leased facilities that terminate at the end user location and provisions/equips them as broadband; or (3) it provisions/equips a broadband wireless channel to the end user location over licensed or unlicensed spectrum.

For this purpose, “broadband service” is “available” at an address if the provider does, or could, within a typical service interval (7 to 10 business days) without an extraordinary commitment of resources, provision two-way data transmission to and from the Internet with advertised speeds of at least 768 kilobits per second (kbps) downstream and greater than 200 kbps upstream to endusers at that address. The list of addresses shall be submitted to WVGES as a tab-delimited text file in which each record has the following format:

- All fields are required.
- Instructions for providers needing to obtain a FRN can be accessed at https://fjallfoss.fcc.gov/coresWeb/publicHome.do.
- The ID field is a sequential integer ranging from 1 to the total number of addresses.
- Address data fields should be space-delimited in standardized Postal Service form. See http://pe.usps.gov/cpim/ftp/pubs/Pub28/pub28.pdf.
- Categories of end users should be entered as integers based on the following table.
- For reporting the technology of transmission, report the technology used by the portion of the connection that terminates at the end-user location. If different technologies are used in the two directions of information transfer (“downstream” and “upstream”), report the connection in the technology category for the downstream direction. The technology of transmission should be entered as an integer based on the following tables.
- Speed tiers should be entered as integers based on the following tables.
- Data for the entire state or territory should be submitted as a single, tab-delimited plain text file named “address_availability_XX.txt” where XX is the two-letter postal abbreviation for the state or territory.

Record Format for Address Data for Each Provider

Field	Description	Type	Example
Provider Name	Provider Name	Text	ABC Co.
DBA Name	“Doing-business-as” name	Text	Superfone, Inc.
FRN	Provider FCC Registration Number	Integer	8402202
ID	Sequential record number	Integer	1

End User location/Service Data End-User Address	Complete address	Text	1401 Constitution Ave NW Washington DC 20230
End-User Building Number End-User Prefix Direction	Building number Prefix direction	Text	1401
End-User Street	Street name	Text	Constitution
End-User Street Type End-User Suffix Direction	Street type Suffix direction	Text	Avenue NW
End-User City	City	Text	Washington
End-User State Abbreviation	Two-letter state postal abbreviation	Text	DC
End-User ZIP Code	5-digit ZIP code (with leading zeros)	Text	20230
End-User ZIP Plus 4	4-digit add-on code (with leading zeros)	Text	0005
Category of End User	Category of End User Served at Address (see details below for codes)	Integer	3
Technology of Transmission	Category of technology available for the provision of service at the address (see details below for codes)	Integer	50
Maximum Advertised Downstream Speed	Speed tier code for the maximum advertised downstream speed available at the address (see details below for codes)	Integer	8
Maximum Advertised Upstream Speed	Speed tier code for the maximum advertised upstream speed that is offered with the above maximum advertised downstream speed available at the address (see details below for codes)	Integer	8
Typical Downstream Data	Speed tier code for the downstream data transfer throughput rate that most subscribers to service at the maximum advertised downstream speed (above) can achieve consistently during expected periods of heavy network usage (see details below for codes)	Integer	8

Typical Upstream Speed	Speed tier code for the upstream data transfer throughput rate that most subscribers to service at the maximum advertised upstream speed (above) can achieve consistently during expected periods of heavy network usage (see details below for codes)	Integer	8

End User Codes

End User Category Code	End User Category	Description
1	Residential	Address denotes a residential living unit, individual living unit in institutional settings such as college dormitories and nursing homes and other locations designed primarily for residential use at which broadband service is available.
2	Governmental	Address denotes a state orl ocal govermnent location at which broadband service is available.
3	Small Business	Address denotes the location of a small business.
4	Medium or Large Enterprise	Address denotes the location of a medium or large enterprise.
5	Other	Address denotes a location not meeting any of the above descriptions.

Technology of Transmission Codes

Technology Code	Description	Details
10	Asymmetric xDSL	
20	Symmetric xDSL	
30	Other Copper Wireline	All copper-wire based technologies other than xDSL (Ethernet over copper and T-1 are examples)
40	Cable Modem - DOCSIS 3.0	
41	Cable Modem - Other	

50	Optical Carrier/Fiber to the End User	Fiber to the home or business end user (does not include "fiber to the curb")
60	Satellite	
70	Terrestrial Fixed Wireless - Unlicensed	
71	Terrestrial Fixed Wireless - Licensed	
80	Terrestrial Mobile Wireless	
90	Electric Power Line	
0	All Other	Any specific technology not listed above.

Speed Tier Codes

Upload Speed Tier	Download Speed Tier	Description
1	--	Less than or equal to 200 kbps
2	--	Greater than 200 kbps and less than 768 kbps
3	3	Greater than or equal to 768 kbps and less than 1.5 mbps
4	4	Greater than or equal to 1.5 mbps and less than 3 mbps
5	5	Greater than or equal to 3 mbps and less than 6 mbps
6	6	Greater than or equal to 6 mbps and less than10 mbps
7	7	Greater than or equal to 10 mbps and less than 25 mbps
8	8	Greater than or equal to 25 mbps and less than 50 mbps
9	9	Greater than or equal to 50 mbps and less than 100 mbps
10	10	Greater than or equal to 100 mbpss and less than 1 gbps
11	11	Greater than or equal to 1 gbps

Census Blocks Less than Two Square Miles

Record Format for Wireline Service by Census Block

(For Census Blocks no greater than two square miles in area in which broadband service is available to end users)

Field	Description	Type	Example
Provider Identification Data			
Provider Name	Provider Name	Text	ABC Co.
DBA Name	"Doing-business-as" name	Text	Superfone, Inc.
FRN	Provider FCC Registration Number	Integer	8402202
ID	Sequential record number	Integer	1

Census Block Identification Data			
Census Block FIPS Code	15-digit Federal Information Processing Standard (FIPS) Code identifying individual Census Block. Must include leading "0"	Integer	60750160001015
Census Block Square Mileage	Provide square mileage for specific census block number to the first decimal place	Number	1.8
Broadband Technology and Speed Data			
Technology of Transmission	Category of technology available for the provision of service at the address (see details below for codes)	Integer	50
Typical Downstream Speed	Speed tier code for the downstream data transfer throughput rate that most subscribers to service at the maximum advertised downstream speed (above) can achieve consistently during expected periods of heavy network usage (see details below for codes)	Integer	8
Typical Upstream Speed	Speed tier code for the upstream data transfer throughput rate that most subscribers to service at the maximum advertised upstream speed (above) can achieve consistently during expected periods of heavy network usage (see details below for codes)	Integer	8

Roads contained within Census Blocks greater than two square miles

Record Format for Wireline Service by Street Segment

(For Census Blocks larger than two square miles in area in which broadband service is available to end users)

Field	Description	Type	Example
Provider Identification Data			
Provider Name	Provider Name	Text	ABC Co.
DBA Name	"Doing-business-as" name	Text	Superfone, Inc.
FRN	Provider FCC Registration Number	Integer	8402202
ID	Sequential record number	Integer	1

End User location/ Service Data			
Census Block FIPS Code	15-digit Federal Information Processing Standard (FIPS) Code identifying individual Census Block	Integer	60750160001015
Census Block Square Mileage	Provide square mileage for specific census block number to the first decimal place	Number	5.8
Street Name	Provide street name to identify street segment	Text	Van Ness
Street Type	Street type to identify street segment	Text	Avenue
Street Direction Prefix	Street Prefix to identify street segment	Text	N
TLID	Unique identifier for each street segment	Text	0015874962
Broadband Technology and Speed Data			
Technology of Transmission	Category of technology available for the provision of service at the address (see details below for codes)	Integer	50
Typical Downstream Speed	Speed tier code for the downstream data transfer throughput rate that most subscribers to service at the maximum advertised downstream speed (above) can achieve consistently during expected periods of heavy network usage (see details below for codes)	Integer	8
Typical Upstream Speed	Speed tier code for the upstream data transfer throughput rate that most subscribers to service at the maximum advertised upstream speed (above) can achieve consistently during expected periods of heavy network usage (see details below for codes)	Integer	8

West Virginia Geological and Economic Survey

State Broadband Mapping Methodology

For the State of West Virginia, October 2012

Contents

Overview

This document gives a summary of the data collection, normalization and verification processes used by the State of West Virginia (State) up to the sixth data submission, in October 2012, to the National Telecommunication and Information Agency (NTIA) in accordance with the State Broadband Data Development (SBDD) program. While most of the processes used in this data submission remained the same as ones for the previous submissions, there were additional adjustments made to continue to refine the process to receive 2010 census geography from the providers in more efficient ways. The State of West Virginia interactive broadband map continues to provide the broadband coverage information to the public and is able to receive comments and feedback from consumers and citizens of the state.

Purpose

This documentation was developed to illustrate the processes used during the data collection, normalization and verification processes. The information within this document will provide a background to the development of the provider list and data request, and specific issues encountered by West Virginia regarding data collection, normalization and validation.

Data Sources

Provider List

The provider list for this sixth round of data collection started during the first round of data collection. For this round, the list was regenerated to include any new providers within the state. The list was created by contacting the West Virginia Cable Telecommunications Association, the West Virginia Public Services Commission (PSC) and the West Virginia Broadband Deployment Council. The state receives an updated provider list from the PSC every six months. This information was compiled and compared against the list from the Federal Communications Commission (FCC). Providers were then contacted using information provided by the FCC's public information search Web tool. Providers who were contacted during the first round of data were contacted again through the same name and address. If a provider contacted during the first round had given more detailed contact information for a specific individual, those individuals were contacted instead of the contact provided by the FCC.

The provider list is updated every six months to reflect any mergers or acquisitions that have occurred. There are some legal issues when a merger occurs, but the data integration does not occur until up to a year later. In those circumstances, the data is kept separate until a full merger occurs.

Data Gathering

Provider Data Request

This component of the project was heavily reliant on working with service providers to obtain data. Each identified provider was mailed a standard data request outlining the elements identified in the Notice of Funds Availability (NOFA) Technical Appendix that were requested from providers. This request included information regarding the availability of broadband services, technology used to provide them, the location of certain broadband infrastructure and the speed of the service. Data was requested to be submitted in the form of census block lists and service area boundaries, including address level and street segment data. If a provider was unable to fulfill such requirements, the West Virginia Geological and Economic Survey (WVGES) worked with those providers to gather the necessary data in an alternative approach. For the last round of data collection, an updated guide for broadband data submission was developed for the providers. Along with this guide, a letter outlining the continued overall goals of the broadband mapping program and the objectives of the new updated guide were sent to each provider. The guide was developed to continue to standardize the data received from providers, including modifications and updates that have been made to the requirements by the NTIA since the original Technical Appendix.

Examples of the letter and guide are provided in Appendix A and Appendix B in this document. This same letter and guide were sent out again for this round of data submission requests. All of the providers that submitted census block information for this submission provided census 2010 geometry or census block numbers. However, once again, no providers submitted TLIDs for roads as described within the guide. Without TLIDs, roads need to be hand selected or geocoded, which can lead to some additional processes and inaccuracies because of the limitations described in the Geocoding Issues section.

After the initial data request was mailed, follow up phone calls and emails were made to remind providers of due dates and to collect any missing or unclear data. As of this submission, the response rate from providers continues to be over 90 percent. After data was received, the data was normalized per NTIA standards and placed into the provided geodatabase. WVGES continued to operate under the same assumption as used in the first round of data gathering. WVGES let the data "speak for itself" and did not make any grand assumptions or estimates in the interest of maintaining clean and accurate data.

Providers submitted only maximum advertised speed data. Providers have not been very willing to submit typical speed data as the typical speeds are generally lower than the advertised speeds. Advertised speed data was given by all providers and then pushed to typical speeds as per NTIA's advice in the Round 3 data review conference call.

In addition to the data request, each provider was required to sign a Nondisclosure Agreement (NDA) between themselves and WVGES. The NDA outlined how provider data would be handled and what portions of that data would be considered confidential, which would be shared with the NTIA and which were to be made publically available.

Coverage Information

Data was derived and normalized into four formats in accordance with the data model:

- Census blocks (2010) of two or less square miles
- Street segments (2010) of census blocks greater than two square miles
- Address level (geocoded point data)
- Wireless area (shapefile)

The normalization procedures were as follows:

- Determine service being provided – what technologies are being used to provide the service
- Understand data/determine how to process – determine which feature class in the geodatabase data belongs
- Georeferencing/geocoding necessary data – georeferencing data for wireless area coverage and other service area maps, as well as geocoding address level data
- Segregating data into NOFA compliant formats – completely filling in geodatabase fields, as well as making sure topology is correct
- Quality assurance/quality control (QA/QC) – verification and validation of data

Typically there were two main types of data supplied for normalization – service area maps and flat Excel tables.

Service areas were georeferenced, digitized and then intersected with the master blocks and roads files. These blocks and road segments were then loaded into the geodatabase and the additional company specific data was appended to those records.

Flat Excel tables were exported to a database and then joined with the FIPS ID for the block files and the TLID for the roads files. The joined fields were exported and then imported into the database. NTIA has not required this information and in cases where a TLID was not given by the provider there was much greater difficulty and inaccuracy as roads had to be geocoded and hand selected.

Geocoding Issues

The West Virginia Statewide Addressing and Mapping Board (SAMB) information is not yet completed across all of the counties in West Virginia, leaving areas within the State without complete or verified address information. This led to low geocoding match rates of provider supplied information, especially in rural areas, throughout the data normalization workflows. For some of these areas, additional broadband coverage processes were used to derive coverage estimates described in the next section.

Other Issues

Another issue of incomplete broadband coverage was due to the acquisition of Verizon by Frontier. When Frontier submitted digital subscriber line access multiplexer (DSLAM) locations for the April 1, 2011 deadline it did not include the entire Verizon infrastructure. Frontier has since re-submitted its DSLAM locations for the October 1, 2011 deadline, which now should include those missing Verizon DSLAMs and the coverage map has been extended into certain areas that were not previously included.

Additional Data Processing Techniques

Because of geocoding inconsistencies in certain areas of the State, some provider address information could not be mapped and other data processing techniques had to be implemented to create broadband coverage estimates. In cases where DSLAM points were able to be provided, broadband coverage was mapped by loading the DSLAM points into Environmental System Research Institute's (ESRI's) Network Analyst. For this processing, the West Virginia State SAMB street centerlines were used as the source roads. DSLAM points were loaded into the facilities point feature class of the service area template using a 1000 foot snapping tolerance to help locate points to nearest roadway. Any points still not connecting to the road network were viewed and manually linked to the road network. Processing was run to create segment lines for each point and to create a detailed polygon area around each street segment area for each point. A 15,000 foot distance parameter was used and no impedances were placed on the streets.

Once the process was run, the created segment lines and polygon areas were linked to the original DSLAM point attribute table and exported from the analyst dataset into standalone polygon and line feature classes. These two feature classes were clipped to the provided wire center boundaries. These coverage areas were used to select covered census blocks and street segments for the data submission. Final broadband coverage estimates were reviewed with the provider prior to final submission.

One of the foremost issues of the fourth round of data collection, submitted in October 2011 was converting to 2010 Census Blocks. NTIA's decision to switch to 2010 Census Blocks did not leave much time during that data collection window to notify providers of the change. Many providers submitted 2000 Census Blocks, not 2010 Census Blocks. The conversion led to multiple inaccuracies between Round 3 and Round 4 submissions because of the problems intersecting 2000 Census Blocks with 2010 Census Blocks and errors of commission. Many block boundaries had been redrawn and the crosswalk file provided by the Census was in a very unwieldy format and not much help. For this sixth round submission, most of the providers submitted 2010 Census Block information and with the previous submission base data having been already converted to 2010 Census Block information, the processing techniques for 2010 Census Blocks has become integrated into the long-term maintenance process.

Prior to this sixth submission, another unique processing issue occurred when providers submitted address-level fixed wireless data which would produce error through the new data model. As per discussion with NTIA, the unlicensed fixed wireless points were plotted and then buffered out to 800 feet. A shapefile was created and moved to the wireless feature class within the geodatabase. For this October 2012 submission, computerized radio propagation studies were used to predict coverage for StratusWave service areas. Site location information as well as equipment and antenna system data was provided by StratusWave engineers. This information was utilized in wireless network engineering software to create propagation prediction models using the Anderson 2D propagation model and 10 meter digital terrain elevation data. Median signal levels (50% time & 50% location variability) are predicted and then an additional margin (Prediction Confidence Margin) is incorporated to account for performance objectives and environmental losses. The propagation prediction models were then exported to map data which indicates StratusWave predicted coverage areas to include in the data submission.

FRN Number Discrepancies

Discrepancies between Round 2 and Round 3 data submissions were noticed concerning FCC Registraton Numbers (FRNs). Effected providers were contacted directly to clear up these issues. FRNs that were loaded into the database come from direct contact with providers. FRNs are verified as a continued validation process during each data collection period.

Community Anchor Institutions

The process used to identify the Community Anchor Institutions was based on the information provided by NTIA. This included the categories of schools K-12, libraries, medical/healthcare, Public Safety, higher education and other community support consisting of either government or nongovernmental facilities.

All public schools in West Virginia were used for the K-12 category. Libraries consisted of all public libraries throughout West Virginia. Medical/healthcare included hospitals, nursing homes and primary care centers. The primary care centers are made up of main locations of the primary care centers along with satellite clinics and school-based health centers. Public Safety consisted of West Virginia police departments along with the correctional facilities and juvenile centers, fire departments and 9-1-1 centers. Higher education consisted of public and private universities located across West Virginia. The community support consisted of courthouses, regional development centers and workforce locations.

There was a cutoff created to focus on identifying main facilities as Community Anchor Institutions (CAIs). However, if there is a need to go and include more facilities, the State is open to adding those facilities for future updates.

The following agencies were contacted for information: West Virginia (WV) Department of Education, WV Library Commission, Hospitals located throughout the state, Nursing Homes located throughout the State, WV Division of Primary Care, WV Primary Care Association, WV 9-1-1 Center Directors, WV Emergency Management Directors, WV Regional Jail Authority, WV Higher Education Policy Commission, WV Courthouse Facility Improvement Authority, WV Workforce, WV Regional Development Centers and county addressing coordinators.

Data was collected and verified by the West Virginia Division of Homeland Security. Surveys were sent out to various facilities and included a section where their primary city-style address could be filled in. For those facilities that returned the survey, the statewide addressing and mapping data that the counties provided was used as a way to verify the address. Once the location was verified the latitude and longitude coordinates were added. In cases where surveys were not returned, the statewide addressing and mapping data was used to determine if the information could be matched. If this wasn't possible, then the Internet was used to find a Webpage with additional information. If this method was not successful, attempts were made to contact the facility directly. At this point in time, there is approximately a 90-95 percent match rate for the location of the CAIs.

Since the October 2011 data submission, additional surveys were sent by mail to healthcare facilities and fire, police and ambulance locations throughout the state. This amounted to approximately 1,500 surveys that were mailed out. Based on the information that was received back from the surveys, the primary city-style address, broadband technology, speeds and other attributes associated with the community anchor institution feature class were verified and updated where necessary. An on-line survey was released since the last data submission with the objective of receiving further updates and also getting the survey, via email address, to those locations where the survey sent by mail was returned by the United State Postal Service due to invalid address information or a facility having changed location. The survey was successful in collecting additional missing attribute information for some of those CAI locations but there are still locations where attributes are missing that did not respond to the survey. Additional methodologies to collect this final missing information will be reviewed and another approach to communicate with these specific CAIs will be undertaken prior to the next data submission. For the April 2012 submission, there were additional community anchor institution locations that are included in the map due to the NTIA allowing some 'unknown' classifications for attributes within the community anchor institution feature class.

Validation and Verification

Throughout the data gathering and data preparation processes for each data submission, the data verification has been continuous and has evolved based on the evolution of the data model. The focus has been on getting complete data from all providers and assuring that all data can be processed into the required data model for submission. Where providers did not submit data in acceptable formats for data normalization into NOFA formats or where they did not submit complete data or any data, there has been continued focus on working with the providers by WVGES to continue to improve the source information being provided. Data verification and validation is an on-going, long term process that will continue to evolve throughout the broadband data development program. With the fourth data submission in October 2011 being a much more complete broadband coverage across the State because of additional data supplied by providers, additional data verification methods, beyond what has been implemented to date, continue to be evaluated to refine the map, where applicable. This sixth submission incorporated further refinement to validate the provider supplied information against the Census 2010 geographies. Limited research was performed for specific areas of the map where any user feedback points to a gap in coverage or an over-estimate in coverage. The research was limited due to a small sampling of user feedback at this time. Plans to advertise surveys and the interactive broadband map continue to be executed and are described further in other sections of this document.

Validation Processes

Data validation begins within the data collection process to determine if the data submission by providers is formatted in a way that can be normalized into the required NOFA formats. Where data is deemed incomplete or in non-conforming standards, WVGES staff reached out to providers as necessary to improve the data submissions. After each round of data preparation the format for the updates being collected has improved.

Quality assurance and quality control has been a big focus of the data validation of the submittals assuring that the required data fields are populated properly and that data fields are populated with values that follow the data model rules. As the data model has evolved over each round of data submission these QA/QC checks have been modified to include the changes in fields, values, domains, etc. that are being required for submission.

Validation methods employed include the following:

- Assuring all applicable providers' datasets are propagated forward to each round of data collection
- Verifying that all required fields are populated with valid values and default values are used when appropriate. This includes:
    - Speeds valid for the technologies reported
    - Latitude/longitude coordinates fall within an acceptable range, given the state boundaries
    - The relationships between maximum and typical, and downstream and upstream speeds are valid
    - Service reported at the block level is done using blocks of the appropriate size (less than two square miles)
    - Speeds and technologies reported per provider are consistent between blocks and segments

- Administrative information (provider name, doing business as [DBA] Name, FRN) is consistently reported per provider in each populated feature class.

Outreach to Providers

To further assure the providers' broadband footprints would be accurately represented in data submissions, "check maps" depicting each respective provider's served small census blocks and segments located in large blocks were distributed back to providers. Providers were requested to either approve their check maps as-is, or submit additional changes if their coverage was not accurately represented. Any modifications received as a result of this effort were incorporated into the broadband coverage maps. WVGES plans to incorporate future data reviews with providers using web collaboration tools.

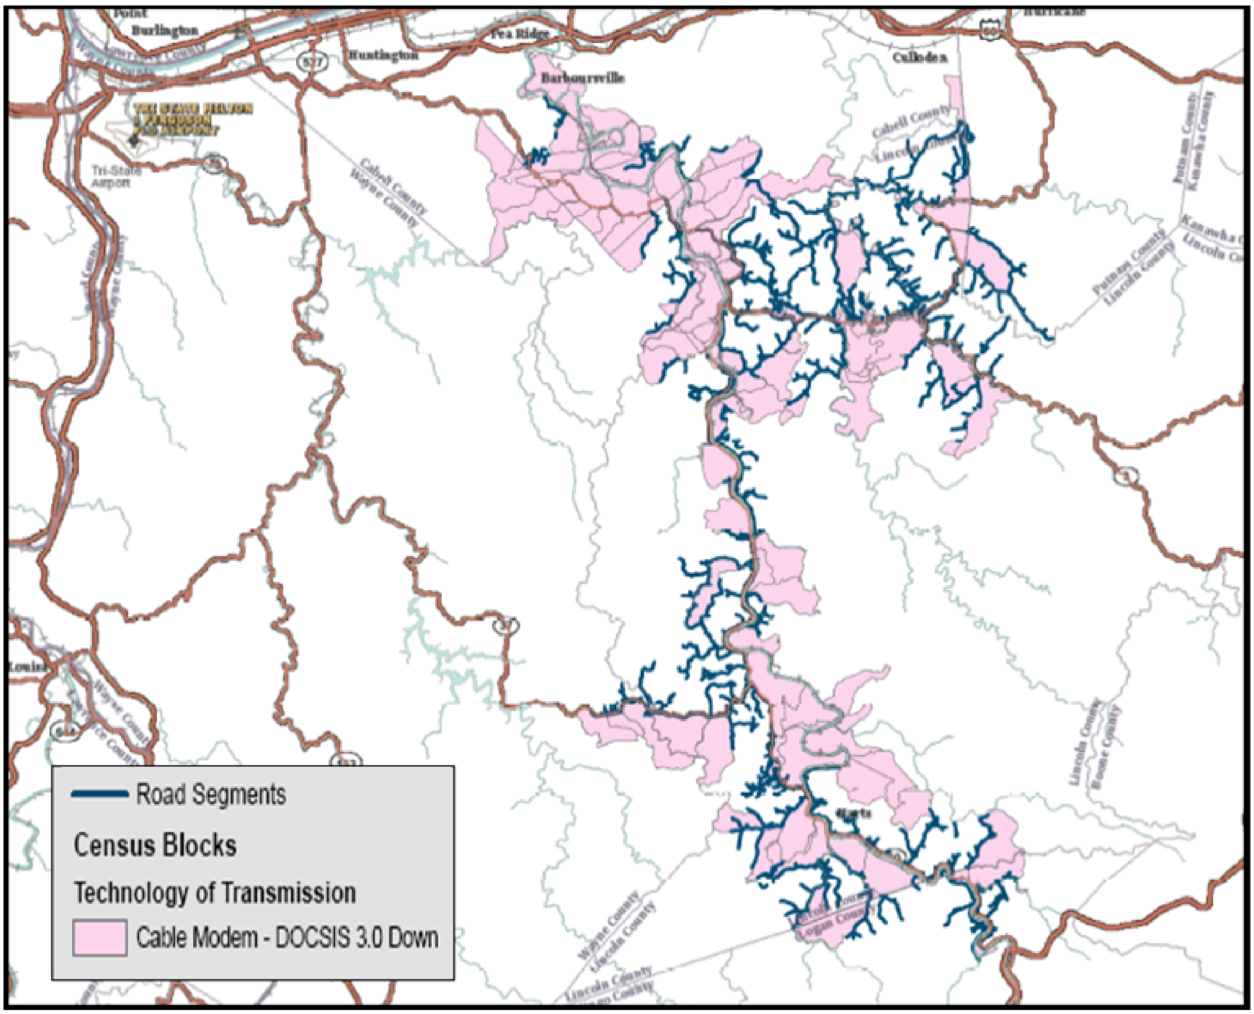

Figure 1—Example of a portion of a provider check map

The validation process for the October 2012 submission includes the use of the Python scripts for validation provided by NTIA.

Third Party Datasets

As data collections and data normalization processes progressed, additional validation was conducted using commercially available datasets. The following commercially available datasets were used as a reference for the specific technologies that their data represented.

- American Roamer datasets

- TeleAtlas Exchange boundaries
- Media Prints Cable boundaries

These datasets were used primarily as a validation source for provider service coverage.

State Broadband Interactive Map

The State of West Virginia released its interactive broadband mapping Website to the public in May 2011. The Website address is www.wvbroadbandmap.org. The Website provides consumers the opportunity to review broadband availability across the State.

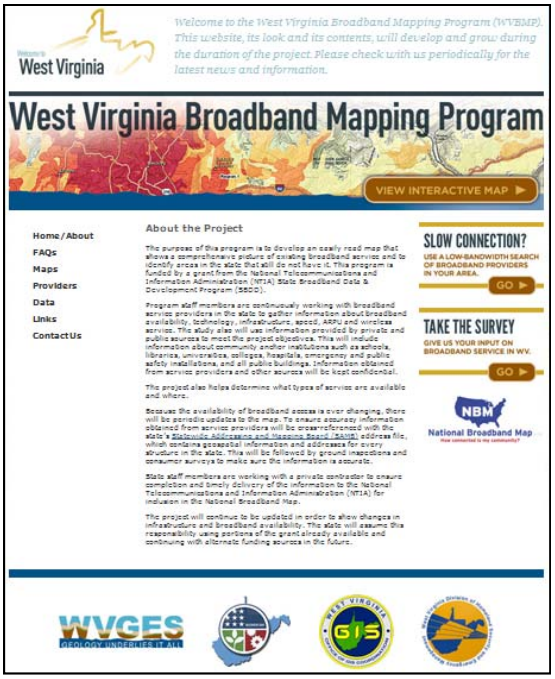

Figure 2—WVBMP main landing page

The main landing page for the West Virginia Broadband Mapping Program (WVBMP) provides background information on the program, contact information and a frequently asked questions section. The landing page has the main link to the broadband coverage map and a link to an address lookup tool for users with slow internet connections. This will allow them to view what coverage is available around their address or zip code without needing to view the entire map, which might not be feasible for users who might still be on dial-up connection speeds. By having this slow internet connection coverage tool, it allows feedback from those consumers even if they do not have the capabilities to bring up the interactive map application.

The Web application has the functionality for consumers and citizens using the State broadband map Web application to submit comments and feedback. The information gathered from that feedback is being reviewed as more potential source information for validating and determining confidence levels of the broadband coverage across the regions of the State. By comparing comments supplied by consumers about broadband availability to the broadband coverage, trends could be recognized where potential inconsistencies in the existing broadband map could exist. This could delineate the need for further focused validation or verification in specific areas that could refine the broadband coverage information for future data submissions.

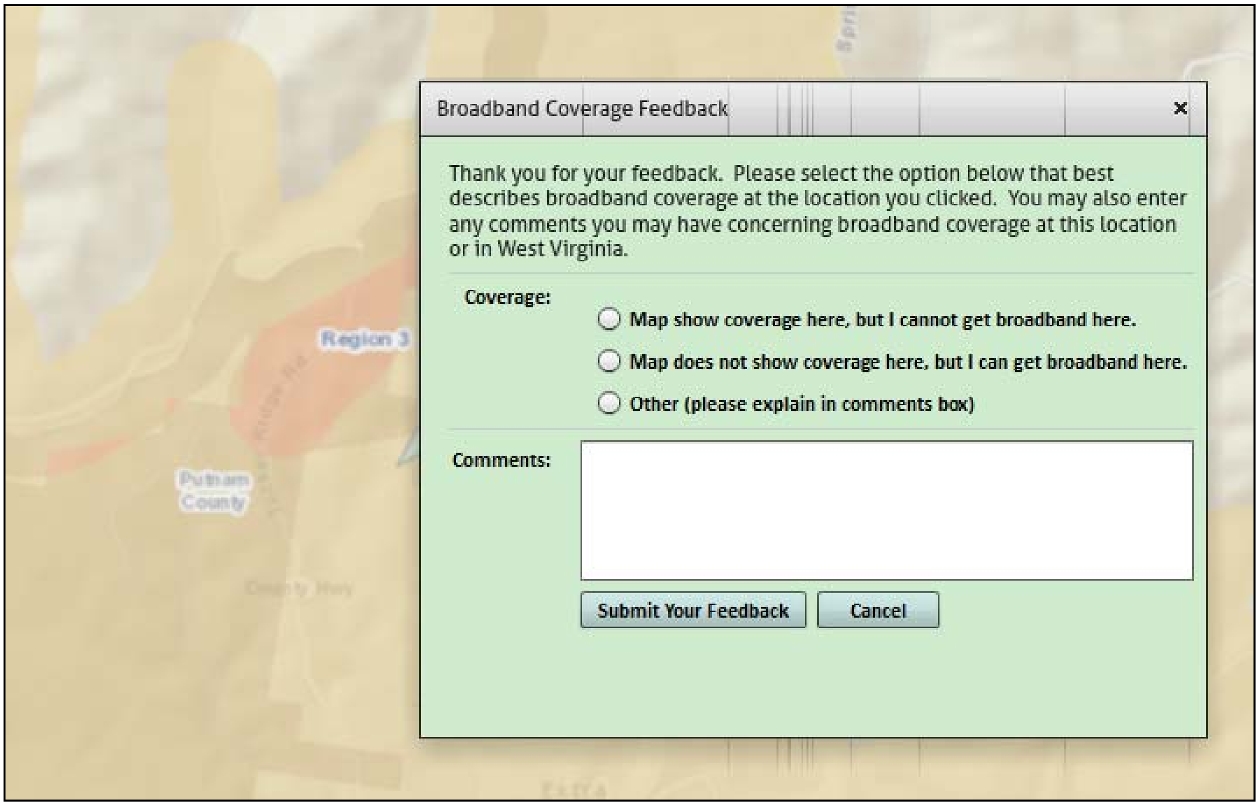

Figure 3—Example of feedback tool interface

For users that can browse the interactive map, they can click on any location on the map and choose to provide specific feedback for that location. This will store the coordinate information of the location that they selected allowing them to choose from a couple of coverage categories for their comment or choose other. Within the feedback tool, they can type in more specific details about their broadband coverage.

After the initial release of the broadband map, there was some initial feedback and comments mainly pertaining to a few areas that were not showing coverage. The feedback indicated that there should be coverage or scenarios where we were showing coverage. One resident made a comment that there was not cable service on a particular road or area. Some of the missing coverage was due to the acquisition of Verizon by Frontier as discussed above.

The State continues to implement plans to incorporate more advertising to the interactive broadband map and feedback tools. Continuing to work more closely with the regional planning councils to review coverage in their communities, a plan to include an advertisement of the interactive broadband map into local phone bills is being developed.

A speed test has been developed within the WVBMP interactive Website. The design of the Website includes links to the speed test developed using the Ookla broadband speed test tools. The speed test is embedded within a broadband survey wizard that allows consumers to provide specific information that will help the State analyze information about use and demand for broadband within the State. To get more users to take the speed test to obtain more results for analysis over the next six months, the speed test will be advertised along with the interactive Website. Speed test results and statistics will be leveraged to compare against the existing broadband coverage and help validate speed information. As stated previously, this could assist in determining if there are any trends or patterns in the information that could be an additional tool for prioritizing areas where more refined verification and validation might need to occur. To date there is still a lack of substantial data collected via the speed-test or surveys to be able to detect patterns or trends and continued planning within the regional planning councils could provide more exposure to the web sites and speed test at the grass roots level. Links to the speed test and the interactive map have also been added to additional web sites, including a new West Virginia Broadband Deployment Council web site (www.broadband.wv.gov) that was launched at the end of 2011.

Future Steps for Validation

Future plans for data validation continue to include establishing confidence levels to assign to broadband coverage based on comparisons with other source information collected, such as feedback from crowd sourcing results from the State broadband map and the national broadband map. Confidence rankings will be used to prioritize any areas where additional verification techniques might be used (consumer and business surveys).

As part of continued broadband planning activities and future validation of data, a third party dataset from Infogroup has been purchased. For broadband map validation, the Infogroup datasets provide consumer broadband use information including coordinate based location information along with provider name and technology that is being used by that particular consumer. The Infogroup data will allow the consumer information to be plotted on the map and compared against existing coverage maps to determine if there are any trends within the Infogroup data that help to determine where additional validation needs to occur. For example, there may be clusters of consumer points for a particular provider that exists in an area of the State where there is no coverage for that provider. The goal would be to identify the major patterns or trends that might need to be re-visited with a provider, if data appears to be missing.

During the summer of 2012, as part of the data verification tasks, a comparison was performed between the State broadband coverage area from the State's last data submission to the National Telecommunication and Information Administration (NTIA) in April 2012 with the third party information from Infogroup purchased by the State. An Excel spreadsheet was provided by Infogroup and contains customer location information for cable, digital subscriber line (DSL), fiber optic (fiber), and wireless subscribers and can be converted into a spatial geographic information system (GIS) dataset. The findings were used to indicate whether or not there are any areas in the submitted broadband coverage data that may need to be updated or verified.

Also present in the spreadsheet table is customer location information for dialup subscribers. This dataset can be converted into a spatial GIS layer and used to identify areas that may not have broadband services, but can still access information through a dialup service.

When comparing the current broadband coverage area and the new XY point layer from the Infogroup records, only a small percentage of points fell outside of the coverage area. Table one highlights the key results that were found.

Type of Service	Total Number of Points	Number of Points Outside of Coverage Area	Number of points Within 50 ft of Coverage Area	Number of points Over 500 ft of Coverage Area
Cable	108503	303	60	92
DSL	63462	268	69	64
Fiber	428	4	1	1
Wireless	4962	54	2	25
Total	17,7355	629	132	182

Table 1—Points Outside of Coverage Area by Technology

In conclusion, the analysis of the dataset indicates that no immediate changes need to be made to the existing broadband coverage area because of the low percentage of points that fell outside of the current coverage areas. The few clusters of points that fell outside of the current coverage area should be reviewed and potentially discussed with providers in those areas to determine if any existing coverage needs to be expanded in those areas. This will be incorporated within data submission request period for the next data submission.

Another dataset that is being considered for purchase for broadband planning activities and broadband demand analysis is Telogical's broadband statistical datasets that provide pricing information. Included in the datasets is information on broadband maximum advertised speed by providers which could help validate some of the speed data within the broadband mapping datasets.

Throughout the broadband data development program, as addressing information from the State Addressing and Mapping Board's addressing datasets are continually updated, address point information from providers will continually be re-verified prior to each submission to NTIA to improve geocoding results and refine the broadband coverage areas.

Specific Verification Tasks- Fourth Quarter 2012

The West Virginia Broadband Mapping Program has outlined specific objectives for data verification through the end of 2012. These objectives are focused on five main components:

1. Begin development of a plan for integration of Public Data Sources for verification activities
2. Begin development of a plan to compile free wireless broadband services offered and operated by a government, business, or community entity
3. Continue verification activities by revisiting contacts for each anchor institution and developing verification strategy for data with which we are less confident
4. Continue to refine a confidence scale that indicates the level of confidence for each record
5. Obtain speeds at the block/segment level

To continue to achieve these objectives as outlined to the National Telecommunications and Information Administration (NTIA) in the West Virginia Broadband Mapping Program activities for 2012, the West Virginia Office of GIS Coordination (WVOGC) will finalize the planning and implementation of the following tasks in 2012.

- Receive the current FCC Form 477 data from the WVOGC and provide comparisons to the round 6 submission data to determine if there are additional build out by providers that need to be requested for the round 7 submission.
- Use service availability query tools published on providers' websites to compare to what has been submitted
- Begin compilation of free wireless broadband services offered and operated by a government, business, or community entity. Research information on web sites and applications that list free Wi-Fi hotspots. Further field verification of these hotspots through a pilot test is described in a separate section of this document.
- Work with WVOGC and the West Virginia of Department of Homeland Security and Emergency Management (WVDHSEM) to launch an outreach campaign to have community anchor institutions take the speed test and take a specific survey developed for community anchors beyond what has already been surveyed and collected so far by WVDHSEM.
- Review submitted wireline attributes (Central offices, remote terminals, etc.) and compare locations as submitted by providers to any visible location information on orthophotos or against of any facilities coded in the State Addressing and Mapping Board (SAMB) data. Additional field verification would be completed in pilot area testing described in this document.
- Launch another outreach campaign to resellers to determine if they want to be included on the state web map in some capacity and determine the best approach to adding those resellers.
- Refine a confidence scale to provide a level of confidence for records in the database. A matrix would be developed to rank quality metrics for each provider to develop a weighted score that could then be applied by to the database. The quality metrics and matrix would be developed with WVOGC.
    - Rank 1-5 on:

  - Consistency/cohesiveness of their coverage – if their coverage pattern is consistent with what is expected given their technology, or if isolated blocks/address points exist
  - Quality of data supplied – customer address points instead of qualified address points, solid wireless coverage patterns instead of propagation-style, street segments that can't be mapped, generalized data, etc.
  - Completeness of data – missing field values, etc.
  - Cooperation of the providers – e.g. whether they are responsive to the data requests each round, if they submit data on time, etc.
- Obtain speeds at the block/segment level. Research the currently available options for obtaining more detailed speed information, including third-party source data, and providing recommendations to WVOGC.
- Continue to mine information from the speed tests and develop new campaigns to encourage the use of the speed test.

Field verification pilot test:

To achieve the long-term success of specific verification tasks outlined above as the project continues into 2013 and 2014, an initial field verification pilot test will be conducted during the fourth quarter of 2012. Field verification will be performed in specific areas of the state as determined by WVOGC. This pilot test will involve the following activities:

- Using mobile applications on smart phones or laptops to test wireless broadband availability and speeds. Verify location of Central Offices, Remote Terminals, etc.
- Collect and verify location of Wi-Fi hotspots and free public broadband to help compile of map of these locations

Once the field verification portion has been completed, analysis of the results will be performed and an overall report developed outlining the activities and recommendations on expanding these verification activities beyond these pilot areas in 2013. A determination will be made as to whether or not the results for the specific activities returned data and information that are beneficial in the development of a more accurate broadband coverage map and valuable for the continued broadband planning activities. If these results indicate that these activities should be expanded beyond the pilot test area, an implementation plan will be developed for the specific field verification activities that should be expanded to a large geographic area.

Use of Broadband Mapping Datasets for State Broadband Grant Program

The West Virginia Broadband Deployment Council launched a state grant program in the summer of 2012 to help bring affordable broadband to unserved areas of West Virginia. One of the most important ways it does this is by providing grants to help fund broadband deployment projects. Broadband deployment projects can be of two types – infrastructure and demand stimulation. Infrastructure projects are those that bring affordable broadband service to people and businesses that do not currently have it and may never have it without some sort of public funding. Demand stimulation projects are those that help people and businesses understand and value the benefits broadband service would bring to them, and cause them to want to use that service. To help delineate specific potential project areas, as described in the West Virginia Code 31-15C-1, the broadband mapping coverage that has been developed as part of the NTIA's broadband mapping program was used to generate maps that depicted Type 1, 2 and 3 areas outlined in that statute.

A Type 1 un-served area is an area in which broadband may be deployed by service providers in an economically feasible manner. A Type 2 un-served area is an area in which broadband may be deployed by broadband service providers and other entities in an economically feasible manner, provided some form of public money is made available. A Type 3 un-served area is an area in which, at present, cable or wireline broadband cannot be deployed in an economically feasible manner and an intermodal approach employing other technologies, such as satellite and wireless, is required to provide that area with high-speed internet access.

Broadband service providers each have unique processes for determining when it is economically feasible to deploy broadband service to a given area. The process varies from provider to provider and depends greatly on the technology being deployed. Because no consistent formula exists and the definition of a Type 1, 2 or 3 un-served area is not strictly defined, an objective means to classify un-served areas based upon known metrics for populations more likely to have broadband service today. Metrics regarding current broadband deployment were obtained from Federal Communications Commission (FCC) reports. Factors including structure points, population density, median income, age, distance from existing networks and terrain were considered in classifying un-served areas as Type 1, 2 or 3.

The known areas currently served by broadband service providers were documented from the state broadband mapping program through the geographic information systems (GIS) coordinator's office and the West Virginia Geological and Economic Survey (WVGES). Areas currently served by broadband service were excluded from the determination. Un-served areas were then subdivided based on proximity to structure points and road segments. Each area was then correlated with 2000 and 2010 census data for population density, income and population age to determine likelihood for deploying broadband service.

Criteria used to determine the likelihood of a given area receiving broadband service was based on metrics provided by the Broadband Adoption and Use in America, OBI Working Paper Series No. 1, by John B. Horrigan for areas where broadband is currently deployed. Specific categories considered in the determination included population density, population age, income and proximity to existing networks. Each category was weighted on a scale of one to five, with a score of five indicating a high likelihood to receive broadband service and a score of one indicating a low likelihood to receive broadband service. Based on the average of the four considered categories, each subdivided area was classified as Type 1, 2 or 3.

Based on the determination, a map was developed which depicts the Type 1, 2 and 3 classifications across the state. A 1,000 foot boundary was included within the documented area around each structure point to reflect the area that a wireline provider may be willing to lay cable from a roadway in order to provide broadband service. Served areas are reflected with a yellow color. Each un-served area is color classified according to the Type 1, 2 and 3 determinations.

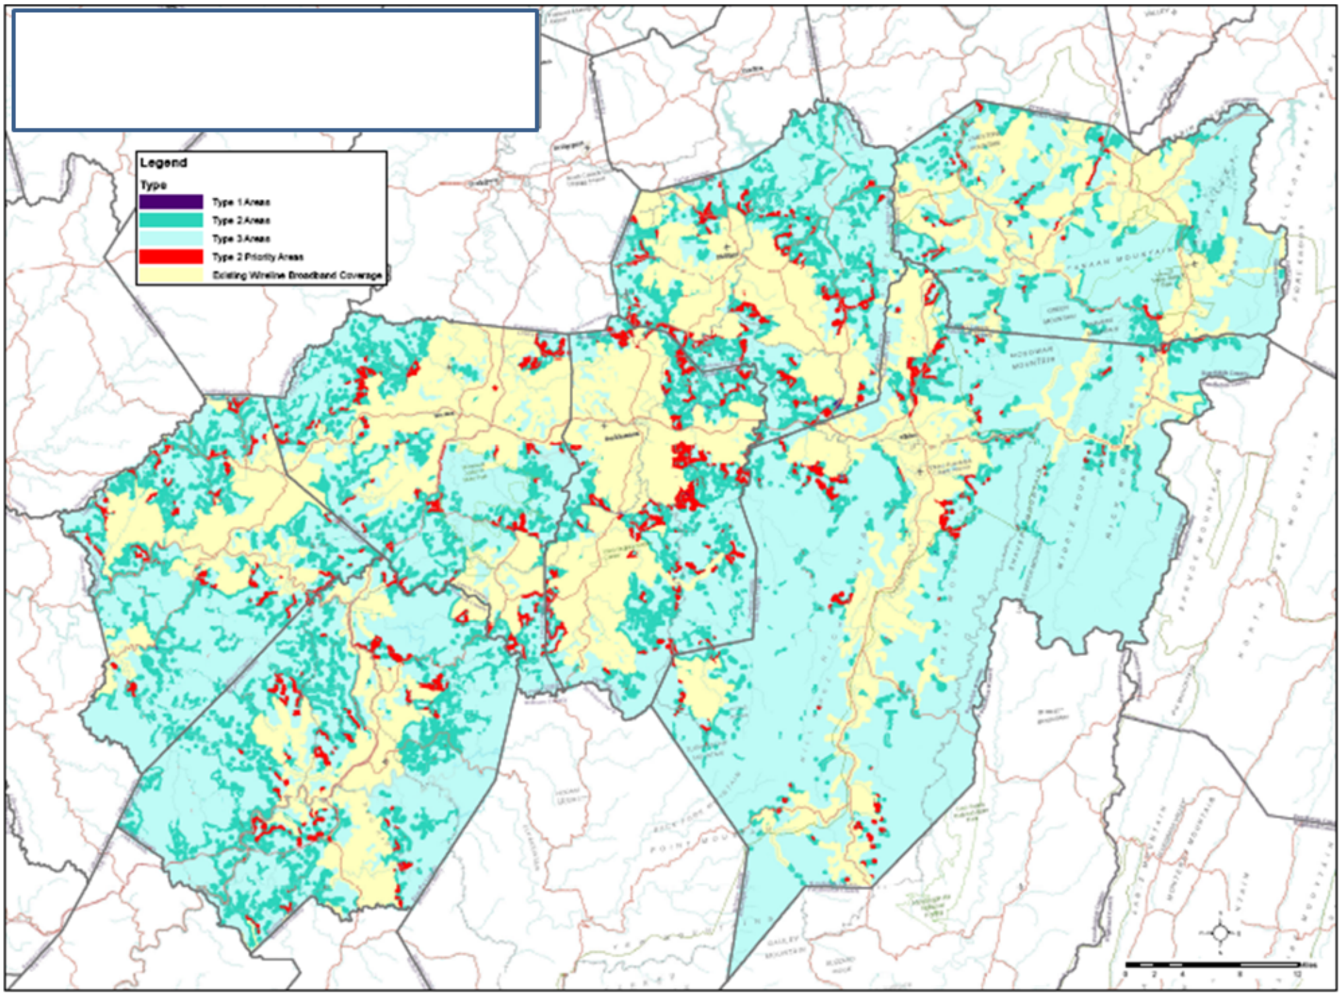

Figure 4 - Sample of a Type 1, 2 and 3 Map

Providers

Non-Responsive Providers

Names of providers who were non responsive will be passed along to the WV Geographic Information Systems (GIS) Coordinator's Office to be contacted again.

Atlantic Broadband LLC
DBA: Atlantic Broadband, LLC
FRN: 0009596883
This provider was contacted eight times. Data was not provided by the October submittal date. Further attempts at data gathering will be made in the next round of data collection.

**Skyweb, Inc
DBA: SKYWEB Inc.
FRN: 0018516799

**Tower locations were provided along with additional information for each tower site. Two computerized propagation studies were performed to approximate coverage for a local provider supplying broadband data. The two studies were predicted in the 900 MHz and 2.4 GHz bands that are utilized at these locations. The data was received from the provider that defined the tower sites currently utilized to provide coverage. Parameters provided include site locations, ground elevation, transmit power, antenna height above ground, and antenna gain. All of these components were compiled into EDX Signal software program which calculates the associated link budget and in which the program takes into account terrain and land use land clutter (LULC). Propagation studies show potential coverage throughout the area. Additional assumptions made include a predicted reliability of 90 percent for any signal received by a device and no additional signal loss was taken into account for signals received inside buildings which may further impact the coverage predictions. Coverage areas based on the propagation studies do not seem to represent realistic coverage patterns and will need to be reviewed again with SkyWeb in the future.

Satellite Providers

Data requests sent to Satellite providers were met with the response of "We provide to the entire state." Attempts made at gathering more detailed data sets were unsuccessful for this round of data collection. Further attempts will be made for the next round of data collection.

Hughes Communications, Inc.
DBA: HNS Licensuse Sub, LLC
FRN: 0018483073
Detailed data was not provided by the October submittal date. Further attempts at data gathering will be made in the next round of data collection.

StarBand Communications Inc.
DBA: StarBand Communications Inc.
FRN: 0005087457
Detailed data was not provided by the AprilOctober submittal date. Further attempts at data gathering will be made in the next round of data collection.

WildBlue Communications, Inc.
DBA: WildBlue Communications, Inc.
FRN: 0007843766
Detailed data was not provided by the October submittal date. Further attempts at data gathering will be made in the next round of data collection.

(Address of Recipient)

Re: Data Request in Compliance with the State Broadband Data and Development Grant Program and the Broadband Data Improvement Act

Response Requested by March 1st, 2012

Dear < >:

The West Virginia Geological and Economic Survey (WVGES) must collect certain data regarding the availability of broadband services, technology used to provide them, and the location of certain broadband infrastructure. The WVGES is required to provide the collected data to the NTIA every six months beginning March 2010 until October 2014. Entities that provide broadband service, as defined below, on either a commercial or noncommercial basis within West Virginia are subject to this request.

WVGES was designated as the single West Virginia entity eligible to receive a grant under the Broadband Data Improvement Act of 2008 (BDIA), 47 U.S.C. §§ 1301-04. In 2009, the WVGES successfully applied to the National Telecommunications and Information Administration (NTIA) for such a grant, pursuant to the NTIA's Notice of Funds Availability (NOFA).

The NTIA's State Broadband Data and Development Grant Program Notice of Funds Availability, Docket No. 0660ZA (July 8, 2009) (NOFA), defines broadband as follows:

> …two-way data transmission to and from the Internet with advertised speeds of at least 768 kilobits per second (kbps) downstream and at least 200 kbps upstream to end users, or providing sufficient capacity in a middle mile project to support the provision of broadband service to end users…

Please note that the broadband inventory maps derived from these data may result in government-subsidized broadband deployment in unserved and underserved areas. Providers that do not respond may face subsidized competition in areas they already serve.

Attached to this request are the Technical Appendix to the NOFA and a technical appendix written by the WVGES to clarify the data that needs to be collected. **Please note this appendix is new as of January 1, 2012.** These documents outline the broadband availability information WVGES is required to collect. Every broadband service provider within the state of West Virginia is expected to provide the information specified in the attached documents to WVGES **<u>no later than March 1st, 2012</u>**, in the format WVGES has specified.

Six Month Update:
Pursuant to the BDIA and the NOFA, WVGES must collect updates on broadband data on a six month rolling basis. **If you had submitted adequate information during the 2nd collection period of 2011 and there are no changes to your infrastructure, the WVGES requests a letter stating such**. If infrastructures changes have been made in the interim period, submissions of the changes are required.

Contact Information:
Please submit the requested data **<u>no later than March 1, 2012</u>** by CD or DVD to Michael "Ty" Clifford, West Virginia Geological and Economic Survey, 1 Mont Chateau Rd. Morgantown WV 26508-8079.

If you have questions about this request, contact Michael "Ty" Clifford by email at mclifford@geosrv.wvnet.edu, or by phone at (304) 594-2331.

Nondisclosure Agreement:
Data submitted to WVGES in response to this request will be protected under the confidentiality requirements set forth in Section 106 (h)(2) of the BDIA. This section states that, "[n]ot withstanding any provision of Federal or State law to the contrary, an eligible entity shall treat any matter that is a trade secret, commercial or financial information, or privileged or confidential, as a record not subject to public disclosure except as otherwise mutually agreed to by the broadband service provider and the entity." Further, the NOFA states that "[a]s a measure to protect the confidential or proprietary nature of the information received from broadband service providers and other organizations during the data collection phase, awardees may execute nondisclosure agreements (consistent with applicable law) that require awardees to treat any matter that is a trade secret, commercial or financial information, or privileged or confidential, as a record not subject to public disclosure except where mutually agreed upon by the information provider and the awardee, provided, however, that any such nondisclosure restriction a) will not restrict the providing of all data collected under this Program to NTIA, nor b) restrict NTIA's use of such data as contemplated under this Notice (including sharing such data with the FCC or other federal agencies)". NTIA expects awardees to enter into such agreements upon the request of the service provider. WVGES believes that these provisions will protect the confidentiality of information that broadband providers submit pursuant to this request and intends to enter into a nondisclosure agreement with any provider that wishes to do so.

Michael Ed Hohn
Director and State Geologist
West Virginia Geological and Economic Survey

West Virginia Geological and Economic Survey Guide to Broadband Submission

Purpose:
Several changes in submission guidelines have been made by NTIA since the writing of the original Technical Appendix. This document clarifies what is preferred and required for submission and the original NTIA Technical Appendix no longer adequately describes what is required.

Broadband definition:
Broadband Service is the provision, on either a commercial or noncommercial basis, of data transmission technology that provides two-way data transmission to and from the Internet with advertised speeds of at least 768 kilobits per second (kbps) downstream **and greater than 200 kbps upstream** to end users, or providing sufficient capacity in a middle mile project to support the provision of broadband service to end-users within the project area.

2010 census requirements:
Beginning in June 2011, all census block and road information **must be derived from 2010 Census Data**. All block and road data submitted **must have a unique identifier present**, such as census block # or **TLID.**
The WVGES has created two shapefiles which contain all census blocks in West Virginia less than 2 square miles and all roads contained in census blocks greater than 2 square miles. All census and road data must correspond to these master files.

The shape files are located at:
https://dssfm.kimballdata.com

```
Username: censusdata
Password: censusdata#1
```

Data preferences:
The WVGES prefers data to be submitted in the following order of preference:

- ESRI shapefile format with all required fields submitted.
- Service area boundary with defined speeds and fields that can be converted to blocks and roads.
- Flat Excel or comma-delimited files that contain all data field and unique identifiers.

Data Types and required fields:

Wireless Services not Provided to a Specific Address – Shapefile

Facilities-based providers of wireless broadband service that is not address specific (e.g., nomadic, terrestrial mobile wireless, or satellite), may provide WVGES with GIS-compatible shapefiles depicting areas in which broadband service is available to end users.

For this purpose, an “end user” of broadband service is a residential or business party, institution, or state or local government entity that may use broadband service for its own purposes and that does not resell such service to other entities or incorporate such service into retail Internet-access service. Internet Service Providers (ISPs) are not “end users” for this purpose. An entity is a “facilities-based” provider of broadband service connections to end user locations if any of the following conditions are met: (1) it owns the portion of the physical facility that terminates at the end user location; (2) it obtains unbundled network elements (UNEs), special access lines, or other leased facilities that terminate at the end user location and provisions/equips them as broadband; or (3) it provisions/equips a broadband wireless channel to the end user location over licensed or unlicensed spectrum.

For this purpose, “broadband service” is “available” at a location if the provider does, or could, within a typical service interval (7 to 10 business days) without an extraordinary commitment of resources, provision two-way data transmission with advertised speeds of at least 768 kilobits per second (kbps) downstream and greater than 200 kbps upstream to end-users at that location. The data shall be submitted to WVGES as an ESRI Shapefile such that the associated data contains the following fields:

- Instructions for providers needing to obtain a FRN can be accessed at https://fjallfoss.fcc.gov/coresWeb/publicHome.do.
- All map areas must be closed, non-overlapping polygons with a single, unique identifier.
- Any variation in any of the required fields necessitates the creation of a separate closed, non-overlapping polygon.
- In the area covered by each polygon, subscribers must have broadband service with the speed characteristics shown in the data record 95% of the time to within 50 feet of the polygon’s boundary.
- The technology of transmission should be entered as an integer based on the coding scheme shown below.
- The speed tiers should be entered as integers according to the reference in below.
- The data must be expressed using the WGS 1984 geographic coordinate system.
- Maps must be accompanied by metadata or a plain text “readme” file that contains a comprehensive explanation of the methodology employed to generate the map layer including any necessary assumptions and an assessment of the accuracy of the finished product.
- Since ESRI Shapefiles typically consist of 5 to 7 individual files including the associated metadata and geodatabase, data for the entire state or territory should be submitted as a single, zipped file containing all the component files. The file should be named “area_availability_XX.zip” where XX is the two-letter postal abbreviation for the state or territory.

Record Format for Availability Area Data for Each Provider – Use Only in Connection with Wireless Services not Provided to a Specific Address

Field	Description	Type	Example
Provider Name	Provider Name	Text	ABC Co.
DBA Name	"Doing-business-as" name	Text	Superfone, Inc.
FRN	Provider FCC Registration Number	Integer	8402202
Technology of Transmission	Category of technology for the provision of service (see details following Part 1(a) for codes)	Integer	41
Spectrum Used	If technology of transmission is wireless, is Cellular spectrum (824-849 MHz; 862-869) used to provide service (Y/N)?	Text	Y
Spectrum Used	If technology of transmission is wireless, is 700 MHz spectrum (698-758 MHz; 775-788 MHz; 805-806 MHz) used to provide service (Y/N)?	Text	Y
Spectrum Used	If technology of transmission is wireless, is Broadband Personal Communications Services spectrum (1850-1915 MHz; 19301995) used to provide service (Y/N)?	Text	Y
Spectrum Used	If technology of transmission is wireless, is Advanced Wireless Services spectrum (1710-1755 MHz; 2100-2155) used to provide service (Y/N)?	Text	N
Spectrum Used	If technology of transmission is wireless, is Broadband Radio Service/Educational Broadband Service spectrum (2496-2690 MHz) used to provide service (Y/N)?	Text	N
Spectrum Used	If technology of transmission is wireless, is Unlicensed (including broadcast television "white spaces") spectrum used to provide service (Y/N)?	Text	N
Spectrum Used	If technology of transmission is wireless, but the spectrum used to provide service is not listed above, please identify as one of the following: Specialized Mobile Radio Service (SMR) (817-824 MHz; Spectrum Used 862-869 MHz; 896-901 MHz; 935-940 MHz), Wireless Text SMR Communications Service (WCS) spectrum (2305-2320 MHz; 2345-2360 MHz), 3650-3700 MHz, Satellite (L-band, Big LEO, Little LEO, 2 GHz).	Text	SMR
Maximum Advertised Downstream Speed	Speed tier code for the maximum advertised downstream speed available (see details following Part 1(a) for codes)	Integer	8

Maximum Advertised Upstream Speed	Speed tier code for the maximum advertised upstream speed that is offered with the above maximum advertised downstream speed available (see details following Part 1(a) for codes)	Integer	8
Typical Downstream Speed	Speed tier code for the downstream data transfer throughput rate that most subscribers to service at the maximum advertised downstream speed (above) can achieve consistently during expected periods of heavy network usage (see details following Part 1(a) for codes).	Integer	8
Typical Upstream Speed	Speed tier code for the upstream data transfer throughput rate that most subscribers to service at the maximum advertised upstream speed (above) can achieve consistently during expected periods of heavy network usage (see details following Part 1(a) for codes).	Integer	8

Middle Mile and Backbone Interconnection Points

In addition to the information shown in the tables below, awardees shall provide NTIA with a list of interconnection points of facilities in their state that provide connectivity between (a) a service provider's network elements (or segments) or (b) between a service provider's network and another provider's network, including the Internet backbone. (Collectively, (a) and (b) are "middle-mile and backbone interconnection points").

Middle-mile and backbone interconnection points typically enable relatively fast data rates, are built to handle substantial capacities, and may be service-quality assured.

Examples might include: points of interconnection enabling communications between an incumbent local exchange carrier central office and the Internet, between a cable aggregation point (headend) and the Internet, or between a wireless base station and the provider's core network elements that connect to other networks including the internet.

These data shall be submitted to NTIA as a tab-delimited text file in which each record has the following format:

- Instructions for providers needing to obtain a FRN can be accessed at https://fjallfoss.fcc.gov/coresWeb/publicHome.do.
- The capacity of the serving facility should represent the capacity as currently configured and be expressed according to the following reference:
- Coordinates must be expressed using the WGS 1984 geographic coordinate system.
- Data for the entire state or territory should be submitted as a single, tab-delimited plain text file named "middlemile_XX.txt" where XX is the two-letter postal abbreviation for the state or territory.

Record Format for Middle-Mile and Internet Backhaul Connection Points Data for Each Provider

Field	Description	Type	Example
Provider Name	Provider Name	Text	ABC Co.
DBA Name	Doing-business-as name	Text	Superfone, Inc.
FRN	FCC Registration Number	Integer	8402202
Ownership	Is the facility owned (0) or leased (1)?	Integer	0
Serving Facility Capacity	Serving capacity of transport facility (see details below)	Integer	1
Serving Facility Type	Type of transport facility (1=Fiber; 2=Copper; 3=Hybrid Fiber Coax (HFC); 4=Wireless)	Integer	1
Latitude	Latitude in decimal degrees	Float	38.88456
Longitude	Longitude in decimal degrees	Float	-77.028123
Elevation	Elevation relative to grade to the nearest foot (positive integers indicate above grade, negative below grade)	Integer	-10

Serving Facility Codes

Data Rate Code	Interconnection Point Data Rate
1	Multiple T1s and less than 40 mbps
2	Greater than 40 mbps and less than 150 mbps
3	Greater than 150 mbps and less than 600 mbps
4	Greater than or equal to 600 mbps and less than 2.4 gbps
5	Greater than or equal to 2.4 gbps and less than 10 gbps
6	Greater than or equal to 10 gbps

Service Address Service Associated with Specific Address

For each facilities-based provider of broadband service to specified end-user locations in their state, awardees shall provide NTIA with a list of all addresses at which broadband service is available to end users in the provider's service area, along with the associated service characteristics identified below.

For this purpose, "broadband service" is the provision, on either a commercial or noncommercial basis, of data transmission technology that provides two-way data transmission to and from the Internet with advertised speeds of at least 768 kilobits per second (kbps) downstream **and greater than 200 kbps upstream** to end users, or providing sufficient capacity in a middle mile project to support the provision of broadband service to end-users within the project area.

For this purpose, an “end user” of broadband service is a residential or business party, institution or state or local government entity that may use broadband service for its own purposes and that does not resell such service to other entities or incorporate such service into retail Internet-access services. Internet Service Providers (ISPs) are not “end users” for this purpose. An entity is a “facilities-based” provider of broadband service connections to end user locations if any of the following conditions are met: (1) it owns the portion of the physical facility that terminates at the end user location; (2) it obtains unbundled network elements (UNEs), special access lines, or other leased facilities that terminate at the end user location and provisions/equips them as broadband; or (3) it provisions/equips a broadband wireless channel to the end user location over licensed or unlicensed spectrum.

For this purpose, “broadband service” is “available” at an address if the provider does, or could, within a typical service interval (7 to 10 business days) without an extraordinary commitment of resources, provision two-way data transmission to and from the Internet with advertised speeds of at least 768 kilobits per second (kbps) downstream and greater than 200 kbps upstream to endusers at that address. The list of addresses shall be submitted to WVGES as a tab-delimited text file in which each record has the following format:

- All fields are required.
- Instructions for providers needing to obtain a FRN can be accessed at https://fjallfoss.fcc.gov/coresWeb/publicHome.do.
- The ID field is a sequential integer ranging from 1 to the total number of addresses.
- Address data fields should be space-delimited in standardized Postal Service form. See http://pe.usps.gov/cpim/ftp/pubs/Pub28/pub28.pdf.
- Categories of end users should be entered as integers based on the following table.
- For reporting the technology of transmission, report the technology used by the portion of the connection that terminates at the end-user location. If different technologies are used in the two directions of information transfer (“downstream” and “upstream”), report the connection in the technology category for the downstream direction. The technology of transmission should be entered as an integer based on the following tables.
- Speed tiers should be entered as integers based on the following tables.
- Data for the entire state or territory should be submitted as a single, tab-delimited plain text file named “address_availability_XX.txt” where XX is the two-letter postal abbreviation for the state or territory.

Record Format for Address Data for Each Provider

Field	Description	Type	Example
Provider Name	Provider Name	Text	ABC Co.
DBA Name	“Doing-business-as” name	Text	Superfone, Inc.
FRN	Provider FCC Registration Number	Integer	8402202
ID	Sequential record number	Integer	1

End User location/Service Data End-User Address	Complete address	Text	1401 Constitution Ave NW Washington DC 20230
End-User Building Number End-User Prefix Direction	Building number Prefix direction	Text	1401
End-User Street	Street name	Text	Constitution
End-User Street Type End-User Suffix Direction	Street type Suffix direction	Text	Avenue NW
End-User City	City	Text	Washington
End-User State Abbreviation	Two-letter state postal abbreviation	Text	DC
End-User ZIP Code	5-digit ZIP code (with leading zeros)	Text	20230
End-User ZIP Plus 4	4-digit add-on code (with leading zeros)	Text	0005
Category of End User	Category of End User Served at Address (see details below for codes)	Integer	3
Technology of Transmission	Category of technology available for the provision of service at the address (see details below for codes)	Integer	50
Maximum Advertised Downstream Speed	Speed tier code for the maximum advertised downstream speed available at the address (see details below for codes)	Integer	8
Maximum Advertised Upstream Speed	Speed tier code for the maximum advertised upstream speed that is offered with the above maximum advertised downstream speed available at the address (see details below for codes)	Integer	8
Typical Downstream Data	Speed tier code for the downstream data transfer throughput rate that most subscribers to service at the maximum advertised downstream speed (above) can achieve consistently during expected periods of heavy network usage (see details below for codes)	Integer	8

Typical Upstream Speed	Speed tier code for the upstream data transfer throughput rate that most subscribers to service at the maximum advertised upstream speed (above) can achieve consistently during expected periods of heavy network usage (see details below for codes)	Integer	8

End User Codes

End User Category Code	End User Category	Description
1	Residential	Address denotes a residential living unit, individual living unit in institutional settings such as college dormitories and nursing homes and other locations designed primarily for residential use at which broadband service is available.
2	Governmental	Address denotes a state orl ocal govermnent location at which broadband service is available.
3	Small Business	Address denotes the location of a small business.
4	Medium or Large Enterprise	Address denotes the location of a medium or large enterprise.
5	Other	Address denotes a location not meeting any of the above descriptions.

Technology of Transmission Codes

Technology Code	Description	Details
10	Asymmetric xDSL	
20	Symmetric xDSL	
30	Other Copper Wireline	All copper-wire based technologies other than xDSL (Ethernet over copper and T-1 are examples)
40	Cable Modem - DOCSIS 3.0	
41	Cable Modem - Other	

50	Optical Carrier/Fiber to the End User	Fiber to the home or business end user (does not include "fiber to the curb")
60	Satellite	
70	Terrestrial Fixed Wireless - Unlicensed	
71	Terrestrial Fixed Wireless - Licensed	
80	Terrestrial Mobile Wireless	
90	Electric Power Line	
0	All Other	Any specific technology not listed above.

Speed Tier Codes

Upload Speed Tier	Download Speed Tier	Description
1	--	Less than or equal to 200 kbps
2	--	Greater than 200 kbps and less than 768 kbps
3	3	Greater than or equal to 768 kbps and less than 1.5 mbps
4	4	Greater than or equal to 1.5 mbps and less than 3 mbps
5	5	Greater than or equal to 3 mbps and less than 6 mbps
6	6	Greater than or equal to 6 mbps and less than10 mbps
7	7	Greater than or equal to 10 mbps and less than 25 mbps
8	8	Greater than or equal to 25 mbps and less than 50 mbps
9	9	Greater than or equal to 50 mbps and less than 100 mbps
10	10	Greater than or equal to 100 mbpss and less than 1 gbps
11	11	Greater than or equal to 1 gbps

Census Blocks Less than Two Square Miles

Record Format for Wireline Service by Census Block
(For Census Blocks no greater than two square miles in area in which broadband service is available to end users)

Field	Description	Type	Example
Provider Identification Data			
Provider Name	Provider Name	Text	ABC Co.
DBA Name	“Doing-business-as” name	Text	Superfone, Inc.
FRN	Provider FCC Registration Number	Integer	8402202
ID	Sequential record number	Integer	1

Census Block Identification Data			
Census Block FIPS Code	15-digit Federal Information Processing Standard (FIPS) Code identifying individual Census Block. Must include leading "0"	Integer	60750160001015
Census Block Square Mileage	Provide square mileage for specific census block number to the first decimal place	Number	1.8
Broadband Technology and Speed Data			
Technology of Transmission	Category of technology available for the provision of service at the address (see details below for codes)	Integer	50
Typical Downstream Speed	Speed tier code for the downstream data transfer throughput rate that most subscribers to service at the maximum advertised downstream speed (above) can achieve consistently during expected periods of heavy network usage (see details below for codes)	Integer	8
Typical Upstream Speed	Speed tier code for the upstream data transfer throughput rate that most subscribers to service at the maximum advertised upstream speed (above) can achieve consistently during expected periods of heavy network usage (see details below for codes)	Integer	8

Roads contained within Census Blocks greater than two square miles

Record Format for Wireline Service by Street Segment

(For Census Blocks larger than two square miles in area in which broadband service is available to end users)

Field	Description	Type	Example
Provider Identification Data			
Provider Name	Provider Name	Text	ABC Co.
DBA Name	"Doing-business-as" name	Text	Superfone, Inc.
FRN	Provider FCC Registration Number	Integer	8402202
ID	Sequential record number	Integer	1

End User location/ Service Data			
Census Block FIPS Code	15-digit Federal Information Processing Standard (FIPS) Code identifying individual Census Block	Integer	60750160001015
Census Block Square Mileage	Provide square mileage for specific census block number to the first decimal place	Number	5.8
Street Name	Provide street name to identify street segment	Text	Van Ness
Street Type	Street type to identify street segment	Text	Avenue
Street Direction Prefix	Street Prefix to identify street segment	Text	N
TLID	Unique identifier for each street segment	Text	0015874962
Broadband Technology and Speed Data			
Technology of Transmission	Category of technology available for the provision of service at the address (see details below for codes)	Integer	50
Typical Downstream Speed	Speed tier code for the downstream data transfer throughput rate that most subscribers to service at the maximum advertised downstream speed (above) can achieve consistently during expected periods of heavy network usage (see details below for codes)	Integer	8
Typical Upstream Speed	Speed tier code for the upstream data transfer throughput rate that most subscribers to service at the maximum advertised upstream speed (above) can achieve consistently during expected periods of heavy network usage (see details below for codes)	Integer	8

State Broadband Initiative Mapping Methodology

For the State of Wyoming
Revised September 30, 2012

CostQuest Associates

LinkAMERICA Alliance

Contents

Overview

This document provides an overview of how the sixth required data set was collected and processed for the State Broadband Initiative (SBI) in the state of Wyoming.

This submission builds upon prior efforts to increase in state broadband mapping and planning capacity. Although each state has taken a slightly different path to building in house capacity, this cross-state partnership helps the LinkAMERICA team focus on comparable outcomes across the four states, where appropriate and support each state based upon the State's elected transition path. Our intent is not to make the states look and be the same, rather it is to leverage economies of scope and scale among the business processes while at the same time pursuing the longer term goal of transitioning sustainable program leadership to the respective states.

As our team completes the third year of the SBI program, more work has shifted to in state partners. Much of this work focuses upon the capacity building, planning and technical assistance components of the program. One immediate result of this is that in some of our states in-State partners have taken direct responsibility for the survey, validation and development of Community Anchor Institution information. The methods by which CAI data were developed are included as Appendix One. During this third program year we also anticipate at least one in State partner taking over the state web presence, both in terms of content and hosting. We also have States hiring in dedicated resources to support the program.

As expected, this document rests heavily on the prior drafts but has also been updated and expanded.

Significant changes include additions covering:

1. Trends in provider inputs
2. Modification to internal provider tracking
3. Increases in the amount of WISP coverage using propagation estimates
4. Requested changes based upon NTIA guidance
    a. Review of submitted speed with respect to NTIA supplied frequency table
    b. Review of NTIA speed guidelines and provider documentation
    c. Inclusion of Provider Universe Table (Appendix 4)
    d. Expansion of verification methods summary table
5. Transition planning with respect to capacity building within the State for Broadband map development (even while the technical data development components of the program continue to rest with CostQuest and the LinkAMERICA Alliance).

Treatment of the following subjects has been expanded:

1. Verification and validation
2. Data production methods

3. Provider advertised speed and coverage validation

As anticipated, the SBI program continues to mature and evolve. Technical leadership and strong program office guidance has been appreciated. We continue to focus resources on establishing stable business processes to track submissions, verify received and processed data, test for temporal stability and provide reporting deliverables consistent with NTIA expectations.

In our view, the mapping deliverable reflects (1) a good faith effort, which results in a reasoned response to the NOFA, Technical Appendix A, as well as supplementary program office guidance and modifications offered in phone calls, emails, and webinars, (2) a stable foundation for improvement and prioritization of both NTIA and state needs and interests , (3) a valid data processing model to support online mapping, consumer feedback, provider verification and reporting, and finally, (4) a valid use of the evolving data transfer model and its intrinsic validation methods. More importantly, the resulting data and online coverage maps that follow from this work are providing good input and context for the Broadband planning teams working across the states we have the pleasure to serve.

We also note that the mapping deliverable is increasingly important to state policy makers as each of the states we work with continues to assess the policy ecosystem that supports the advancement of broadband access and adoption.

We close this methodology document with 4 appendices. Appendix 1 refers to efforts related to Community Anchor Institutions. Appendix 2 describes data collection challenges. This section describes some of the open issues, challenges and questions we are exploring. Our hope is to receive clarification and counsel from NTIA in how best to confront some of these issues, which are likely common across states. Appendix 3 describes the confidentiality framework explained by NTIA. Appendix 4 details the provider universe, those providers found to be non-NOFA compliant and those providing data.

Purpose of This Manual

This technical document was developed to provide transparency in our data production process.

Our goal is to illustrate a thoughtful process designed to meet the intent of the submission. Our hope is that we have developed a process that is reasonable, with respect to the data it deals with, as well as flexible enough to change with evolving NTIA requirements and lessons learned from the Broadband mapping community.

Data Sources

Developing the Provider List

Broadband provider lists for all states were developed from the following sources:

- Prior comparable mapping/research efforts
- State lists of regulated telecommunications, cable and wireless service providers
- State and national industry organizations (i.e. cable associations, wireless service provider organizations, telecommunications associations)
- FCC Form 477 respondents
- Third party data sources such as Warren Media, Media Prints, American Roamer Coverage Right, GeoResults Wirecenter Boundaries.
- Independent web searches
- Interviews with key state staff members and important community influencers

As one would expect in a dynamic marketplace, provider identification is an ongoing and important component of our work. Mergers and acquisitions, the use of multiple regional DBAs, the lack of any universal identity management attribute, and the generally complex parent-subsidiary structure of many telecommunications companies, make provider identification and tracking very challenging. Because of this dynamic environment, the Provider list is reviewed on an on-going basis and changes are made as necessary to ensure that the list remains current.

At the start of each round, email and telephone contact is made to all known providers. This time consuming, but necessary, process ensures that the list of contact persons remains current, and that providers are aware of data request changes and deadlines associated with each round. Where necessary, we execute new NDAs with providers. We maintain this communication with providers throughout the Data Collection period, providing multiple paths and opportunities for participation in the program. Providers that respond too late to be included in the final dataset are flagged for inclusion in the next submission. Unresolved data concerns are also flagged and tracked so that we can begin working on a plan for resolution prior to the next data collection round.

As contact is made in each round, we qualify each provider by asking a series of questions regarding the type of service and speeds offered. If the provider does not meet the minimum specifications for a

Broadband provider (as defined in the NOFA) we make a note of the change in status.[1] Providers remain on our list and are included in program communications so that in the event that their service is upgraded or expanded their status can be updated accordingly.

Provider Outreach

To meet the program's aggressive deadlines and participation goals, LinkAMERICA believes it is critical to maintain rapport with providers. To do this we reach out to providers with regular project communications, including a program newsletter and links to the various State mapping websites. In several states we have participated in trade association and policy summits.

As described above, individual e-mails and/or telephone calls are made to all providers explaining the status of the program and requesting their continued support. In some instances we've also had the opportunity to support providers in their BTOP / BIP applications. Through these collective outreach initiatives, and our engagement with various industry associations, we continue to enjoy a healthy and appropriate relationship with Broadband service providers.

NDA

To provide protection for all parties involved, LinkAMERICA continues to honor the terms of our NDA. If providers did not execute the NDA in previous rounds they were offered the opportunity to do so in this collection round. New providers were of course also supplied with a copy of the NDA.

To facilitate the execution of NDA's, LinkAMERICA continues to use the DocuSign online document management solution. This system allows providers to review and digitally sign the NDA in a legally binding manner, and has been instrumental in achieving rapid approval and execution of NDAs with the majority of providers. In some cases, NDA's were individually negotiated to address specific provider concerns. In all cases, minimum standards established by the NOFA are honored. In other cases, providers chose to submit data without executing an NDA.

Provider Survey

Since five prior rounds of data collection have been completed, the LinkAMERICA team has a solid base of coverage and speed information with which to begin Round 6. This allowed us to provide flexible response options to participating providers. One option allowed them to review check maps of their coverage and speed data – submitting only corrections and additions to the existing dataset. (For provider convenience the check maps were created in both PDF and Google Earth (.KMZ) formats.) The second option was to allow submittal of completely new datasets, either in tabular form or in multiple other digital formats. For those without CAD or GIS systems, we continued to allow the submittal of printed/scanned maps and other written materials.

---

[1] As with other Grantees, we struggle with appropriate and consistent classification for service providers who opportunistically provision Broadband services. In this submission we continue to bring them into the analysis as a provider type "other". As the inclusion of this category isn't our primary goal, we are working to process data as we can. We are similarly categorizing and retaining reseller information. Appendix 4 illustrates the categorization of non Broadband providers within our provider tracking and verification systems.

Survey Methods

Once again, we used a secure digital survey process (via our provider portal websites) to collect and display information for providers. The Round 6 survey process was designed to accommodate both new and returning providers, and the different types of information they would be submitting. The following is a summary of the process encountered by each group:

New providers: New providers were routed directly to our standard survey where they were provided with templates for uploading data in tabular NTIA-compliant formats. As in previous rounds, if providers could not supply information in the requested format, alternatives were offered. These alternatives included uploading service-area boundary maps, exchange area maps, CAD drawings or customer address lists. From that information, the LinkAMERICA team developed a geographic representation of coverage and was able to build coverage features for each provider.

Returning providers: For Round 6 we continued to work with participating providers to improve their datasets. Check maps continue to be a useful tool to show providers how their area would be displayed on the resulting interactive state map and to get constructive feedback regarding corrections and changes that need to be made to their coverage and speed data. Generating these customized documents in each round is an extremely time consuming verification process, but it allows us to close many of the gaps that might have otherwise persisted.

Follow Up

After the release of the Round 6 survey in early July 2012, LinkAMERICA launched an extensive effort to encourage responses. Every known provider was contacted at least twice during the months of July and August. The initial data submission deadline was set for mid-August, but we continued to accept "straggler" submissions into September.

No Response Policy

As mentioned above, every effort was made to contact each provider who appeared on our initial list. However, if no current information could be found on the company (i.e. no website, no valid phone number, and no contact person identified) they were removed from the list of "known providers". We believe the vast majority of those we were unable to reach were providers who have simply ceased to exist[2]. If we verify that a company is a broadband provider still doing business and are not able to get a response to our request for data, we make note of that in our datapackag.xls, and continue to reach out to encourage participation.

Summary

In summary, an intensive 45-60 day provider outreach and data collection process is initiated at the beginning of each round. In Round 6, given the data vintage of June 30, 2012, we began this process in June and the last submissions were accepted in September, 2012.

While we continue to successfully engage the majority of providers in each round, the amount of manpower required to solicit complete and timely responses should not be underestimated. This process is one of the most costly and complex within the entire SBI program.

[2]The list of known providers and important submission statistics are contained in the datapackage.xls file.

Third Party Data Used

We acquired the following commercial/restricted use data products:

- American Roamer, Coverage Right Advanced Services (tabular). This data served two purposes. The first was to verify the provider list and help find Broadband service providers not on other lists. The second was to verify the reasonableness of the Broadband service provider's submission.
- GeoResults Wirecenter Boundaries. This data was used in the verification of 'telephone' Broadband provider data. Where a public domain exchange boundary wasn't available, the boundary was used for coverage containment tests.
- Media Prints Cable boundaries. This data was used in the verification of Cable/HFC Broadband provider data. It was used to research valid providers and discover if that provider was offering Internet service. FCC 477 restricted use data were analyzed to find valid providers within a given area.
- Proprietary Provider Serving Areas. Since the first survey, a number of providers have supplied their engineering, serving area and/or franchise boundaries. We have maintained and enhanced these proprietary data sources.

We have included third party data sources which touch on each of the three major technologies analyzed within the SBI program. Each of these data sources tie back to a public domain data source, which provides a cross-verification mechanism for the commercial data product.

Although there are a large number of third party licensed data sources available, we remain conservative in our acquisition plans. From our limited analysis we are concerned about the ability to cross-verify additional third party licensed sources against public domain data. Further, we are unsure of how we may be able to integrate another data provider's view of valid Broadband providers within the definitions used by the NOFA (e.g. Are they using an FRN/DBA identity view or a marketing view? Can the provider supply in a 7-10 day window? Are they facilities based or not?). This leads us back to a statement we made in a 'lessons learned' Webinar (April 2010) about exploring a consortia to lower the cost of data acquisition and allow multiple entities to peer review the quality and methodologies behind licensed data products.[3]

Beyond these commercial data sources, we used a number of public domain sources. These included:

Geographic Data Files

- US Census TIGER data[4]

Sources that helped isolate providers, identity management or provider service areas

- NECA Tariff 4
- State produced exchange boundaries
- Carrier produced wirecenter boundaries (sometimes proprietary to provider)

---

[3] We also suggested forming a technical standards committee and a consistent system for confidence reporting.

[4] Census data were derived from < http://www.census.gov/cgi-bin/geo/shapefiles2010/main>, Census 2010 files. Roads were derived from the county faces and edges file downloaded at the same location and tiled for a full state.

- FCC Coals reports (321/325)
- FCC FRN API lookup tool
- FCC/FAA Antenna Registration System
- FCC FRN Lookup Tool (plain text search)
- USAC High Cost FCC Filing Appendices

Sources that helped isolate anchor institutions

- USAC Grant lookup tool
- USAC High-Cost FCC Filing Appendices
- HRSA data warehouse
- NCES data lookup
- State managed lists of schools (K-12), post-secondary institutions and libraries
- List of museums, conventions, and visitors bureaus from www.onlineatlas.us
- In state relationships to key stake holders.

Finally, challenges exist when dealing with the inevitable conflicts between provider-submitted data and third party sources (public or commercial). There is no guarantee third party sources are more accurate or timely than the providers' own reports. Indeed, some third party sources are based upon different standards than those specified in the NOFA, perhaps making them less reliable than information collected directly from providers. At the very minimum, provider data has a lineage and temporal status that we can identify. A concern we have with increasing use of third party data is that we have no way to verify its quality or development methodology. Particularly in rural areas we are concerned about what third party data may reflect based upon what we assume to be a small sample of information.

In other words, we may hit a wall in which we can't determine how the commercial source derived its coverage conclusion. To us this means that third party data sources are beneficial, but represent a supplementary view, not an authoritative one, of the NOFA defined Broadband market.

In short, we have chosen to use provider data as the baseline. We will challenge provider reports when third party data shows major anomalies, when submitted data conflict with prior submissions or when a consistent volume of consumer feedback points to a potential error.

Confidentiality and the Use of Licensed Materials

As a mapping vendor, we are reliant upon the cooperation of Broadband service providers. In large part, what underlies this cooperation is trust that we will not violate the proprietary and confidential nature of the data provided to us.

We are thankful for the confidentiality clarification that NTIA shared with us (included as Appendix 3). We use this as a guiding document to help us communicate with providers about what information NTIA considers to be confidential. Our suggestion is that NTIA publish this, or something comparable, to ensure a consistent interpretation of the NOFA and how it guides NDAs.

As some providers are non-responsive to requests for information, or lack resources necessary to put data into NTIA compliant formats, we have fallen back to the use of commercial data sources in several places.

For incumbent telephone providers we have used commercial wirecenter boundary products to filter Census Blocks and segments that are clearly out of their exchange areas. For cable providers we will use an estimate based upon Census Designated Places within MediaPrints named areas.

Public Engagement: Crowd Sourcing, Surveys and Social Media

Crowd sourcing (i.e., an intentional and carefully designed effort to tap into the collective intelligence of the public at large to expand our knowledge base) continues to be an important element of our data collection and validation process. An expanding use of social media is also an important strategy in our efforts to promote the state programs overall and engage more citizens in the work at hand. In addition to the various opportunities the public has to provide input via the online service coverage maps and the related 'Broadband story' process, our crowd sourcing efforts are grounded in a time tested telephone survey approach focused on the consumer market. In addition, we continue to advance our process to include certain initiatives centered in two social media outlets – Facebook and Twitter. These initiatives are discussed below.

Consumer Surveys

Working under contract for the state of Alabama in 2009, our initial consumer survey was performed before the NTIA SBI grant was in place. Subsequent consumer surveys funded by the SBI grant were hosted in 2010 for the states of Idaho, Wisconsin and Wyoming and then again in 2011 for Alabama (as noted below). These surveys will be repeated after two years to establish and evaluate trends. These primarily telephone based surveys include two distinct and carefully scripted tracks: one for Internet users and one for non-users. The telephone survey approach allows us to reach the non-Internet user group as well as the current Internet user. A secondary online approach is also used to augment input from current Internet users. In the most recent Alabama survey we added a third tier to our approach as we equipped local field survey teams with an iPad-based survey tool and targeted their time to reaching the younger market. For non-users, the surveys help determine why they don't have or don't use Broadband. For current Broadband users, the survey helps determine the nature of their Broadband access and how they use that connectivity in their daily lives. In addition to our state-specific surveys a nation-wide survey was also hosted to provide a broader view of consumer views for comparison purposes. State-specific surveys are, where possible, framed to match the state's regional Broadband planning structure (e.g., the updated consumer survey in Alabama was designed to produce results relevant to the state's twelve Broadband planning regions).

The resulting data is helpful on a number of fronts in the SBI's mission to advance the access and adoption to Broadband. Survey data provides an important, albeit broad, gauge for assessing coverage information obtained by providers. For example, areas with widely available coverage (according to provider information), but lower consumer subscription levels (according to survey results), or perhaps where survey results suggest Broadband is not available, can be examined in more detail. Survey results

are also very important to the broadband planning (and capacity building) components of the SBI program in that they help inform and formulate Broadband advancement priorities. Survey results also help inform Broadband policy discussions on both the local and state levels. Finally, survey results provide important information to the service provider community regarding market demand and specific Internet use in specific communities (i.e., regions).

Our ongoing consumer survey process adheres to a consistent process. For example, consistent with prior practice the 2011 Alabama survey was launched in June 2011 with a test number of survey calls to confirm (and adjust as needed) the structure of the survey and the underlying survey process. Our surveys typically run for three to four months. All telephone surveys are completely random beginning with the acquisition of a list of state-specific, randomly selected landline telephone numbers. Mobile phones are not typically included in the surveys. Upon evaluation of the survey statistics, auxiliary surveys are executed to ensure appropriate representation is achieved on both demographic and geographic fronts. For example and as noted above, the recent Alabama survey was augmented with a field effort to ensure the younger demographic (i.e., age 18 – 25) was adequately represented. This secondary step is required because of the continued migration (by younger markets) to non-landline based communications. This younger market is also surveyed by reaching out through social media outlets (primarily Facebook and Twitter) to encourage their participation in an online survey process.

As noted above, our telephone survey process is augmented by providing online access to the survey. Participation in the online survey is promoted on all of our state-specific public web sites and selected social media.

As a final relevant point with respect to the consumer survey process the length of the survey is noteworthy. By survey standards, these tend to be long surveys. The surveys typically average just over fifteen minutes. While this clearly contributes to the number of survey call attempts that were required to reach the level of statistical validity, it is not insurmountable.

Social Media

The phenomenon of social media is widely documented and yet still emerging as an effective access point for public engagement. We continue to explore appropriate ways to use a variety of social media venues in our SBI efforts. All of our efforts are informed by and consistent with relevant state statues and guidelines. Different states have different perspectives on if and how the state will participate in the use of social media. Some state requirements are well defined and some are still being formed. Where appropriate, we use LinkedIn, Facebook and Twitter to support our work. A central focus is on promoting awareness of the program and seeking to expand engagement. In some situations we find that sub-program initiatives (e.g., regional planning teams) are making very effective use of Facebook to help inform and engage citizens impacted by the SBI program. As noted above, we are able to promote additional input on the consumer surveys through a social media outreach program aimed at our younger market segments.

In addition, we continue to evaluate how Facebook and Twitter can be used to drive public input on two important crowd sourced issues: online speed tests and input on map accuracy. Based on data obtained

through our web site traffic monitoring process and readily available social media tracking processes, results are promising.

Capacity Building and Transitioning to State Partners

A fundamental goal of LinkAMERICA has always been to transfer knowledge and capacity to our in-State partners.

Within each State, transition planning and responsibility for specific activities is on a slightly different timeline. Much of this is driven by resource availability and partner identification within the State. For example we began transitioning the responsibility for Community Anchor Institution data to the State of Alabama in Round 3, starting with the use of interns to validate Community Anchor Institution data. In Round 4 the state's responsibility expanded to include collection of all CAI data, and in Round 5 the effort culminated with Alabama assuming responsibility for the CAI submission. LinkAMERICA supported this process with detailed transition documents and technical support.

Alabama plans to continue the transition process though the end of year 3 assuming more responsibility for the interactive State maps and website. In Idaho the SBI Framework Coordinator took on the responsibility of reaching out to CAIs in round 5. In round six the outreach became more relationship based and face to face. Other States are looking more towards program year 4 and/or the in-State hire of a Broadband Coordinator as the initiation point to support their transition efforts. Broadband Coordinators were brought on board in both Idaho and Wyoming in year three. An open position was recently filled in Wisconsin. Alabama has had a broadband coordinator in place for nearly two years.

Data Sharing With Other States

Where possible, LinkAMERICA works to share data with other state mapping entities. This data exchange tends to take two routes.

First for wireless providers if we find a fair amount of coverage that crossess into an adjacent state, we will ask the provider's permission to convey this information to the neighboring states. If the permission is received, we send the data to the mapping agency.

Second, in circumstances where we receive a speed that is outside of the technology speed 'norms' and this provider offers service in another state we try to check with other covered states to find out if the service is comparably marketed.

Trends in Submitted Data

Overall we note several important trends in this data submission. The list below represents general trends and not a scientific survey.

We note the following trends:

The coverage of advertised speeds is increasingly important. More and more providers are specifically concerned about where the submitted NTIA footprint shows available of 4 x 1 Mbps or 6 x 1 Mbps service.

Large national providers are beginning to submit block level speed information. In round 6 AT&T submitted block level coverage and speed. Other national Wireline providers, such as Frontier improved their submission based upon the completion of system conversion of acquired properties.

xDSL speeds are increasing. More and more xDSL is likely ADSL 2+, VDSL, shortened loops, pair bonded or some combination of these. As we talk to providers who trigger speed/technology tripwires, we receive more and more feedback about the presence of these new technologies to enable speeds comparable with DOCSIS systems.

DOCSIS 3 is becoming the norm. Most cable systems are becoming DOCSIS 3.0. Over time we are seeing the DOCSIS 2.0 areas diminish. In some DOCSIS 3 areas there tend to be pockets of non DOCSIS 3 in predominant DOCSIS 3.0 markets.

There seems to be an increase in acquisitions among fixed wireless providers. A large consolidation with respect to T6/Digis/Skybeam/JAB has changed the provider landscape in several of our states. As much of the system consolidation has not yet taken place our coverage remains largely in tact but we anticipate changes in the next submission.

Fixed wireless providers are offering broadband services approaching 1 Gbps. This is occurring both in terms of licensed and unlicensed spectrum. Part of this is driven by where a provider has fiber or high capacity wireless backhaul but we are receiving more and more information from providers and radio manufacturers specific to very high speed wireless services. Although the service can be deployed within the 7-10 day NOFA window, these higher speed services tend to be purchased by high capacity customers. It may be worth reconsidering the speed norms in this category as well as adding a field in the datatable to indicate when a speed value is geared toward a specific end-user class.

There is less and less of a distinction between fixed wireless and mobile wireless. As firms market LTE and/or WiMax as home DSL alternatives we are a bit unsure how these two classes are to be established-what is the operating distinction between Transtech 80 (mobile licensed) and Transtech 71 (fixed licensed) when both are used as in in-home Broadband service?

Satellite providers are advertising broadband services exceeding the speed ranges in the data model. Further the spectrum used isn't available in the NTIA data model.

We continue to see a number of national Broadband providers who do not show broadband coverage within pockets of otherwise covered areas. In the figure below, the orange represents Census blocks which are NOFA broadband covered. The transparent areas have no NOFA broadband coverage from the same provider.

Figure 1--Uncovered pockets within urban, covered areas

This coverage drop-out appears to be happening in urban Census blocks typically with schools, shopping malls, universities and large businesses. We don't know what his is happening, but it could be an impact of the NOFA restriction on 7-10 provisioning. This is a noticeable artifact in the data and does challenge the notion of some who see NOFA compliant Broadband coverage as a uniform surface across an area.

Data Production Process

To support our objective of transitioning the data development process to our State partners, we continue to model, refine and document our data production process. We find this to be a very beneficial step for two purposes.

First, it helps us understand why (and if) a task is being done, and if it is being done efficiently. Much of this program started so quickly that it was difficult to plan logical integration and hand off points among the various workgroups. Further, we are currently in the process of consolidating much of the process data (check-ins, check-outs, metadata) and we can use this process model to efficiently plan cohesive information architecture.

Second, our process documentation and modeling helps explain why resources are being consumed in a particular way. This helps our State partners plan for in-sourcing specific tasks as their time and

budgetary constraints allow. It also helps our LinkAMERICA team better plan and cross-train members to deal with the work surge that occurs 30-45 days prior to submission.

Finally, documenting and modeling our process helps us to take advantage of increasing specialization and proficiency with certain types of data and management responsibilities. In submission 3, we had identified data "czars" responsible for check-in and check-out of data. That data czar helped to bridge the gap among receipt functions, provider feedback, production and DBA. In round 5 the data czar was also tasked with alerting on speed/technology tripwires. This individual was responsible for taking the initial review of each submission and determining if an NTIA speed/technology warning would be triggered.

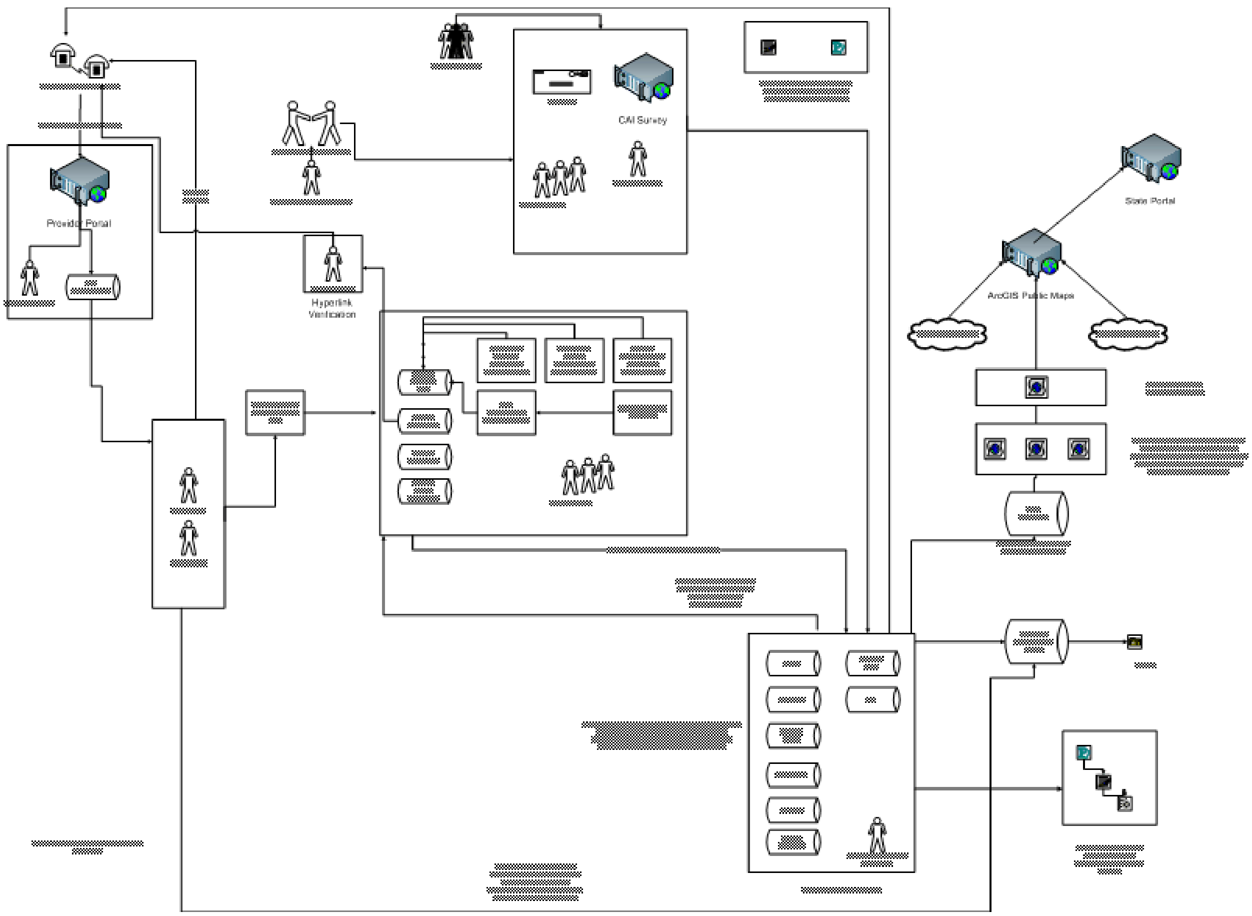

Figure 2—SBI Data Development Business Process Diagram

Provider Tracking In the Cloud

Prior to initiating the Round 5 survey, LinkAMERICA transitioned in house provider tracking systems to a Cloud based application, TrackVia.

The movement away from desktop solutions was based upon several factors. First, the architecture these systems were designed under no longer met the program realities. For example, deliverables like

Datapackage.xls were not contemplated when the original provider tracking system was developed. Second, the ability to share data across multiple geographic areas and organizations was becoming increasingly important as the program evolves and responsibility moves to in-State partners. Third, portions of this data need to securely transition back to State resources who may or may not be able to support a specific IT infrastructure. These factors combined to make the Cloud applications a valuable alternative.

As with any IT transition, the process has not been without challenges. Nonetheless the investment in time and resources has proven to be effective and worthwhile. We anticipate further movement away from desktop oriented architecture to a more open, Cloud type solution.

Data Production Methods

As raw data were received from the provider community, attention turned to normalizing the disparate submission formats[5]. The team considered each submission with respect to the following criteria. These criteria are important because they perform the basis for our verification and quality assurance process. In other words, we have to appropriately scale our data verification efforts to match the scale or ambiguity of the following:

- Locational certainty
- Speed certainty
- Temporal certainty
- Provider and network ownership certainty

The team's goal was NOT to quantify a particular degree of precision with respect to any of these criteria. Rather, we are working to attribute the above "certainty attributes" to each submission, and will continue to implement quality assurance and verification mechanisms that are resource-appropriate for each.

Deriving Broadband Coverage Information

Broadband Coverage[6] was normalized into four formats:

1. Coverage in Census Blocks (2010) of 2.00 or less square miles
2. Covered Street Segments (2010) in Census Blocks greater than 2 square miles[7]
3. Address Level Coverage (point data)
4. Wireless Service Areas (SHP file format)

---

[5] In line with NTIA Best Practices we continue to request and receive a large number of data input formats. This ranges from tabular Block lists to hand drawn maps.

[6] Speed, Anchor institutions and Middle Mile facilities are discussed in later sections.

[7] To help clarify issues relating to Census block area and vintages in use, our team published a technical paper to the Grantee workspace. Because we were unsure if this standard should be implemented uniformly, this document was never distributed to the provider community.

With each submission, the team went through a series of steps to normalize and categorize the data. Since data arrived in many different formats, and at many levels of granularity, the following normalization procedures were used:

- Determining the nature of service being provisioned (who is providing service and what technologies are in use)
- Planning an attack strategy for the submission –understanding the data and assigning team members to various tasks
- Alert provider relations staff if the received data trigger an NTIA speed/coverage tripwire.
- Geo-referencing the data; QA the geo-referenced data
- Geoprocessing the geo-referenced response
- Segregating the submission into the correct NOFA-compliant submission formats.
- Apply appropriate source metadata[8]

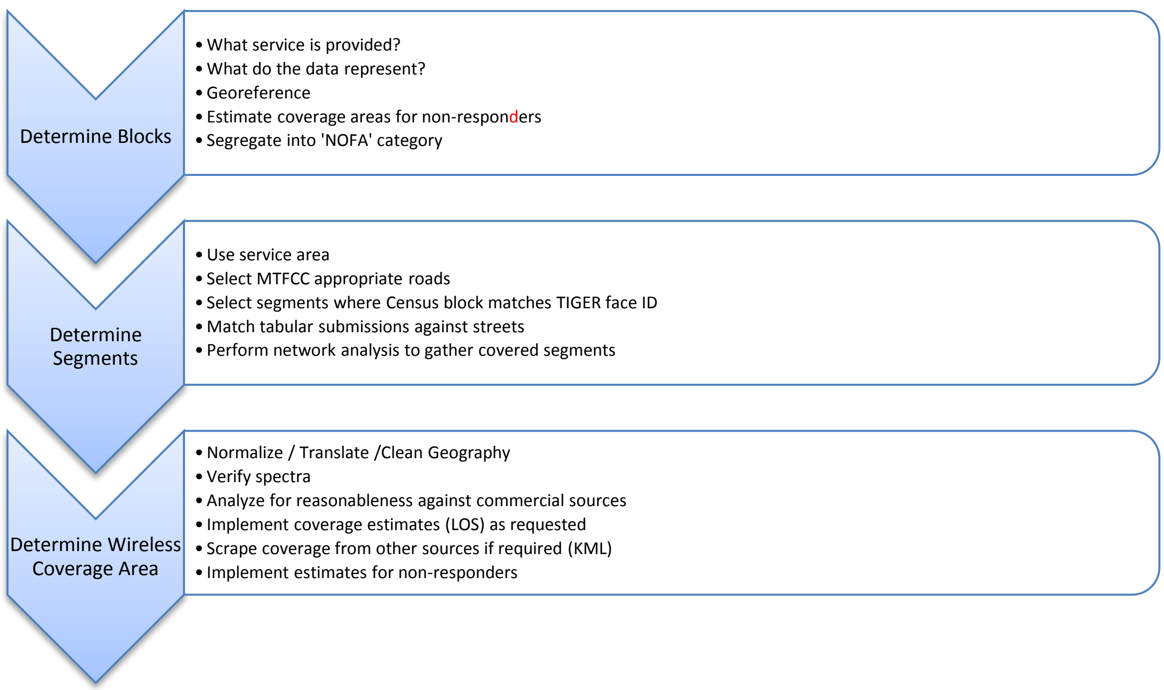

Figure 3-Components of Broadband Coverage Process

Impact of Program Change

There were several important program changes that impacted how Broadband coverage was developed and submitted to NTIA in Round 6.

[8] When our team logs a submission into the staging database we record at least two attributes. One records the method used to derive the coverage, the other records the method by which speed was attributed to that object. Other attributes carried to NTIA carry source meta values as well.

Speed Examination

Given recent concerns about the depiction of speed and what that mapped speed represents, LinkAMERICA invests considerable time requesting detailed information on speed which appeared to be beyond normal speeds for a given Technology of Transmission given the NTIA supplied frequency tables.

Based upon these conversations we learned

A) For incumbent telephone providers; the speeds beyond the normal xDSL range represent significantly shortened copper loops, as well as upgrading DSLAMs and modems to support ADSL2+ or VDSL.

B) For cable providers the intermixing of DOCSIS 3.0 and non 3.0 systems in a market area is typical and sometimes reflects a circumstance where segments of plant cannot be upgraded to DOCSIS 3.0. This variance can be at a level below the Census block. In these cases the maximum advertised speeds remain to represent the market area but the plant variance is typical. We also have one 'cable' provider who is delivering DOCSIS 2.0 over fiber plant.

C)There exists a fundamental disconnect between some providers reporting a service qualified speed--the maximum speed available at a structure versus other providers submitting their maximum speed at the market (MSA/RSA level). Both submission paths are available to providers but the likelihood of providing a speed incompatible with a technology is much greater for providers submitting market level speed.

D)Fixed wireless provides are using new radio technology to quickly deploy services which rival and sometimes exceed those of wireline service providers. These speeds are being advertised, sometimes on public facing websites as well as using direct field sales staff to target specific high demand customers. These services are actively marketed but they challenge the data model in that the speed is marketed and available within 7-10 days of request but the nature of the fixed wireless submission forces attribution of this speed within a potentially large geographic area.

E) There exists a minority of providers who submit a theoretical speed that is unmatched by their web advertising. In these cases we request clarification from the provider on the inconsistency. Our experience has been that providers will modify the speed to be consistent with their marketing and advertising.

F) The maximum advertised speed offered is not always clear. Sometimes the speed is described in advertisements in terms of a combination of video and data. Other times it is data not video. Some providers allow a customer to select how much bandwidth they want to allocate to their data stream versus video stream. In other words the bandwidth available to a household is constant but how it gets allocated among the data versus video becomes a customer or service directed choice. This makes getting Maximum Advertised Downstream speed very difficult because it is not just a product of the broadband network which we are mapping but also the customer's selected service package.

Provider Definitions

Within our provider verification process we work to derive a state level provider match against third party data sources. As discussed in the early pages of this manual, there is no guarantee that a third

party data source is any more accurate than submitted data, nor does it necessarily reflect the provider ecosystem specified in the NOFA, Technical Appendix A. We devote significant resources to matching our submitted data against outside data sources. In many cases this becomes a judgment call trying to match provider names across systems. It is a difficult and somewhat arbitrary process. Nonetheless we do believe it has value because it forces a re-examination of who we believe is an appropriate provider within a non-NOFA context[9].

The use of a provider match system, as well as the webinar comments (3/17/11)[10] directing grantees to estimate, wherever possible, non-participating providers have made us back away from one of our fundamental assumptions in data collection. As discussed in prior versions of this manual, we had developed a certain "hold-out" class of data when a provider's data wasn't of sufficient quality to verify, or we were unable to put it into the data model (e.g. address points submitted for fixed wireless). In submission four, much of this hold-out data was included[11]. In some cases this involved using simple polygons to capture a wireless ISPs serving area. Other times, if we are confident in the coverage, but can get little clarification on the submitted speeds or frequencies, we release the coverage and note in our internal metadata the source issues with the other attributes.

In the weeks leading to submission 5 we received a request from NTIA to clarify the presence of unusual shaped wireless polygons. Our interpretation of this was a request for information relating to the source of these data which do not appear as propagated coverage. Although the 'unusual shapes request' represents a very small portion of the submitted data, it begs an important question about the expectations with respect to wireless coverage patterns. We look forward to working with NTIA to address these issues in a fair way across States and providers. We would not want to create a coverage dichotomy where advertised coverage was disallowed from the NTIA submission because of an expectation about how advertised coverage should appear. One concern we have when we develop a coverage estimate which differs from a providers advertised coverage pattern, which should we submit?

Finally, we use the provider type classification of 'other' to bring specific aspects of certain provider's data into our submission. There still seems to be confusion on how to handle provider types where a provider offers multiple paths to provision Broadband for typically business customers. Rather than waiting for certainty on the answer, we bring the provider in and list them as provider Type "other". Our sense is provider Type "other" will continue to expand in subsequent submissions.

Clearly one challenge is the data, but an equally significant challenge is appropriate messaging around this "other" provider type category. We do not want to leave consumers with the impression that they

---

[9] We have requested from NTIA information on how provider matching is done within their QA process; beyond the relatively short whitepaper posted with the national map <http://www.broadbandmap.gov/blog/wp-content/uploads/2011/02/DataComparison_Methodology2.pdf>, we have not received any more detailed information on how providers are cross verified between submitted and third party sources at the national level. Our understanding is licensing concerns are holding the release of this information.

[10] Clarifying comments from Akins Lawl indicate the Program Office does not want Satellite providers estimated if the provider is non-responsive to data requests (email 9/12/12).

[11] We continue to process older submission data looking for information and methods by which we can estimate coverage information. This will be an ongoing process.

can get a high capacity fiber or microwave link despite the fact that the hospital next to them or in a nearby Census block can get this service.

After the April 2011 Grantee conference, LinkAMERICA submitted a paper describing our provider classification system[12]. It is our feeling that understanding the type of provider is essential to appropriate verification methods.

Coverage Geoprocessing Methods

The next section discusses how data were georeferenced and geoprocessed given a particular submission format. We have yet to find a particular method that works across all submissions. Rather we tend to tailor our geoprocessing to meet the specifics of the service provider and data submitted.

In most cases, in Round 6 we were not provided with street segment geographic objects for Blocks greater than two square miles (large Blocks). This necessitated subsidiary geoprocessing. As stated before, our first goal was to derive block level coverage. Then, for Blocks greater than 2.00 square miles, we moved to a segment gathering processing. The segment process will be described in the last section.[13]

Block Level Coverage Derivation Using Service Point Data

A number of providers submitted point level customer data.

In some cases the submissions themselves were not internally consistent. For example, in the image below, unprojected points are shown, while the Census block polygon to which the points are supposed to “belong” is highlighted. In this case, one of the following scenarios has occurred: block attribution is wrong, the points are not in the location to which they are attributed, or different block shapes were used than what is assumed.

[12] https://sbdd-granteeworkspace.pbworks.com/w/file/42309493/provider%20ClassificationFINAL.docx

[13] As has been discussed previously, we note inconsistency in how providers are supplying information at the block and segment level. Beyond the temporal differences, we see that providers are computing area differently, as well as including or excluding water areas. This provides an inconsistent measure across providers for the 2.00 sq mile cut off. Our preference would be to provide guidance to service providers within our states, but our concern is that we will inconsistently message this with grantees in other states. We would appreciate consistent guidance from FCC/NTIA on this topic.

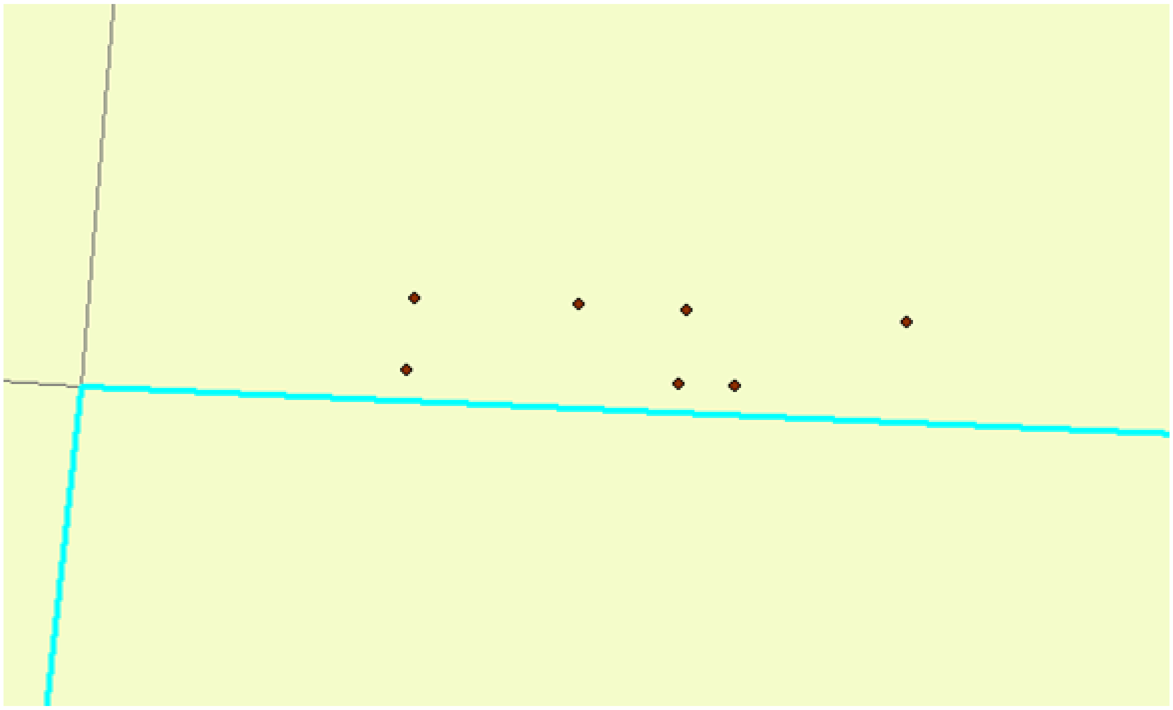

Figure 4-Internal inconsistency in submitted data

In other circumstances, we found that inconsistent geocoding standards may produce misleading results. The next image shows point level data, and the Blocks are colored based upon the counts of points intersecting Blocks. The challenge this presents is that if geocoding was performed on a different dataset than the block boundaries (the road traces are not coincident with block boundaries) and/or geocoding was done without an offset, it becomes problematic to assign coverage to a Census block based upon only the point locations.

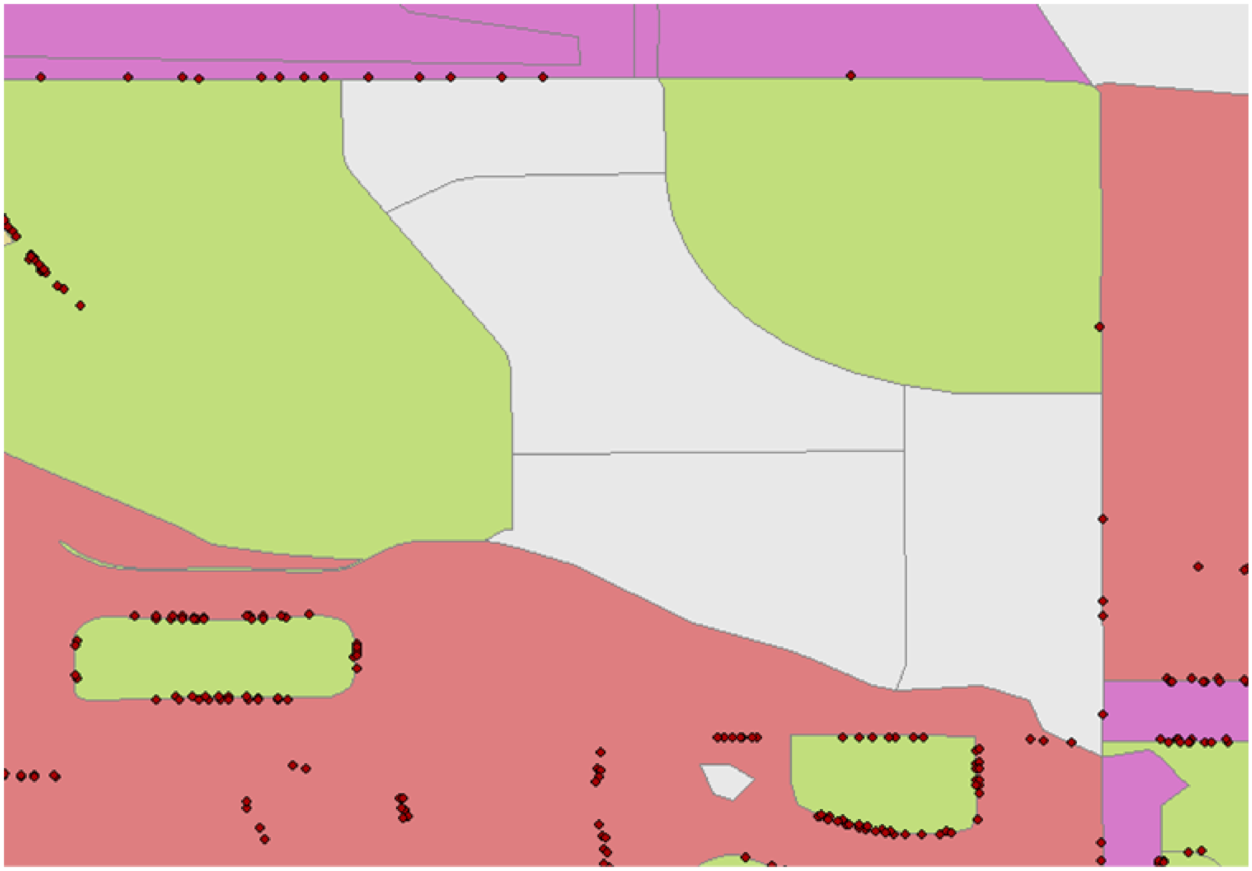

Figure 5-Block Coverage

For this reason, where we were provided address point data and asked to generate covered Census blocks, we elected to use a 200-foot buffer to select Census Blocks that intersect our points.

We also see a number of providers submit customer data and facility data. Their intent is to allow us to have two primary sources from which to derive the most accurate coverage. In these cases we tend to look for clusters of customers in areas where we see no facility based coverage.

With respect to deriving Block level speed from sub-Block data, we have instituted a business rule where the predominant speed in a Block is the speed we attribute to the Block.

Block Level Coverage Derivation Using Customer Facing Plant Level Point Data

In other circumstances, providers submitted point level plant data. From what we could gather, these points tended to be customer-dedicated terminals. Typically, these providers were high speed Broadband producers—which may somewhat strain the definition of Broadband as other providers supplying comparable services specifically disclaimed the ability to provide high-capacity Broadband services in the required 7-10 day interval. In these plant point data submissions, we had similar concerns to the point level customer data, but two factors tended to make us use a more conservative intersection buffer. First, we tended to have far fewer points to work from, so our concern was grabbing too many covered Blocks as the Blocks tended to be much smaller in these urban areas.

Second, these plant points tended to be dedicated to distinct customers, but it was difficult to know which element of the customer's campus to attach coverage to.

In the case of the image below, given a small shift to the left, it would be easily possible to gather 1 to 3 Census Blocks from this point. Although orthoimagery is helpful in a circumstance such as this, it is still indeterminate.

Thus, in the circumstance of plant level point data, we used a 100-foot intersection buffer.

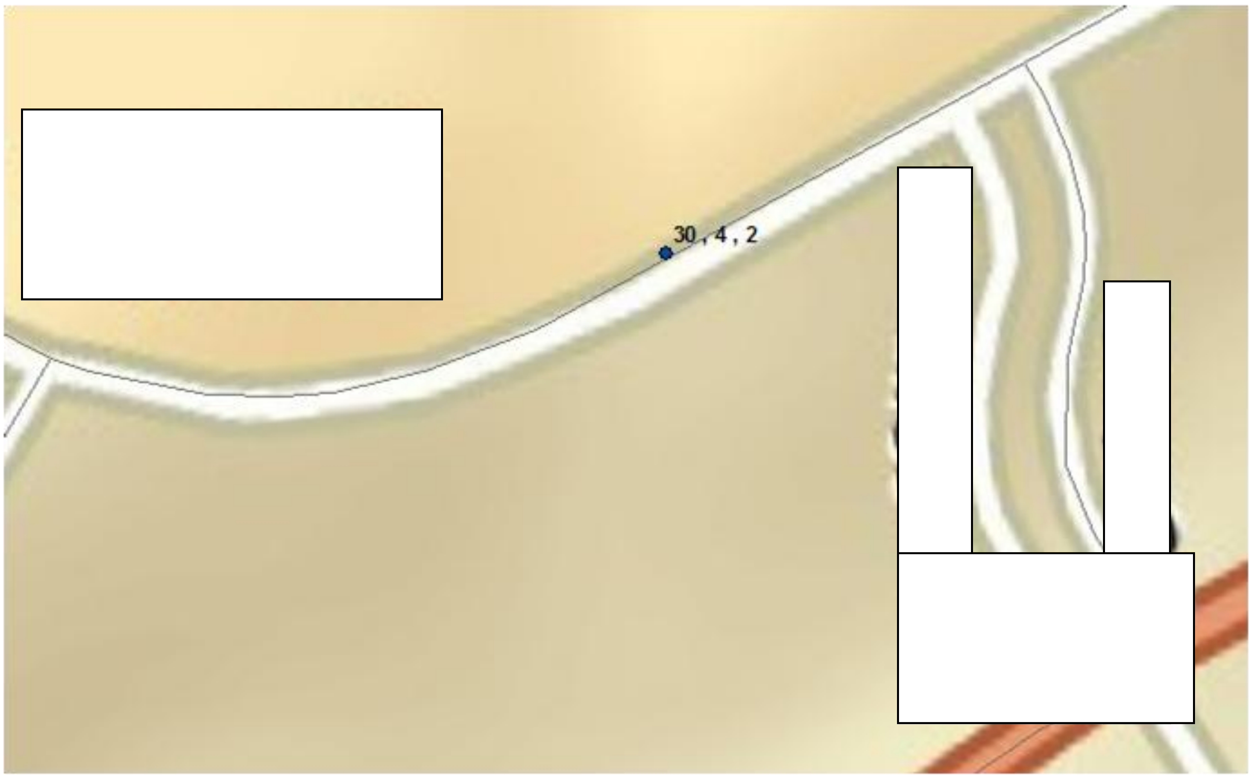

Figure 6-Plant Point level data

Coverage Derivation Using Linear Facilities Data

A number of providers submitted facilities data. We handled this data in different ways depending upon what we believed the facility data represented.

Most telecommunications networks are divided into two components. Feeder - supplies higher capacity nodes (eg. DSLAMs, Fiber Nodes). Distribution - usually supplies customer premises (NIDs, Pedestals, Taps, ONTs). Where we could discern what facilities we were provided, we used different methods.

The next image demonstrates a geo-referenced CAD image as given to us by a service provider. Note the light and dark green shading. We would infer that the lighter segments represent distribution and the dark green represents the feeder network.

In the case of a combined strand map, we used a relatively tight buffer of 200 feet to gather covered Census Blocks. Our intersection tolerance is based upon an assumption that our data likely represent a

situation comparable to customer point level submission in that we have most of the network footprint captured.

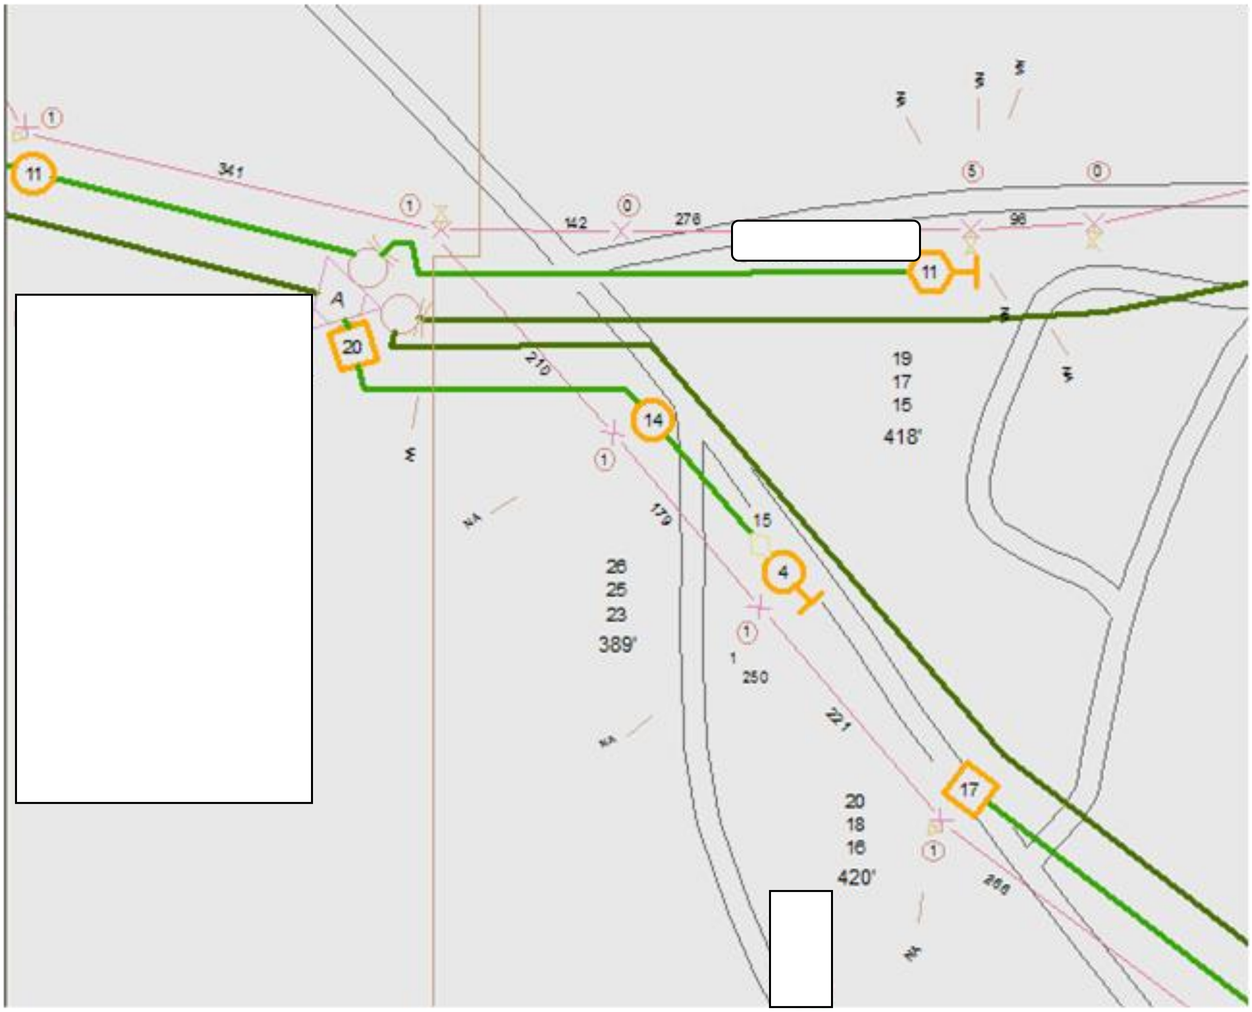

Figure 7-Georeferenced CAD information supplied by Broadband provider

In other circumstances, we were provided engineering information that we inferred to be feeder only. This inference was typically based upon the presence of fiber optic equipment only. In these cases, we used a more generous 2,000 meter Census block intersection. The 2,000 meter criteria was based upon an informal survey of population in proximity to the geo-referenced strand data, but it could be varied based upon a more complete survey.

Coverage Derivation Using Covered Street Segment Data

In some cases we were provided with covered street segment data. Covered segments tended to come from two sources.

In some circumstances, providers gave us CAD data, which was not drawn in a projected manner. This is relatively common for older engineering data derived from hand drawn records. This meant that our

team geo-registered the image into an approximate position. In this case, the boundary streets were selected, and an enclosing polygon was derived. The intersection of this polygon and the Blocks within became the geoprocessing method to derive Blocks.

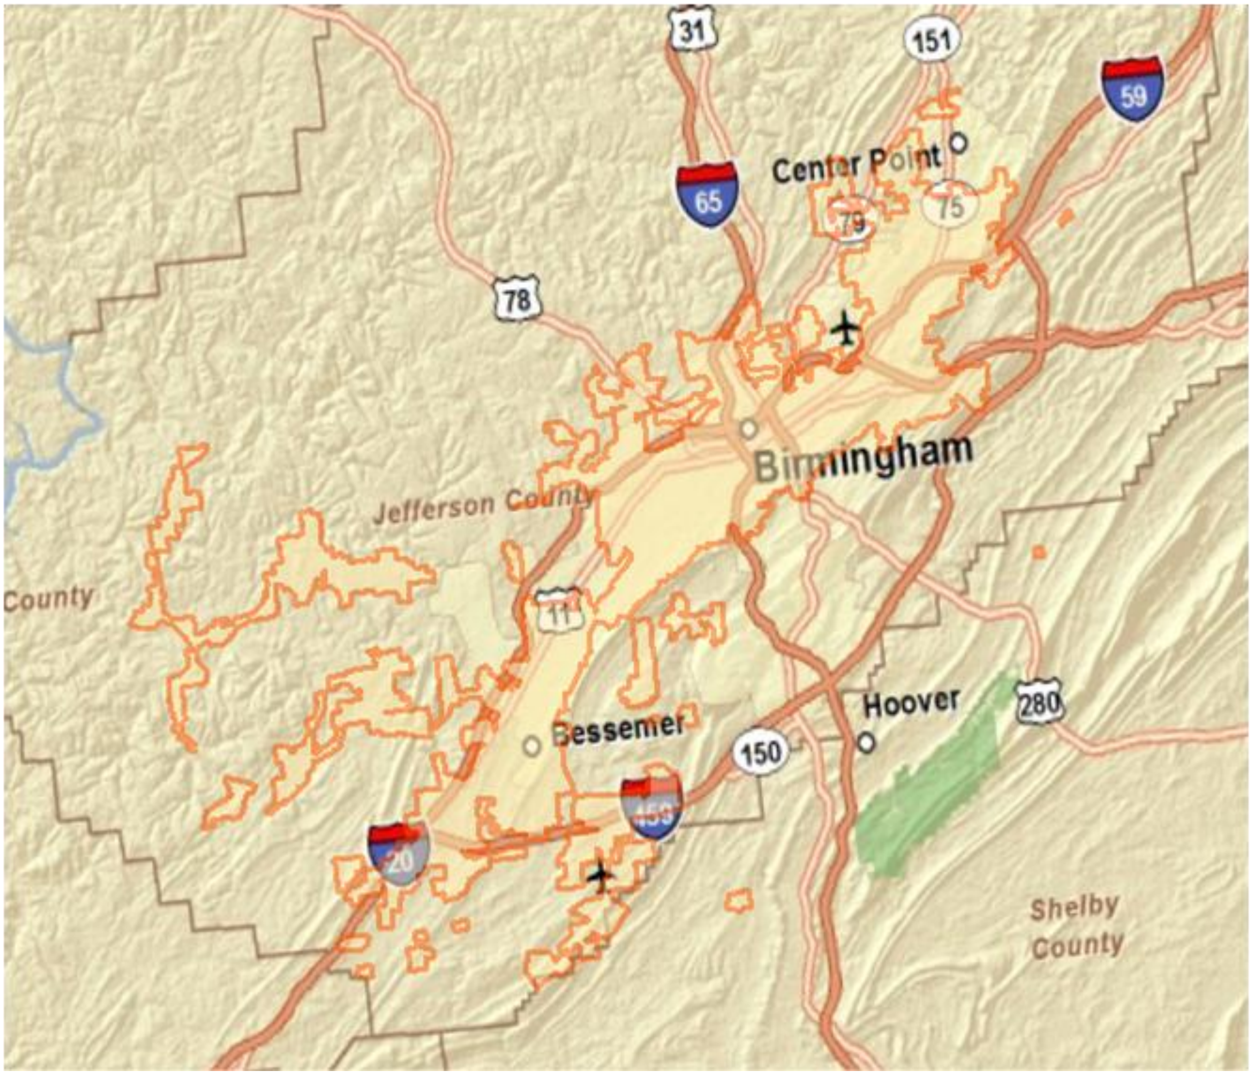

Figure 8-Coverage derived from street segments

In a second circumstance, street segment data was developed during coverage estimation. Handling the estimated data is discussed below.

Coverage Derivation Using Serving Area Point Submission Data

In other cases we worked with providers to derive service areas based upon point plant data. In these cases we were given a serving node and an appropriate road length service boundary. There is an important distinction from the plant data discussed above. In this specific case, the data submitted was a node that served many locations--such as a Central Office or DSLAM. This is contrasted with the earlier example in which the point represents a node serving only a few customers.

When trying to derive coverage from Central Office or DSLAM nodes, the team used ESRI Network Analyst to derive covered road segments honoring these road engineering parameters.

The figure below shows street level coverage derived from Central Office and remote DSLAM point data.

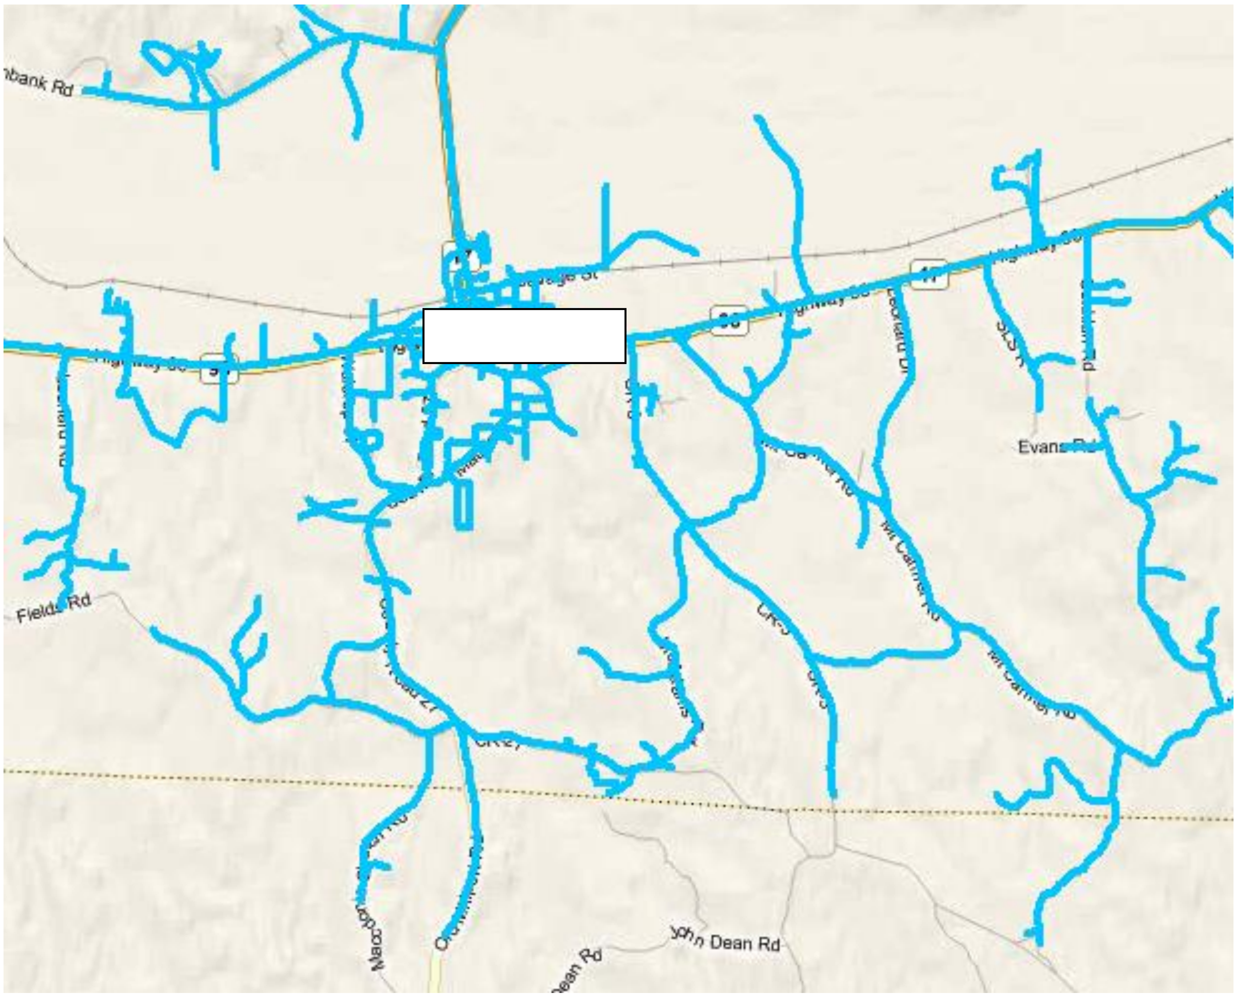

Figure 9-Coverage derived through road paths

In response to Provider feedback we revised this process to include a larger variety of TIGER road types. In Round 1, unimproved roads were not used. In the current submission -- particularly to improve estimates in areas bordering parks and public lands -- a wider class of TIGER roads was used.[14]

The segment level coverage is easily extendable to derivations of Census block level speed. The figure below shows the attributions of block level speed based upon the Maximum Advertised Speed available from a DSLAM. Although the methodology isn't perfect, it does provide insight into the value of granular infrastructure data.

[14]Only TIGER features of MTFCC type S1100 and S1200 were excluded from use.

Over time we have seen an increase in the number of providers submitting this type of data for our use. Our sense is some providers find plant level data easier to generate and are satisfied with the results of derived coverage.

Coverage Derivation Using Polygon/Polyline Serving Areas

Broadband service providers sometimes submitted coverage in terms of served areas. This was either in direct geospatial formats, CAD files, or paper maps. The image below reflects a carrier's service area. Within that service area, there are variations in technology of transmission and served speeds. When polygons with speed data and technology of transmission were available, we used a spatial intersection to gather covered Census Blocks. In many cases, using covered Census Blocks resulted in a loss of the speed variation (sometimes the speed variation was at a level smaller than a Block and did not get picked up within a spatial query).

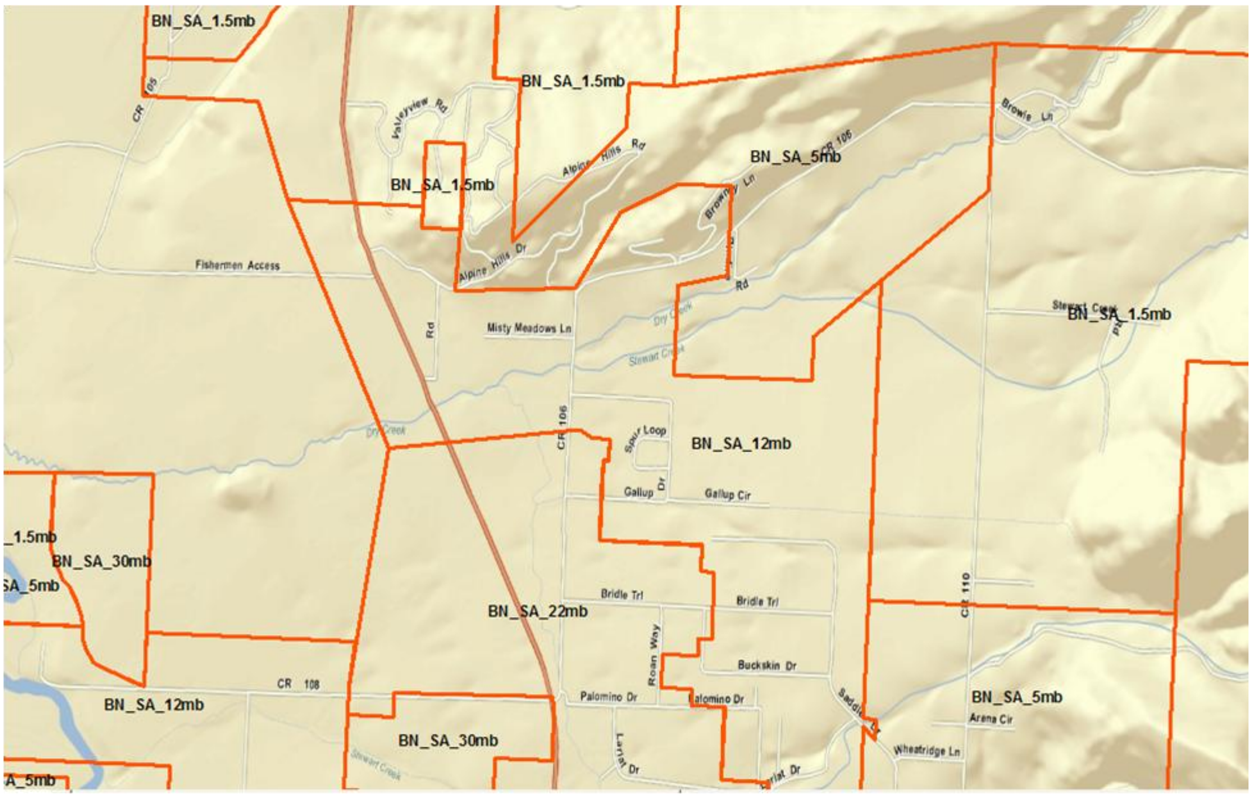

Figure 10-Coverage derived through serving area polygons

Although we cannot directly solve the loss of speed granularity due to Block shapes, we honor a business rule wherein we always select Blocks from the highest speed areas first, and then allow the lower speeds to select from the remaining Blocks. This is an arbitrary rule, but our feeling was that it should be a consistent selection, rather than an unordered selection.

Street Segment Derivation, Large Blocks

For those calculated Blocks greater than 2.00 square miles (large Blocks), we provided coverage in terms of covered street segments and corresponding geography.

With respect to segments we had four sources of data:

1. Covered large Blocks
2. Tabular street segments and address ranges for large Blocks

3. Geographic segments either with street attributes or without
4. Service area boundaries

A few providers only provided a list of covered large Blocks without corresponding segment information beneath the block. This provided the choice of either selecting all segments in the block, or none. Because we had little information from which to make the selection, we elected to be conservative and did NOT pass any covered segments to NTIA from this submission format.

Some Broadband providers submitted covered street names and street ranges. In these cases we performed a manual analysis trying to link to specific segment names and address ranges within covered Blocks. Sometimes this was a simple process because a provider used a TIGER derived street database. In other cases we could not determine the source of the provider's street data. Street and Address matching tended to yield a relatively good result (typically between 30% and 100% of possible segments in the Block), but was very time consuming. Where yield rates were low, our result was a shredded

segment coverage pattern, like the image shown below.[15]

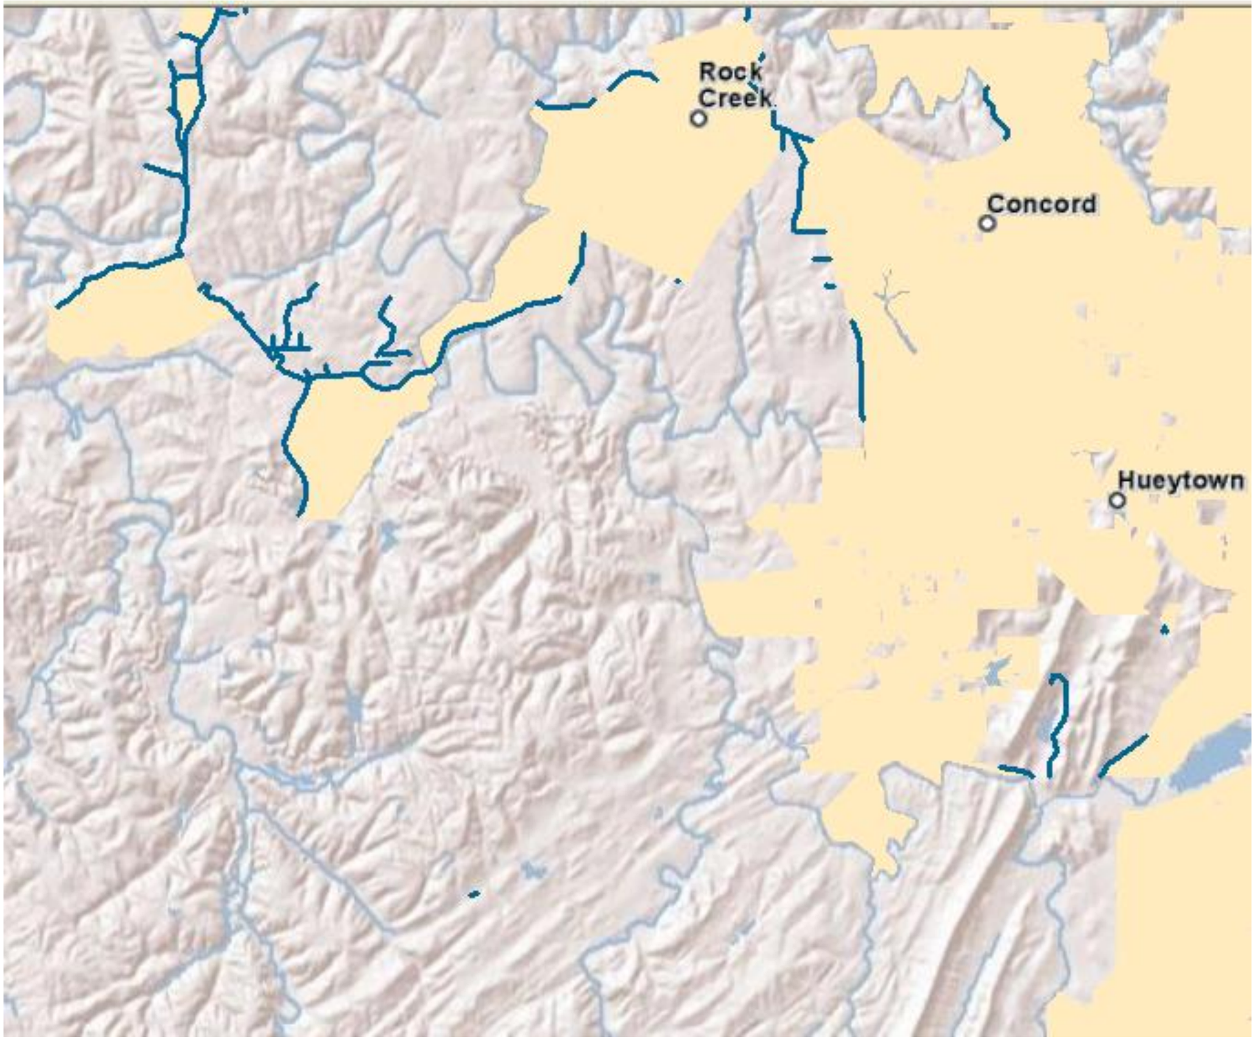

Figure 11-Blue road segments adjacent to peach covered small Blocks

A number of providers submitted geographic objects. In this case, our manual process was directed toward a conflation of data sources. The goal was to take provider submitted segments and put these segments in terms of our TIGER 2010 basemap. Although there is a trade-off in the accuracy using non-provider submitted segments, we felt it was more important to have a license-free road set that would edgematch our Block features, the TIGER state boundary and remain consistent with the block size standards we used for other providers. This is important for the appearance of the online maps, as well as potential verification work where we are attempting to judge a feature based upon its attachment to a covered small Census block. The figure below shows street segment input data.

[15] We continue to hear providers expressing concern that our request for either a geographic object or TIGER Line ID is beyond the scope of the NOFA clarification. Therefore, they cannot supply additional information to us.

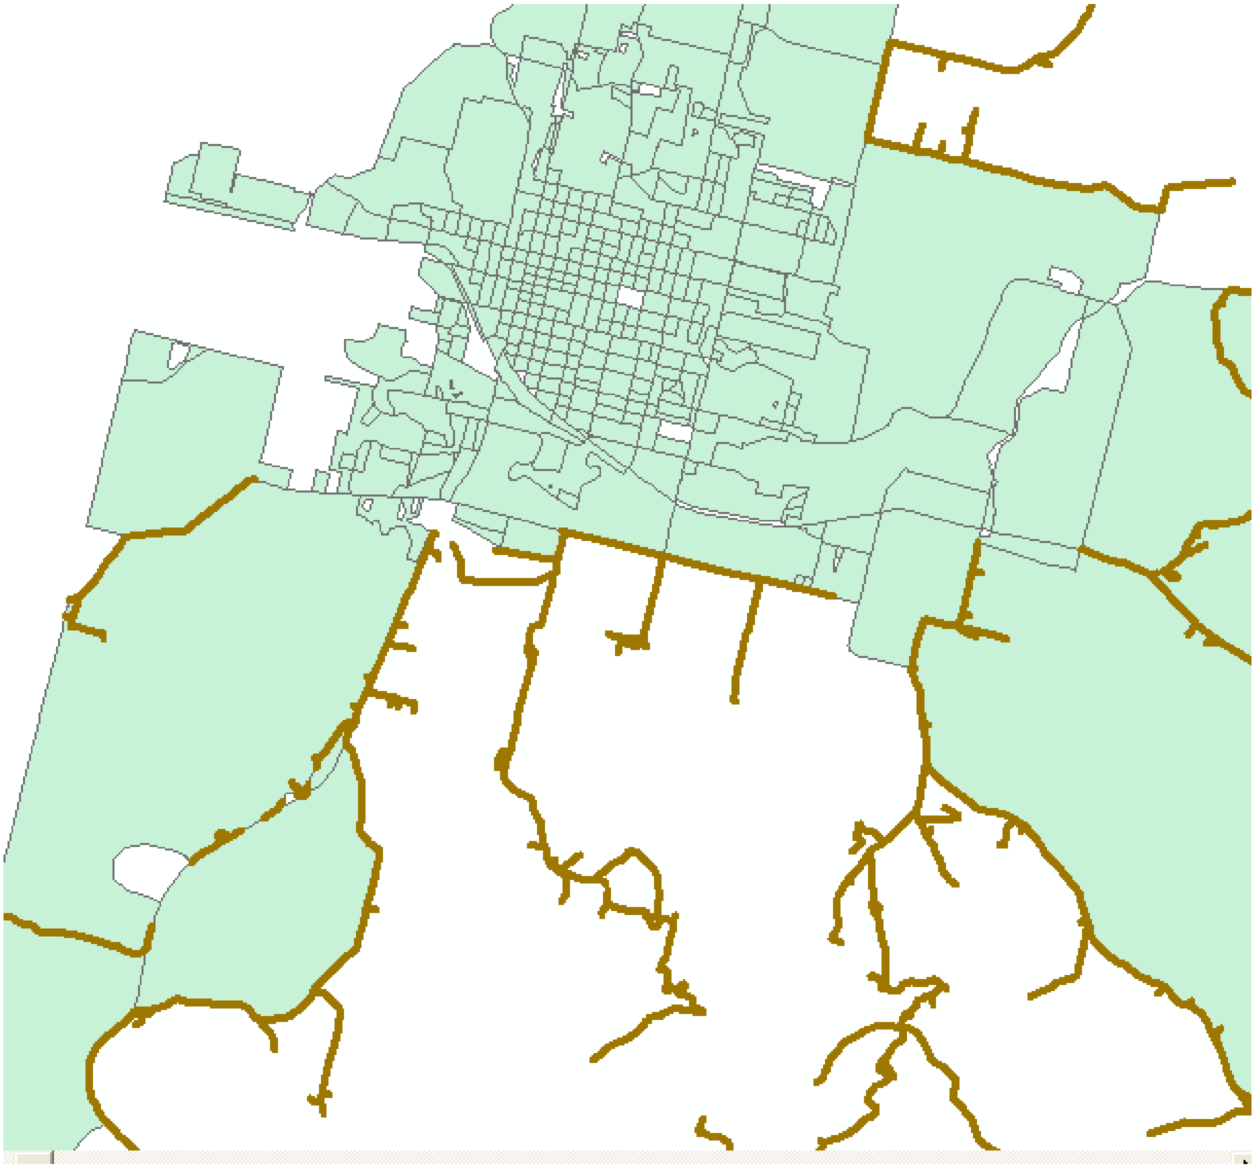

Figure 12-provider Submitted Street Segment Objects. The segments don't edge match the Blocks nor are they continuous.

The figure following demonstrates the same area after the conflation process. Blue segments are the conflated TIGER roads which will be passed to NTIA.

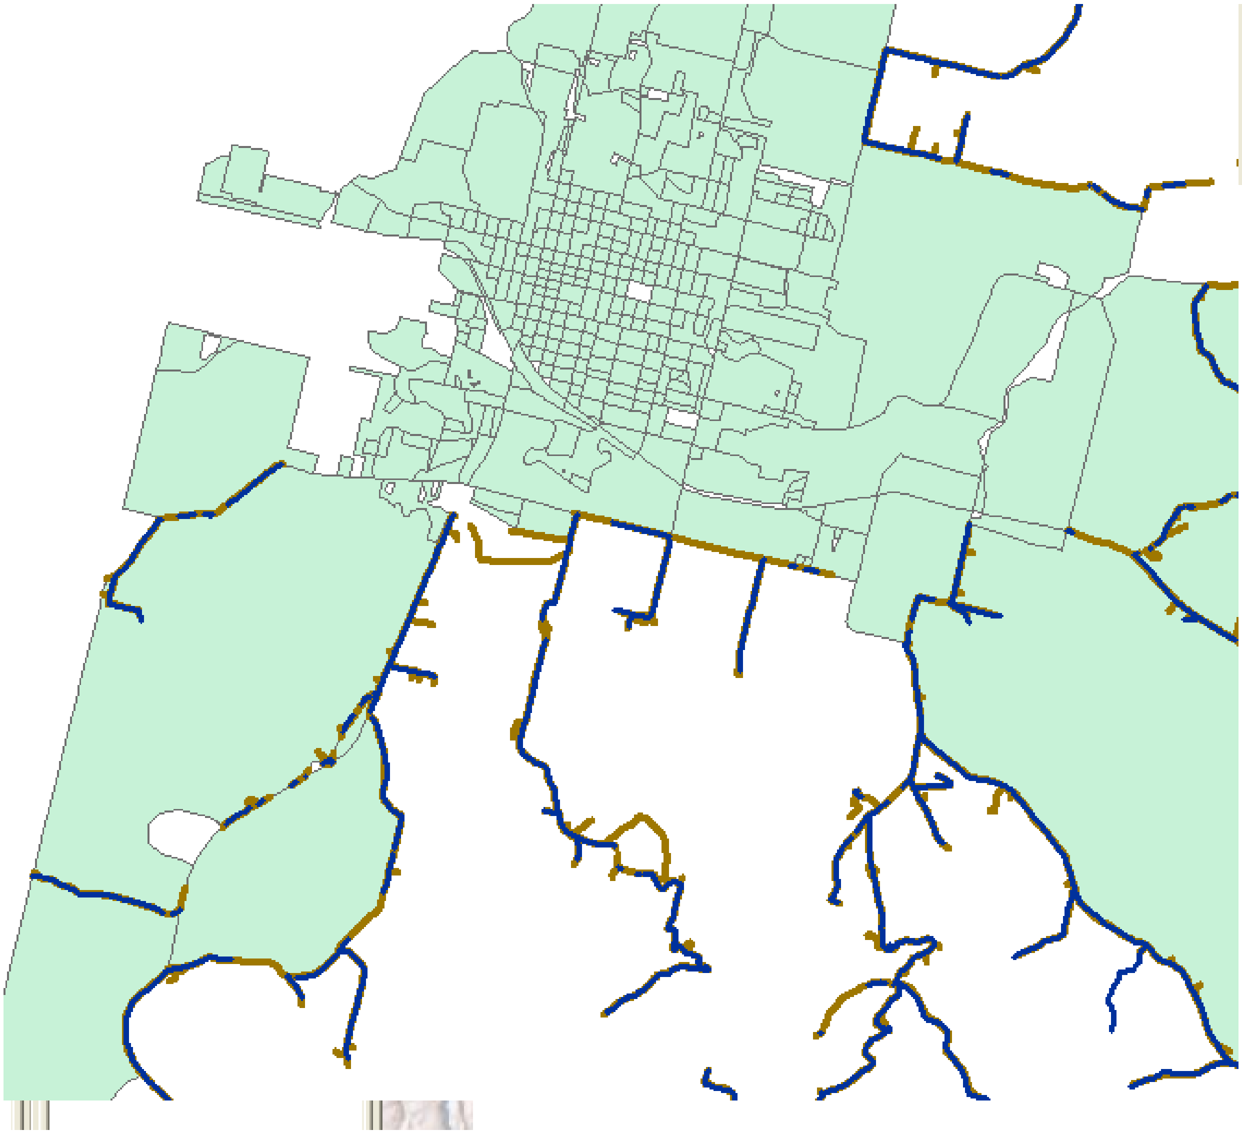

Figure 13-provider submitted segments in gold, selected TIGER in blue—Conflation result; in many cases what was a continuous segment is made discontinuous because even with a distance buffer the TIGER segment doesn't always intersect the provider segment

The final segment process was used when we were supplied with a Broadband covered area polygon. In this case, we found the segments within covered areas and eliminated those segments inside of Blocks less than or equal to 2.00 square miles.

Because there was more control over the format of the inputs (we knew we had a boundary and were working with TIGER segments), this was an automated process that followed this general format:

- Select large covered Blocks by provider ID (from updated Large Block table)
- Select TIGER 2010 road segments (MTFCC like 'S%') that face (CB = CBLeft2010 or CB = CBRight2010) covered large Blocks for provider

- Select segments as distinct records, max speed with corresponding technology, join in feature names, export selected records to temporary DBMS table
- Join TIGER roads feature class to temporary table on TLID
- Select covered segments (Python script)
- Select service area polygons for provider
- Clip selected facing segments with selected service area
- Export clipped segments to staging feature class, keyed by providerID

In this figure, orange represents covered small Blocks; black lines are covered segments in large Census Blocks (light blue). The service area boundary is shown in grey. Based upon feedback from providers, we have elected to clip segments at the end of a coverage boundary.[16]

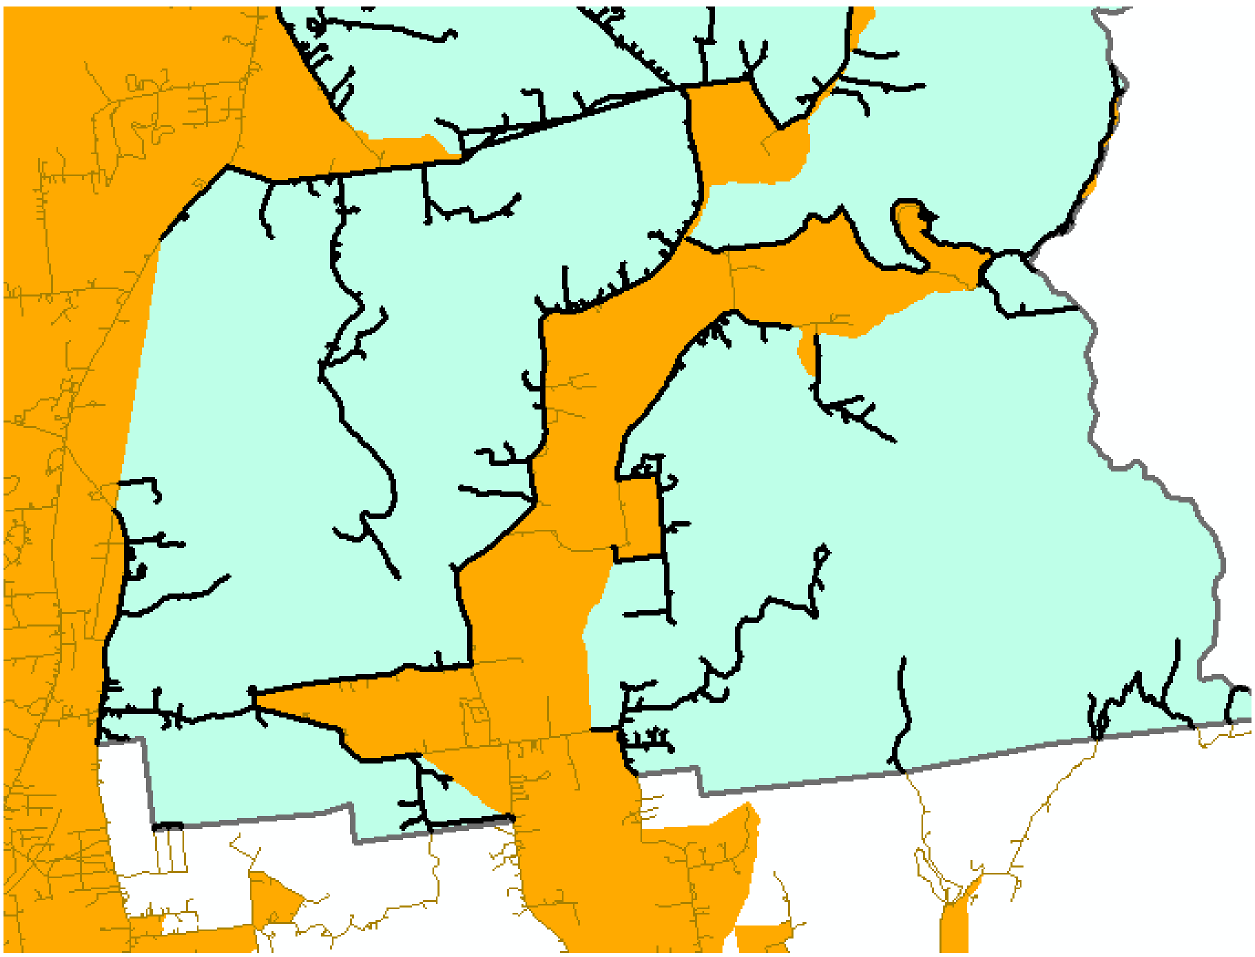

Figure 14-Output of the Segment Process

Wireless Coverage Process

In general, most providers of mobile Broadband submitted coverage information in a NOFA-compliant format. Other than attributions for spectrum and speed, little was done to this coverage.[17]

[16] An outcome not discussed here is how to handle address ranges on segments. As NTIA has asked for a Min and Max on the segment, deriving theses values for clipped segments is very problematic. Also the prevalence of alphabetic characters in addresses makes the min/max selections very arbitrary. We are grateful that addresses are nullable data elements.

Per Program Office direction, LinkAMERICA followed up with wireless providers where we determined that submitted data did not edgematch TIGER 2010 state boundaries. For the most part providers were unable to submit coverage data that edgedmatched as requested. In this case, we left the submitted data alone and did not perform any adjustments.

LinkAMERICA continues to make aggressive efforts to bring additional WISP coverage into the NTIA dataset. For the most part, our outreach was with providers who were unable to supply sufficiently granular data in the past or those that could only submit wireless address points which is no longer a valid submission format.

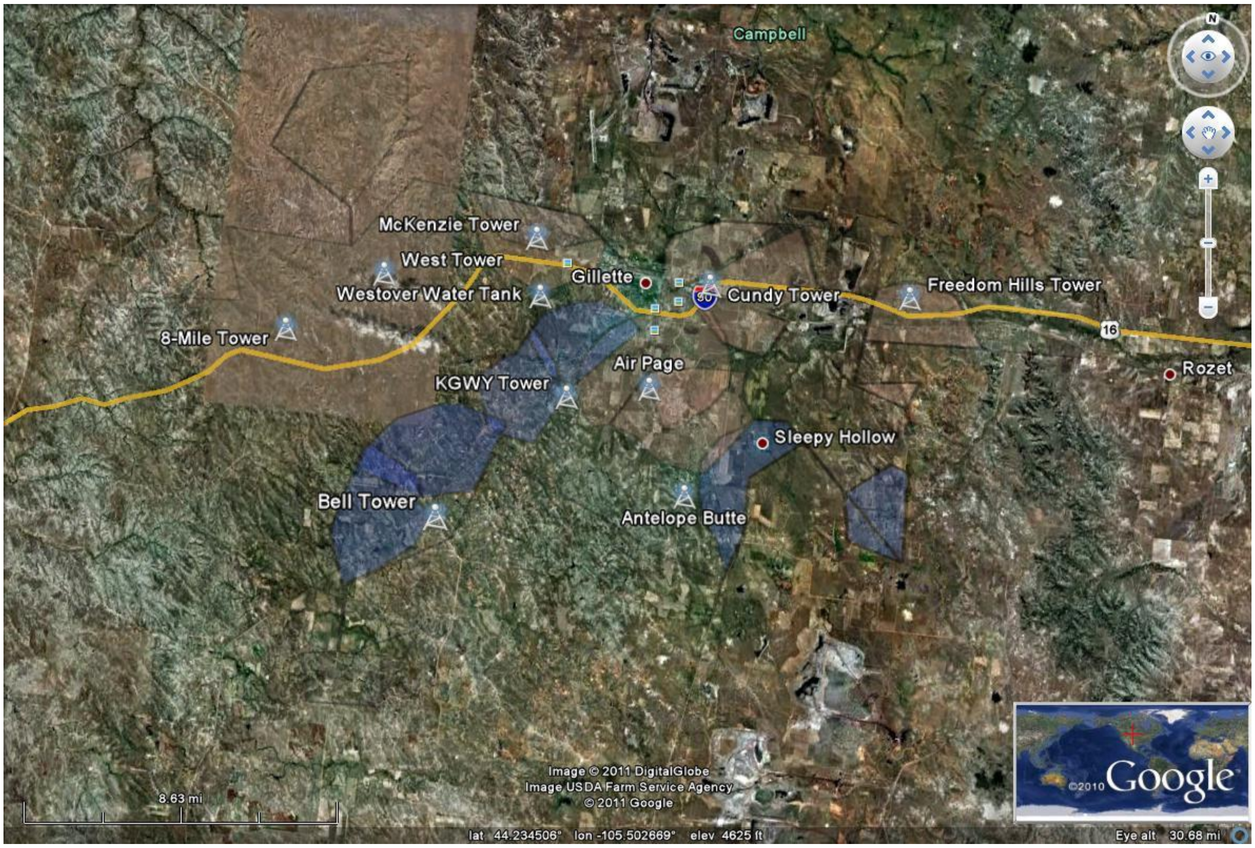
In Round 6 fixed wireless providers generally either supplied coverage information or infrastructure from which coverage estimates could be derived. Many allowed us to use their tower locations, antenna heights and direction/spread of coverage to derive a line of sight coverage estimate. In our experience, this is a conservative and reasonable derivation of coverage.

Some wireless providers submitted RF propagation studies. When this was done, there was a request that the signal strength be removed from coverage data. The request was honored. We note that some providers are very careful in that their coverage is an estimate of the probability of receiving an upstream link to their network. It is not intended as a depiction of any particular speed availability.

Other fixed providers were able to supply us with hand drawn maps or polygons/polylines drawn in Google Earth format. In these cases we did our best to georeference and verify the coverage areas with the WISP.

When we received coverage information in KML format, like the image below, we accepted the data as it was presented to us as the submitted coverage patterns were used in the provider advertising.

[17] Some polygon data did exceed the node count threshold. In these cases, data was rasterized to 100m cells and then converted back to polygons. The polygons were dissolved to multi-part geometry. This addressed the node count concern.



As the image above shows, in some cases we were provided hand-drawn coverage, as well as infrastructure. Instead of estimating their coverage using a line of sight or RF study, we elected to stick with the provider's supplied information. Our decision was guided by two primary factors:

If the provider is advertising using this coverage they must have specific confidence in its accuracy.
If the provider can supply coverage, as well as infrastructure that reasonably supports the coverage, there is a very high likelihood in the accuracy of the information.

The downside, of course, is the polygon shown on the map may not represent our notion of how wireless coverage should appear.

In general we note several interesting trends in the wireless data. First, we can be successful in increasing the amount of WISP coverage when we aggressively pursue WISPs. This means we have to be willing to accept data on their terms and convey it into SBI formats. Some of our WISP submissions have taken over 12 hours to normalize into SBI formats. Second, we have to accept that some WISPs will not be able to supply FRNs. Third, there appears to be some variation on how the NOFA coverage definition is met. In other words, there seems to be a disparity on the necessary link budget necessary (e.g. -80 dB, -98 db, -120 dB, etc) to provide the appropriate quality of service for data services to be provided at a location/inside a location.. Fourth it was very difficult getting providers to identify spectra used for

Broadband data services[18]. We are unsure if this is a competitive concern, or if the same coverage pattern is yielded for multiple frequencies. Typically, the spectra returned were those that a provider was licensed for. At this point, we have no reliable way to locally determine what set of frequencies are used to provide Broadband data services in a local area at a specific point in time.

Service Address Point Process

A handful of providers have requested that customer level, service address point data be submitted to NTIA. In these circumstances we have done minimal processing to preserve the provider's intent with this deliverable and not bias downstream NTIA use.

Our verification included checks against commercial or Public Utility/Public Service Commission exchange boundary maps. Points not contained within three miles of a boundary are not submitted to NTIA. The percentage of excluded data varies cross providers, but it tends to be under 1% of the total submission.

We retain from the provider the provided latitude and longitude, as well as Census block. For some coverage data, if a provider is unable to supply a longitude, latitude or Census block, we fill in these attributes. In those circumstances where we do not have a Census block, but we do have a longitude and latitude, we accept the given longitude and latitude and use that as the basis for our Census block assignment.

With point data we have tested for comparable geocoding success rates but do not overwrite provider information.[19] From this type of analysis we note the amount (usually little more than 10%) of addresses that seem to locate with less than street segment certainty. Deriving a thematic representation of the points on speed also illustrates some of the locational certainty issues in this point level data.

Coverage Estimation Process

Although the derivation of Broadband coverage into Census Blocks, street segments, or wireless coverage files is, in itself, a bit of an estimation process, there was an explicit estimation process required in cases where a Broadband provider either refused to participate in our survey, or provided such a threadbare submission that no carrier-based coverage information could be gleaned[20].

We typically resorted to three possible estimation paths.

---

[18] One provider responded by email, "This mapping program is to provide the coverage area for Broadband provided by a company. Not to keep a detailed account of every aspect of a companies (sic) network."

[19] We will make a second geocoding pass on locations with no longitude or latitude from provider. We typically pick up ~5% from our second geocoding pass. Typically the issue is address quality but also difficulties in geocoding in very rural areas.

[20] We report estimated submissions to NTIA as a non-responsive provider but we have data in the submission for them. This is the reason for datapackage.xls entries which are non responsive but contain submitted data.

For Cable (HFC) providers who did not provide any coverage information, we fell back to Media Prints data. Rather than using the entire Census Block Group gathered by Media Prints, we used only those Census Designated Places carrying the same or similar names to the Media Prints p_com field. Our reasoning was that Cable systems tend to be franchised on a municipal or at least administrative basis so the coverage will likely follow a governmental boundary. As a general rule, cable infrastructure is not available in the public domain[21] and what could be found was poor in quality and difficult to ascertain for validity.

For DSL providers who did not provide any coverage information, we estimated road-based coverage from their Central Offices[22]. We only used Central Offices that showed evidence of DSL or fiber-based services in the NECA 4 tariff. Road-based engineering areas were derived via ESRI Network Analyst to 18kft. These segments/boundaries were clipped to commercial wirecenter boundary edges.

For fixed wireless providers who provided no coverage information, we relied on their public websites to derive coverage maps. When these maps were available, we georeferenced them and tried to use the outer polygon boundary to represent their serving area. In other cases, when only a tower could be provided, we used a view shed analysis and estimated line of sight coverage at 10mi per tower[23]. Because much wireless propagation is driven far below the Census Block and much engineering information isn't known (frequency in use, polarization of the signal, coverage pattern of antenna(s), local terrain/land cover) this was the most complicated group to estimate.

Speed

Speed attributes are reported both at the block (typical) and higher levels (maximum advertised and subscriber weighted). We note that in many cases, providers did not supply typical or subscriber-weighted speeds. In some cases, it appears--although we cannot verify--that their maximum advertised speeds were used to populate typical speed columns.

We do have limited testing data on reported speeds, but we have been careful to not use our typical reported values with carrier-provided information. If we do not have a speed value from a provider, we report an empty value.

Several service providers claim they do not have data on typical speeds available, but estimate a 20% overhead factor between the advertised speed and what may be experienced by an end user.

We continue to request advertised speed at the block level. Nevertheless we appear to be getting speeds that do not vary over a large geographic area – leading us to believe that providers may still be submitting the maximum speed advertised in local media for the entire market. For the most part, we

[21] The team tried to use data from the FCC Coals system and 321/325 fillings but this seemed to be a bit non-uniform in quality.

[22] Central Office location was derived from GeoResults. Wirecenter boundaries also came from this commercial product.

[23] In some cases we had an approximate radius of coverage but no height. In this case we used a 50' height estimate and then clipped the coverage to the provided coverage range. We also clipped wireless coverage to honor state boundaries but did not look for providers serving coverage with out of study state facilities.

have been unsuccessful in messaging that advertised speed should not correspond to a market area, but instead, the maximum speed, which can be provided to a household—what some may describe as a 'qualified speed.'[24]

As a general rule, in circumstances where a provider supplies a range of speed attributes, we assign NTIA categories based upon the midpoint of the range. We follow this rule unless we can determine other grantees are handling the same submitted information differently.

To support NTIA program office requests, we have also modified the structure of the Service Overview table. Even if Maximum Advertised Speed is supplied at the market or county level, we push that speed down to the contained Blocks. The only records that remain in this table, will be those wireline records with either a non NULL nominal weighted speed or ARPU value.

Middle Mile

Middle Mile information was collected directly from providers via survey or interview. Middle Mile is a "chicken or egg" type of challenge in that it is possible to verify that the infrastructure exists, but extremely difficult to know what the site is doing without engineering level assistance. Although most providers submitted "something," there was a significant variance in what that "something" represented.

The purpose of this section is to record some of the comments and questions we have received about Middle Mile. We hope this provides better context for our data submission.

Within the NOFA, Middle Mile was defined as (a) a service provider's network elements (or segments) or (b) between a service provider's network and another provider's network, including the Internet backbone. (Collectively, (a) and (b) are "middle-mile and backbone interconnection points.")[25]

Given the existence of the "or" in this definition, providers submitted a variety of information. Based upon the NOFA example, several fixed wireless providers interpreted Middle Mile in terms of the connection points from their towers to their own serving backhaul location. The topology was commonly Microwave from their distribution towers to their NOC. The NOC and towers were listed as the Middle Mile points. This seems to be consistent with the first definition clause (a).

Telephone, Mobile Wireless, and Cable providers tended to remain either silent on the question, or would provide a single location in which Internet peering occurred (clause b). A number of participants explained that the NOFA was quite ambiguous with data traffic moving back and forth over both TDM

[24] As an example of a response to our request for Block level advertised speeds, we received the following comment from one anonymous provider, "This is and of itself does not require anything new of us – just states the NTIA supports efforts focused on getting that information on the CB level." It would be helpful to have broader messaging so that providers understand this new direction.

[25] From http://broadbandusa.gov/files/BroadbandMappingNOFA(FederalRegisterVersion).pdf at 54, visited March 28, 2010

and IP networks--it was unclear where the distinction should be drawn. As a general rule it seemed like many providers listed a single location where Internet Peering occurred.

A number of providers refused to answer the question on grounds of confidentiality[26]. Others would not disclose as their Middle Mile points are not owned--another company provides the physical and electronic connection to their network. In other words, the entity providing Broadband is not the entity providing Middle Mile.

Additionally, based upon the new Provider Type classification of "other," we have started to integrate points provided by Broadband service providers not meeting the NOFA definition. This includes POP locations and aggregation points for public / private networks.[27] Within a given submission there were two final attributes that tended to concern respondents. First, speed should be measured in terms of only data capacity and what exactly is "data" (e.g., can/should you segregate out voice or video), and is the relevant capacity of the physical connection, channelized to a specific virtual circuit on their network.

Finally, a number of other providers were unsure of the height above grade measure (is this their floor, the street outside, etc). We seem to have a combination of height above or below grade, as well as heights above mean sea level (AMSL).

To the extent possible in our timeframe, we verified the location of a sample of Middle Mile points. Where we could see infrastructure that appeared to be consistent in location with other provider infrastructure, we felt that the location was accurate. In some cases, the point provided seems sensible (is on a road, near other equipment), but using imagery, we couldn't find a place where this type of connection could occur. This wouldn't be unforeseen, in that Middle Mile connectivity likely takes place in a protected environment much smaller than a standard Central Office installation.

Mobile Wireless Coverage

We have received mobile wireless coverage from most mobile Broadband providers in each state. At this point we have cleaned the geometry of the data and attributed it with spectra, NTIA speed categories and FRN as required.

Where possible, provider derived coverage has been reviewed for consistency against the commercial licensed product.. To a limited extent we also use licensing locations and tower infrastructure to spot-check supplied coverage. This mode of verification remains complex, given the lack of facility-based information with mobile wireless.

---

[26] As received in email 9/30/10, "Due to security concerns and the risk of public disclosure of highly sensitive data, whether inadvertent or otherwise, ***REDACT***response to the Middle Mile and backbone interconnection request is limited to publicly available information available on {remainder not included}"

[27] As discussed in our readme.txt file, a number of middle mile points were lost in validation due to their location in adjacent state. This will cause a decrease in some providers relative to prior submission.

Finally with respect to mobile Broadband services, we note several trends.

First LinkAMERICA used the NTIA supplied frequency tables to report speeds consistent with other grantees. In circumstances where a provider supplied a range of experienced speeds, we used the portion of the range consistent with the most frequently reported Grantee value.

Second where a provider reports multiple frequency bands in use but doesn't distinguish these bands by submitted SHP file, we submit identical geometries but attribute one geometry to each submitted spectrum value.

Third we are seeing a trend toward increasing Broadband speed. As of this writing, there is not consistency across providers in how they attribute the advertised 4G speed values. In other words, for some providers 4G means advertised speed categories increase. For other providers the speed value did not change.

Fourth, we have requested providers submit SHP files that are consistent with the TIGER 2010 boundaries. For the most part, providers have not done this. As the request came late in the round six submissions our hope is this request will be honored for round 7. We have not modified the submitted data to impose the TIGER 2010 state boundary.

Verification

Data verification is an ongoing and evolving process. Clearly, with each new data submission there will be a validation process at hand and at the same time, our team continues to expand and improve the efficiency and effectiveness of our data verification routines. Consistent with the movement toward an fGDB export database and use of a data receipt script, much of our validation effort is spent in supporting the ETL processes into the required formats. In future data submissions we will continue our work to stabilize and improve the business process that normalizes provider submissions into NOFA formats and expands in more depth on the confidence analysis within the data.

Verification Methods Summary

Our overall verification standard is focused on the level at which we supply processed data to NTIA. This means that the vast majority of our verification process and resources will be focused on verifying provider identity, coverage, advertised speed and appropriate metadata for Census block's less than or equal to 2 square miles.

We believe three broad verification themes are important to consider

a) The first step of broadband service verification is a consistently applied market definition—we call this provider identity verification.

b) There is probably not a single dispositive method of verification. Rather, a number of verification approaches are needed to appropriately classify confidence in data submitted to NTIA.

c) Verification approaches tend to meld together. As an example a web survey is complimented by a phone survey but expert review and external data may be necessary to reach a final informed judgment.

The table below demonstrates the various methods used across each feature class submitted to NTIA.

	Data Types			
Verification Method	**Census Block, Road segment or, address specific service availability**	**Mobile wireless service availability**	**Middle mile infrastructure locations**	**Community anchor institutions**
Provide/Subscriber Identity Verification	METHOD USED	METHOD USED	METHOD USED	METHOD USED
Internal data consistency check	METHOD USED	METHOD USED	METHOD USED	METHOD USED
External data consistency checks	METHOD USED	METHOD USED		
Carrier confirmation	METHOD USED	METHOD USED	METHOD USED	
Public review	METHOD USED	METHOD USED		METHOD USED
Anchor institution review				METHOD USED
Expert review	METHOD USED	METHOD USED	METHOD USED	METHOD USED
Telephone sampling	METHOD USED			METHOD USED
Purchased Datasets	METHOD USED	METHOD USED	METHOD USED	METHOD USED
Developed Datasets	METHOD USED			
Web-based surveys	METHOD USED	METHOD USED		METHOD USED
Field Surveys	METHOD USED	METHOD USED		METHOD USED

The following table defines each of these methods and provides a summary of why this method is used, and the value we gain from it.

	Definition	Methodology	Purpose	Benefit
Provider Verification	Provider verification is the process of assembling a broadband provider database, determining which providers are properly classified into SBI eligible providers and developing contact information.	Provider verification involves combining multiple data sources, interviewing providers and classifying the broadband provider type.	Without a consistent understanding of the provider 'market' it is impossible to appropriately classify the coverage data. It is also impossible to explain to consumers of the data why a given provider is or isn't available in the submitted data.	The main benefit of this verification process is understanding who is providing broadband services, are the broadband services NTIA compliant and how do you 'contact' this provider (Name, DBA, FRN, Holding Company)
Internal data consistency check	An internal data consistency check is a validation measure across at least two dimensions. First is the provider data consistent with prior submissions. This would be an examination of this submission relative to a prior submission. Second is this submission	Most of this validation is performed using our spatial databases and running queries that compare submissions. We also use a similar set of queries to isolate transmission of technology outliers. These would be data sets which offer speed technology combinations	The purpose of this type of validation is to understand how things change over time and why. It also helps inform us for circumstances where we have data points which appear to be outside of the norm. If these outliers are	The main value is understanding why something changes and providing an opportunity to engage with the provider to understand why there has been a change.

	consistent with the technical specifications of the service offered.	which are unusual relative to other data received across all states.	detected, they can be pursued directly with the provider.	
External data consistency checks	An external data consistency check is a measure of the provider data against external sources (not from the Provider). The distinction between internal and external isn't pure, but our typical experience has been that External checks involve the acquisition of additional data sets and a comparison across multiple sets.	External validation can be performed by verifying supplied coverage against third party data sources. An example would be to test provider claimed DSL Census blocks against a commercial source of exchange boundaries. Wireless coverage is also compared to tower locations.	We don't believe a single, exhaustive third party data set is available for validation. We do believe a combination of external datasets can be used to inform and help filter out the false positive cases from provider data. We also note that the external data appears to diminish in accuracy as the area of analysis becomes less urban.	External validation provides an external measure of data quality assessment not influenced by internal data sources. It can be one of the more effective means of isolating false positives in submitted data.
Carrier confirmation	Carrier confirmation is the process of sending processed data back to the service provider	We use two techniques to accomplish this. First a provider's data is summarized in a tabular format. This lets the	One of the more critical steps in broadband mapping is translating carrier	Carrier confirmation gives the provider information on how their data will look when submitted to NTIA. It also helps short circuit complex problems like

	to ensure that translation into NTIA formats is fair and appropriately accurate.	provider quickly verify firm information (FRNs, DBAs, counties served). We also develop two sets of check maps. One is a PDF version and the second is a Google Earth (KMZ) version. Both versions display the NTIA reported coverage and speed. A different map is developed for each technology of transmission	supplied data into NTIA formats. Providing verification deliverables to the service provider (carrier) isan important external feedback process. Several providers also ask us to repeat this process before data are submitted to NTIA so they can see what will be submitted to NTIA.	online map display problems—which tend to come from FRN issues or incorrect data entry. This process also helps to strengthen the sense of ownership and participation with providers.
Public review	Public review is the process of collecting structured feedback from the general public in a manner which can be analyzed and used to improve/validate the submitted data.	Currently we use an online map 'layer' which provides consumers the ability to feedback about the coverage and provide in depth information about their concerns. The maps are also discussed within the context of planning teams within each state. We receive	As with other crowd-source approaches the intent is to allow the general public to feedback and improve the displayed and submitted data.	The benefit is to provide feedback and also display real time the comments of the general public. As a mechanism for validation the key is to develop feedback data which is structured in way that informs the mapping process.

		feedback from these meetings.		
Anchor institution review	Anchor institution review is targeted surveys intended to better understand the Anchor Institution broadband market.	We have used three methods to verify anchor institution data. The first is a targeted series of telephone calls. The second is specifically targeted mailers. The third is direct interviews with stakeholders. Schools for example, may have someone at the state level who maintains information about broadband connectivity.	As Anchor Institutions represent a different class of coverage information as well as a very different type of end user, a focused stakeholder management, data acquisition and data review process is advantageous.	Because CAIs represent a very distinct stakeholder community, building identifiable connections between the SBI program and the anchor institution community is important. Tailoring a specific data acquisition/ data review process helps Anchor Institutions establish a reliable set of infrastructure benchmarks which they can use to fulfill their mission.
Expert review	Expert review is the process of using subject matter experts to review submitted or processed provider data.	The method of subject matter review will be dependent upon the type of data in question. In the past this has taken the form of conversing with a wireless engineer to ensure that the coverage pattern appears plausible for a given technology. It may also involve a cross check on data from a second source—	The purpose of expert review is to get a second opinion regarding some aspect of submitted or processed data. Given the large number of submission formats and innovative ways to supply broadband, it is always	The most significant benefit is to have a secondary source for back checks and verification. For the most part expert review is from an engineering or deployment resource. Expert review also helps support process transparency so there isn't a closed GIS driven process making all the decisions.

		can this type of middle mile infrastructure support the maximum advertised speeds in this area? SME validation is also helpful trying to understand ambiguous information in submissions.	helpful to have multiple sets of eyes available to reduce errors from misunderstanding.	
Telephone sampling	Telephone sampling is the process of using targeted phone calls to verify aspects of submitted or processed data.	Telephone methodology tends to be consistent across the type of data being verified. A subject location or individual is identified. The phone number for that location is identified and a call is placed. The person performing the survey asks a scripted set of questions and records the responses in a database. For example, our team produces a survey to develop and monitor access and use trends at a regional level.	The purpose of a telephone survey is to gather in depth information from a targeted respondent. We would likely use telephone survey for targeted purposes--either clarifying anchor institution data or randomly polling consumers to better understand attitudes.	The primary benefits are to develop in depth information as well as surveying a large number of respondents regarding opinions or behavior. Phone surveys tend to be more helpful to survey attitudes or to find out location specific information. Telephone sampling is used in our consumer surveys.

Purchased Datasets	See external data consistency checks.			Also note that not all external data checks must be purchased. For example Census data could be used for an external consistency check but it is freely available for download.
Web-based surveys	Web based surveys can involve three dimensions. First a web survey (a form available to be filled out on the Internet) can be used to supplement and better understand consumers. A web survey could be a compliment or a substitute for a telephone survey to target a specific demographic (a web survey can also be part of a social media campaign). Further web surveys can be used to verify provider information.	In the case where a web survey is a compliment to phone or in person, a survey,instrument is developed and then respondents are invited to complete the form. In the case where a survey is a mechanism to gather additional information from provider web sites, this could take the form of manual queries (looking for address listed in a Census block) or automated scraping where information is pulled from a website via a specific web application. We currently use both approaches depending on our goal.	The purpose in all cases is to gather additional information via the Web.	The benefits of web survey are its relatively low cost as well as the ability to gather specific information into a form that can be easily used by downstream work processes.

Field Surveys	A field survey is sending a team of skilled participants into the field to verify submitted data or sample some aspect of the environment in a given area.	Field survey methods involve assigning a field team, equipping them with data acquisition hardware, ensuring they have a consistent skill basis and recording observations. To date most of our field survey work has been in engaging CAIs into the process. We have performed limited wireless testing and infrastructure verification.	Although expensive, field surveys are sometimes the best way to verify information such as provider equipment presence or the strength of a wireless broadband signal.	The benefits to field work are significant. They can help us better understand the exact phenomenon in a particular area.

Verification Standard

Verification is a broad term, but in our definition it boils down to determining if broadband coverage is in the right place. For a given provider, the question is whether the coverage is assigned to appropriate Census Blocks, road segments or area features. Coverage verification can be further broken out into two distinct classes:

- Technology verification, which is determining if the provider is listed with a technology consistent with their marketing information.
- Speed verification, which is determining if the speed supplied for that block, road segment, point area file or market area is consistent with the technology and the marketing information received.

The final verification dimension is consumer feedback and crowd-source verification. This is a dynamic set of steps we are beginning to implement. One side of this is responding to consumer concerns. The second is using the crowd sourced data to validate provider claims and, if appropriate, update the map and the underlying data.

At this stage, our working hypothesis (confirmed by our experience) is that there will not be a single measure to indicate broadband coverage availability in a Census block or along a segment. From prior work, and examining our current provider submissions, we believe that there is too much variation below the submitted record to make a single binary yes/no indication. Rather, there will be a series of measures that combine to provide qualitative confidence (a classification scheme) in our indication of Broadband availability at the block, segment, or wireless polygon level. We believe such a qualitative classification scheme is both relevant to and supportive of NTIA interests, as well as the interests of our end-user community – that is, the states and citizens we serve through this program.

The intent of this section is to illustrate why our team is moving toward a particular verification methodology. Our team is learning as we go along, and will adjust and improve this thinking. But given our experience to date, this is our path. As stated above:

- First, coverage verification is at the level of data submitted to NTIA.
- Second, coverage verification is enhanced when there is a secondary measure of availability (such as infrastructure presence or serving area boundaries)
- Third, given the limited resources of this effort, the most important coverage verification process to implement is the erroneous dispersion of coverage. These are the “islands” of coverage isolated by significant distance from other covered areas. In other words, Broadband Internet likely doesn’t exist far away from other areas with Broadband Internet access supplied by the same provider.
- Next we present several examples which illustrate the complexity of coverage verification.

The first example is taken from a gentleman who requested a map change in Alabama. His home is near the yellow dot. The darker grey Blocks are covered Census Blocks. The black lines are covered road segments. He cannot receive DSL from his incumbent provider, although his neighbors can. The incumbent carrier does have at least one structure in that block from which Broadband services can be provided; unfortunately his home is not served.

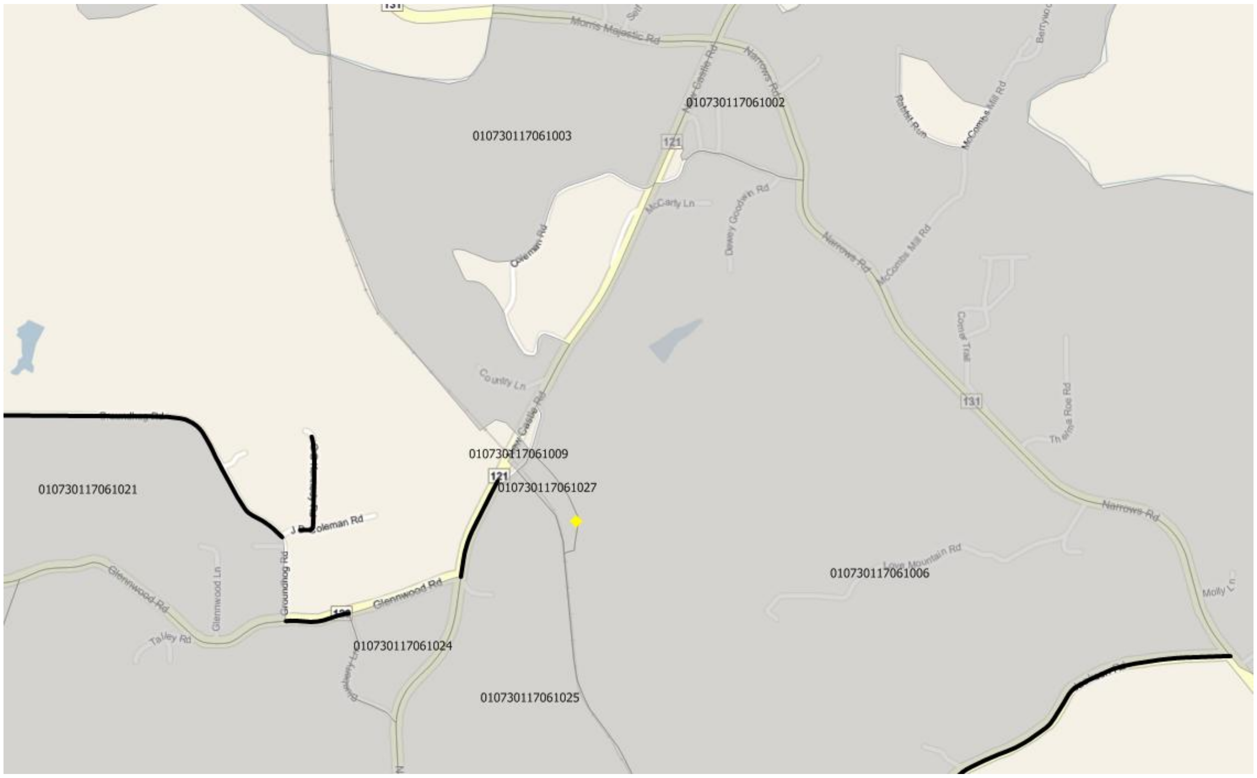


Figure 15--Sub block variation

Because the SBI program requires the depiction of coverage at the block level, the above map has been correctly generated. However, from the customer's point of view, the map is inaccurate. This requires us to explain that the maps are not intended to be a structure-level qualification, at which point some consumers question the value of the maps when seeking service information.

Beyond this type of one-off structure-level qualification, sometimes, as shown below, we have even larger gaps in provided coverage. The image here shows an "outlier" block that could be an error, or it could indicate missing Blocks along a major road that should have been filled in. In this figure, the outlier block is highlighted in turquoise.

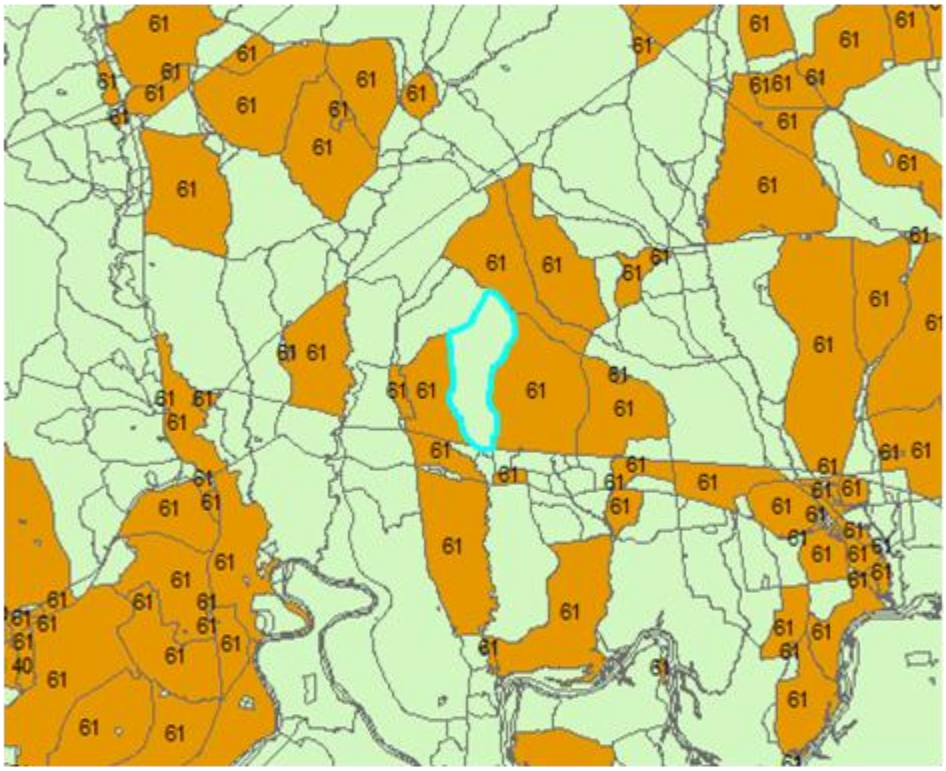

Figure 16--Dispersion in Submitted Data

In this particular case, we are faced with a different verification question. Based upon the properties of the neighbors, we believe this block should likely be covered (coverage interpolation,) but supplied data from the incumbent says otherwise. Although we don't have information to know how much of the data submitted to us is generated, our sense is that geocoded customers or plant are used. In this case the block dispersion could be the result of a side of the street assignment rather than an availability assignment. In other words the data may speak to where is working plant rather than where could service be provided in 7 to 10 days.

The next example shows where an interpolation process could require some adjustment. The figure below shows a town level view. There are some smaller Blocks that are likely covered by interpolation logic, but we also do not want to extend coverage beyond a franchise boundary as in the areas shown in a box on the bottom of the map.

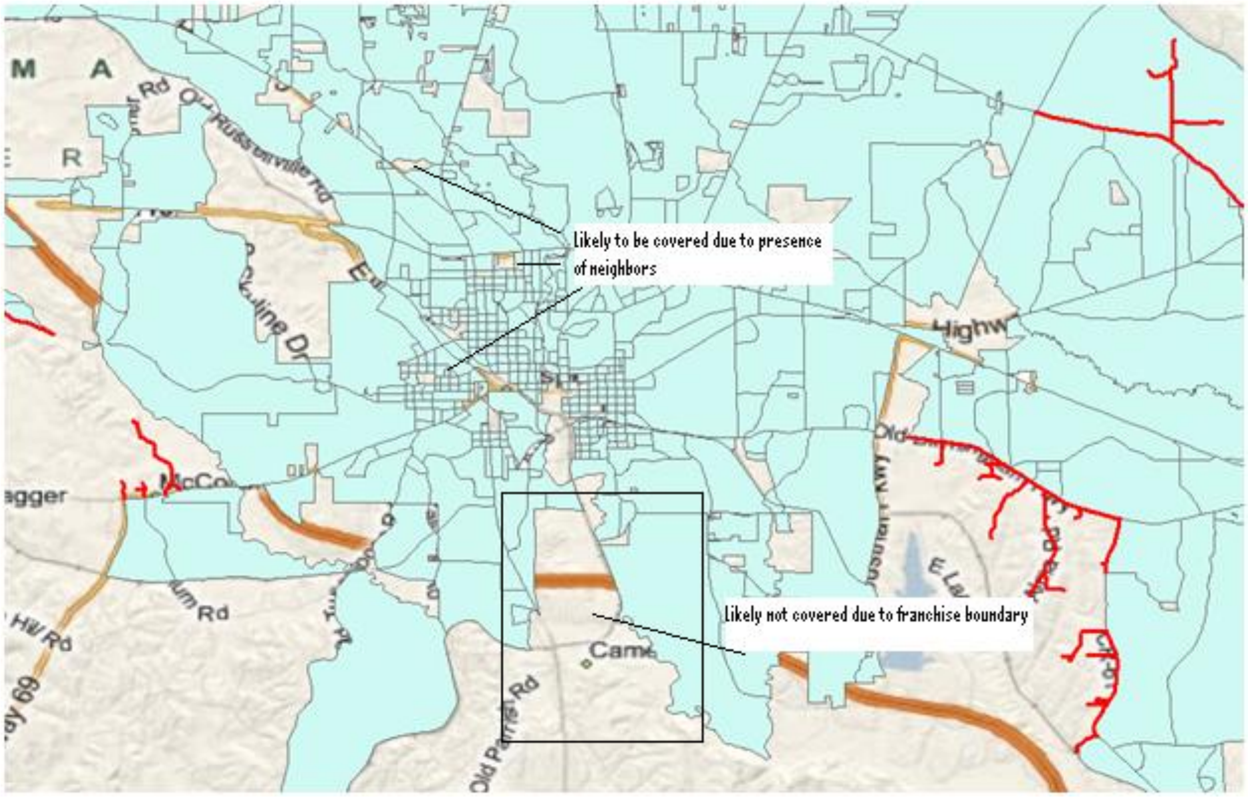

Figure 17-Where do you stop interpolating?

From what we can gather from some providers, the submitted data—data with consistently high degrees of dispersion or coverage holes—tends to come from geocoded billing records. In this paradigm, this means where there are no billing address points; service is not identified on a map. The interpolation verification question then takes on three dimensions.

First, if a provider has no customers in an area, how can we know if they would be able to provide service in a 7-10 day interval?

Second, if we use the properties of neighboring Blocks to interpolate coverage, when should we stop (e.g., at a franchise boundary, at a certain distance, etc.)?

Third, if we are comparing to a data source that examines coverage at a higher level (such as 477 Tract) do we use the Tract information to assign information block level coverage or do we use the tract coverage to filter out dispersions in coverage.

We continue to work with providers to get additional information to help us better understand and contend with this type of circumstance. However, we have not been entirely successful at getting franchise/service area boundaries that would address much of the issue.

The final map shows this dispersion problem, but to an even larger degree. This solitary large block is likely the result of a bad geocode, but we don't know, given the data that has been submitted by the provider and the "single customer in a block standard" set by the NOFA clarification.

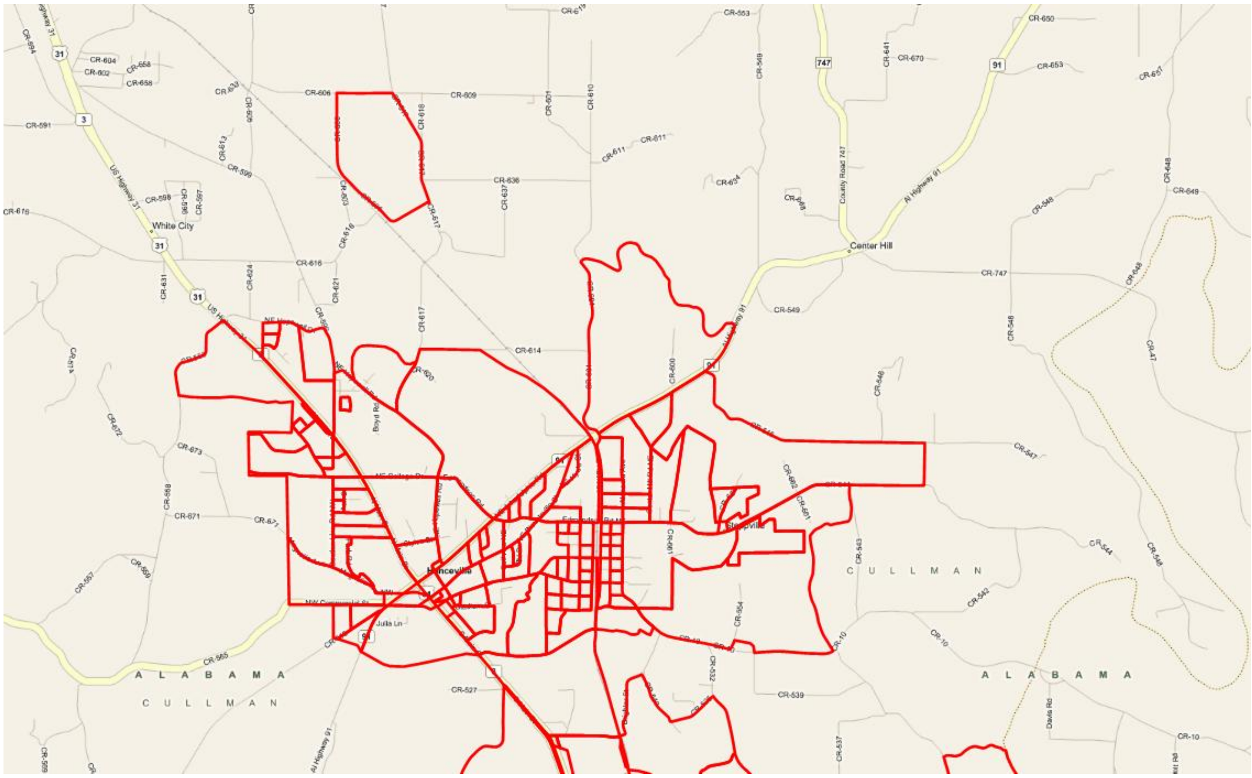

Figure 18-Dispersion in covered Blocks

Due to the fact that this situation is quite obvious in display, this type of problem is one that we are more aggressively trying to resolve. Where a single block has no neighbor offering comparable coverage and is a specified distance beyond an exchange boundary, our approach has been to filter these Blocks out. As of now, this filter is limited to incumbent xDSL providers because we have a good source of exchange boundaries.

The exchange boundary dispersion verification method breaks down when examining providers who are more likely to CLEC into neighboring territory. In the figure below, the black line represents the exchange boundary, while the continuity in the DSLAMs likely points to coverage extending along a road into another provider's territory.

Figure 19--DSL Coverage outside of exchange boundary

In sum, the variability in our source data continues to suggest that our dynamic verification process is relevant, appropriate and evolving in a manner consistent with the overall program. And, as noted above, we believe the more meaningful outcome of our verification processes will likely be a series of qualitative indicators or expressed confidence levels. Our concern, as with the development of any sort of classification process, is how rigid we should make this classification given the variation in our input data and the varied perceptions of service providers, map viewers and down-stream data consumers.

Verification Work Process

To support our dynamic multi-factor verification process, we have implemented the following steps.

Between submissions our provider relations team works to analyze our current broadband provider ecosystem and capture any changes such as acquisitions, mergers or cessation of operations. They also remain in touch with providers who have indicated when follow-up is necessary. The team confirms that the providers who submit data are NOFA compliant. Given these steps they begin a survey and awareness campaign to get data submitted for the program.

When data is received, an analyst reviews the submission and any immediate questions or concerns are sent back to the provider as quickly as possible. We have found this gatekeeping step very helpful in making sure we understand the intent of the submission.

For all providers who submitted data to us in the prior round, the provider received both a tabular data summary and mapped output[28]. Prior to releasing the "check maps" to providers, we inspected each provider's coverage area. After this in-house review, we solicited a second level of feedback from providers and received a number of requested changes and corrections used in the development of the current dataset.

For those providers who submit only block or segment level coverage (i.e., in those cases where we have no infrastructure to test with) we test for coverage containment within known service boundaries. The intent of this validation step is to remove Blocks that are obviously erroneous.

We have also begun to perform a mechanical test against wireline providers. This is an examination to ensure that each feature submitted has some neighbor within 1 mile. We are testing this process to try to understand what the neighbor distance should be. This has proven to be a difficult process.

We also verify the submitted speeds against the typical speed ranges in the NTIA frequency tables. If we note a value outside of typical range, we ask the provider for clarification. These responses are recorded.

As mentioned in the sections above, we have implemented a check on dispersed Blocks, but we have implemented less with respect to coverage interpolation (holes in coverage). We continue to work on a

[28] For the verification of round 3 data, we submitted both PDF and KMZ (Google Earth) format check maps. Some providers prefer to work with the Google format as it supports easier modification. Others continue to submit marked up PDFs.

series of mechanical tools to assist with the inspection process but have run into challenges related to geographic basemap and timing.

As our submissions have moved online, we have also begun to benefit from crowd source feedback. In some cases this has helped us identify and fix errors in our underlying data. In other cases, as we have shared with NTIA, we have encountered some perceptual issues rooted in how the data are developed and modeled to comply with the NOFA. Depiction of uniform coverage in small Census Blocks continues to be a challenge. Despite our best efforts to explain the full block coverage requirement, we continue to receive complaints that the coverage shown on the map is not accurate for a particular location within that block.

Consumer and Provider Responses to Deliverables

Here, we segue from internal verification to external verification. We view responses to our work product as a form of validation and verification. On the one hand, this gives us the opportunity to fix mistakes and then generate QA steps to make sure that the problem does not reoccur. We also learn how to improve what we are doing or better explain what we are doing to a community not always familiar with the NOFA and program office framework. On the other hand, listening and learning from this feedback helps us better target our mapping deliverable to meet the needs of our external customers. In this second case, external feedback not only provides feedback on perceived qualities (or lack of quality) in the data, it helps us to learn if we are developing data that is truly helpful to downstream users across a wide range of usage and intent.

At this point, our external deliverables take three forms: State Broadband Maps, data transfer to NTIA used for the National Broadband Map, and text format data requested by outside parties.

Online Map Experiences

With our State maps online, we continue to harvest viewer feedback and comments. Because an online map allows someone to zoom in far below the scale of the data, a large number of comments reflect sub-Census block concerns. While important to the citizens reporting these issues and to our Broadband planning teams, this level of data is outside the scope of our core validation process, which as noted above, is focused on the level of data submitted to NTIA.

There are several other themes that our team believes are important to share. These comments are actually quite helpful because they also improve our data processes to better meet the needs of map viewers. For example, we have invested significant time in harvesting more segments from provider data. Because the appearance of segments is so important, we are putting time into ensuring a visually appropriate edge match between the roads we harvest and the Blocks/roads we will show online. On a technical level, we also believe that a good segment process will help us understand more about dispersion in the data, and what is valid versus what is not valid.

Online Display of Consumer Feedback

We have completed development of a consumer feedback layer for our online maps.

The intent of the new layer is to show viewers the feedback of other map viewers. This layer went live after the Round 4 data was posted.

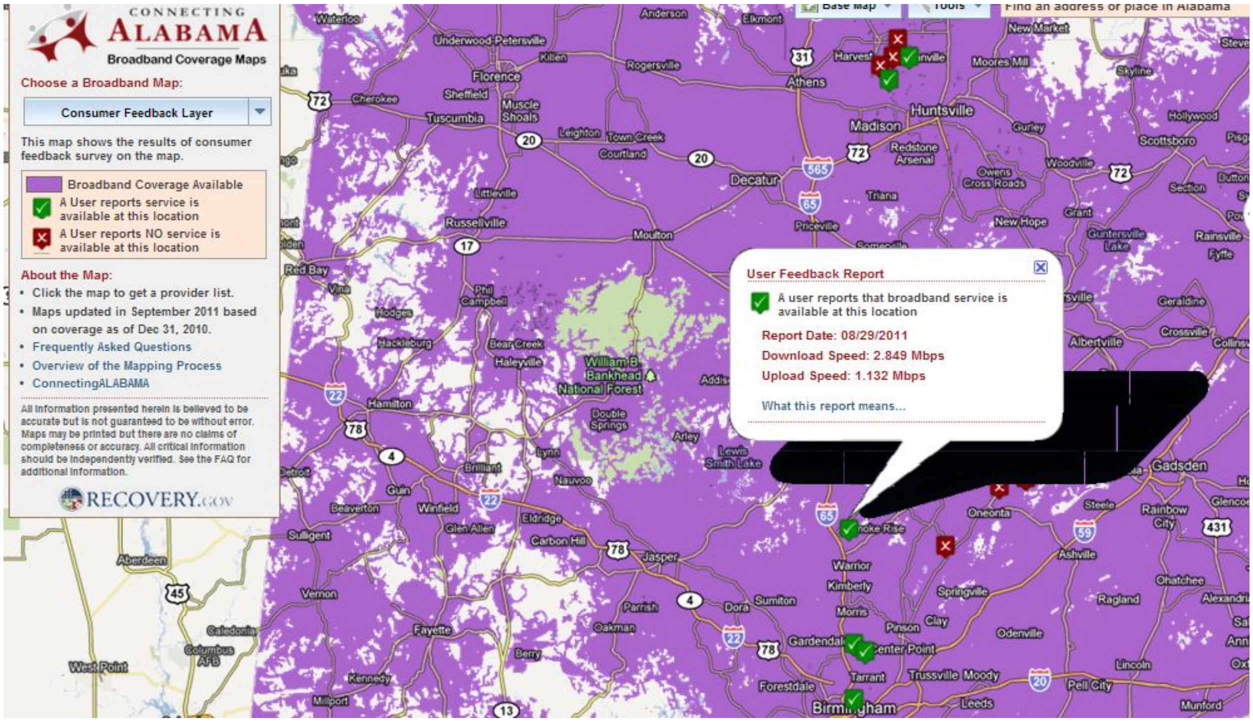

Figure 20--Consumer Feedback Layer

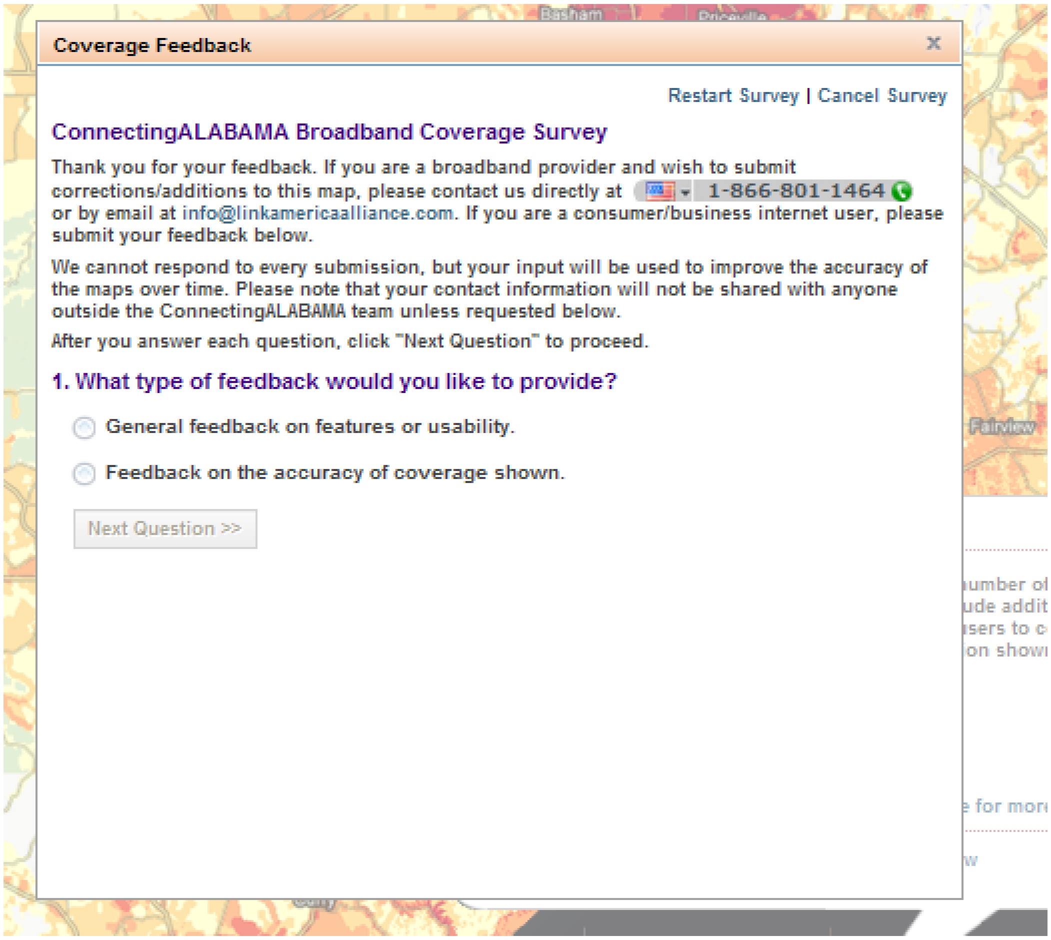
To gather feedback, we use a survey wizard which asks the end users to categorize their concerns. The survey went through several iterations of design and usability testing. Our experience has been unless we get a way to constrain the user feedback into manageable categories, it becomes very difficult to act upon.



As mentioned by other Grantees we struggle with how to use all of the feedback we receive. The qualified data points seem to fall below a volume in which we can infer significant modifications to the map data. Nevertheless, we believe it is important to gather structure and display the feedback to support project transparency.

Perception of Unfair Treatment Across Technologies

Several Broadband service providers have expressed strong concerns regarding how wireline services are displayed, as contrasted to how wireless coverage is displayed. This is an artifact of the SBI data model. As an example, consider the figure below.

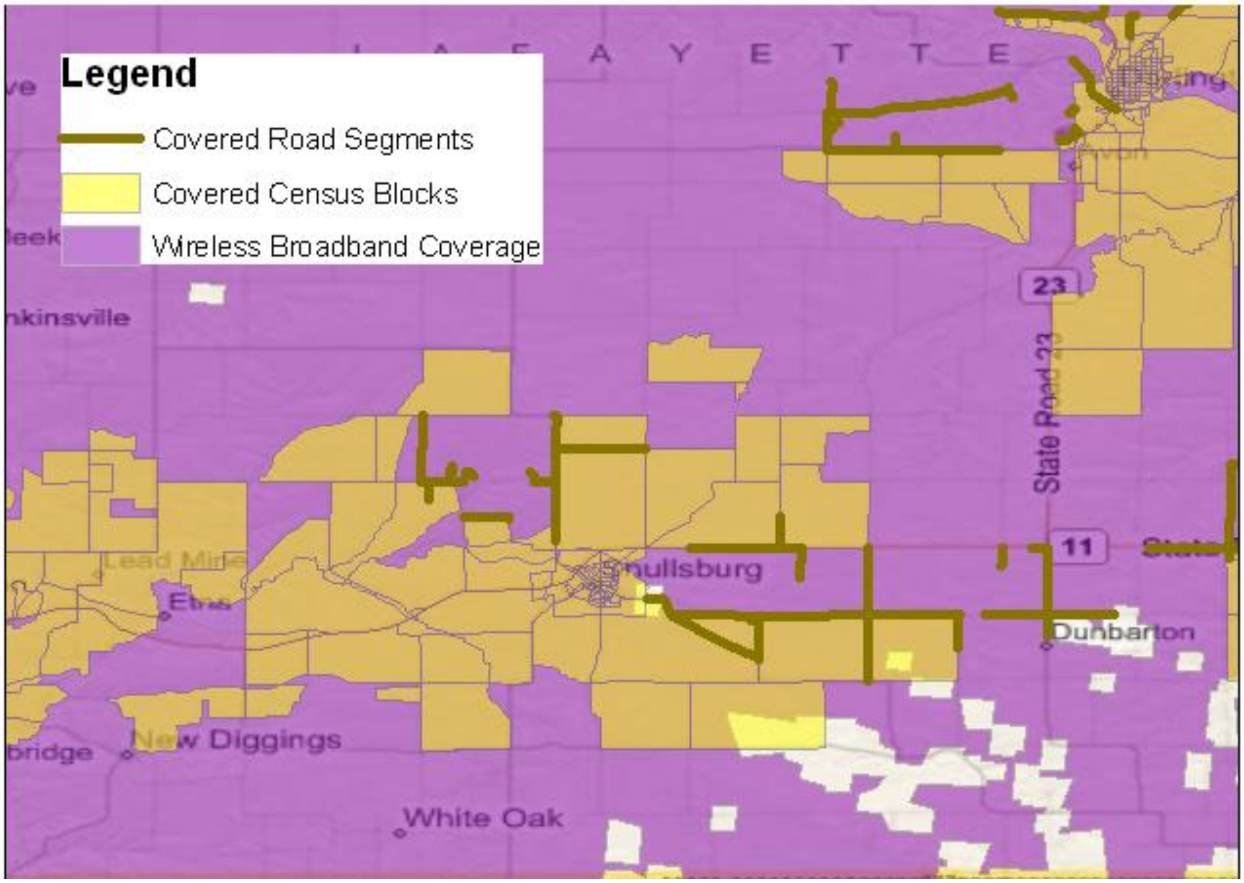


Figure 21--Multi Network Coverage portrayal

In this image, covered Census Blocks are light gold. Covered road segments are a darker gold and wireless coverage is purple. The concern seems to come down to how a wireline provider's coverage is shown in the large Census Blocks (greater than 2.0 sq mi). Some wireline providers have expressed dissatisfaction because their coverage is only tied to road geography, which leads to a visual "hole" in their coverage map. At the same time, they feel that it is unfair that the wireless provider's coverage is shown to be uniform in the same area. Put another way, if our maps show wireline in terms of Blocks and segments, why don't our maps show wireless the same way?

Loss of Geographic Granularity

Some providers particularly those who submitted facility level information are disappointed when we have to roll the derived data up to Census blocks or road segments as this changes the appearance of their service areas. This is especially important in rural areas where the larger blocks represent more of the service territory.

Perceptions of Carrier of Last Resort (COLR) Obligations

Some wireline providers have also expressed dissatisfaction because online maps limit the distance of coverage from a road segment. In our current online maps we buffer a wireline carrier's service 300' from road centerline. A number of providers have expressed that they are mandated to provide voice coverage (which Broadband will accompany) anywhere in the Exchange. There seems to be many

dimensions to this argument, but the basic concern comes down to not being able to accurately reflect the scope of their COLR obligation within the mixed block/segment view. Their ability (or lack thereof) to actually provision such services for new users within a 7-10 day period adds yet another level of complexity when attempting to fairly portray their coverage capabilities.

Intentions of Coverage Mapping

When a viewer of an online map clicks on the map (or zooms to an address), they are provided with a pop-up of service provider coverage in the area. The critical question is this: what is the area to which that pop-up window responds to? In the past, we reported back to the specific Census block, or buffered road segment intersected by the user click. As far as the map was concerned, once we move off of that road, or out of that segment, we have a new area to examine.

Our sense, given feedback received, is that our provider view should be a bit more tilted toward finding providers in a general area, rather than finding providers at a single-click location. If the goal of the map is to get someone to call a provider for service, our bias should be to include all of the potential providers in the general area, rather than giving potential customers a method to self-disqualify. That is, we want to cast a wider coverage net, rather than one too narrow. The problem with this approach is that it will create a number of false positive Broadband reports. As of this date we cannot determine if the claims of inaccurate coverage in online maps are due to the looser provider view standard or not. We keep this looser standard in place to minimize the likelihood of self-disqualifications.

Appendix One--Wyoming

Community Anchor Institutions

In earlier submissions, the Community Anchor Institution (CAI) process was referred to in terms of a learning curve. This continues to be an appropriate metaphor. The mapping team continues to focus on data that will support and help inform policy makers and the SBI planning process. Obtaining connectivity information for CAIs continues to be a significant challenge. In general we have found that one of the primary obstacles is identifying the correct person in the CAI organization that can provide the information we seek.

In the first submission, the team gathered information on what data was available and what resources will be required to engage these categories of important institutions. In subsequent submissions we have focused our efforts on obtaining connectivity information for CAIs through direct outreach to the specific institutions as well as through central sources within the state or institution associations. In the current submission we had the following objectives:

Identify the correct person in the organizations that can provide connectivity data for the institution. For schools we focused on district level contacts.
Raise awareness of the broadband mapping program to organizations associated with the CAI categories with special emphasis to relevant local and, state government agencies.
Continued outreach to unresponsive CAIs to invite them to become engaged with the SBI program by participating in the online survey.
Verify the available connectivity information based upon new survey information
Update the physical addresses of the CAIs, with the goal of eliminating P.O. Boxes from the dataset

CAI Philosophy

Our work with CAIs is guided by three principles.

First, CAIs are important stakeholders within the planning process. Our goal is to engage participants in regional planning that have strong ties into the CAI categories identified by NTIA. This has a direct benefit of engaging an established stakeholder community. It also allows broadband planning to tie into existing organizational and planning networks. In each of our states, key relationships with education, public safety, libraries, and economic development sectors are being identified and developed.

Second, we believe that CAIs will likely be one of the primary beneficiaries of targeted broadband funding. Our belief stems from the sense that many of the benefits of Broadband will extend from these community 'anchor points'. In other words, it isn't solely the existence of Broadband at a library that provides a benefit. It is people using applications that work only on a Broadband network to upgrade their skills (e.g., online training) and gain access to online content (e.g., job postings, goods and services), etc. The targeted use of a specific application--that can only take place with Broadband networks-- is what produces the priority benefit. Put another way, there seems to be a realization that things are less about pure connectivity (for the sake of connectivity) than about connectivity in terms of an application (for the sake of the benefit obtained through the application).

Third, we continue to use a rational and targeted approach to derive information. This means we will utilize our planning teams for as much field work as possible. This also means that a goal of our CAI process is not an exhaustive Census of anything that could be a CAI; rather, it is the discovery, inventory and integration of Broadband planning activities into those CAIs that stand to produce the greatest synergies with the SBI planning process.

The above implies two significant points. First, the team's goal is to document community anchor institution connectivity within a broader context of regional and statewide planning objectives. Second, if a particular category of CAI has an independent Broadband planning effort underway, we will encourage that organization to take the lead, and we will provide relevant expertise and support as warranted. For example, in one of our states, the public safety community was engaged in a mobile Broadband survey effort. We aligned our CAI data collection process with that effort and shared information and expertise (e.g., hosting a survey) to support their mission. In another state we attempted to glean connectivity information from a municipal government survey. There may be some downside to this collaborative approach in that we may have to work with data spanning different times or we may not have all of the location-specific information we need, but this does prevent the same user from receiving multiple inquiries.

Anchor Institution Survey

During the third submission period we designed and developed a simple on-line survey system called CAVS (Community Anchor Verification Survey). The intent of the survey was to both verify received connectivity information and garner additional connectivity information from CAIs. The link for the survey is housed on the Home Page of the State SBI website, thus providing the added opportunity for responding institutions to learn more about broadband activities in their state. The survey remains open between collection periods so that the Regional Planning Teams can update information as they engage with the community, and to allow responding institutions access to update their data as necessary.

Although we have found that reaching out to central contacts, for specific institution groups, is the most fruitful way of collecting connectivity data we find value in inviting individual anchor institutions to participate through means of a survey. In each round we reach out to CAIs using an adaptive approach that consists of: 1) Emailing individual institutions inviting them to participate in the on-line survey; and, 2) Follow-up phone calls, when appropriate, to the CAIs to obtain/confirm contact information and encourage participation in the survey. From our perspective, although this method is very time consuming and work intensive, it allows the opportunity to personally explain the objectives of the program and answer questions. It also provides an opportunity for the individual institutions to become engaged in the broadband planning process.

Anchor Institution Trends

To date we have focused our CAI attention on schools, libraries, and hospitals with respect to connectivity. We benefit from strong relationships throughout the education sector, (K-12 and Post-Secondary), and have found excellent resources with State librarians. In addition, we have formed organizational relationships with the major hospital associations and other key health organizations within each state. Our goal with these relationships is to cull information from their planning process and partner with them on outreach.

As in the prior submissions, we rely on public domain sources of information for the public safety-category. Collecting connectivity data for this group continues to be one of our most significant challenges. We continue to look for ways to reduce the size of this category and connectivity information specific to root nodes of the public safety network--such as County Emergency Operation Centers.[29] At this point we have had minimal success gaining this information.

Further, because we have a wide ranging population of CAIs in our data set we have a variety of Broadband services that don't always fit NOFA parameters. Services like PRI or T1 are classified into "other copper," We also had difficulty obtaining both the upstream and downstream channel capacities. In most instances, when it was logical to do so, we made the speeds symmetrical, but this is an assumption on our part. If a site records bandwidth across several services (eg. video and data), we record the total bandwidth to give a picture of available site bandwidth. We are also working to standardize our response to NTIA in circumstances where an entity shares a Broadband connection among a campus. In this case we use the total campus bandwidth and use the primary campus Internet connection. In this regard, we have also received strong comments that for many school districts the problem is less about connectivity to a central node then connectivity from the central node out to served buildings.

As a final verification step, we attempt to screen the CAI data for duplicate values. Because many CAI are closely clustered together and may even share the same building (physical address) we perform the de-duplication manually.

[29] Within the public safety category, it is also very difficult to derive precise locations as many CAI are addressed to PO boxes . This is further complicated due to the many Volunteer Fire Departments used in Rural Communities which often do not have a physical location.

Appendix Two

Data Collection Challenges

This section summarizes some of the challenges we have experienced with data collection and processing. The team believes it is important to categorize these challenges as they help inform the geoprocessing and verification methods used. It is also our hope that some of the more global issues can be discussed and decided within the Grantee community.

We begin with several global issues and then continue toward more granular challenges.

Global Data Collection Issues

Maximum Advertised Speed is Not Reported Consistently

As has been discussed in webinars and also within the context of NTIA data assessments, much reported speed information continues to be reported at the market level (MSA/RSA) and then uniformly pushed down to the Census blocks. This has a tendency to create a problem with NTIA speed tripwires since the technology is reported by block but the maximum advertised speed is reported at a regional level.

This challenge gets further amplified at a block level when comparing to a third party data provider. It can create a mismatch between third party data generated at an area larger than block level versus block level generated speed and vice versa. To minimize the potential confusion, it might be helpful to be able to provide a flag at the submitted record level which indicates the geographic basis by which the Maximum Advertised Speed is reported.

Census Block and Road Standards are not clear

There seem to be several methods by which providers are calculating the Census block area. So the distinction at 2.00 square miles can be uniform, it would be ideal to articulate an operational area calculation definition.

Providers Not Wishing for Block Level Aggregation of Their Data

For providers who submit address point data, we do minimal additional processing. Our main test is to ensure that points are contained within 1 mile of exchange boundaries; the only other processing was normalization into NTIA formats.

Broadband providers not Meeting the NOFA "provider" Definition

Comments on PBWorks appear to reflect a concern among a number of grantees about what a Broadband provider is--and how that definition impacts mapping.

If the 7-10 day provisioning rule is to be strictly enforced, it could seem to eliminate a number of prominent Broadband providers[31]. Further, the need for clarification around a facilities-based provider,

[31] By email ***REDACT*** informed us they could not provision in 7-10 days, but they also supply information on qualified locations to the address point level. Therefore, we draw a distinction between an incumbent provider

versus the reseller, has injected even more uncertainty. Right now we are unclear on how strictly to interpret either of these important distinctions, but we are concerned that we are beginning to create an NTIA exclusion criterion that is going to confuse downstream consumers of the data.

Given mergers and acquisitions in the CLEC space we are noticing a drop off in participation in this program by several national CLECs. We hope this is an artifact of the mergers and resource constraints rather than a long term trend.

Again, we do not want to exclude a service provider, but we believe there needs to be further clarification around the "7-10 day rule," the definition of a "reseller," and better interpretation of facility-based providers, versus equipping UNEs, SpA or leased lines.

We have used the provider Type of "Other" to classify a number of providers who offer Broadband services, but we do not offer them in a manner consistent with Technical Appendix A definitions.

To What Extent Should We Begin "Classifying" the Data and Maps?

The question immediately preceding gets to the intent of a Broadband provider. This question gets to the intent of the Data and Maps.

Earlier in this document we discussed the question of what type of bias we should introduce to our online map messaging. In an online environment, do we want to more likely create an overstatement of coverage for a provider than an understatement? In other words, is the larger problem allowing a consumer to self-disqualify, versus calling a number of neighboring providers? There is a related issue to this. Clearly in our maps there is a lot of scatter in data that we believe should be more continuous. These are the islands of coverage from an incumbent provider[32]. There are a number of processes that could be put in place to deal with this type of scatter, but without more information from the service provider-- essentially the last mile facilities-- it will be difficult to perform this clean up in an informed manner. On the one hand, we can aesthetically clean the maps up and reduce the scatter, but we have little sub-block engineering information upon which to make this decision. Right now our preference is to put out a somewhat aesthetically messier deliverable and work with providers to get better information to clarify their submission. If that isn't forthcoming, we are limited in what can be done given the lack of facility level information. In summary this yields two questions

In our online maps should we error on overstating coverage to prevent consumer self-disqualification?

---

owning the facility--which terminates at a customer premise--who cannot turn up service at a qualified location, versus a provider not reporting any specific qualified locations in which they cannot turnup service in the 7-10 day window. In the first case we have a sense of where service can be offered and verified. In the second, we have no evidence that a service could exist there until a specific location becomes a customer.

[32] For a provider who sells opportunistically (not within a franchise area) it becomes even more problematic to classify their coverage because the points are more related to the type of consumer purchasing the service than a bounded offering. In a matter of speaking, the ProviderType is more determined by the technology and/or location than a type of business. The core intent of the NOFA and our grant application was centered around the 7-10 day providers but we believe maintaining information on provider Type "Other" and "Reseller" is important to assist in validation and market segment analysis as resources are available.

In our online maps should we work to clean up a lot of the scatter that we see without having facility-based evidence from which to remove it?
As we examine results from third party data assessments, it appears that this scatter is something that is also problematic with the assessment results. It also appears to be evident that different third party data sources treat water areas differently. When we are developing data based upon Wireline facilities, we exclude water blocks. We do not filter out water blocks from provider submitted data. We are unsure if there is or should be a standard in how water covered blocks are treated for Wireline broadband providers.

Community Anchor Institution Surveys

Over time the base of participation in CAI surveys has broadened. Our teams are interacting with more organizations interested in broadband planning. This is a benefit because it helps integrate the importance of Broadband mapping, planning and capacity building within their organizational framework. But it also begins to create challenges in data collection. There are two noticeable trends in this area.

First, CAIs are organizationally diverse. For a school, you expect to have a centralized entity that can answer and support questions about Broadband services. For a rural, volunteer fire department answering questions about broadband may go to the Chief. The way that he/she answers about Broadband is probably specific to her experience and context. The implication is two-fold. First saying that some percentage of CAIs in a state have access to broadband can be misleading because the formality of a school or government building is much different than the formality of a volunteer fire department. Second, that volunteer fire department may get broadband via a 3G mobile hotpsot when they need it…but the presence of *this* type of broadband is a very different thing than the presence of a responder who has mobile LTE broadband.

Second, technical knowledge of the survey respondent differs within each organization. This complicates our data collection. It is not uncommon for someone to say yes we have Broadband, I just don't know how we get it or how fast this is. So in response we report they are broadband served but unknown speed or technology. This doesn't mean they haven't been surveyed, it just means the response was unknown. As there are now a large number of people collecting this data, it would be helpful to have some consistent national business rules from which we can answer questions about the meaning of any particular data element. As an example, when should "no" be used versus when should "unknown "be used. In other words, what is the standard for the difference between never made contact with the CAI versus a respondent didn't know/couldn't answer. We have guidelines internally but are unsure if this is consistent across states.

Granular Data Collection Issues

Non-Uniform Submission Standards

It is clear among providers that there isn't a consistent method used to derive Broadband coverage. Some providers appear to be use a geocoding approach and then point in polygon or point on segment process. Others may be using GPS locations. In some cases, it is difficult to infer what reference data was used to georeference plant (is it the carrier's roadbase?). This leads to uncertainty regarding the input data scale or accuracy relative to other base layers. Although we may be trading off absolute accuracy, our standard has been to conflate submitted data to TIGER 2010 Blocks and TIGER 2010 roads. We perform our verification against this conflated data product.

Temporal

We are unsure of how well the data are temporally consistent. Some providers gave us their best effort to control to June 30, 2012. We note that some providers were clear that the submission was as of extract date without any way to move back in time. They have no means to control for time and cannot provide any audit support beyond when the data are released to us. Some data-especially loop qualification data-may change from day to day. It will be very difficult to clarify why something was changed from a given point in time.

Perceived Inaccuracy with Respect to Internal Standards

The NOFA is clear on submitting a list of Blocks in which a provider delivers Broadband service. This is a different objective than perfectly reflecting service territories. If a firm's accuracy standard is a reflection of their service area, then the data created under the NOFA will not meet their perception of accuracy. This leads to two other issues: First, using Census Blocks rather than serving area may overstate or understate a particular provider's Broadband serving area. This was a significant concern of ***REDACT*** who specifically required us to submit only address-level qualification data. The second issue this brings up is how or if, there should be some standard on how much of a Census Block needs to be covered to call it covered.

Confidentiality

Several providers have noted concerns with CPNI-related issues and have stated this as a reason for non-participation. We have also heard expressions of comparable concern regarding identifiable responses to Anchor Institution information.

Unclear on Definitions

As discussed earlier, several providers claimed confusion on several key terms involved in Middle Mile. We note a consistent stream of questions around the interpretation of Maximum Advertised Speed. Some providers understand this to be the most common speed package bought within the mass market, while others view this as a speed that can be purchased for an additional cost above a mass market offering (e.g. a Turbo option for an additional fee per month). Others interpret this as the fastest speed that is available for that particular location--in terms of xDSL, a structure qualified speed, for example.

Perception of Data Use

There seems to be some hesitancy releasing speed information because no one is sure of how the information will be used, or what the speed is intended to reflect. A number of providers have verbally indicated that typical speed will be about (on average) 80% of purchased speed due to overhead. But there are many other factors (such as a user's home network) that influence speeds measures. Providers are concerned about introducing statistics without a clear understanding of how those statistics are derived and will then be used. Also, as advertised speed is pushed down to a block level, we sense more trepidation to report speed values. This quickly begins to touch on parity across network types (why is wireline down at the block when wireless is half the state, etc.). Finally we note a

significant increase in speed values reported to us. This may be due to network upgrades or competitive concerns to match the theoretical network speed.

Location Uncertainty In Source Data

Within this document we have noted concerns about the impact of source data accuracy. Our geoprocessing methodology provided what we believe is a relatively conservative tolerance to account for the scale issue in the source data, but we are unsure of how this may impact downstream users. Clearly, it also impacts the verification process because we can't attempt to verify received data beyond a scale at which it was developed.

Covered Segment Process

Deriving Broadband covered segments in Census Blocks greater than 2 square miles has proved to be a challenge. Moving from a NOFA specified tabular deliverable to a requested geographic deliverable also increases the complexity of the effort.

Record Level Metadata

It would be helpful to have one or two additional fields in each feature class transmitted to NTIA. One User Defined field could be helpful as an expression of record level confidence. The second field could be used as a Key between the transfer geodatabase and our systems. Ideally, both fields could be large text fields (50 char) so the Grantee can use them to express a variety of attributes.

Miscellaneous Data Collection Notes

We note the following important observations regarding our data submission:

There are Middle Mile plant records for providers who are not present in the Census block, segment or wireless area feature classes. This is due to classification as non-NOFA Broadband providers.
In some cases, we have trimmed wireless coverage estimates to honor state boundaries.
We believe some providers are trimming their coverage to honor license area boundaries.
Where a provider submitted Middle Mile points out of state, we are no longer passing those points to NTIA as they fail the validation script.
In tables with mandatory Street and Zip5 attributes (Service Address), if the value is unavailable we fill the default value.
As before there remain some differences between the Data Model, Data Model Default Values and the Python Validation Script.
We have a significant amount of VDSL, ADSL 2 and ADSL 2+ coverage categorized into the xADSL category. This introduces large variance in speed availability as some providers are using VDSL, shortened loops and/or pair bonding to increase speed to levels nearly 30 Mbps.
We note a few providers who have speeds seemingly inconsistent with their technology of transmission. This is either very low speeds with optical fiber, or very high speeds with non DOCSIS 3.0 systems. We have verified on provider websites that the reported speeds are available in the area but these speeds will fall out of the NTIA frequency table analysis.
We have a small number of providers who serve an area with both a residential and business speed tier. In cases where we cannot distinguish which speed tier offering to use, we use the higher of the speed tiers.

Per NTIA request we have modified the manner in which we handle Wireless coverage polygons. If a Provider submits a single geometry but specifies multiple spectrum codes in use in that polygon, we duplicate the polygon for each spectrum code. In other words the geographic object is identical but the attribute data for the object is unique.

In point level data submissions (Service Address and CAI) we note points that are spatially coincident. With respect to Service Address points our thought is these represent multi-unit dwellings or businesses but we don't have enough address detail to determine if these are multi-unit structures or duplicated customers. Because we cannot determine the reason for the duplication we leave spatially coincident records in our submission. We also leave in our CAI submission points which may be the same physical structure but have slight variations in addressing.

In point level middle mile data, we are finding a variance in the quality of the geocoded longitude and latitude returned. Given the data received we are unsure if this is an issue where the plant address is difficult to geocode or if the longitude and latitude provided to us is different than what would be returned in geocoding.

For Block and Segment level data which we produce based upon provider facility or service area boundaries, we remove Census blocks which are entirely water covered. This results in a drop of Census block counts for a number of providers.

Appendix Three

This appendix contains the confidentiality clarification supplied in a series of emails between CostQuest and NTIA.

Feature Class	*Metadata*	*NOFA Confidential?*	*Online Map*	*Public Disclosure*	*Exemption*
Last Mile	Constraints on accessing and using the data	Yes	No	No	None
	Access constraints: None				
	Use constraints:				
	This data is confidential as defined in the NOFA.				
Middle Mile	Constraints on accessing and using the data	Yes	No	No	None
	Access constraints: None				
	Use constraints:				
	This data is confidential as defined in the NOFA.				
Service Address	Constraints on accessing and using the data	No	No	Yes	
	Access constraints: None				
	Use constraints:				
	There are no restrictions on distribution of the data by users.				
CAI	Constraints on accessing and using the data	No	Yes	Yes	NO attributes on any record in this feature class are considered confidential

	Access constraints: None				
	Use constraints:				
	There are no restrictions on distribution of the data by users.				
Census Block	Constraints on accessing and using the data	No	Yes	Yes	NO attributes on any record in this feature class are considered confidential
	Access constraints: None				
	Use constraints:				
	There are no restrictions on distribution of the data by users.				
Service Overview	Constraints on accessing and using the data	No	Yes	Yes	The only provider who may not show up on this table is a provider who has provided only confidential data (last mile, Middle Mile,

					address point with provider name)
	Access constraints: None				
	Use constraints:				
	There are no restrictions on distribution of the data by users.				
Road Segment	Constraints on accessing and using the data	No	Yes	Yes	NO attributes on any record in this feature class are considered confidential
	Access constraints: None.				
	Use constraints:				
	There are no restrictions on distribution of the data by users.				
Wireless	Constraints on accessing and using the data	No	Yes	Yes	NO attributes on any record in this feature class are considered confidential
	Access constraints: None				
	Use constraints:				

	There are no restrictions on distribution of the data by users	

Appendix Four-Wyoming

This appendix details our analysis of the potential and actual broadband provider market. We include both our internal tracking description document and then our categorization for each provider. As this extract was made prior to final submission, there may be differences between provider categorization and the attributes on the day of submission to NTIA.

Provider Categorization

Provider Type and Status Definitions

The Provider Type is based upon categories provided by NTIA, while the Provider Status is based upon categories developed internally for tracking purposes. It should be noted that the Provider Status discussed here relates to the provider's overall status within the program.

Provider Type Codes and Definitions:

NTIA code	Code	Name	Definition
1	P	Provider	This code applies to all confirmed providers of broadband service per the SBI program NOFA. A provider is given a "P" designation if we have determined that the company does indeed exist and appears to be providing broadband services.
2	R	Reseller	This code applies to all broadband entities that have been confirmed as pure resellers – meaning they do not own their own facility/equipment and simply resell services under their own brand name or the brand name of an actual Provider.
3	O	Other	The code applies to entities who were originally placed on the SBI provider list, but whose status is still in question or has been determined to be non-NOFA compliant.
4	N/A	Not applicable	This code applies to entities who appeared on the original state provider list or a third party list (such as the FCC 477, American Roamer, or Warren Media lists) but who have been confirmed as NOT providing broadband services.
	X	Inactive	This code applies to entities that may have appeared on an early provider list but whose identity and existence we subsequently have been unable to verify. This code may also apply to providers who have since been acquired or simple gone out of business and for which no FRN appears on the FCC list – These no longer need to be reported to NTIA. This is an INTERNAL category used to remove entities completely from the list of entities submitted to NTIA.

Once the proper Provider Type has been assigned to an entity, and overall Provider Status must be established. The Provider Status codes are specific to the Provider Types, and are not interchangeable. The following table lists the status codes associated with each Provider Type.

Provider Status Definitions

Provider Type Code	Provider Status Code	Name	Definition
P	D	Declined	A provider is given a Status of "D" if they have officially stated verbally or in writing that they will not participate in the SBI program.
	P	Participating	A provider is considered to be "Participating" if they have submitted USABLE data in at least one data submission round. The data does not need to be 100% complete for a provider to be assigned a "P" code – they simply have to have provided a level of data that is sufficient to submit to NTIA.
	NR	Non Responsive	A provider is considered "Non Responsive" if they have either failed to respond to any of our correspondence, or they have submitted insufficient data that makes inclusion of their data in the NTIA submission impossible.
	V	Submitted under other ID	A provider whose data is submitted under another Provider ID, but is operating under their own FRN.
	E	Estimated	A provider is marked as "Estimated" if they have not submitted usable data, and would otherwise be considered non-responsive, BUT for whom we are able to submit data by using estimation techniques and/or third party sources. This designation applies only to providers whose data is 100% estimated.
R	R	Reseller	"R" is the only status code for Resellers and it simply reconfirms their status as a reseller –data may not be submitted but name of provider is included in NTIA data package.
O	U	Unknown	The status of Unknown is assigned to an entity whose name has appeared on a list (or been submitted as a new possible provider) and is currently under investigation. It has not been determined yet if this entity is indeed offering broadband services or not.
	NC	Non-Compliant	This status is assigned to entities who appear to be in the broadband industry, but who do not meet the formal definition of a BB provider under NOFA requirements. Examples may be entities who cannot provision service within 7-10 days.

	P	Participating	These are providers who do not meet the formal definition of a BB provider under NOFA requirements, but are participating in the program and submitting data.
	NP	Not a Provider	This status applies to entities who may appear on a third partly list of valid providers, but who have been proven to either no longer exist, or simply no longer provides broadband services.
N/A			No status codes associated with this Provider Type
X

State of Arizona

Arizona Strategic Enterprise Technology Office (ASET)

Arizona Broadband Assessment Project Methodology White Paper

Submission 6 - October 1, 2012

Arizona Broadband Assessment Project Overview

The purpose of the Arizona Broadband Assessment Project (AZ BAP) is to identify both the availability and speed of broadband services, and the location of broadband infrastructure throughout Arizona. This project is provided through the American Recovery and Reinvestment Act of 2009 (ARRA) and the Broadband Data Improvement Act (BDIA), and in conjunction with the National Telecommunications and Information Administration (NTIA).

Submission 6 for the broadband availability data set was duly submitted to NTIA prior to October 1, 2012. Fall 2012 was the sixth of ten semi-annual submissions by the State of Arizona and attempts to capture and reflect broadband availability and conditions in the field as of June 30, 2012. See Arizona's Changes & Corrections document for a list of included Broadband Providers and relevant notes.

The Methodology White Paper for this submission cycle focuses on the Data Intake and Validation Application (DIVA) developed by the Arizona team and utilized in the transformation and processing of Broadband Provider data. It was trialed in earlier submittals, but has reached a level of maturity and utility warranting its featured role here.

A brief overview of its development and role as well as a summary of its capabilities and impact, followed by a draft of the DIVA User Manual for a deeper view of its functionality and user interface.

Data Intake and Validation Application (DIVA) Overview

The Data Intake and Validation Application (DIVA) was developed by TerraSystems Southwest (TSSW) as a subcontractor to Data Site Consortium (DSC) under contract with Arizona Strategic Enterprise Technology Office (ASET) in support of the Arizona Broadband Assessment Project (AZ BAP). DIVA is a Windows desktop application designed to transform raw Broadband Provider data about the location, technology and speed of broadband services into a form that can be cleanly linked to GIS layers and imported into the NTIA standard national broadband mapping program geodatabase.

A key goal of the DIVA design was to reduce data processing time while increasing data integrity. A secondary goal was to create a freely distributable software tool that Providers and other State broadband organizations could apply to their data intake and validation tasks. Alternative approaches, such as integrating with ArcGIS or data translation software like FME were not pursued as that would mean users would have to purchase those products at a significant expense.

DIVA does not perform any spatial validation or processing. DIVA was scoped as "pre-GIS" software, designed only to speed and improve the processing of Provider data to a point where it could be more cleanly geocoded or linked to NTIA GIS layers. Based on this design criteria, DIVA is not very useful for wireless service shapefile deliveries where the feature counts (data Records) are a couple of hundred, or less, and are in more or less proper SBDD format. It really shines in processing address, census block and road segment submittals of tens or hundreds of thousands of records, and where Providers have not followed the SBDD coding scheme.

Data Intake and Validation Application (DIVA) Capabilities

DIVA offers a rich user interface for exploring and processing Provider broadband data into a form that can more easily linked to NTIA-required GIS feature classes. Some of its key features are listed below.

- Configurability – DIVA offers many opportunities for configuration. New Provider identification information can be imported and applied to every Provider submittal. New releases of the SBDD geodatabase are read and up-to-date Rules are automatically created and applied. Processes and Rules in DIVA are very general and may be user-configured to achieve various results.

- Consistency – a very structured approach to data processing is embedded in the design of DIVA. This begins with the clear definition of data elements and their relationship to one another in an Object Data Model. Consistency is also inherent in the clear definition of Processes and Rules that can be applied to the data and in the way that Processes and Rules are used to transform and validate the output data. In the rush of meeting data-delivery deadlines It is easy to forget or misapply data processing steps. By automating much of the required processing, DIVA increase the amount of time that a user has to actually review and check data, and makes it easier for the user to achieve consistent results in the exported data sets.

- Re-usability – Users can define a set of Processes within a particular Reporting Period as a Template and then apply the Template to new Input Files. Rules are uniformly applied to Providers for each Reporting Period. This includes user-defined rules: once defined and applied, they will automatically be applied to subsequent Submittals.

- Processing Documentation – metadata (e.g. notes) regarding Providers, Submittals, Input Files and other elements may be added at any time using the "Edit Metadata" button on the Status Bar. Notes can be viewed or exported at any time for cutting and pasting into NTIA documentation. These notes, plus the actual Input File(s) associated with a Submittal, the assigned Processes, Rule violations and final output, constitute DIVA's Metadata system. A good example of metadata stored in a Process is the translation table from Provider actual speed values to NTIA speed tier codes: the value mapping is preserved and can be reviewed in DIVA by opening up the applicable Submittal and generating a detailed Input File report or by right-clicking on the Translation Process in the Processes tab.

Data Intake and Validation Application (DIVA) Impact

The efficiencies resulting from the application of DIVA to Provider data are substantial. In the first submittal period in Spring of 2010 a number of larger providers would consume 24-40 hours of processing time to evaluate, transform, quality check and export to SBDD database format. Processing a similar set of data in the latest submittal period (Spring 2012) using DIVA is a 2-4 hour process.

A substantial portion of this improvement is the result of (a) knowing the data and what to expect from a given Provider and (b) improved manual processing, especially on the GIS side. However, another substantial portion of the improvement has come from the integrated data evaluation, checking, transformation, validation and export capabilities of DIVA itself. We estimate that DIVA can reduce processing time in half for large address or census block submittals from the Providers. This efficiency is gained from having all the evaluation, transformation and validation tools available in a single interface instead of applying a variety of application software packages in varying order to each Provider file in each Reporting Period.

Arizona Broadband Assessment Project (AZ BAP)

The Data Intake and Validation Application (DIVA)

User Manual for Version 1.0

As of 06/25/2012

The Data Intake and Validation Application (DIVA)

Table of Contents

Foreword

This User Manual includes three chapters to introduce users to Diva. The "Functionality Overview by GUI Elements" chapter shows keyed illustrations of the user-accessible controls on each major Graphical User Interface (GUI) element in DIVA along with a brief explanation of the purpose of those controls. More detailed descriptions of the functionality behind many of those controls can be found by clicking on the hyperlinks which take the user to the appropriate section in the "Functionality Details" chapter. Finally, an example workflow using DIVA is presented in the "Sample Workflow" chapter.

It is important before examining the use of DIVA in detail, however, that the user understands the overall approach that DIVA takes to processing data. The discussion in "The DIVA 'Paradigm'" section of the "DIVA Overview" chapter is the key to understanding this approach. Also important to user understanding are the summaries in the "Design Goals", "Processing Workflow" and "Key Features" sections of that chapter.

As part of the DIVA development process, a very specific, structured vocabulary was developed and is enforced throughout this document. The first time a particular term is used, it is hyperlinked to the Glossary where a complete definition of the term may be found. Users will greatly speed their understanding of DIVA if they become familiar with this terminology.

DIVA is made available to the State Broadband community at no charge, but it is not supported by TerraSystems or any other public or private organization. The developers are happy to hear comments, bug reports and suggestions for improvement via email at hlward@terrasw.com , but we cannot guarantee a response to each inquiry. The source code is available to the State broadband community under certain circumstances. Please ask for details at the email address above.

DIVA Overview

History:

The Data Intake and Validation Application (DIVA) was developed by TerraSystems Southwest as a subcontractor to Data Site Consortium under contract with the Arizona Broadband Mapping program.

DIVA is a Windows desktop application designed to process raw Broadband Provider data about the location, technology and speed of broadband services into a form that can then be cleanly linked to GIS layers and imported into the NTIA standard national broadband mapping program geodatabase.

Design Goals:

A key goal of the DIVA design was to reduce data processing time while increasing data integrity. A secondary goal was to create a freely distributable software tool that Providers and other State broadband organizations could apply to their data intake and validation tasks. Alternative approaches, such as integrating with ArcGIS or data translation software like FME, would mean users would have to purchase those products at a significant expense.

By design, DIVA only processes provider data to the point where it can be geocoded or joined to spatial database layers. It does not perform any spatial validation functions. See Appendix A for a summary of the User Needs document on which DIVA was designed.

The DIVA "Paradigm":

Using DIVA effectively requires an understanding of how DIVA approaches the processing of Provider data for the NTIA and, as noted in the Foreword, this view is expressed with specific vocabulary. The DIVA "Paradigm" will be outlined in these terms. Links to the glossary can be used for further reference. Figure 1 below illustrates the main DIVA entities (the "object model") and their relationships in a simplified manner. An illustration of the complete object model can be found in Appendix C.

A Submittal is the data that will be reported to the NTIA for a particular Provider for a particular Period-Type (Reporting Period / Submittal Type). **The Submittal is the key organizing element in DIVA**. The collection of all Submittals is what will ultimately be reported to the NTIA. One of the important consequences of this definition is that, for one Provider, there may be several Submittals in a Reporting Period, e.g. Census Block and Street Segment submittals.

It is possible that a Provider will provide more than one data set for a particular Submittal Type during a Reporting Period. For example, supplementary information may be sent by a Provider after their first provision of data, or the first provided data set might be entirely replaced by another. DIVA identifies each of these provided data sets as a separate Input File, and allows a Submittal to have more than one Input File in a Reporting Period. Each Input File is processed independently, although the resulting exported data may be combined later, outside of DIVA, depending on the reasons for the multiple data set submission.

An Input File in DIVA is a collection of Input Fields each of which (usually) has a value. This Input Field collection is repeated numerous times, each repetition being viewed as a data Record or Row. The order of the Input Fields in this collection does not change from Record to Record. Each Input Field may be viewed as a data Column when it is considered across all data Records (Rows).

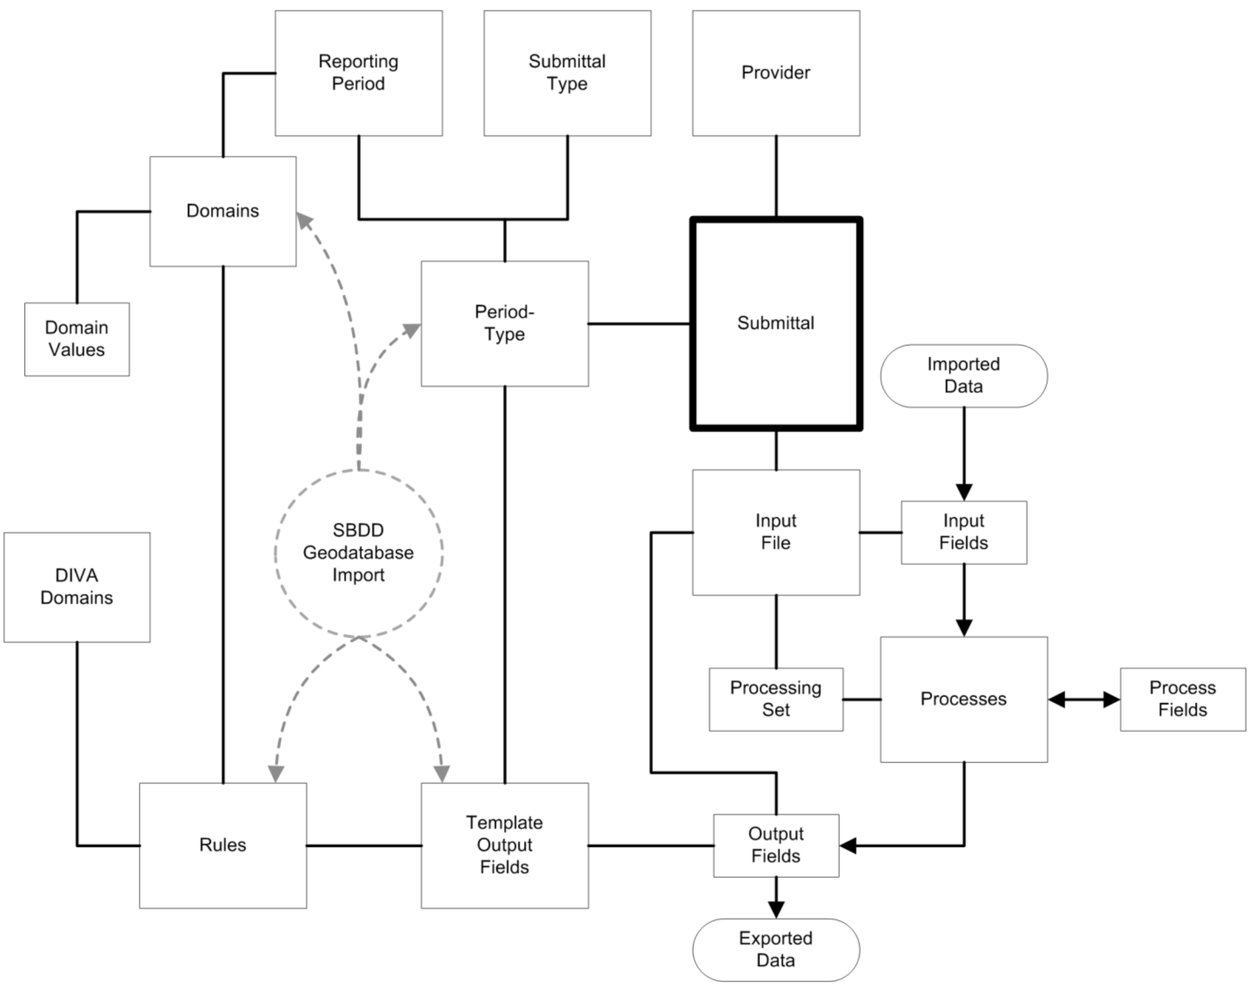

Figure 1. The DIVA "Paradigm" (Object Model) in simplified form.

Lines denote relationships and arrows denote data flow.

Each Reporting Period, the NTIA requires that certain data be submitted for each participating Broadband Provider in the State. The data is grouped into particular Submittal Types (e.g., service by Census Blocks) and these types and the required information for each type, the Output Fields, are defined by the NTIA prior to each Reporting Period in the form of an SBDD ArcGIS File Geodatabase (SBDD geodatabase, for short). A Submittal Type corresponds with a feature class in the geodatabase and the Output Fields are the attribute fields of each feature class. Since the same Output Fields will be used with each Submittal Type for a Reporting Period (i.e., for each Period-Type) for every Provider, they actually constitute a set of Template Output Fields that are used to create each particular Submittal's Output Fields that are eventually exported from DIVA. Thus, importing the SBDD geodatabase results in the creation of a set of Period-Types and a set of Template Output Fields for each Period-Type. These Template Output Fields will ultimately be used to create a set of Output Fields for each Input File.

In addition, the SBDD geodatabase contains a set of Domains that define the permissible values for a particular Template Output Field; the SBDD geodatabase specifies the Domain names and values as well as the Template Output Field to which it applies. Since the names and / or contents of the Domains may vary for each Reporting Period, a new set of Domains and values is created during SBDD geodatabase import and is used only for that Reporting Period.

In some cases, the SBDD geodatabase will specify a Default Value for an Output Field. Since this applies to all Output Fields for that Period-Type, the value is stored as part of the Template Output Field definition during SBDD geodatabase import.

While the feature classes in the SBDD geodatabase have been fairly consistent over all Reporting Periods, their defined attributes (Template Output Fields) have not been, nor have the number of Domains, their values, or assignment to Template Output Fields remained unchanged. DIVA handles this variability by creating a match between a Reporting Period and a Submittal Type called a Period-Type. Thus the “Spring 2011 Census Block” Period-Type may have a different structure (Template Output Fields, Domains, Domain assignments, etc.) than the “Spring 2012 Census Block” Period-Type. So when we speak of a “Census Block” Submittal Type, it is usually understood that this is for a particular Reporting Period and that we are actually referring to the matching Period-Type.

The “SBDD Geodatabase Import” operation, which must be done once for each Reporting Period, creates all of the Reporting Period's Period-Types (one for each feature class in the geodatabase, each feature class corresponding to a Submittal Type), creates each Period-Type's Template Output Fields (one for each attribute in a feature class, plus some additional DIVA-specific fields), and creates a set of “default” Rules that are attached to the Template Output Fields. It also assigns Default Values, if defined, to the Template Output Fields.

DIVA uses pre-defined, general data transformation operations, called Processes, to convert Input Field values to Output Field values. The collection of all Processes for a particular Input File is held in a Processing Set, and this set may be copied to other Input Files or used to create a Template Processing Set. As can be seen in Figure 1, data moves from an Input Field to an Output Field only by using a Process. In addition, depending on how Processes are "wired" together, intermediate Process Fields may be created. This is done according to the operational requirement that Processes cannot connect directly to each other (connections can only be made to Fields) and Fields cannot connect directly to each other (connections can only be made to Processes).

One of the primary reasons for creating DIVA was to automate, to a certain degree, the process of checking data. DIVA handles both data verification and data validation (the term "validation" is generally used to mean both of these, but we use these terms in a very particular sense; see Glossary). The DIVA Rule is our way of implementing this checking. For example, if an Output Field is required to have data according to the SBDD Geodatabase, then a "MustHaveData" rule is assigned to the corresponding created Template Output Field. Since all Output Fields for an Input File (Submittal) of a particular Period-Type are derived from the same set of Template Output Fields, these Rules thus apply to all such Output Fields. Rule violations can be checked after Processes are applied, and then the Processes can be adjusted to correct the data transformations to reduce the number of Rule violations.

An important item to note regarding DIVA data processing is that, unlike Input Field values, **Output Field values are never explicitly stored (saved) in an internal data table**. Output Field values are only generated during Process operations; the Processes tab must be "visited" in order to generate any Output Field values. This has important consequences in the order in which various Tabs should be visited, as well as to what information will be shown in various display windows. For instance, selecting a Submittal and then immediately opening the "Output Data Review" window will result in no output data being displayed; it has not yet been generated. You must click on the Processes tab to generate the data (or, if you are creating Processes on that Tab, then you must click the "Apply" button to have any changes take effect). If the Output Data Review window is open at this time, you will see the generated data "fill" the display.

Because Output Fields will not have values until the Processes tab is visited, the Output tab will not have any meaningful results, in terms of checking for Rule violations, until the Processes tab is visited.

The summary and detailed Input File reports will not have meaningful data until both the Processes tab is visited and the "Refresh Violation Counts" button is clicked on the Output Tab.

Generalized Processing Workflow:

The general DIVA processing workflow for a particular set of data (an Input File) for a Submittal is as follows:

1. Submittals tab: Create the Submittal or add an Input File to an existing Submittal.

2. Submittals tab: Load data from a Provider's data set (source file on disk) into the Input File (stored in an internal DIVA data table).

3. Processes tab: Create and apply transformative Processes linking Output Fields to a data source. A data source is typically an Input Field, but some Processes can serve as a data source themselves.

4. Rules tab: Assign Rules to check values in the Output Fields.

5. Output tab: Examine data errors.

6. Iterate over steps 3 – 5 to fix errors in the Output Fields by modifying assigned Processes and / or adjusting Rules as necessary.

7. Output Data Review window: Examine and export the transformed data.

8. Reports tab: Generate reports.

Key Features:

DIVA offers a rich user interface for exploring and processing Provider broadband data into a form that can more easily linked to NTIA-required GIS feature classes.

- ***Configurability*** – DIVA offers many opportunities for configuration. New Provider identification information can be imported and applied to every Provider submittal. New releases of the SBDD geodatabase are read and up-to-date Rules are automatically created and applied. Processes and Rules in DIVA are very general and may be user-configured to achieve various results.

- ***Consistency*** – The "structured approach" to data processing is embedded in the design of DIVA: in the Object Data Model that defines DIVA entities, in the definition of Processes, in the definition of Rules, and in the ways that Processes and Rules are used to generate and check output data. It is easy to lose data integrity in the rush of meeting data-delivery deadlines. By automating much of this processing, DIVA tries to increase the amount of time that a user has to actually review and check data, and made it easier for the user to achieve consistent, known results in the exported data sets.

- ***Re-usability*** – Users can define a set of Processes within a particular Reporting Period as a Template and then apply the Template to new Input Files. Rules are uniformly applied to Providers for each Reporting Period. This includes user-defined rules: once defined and applied, they will automatically be applied to subsequent Submittals.

- ***Documentation*** – Notes regarding Providers, Submittals, Input Files and other elements may be added at any time using the "Edit Metadata" button on the Status Bar. Notes can be viewed or exported at any time for cutting and pasting into NTIA documentation. These notes, plus the actual Input File(s) associated with a Submittal, the assigned Processes, Rule violations and final output, constitute DIVA's Metadata system. A good example of metadata stored in a Process is the translation table from Provider actual speed values to NTIA speed tier codes: the value mapping is preserved and can be reviewed in DIVA by opening up the applicable Submittal and generating a detailed Input File report (or by right-clicking on the Translation Process in the Processes tab).

What DIVA is Not:

DIVA does not perform any spatial validation or processing. DIVA was scoped as "pre-GIS" software, designed only to speed and improve the processing of Provider data to a point where it could be more cleanly geocoded or linked to NTIA GIS layers. Based on this design criteria, DIVA is not very useful for wireless service shapefile deliveries where the feature counts (data Records) are a couple of hundred, or less, and are in more or less proper SBDD format. It really shines in processing address, census block and road segment submittals of tens or hundreds of thousands of records, and where Providers have not followed the SBDD coding scheme.

Installation

DIVA comes with a basic installer which installs the application program, builds the basic SQL Server schema and populates various tables with DIVA-standard values (e.g. Reporting Period names). The DIVA installation requires and assumes you have already installed the latest free version of Microsoft's SQL Server Express 2008 R2.

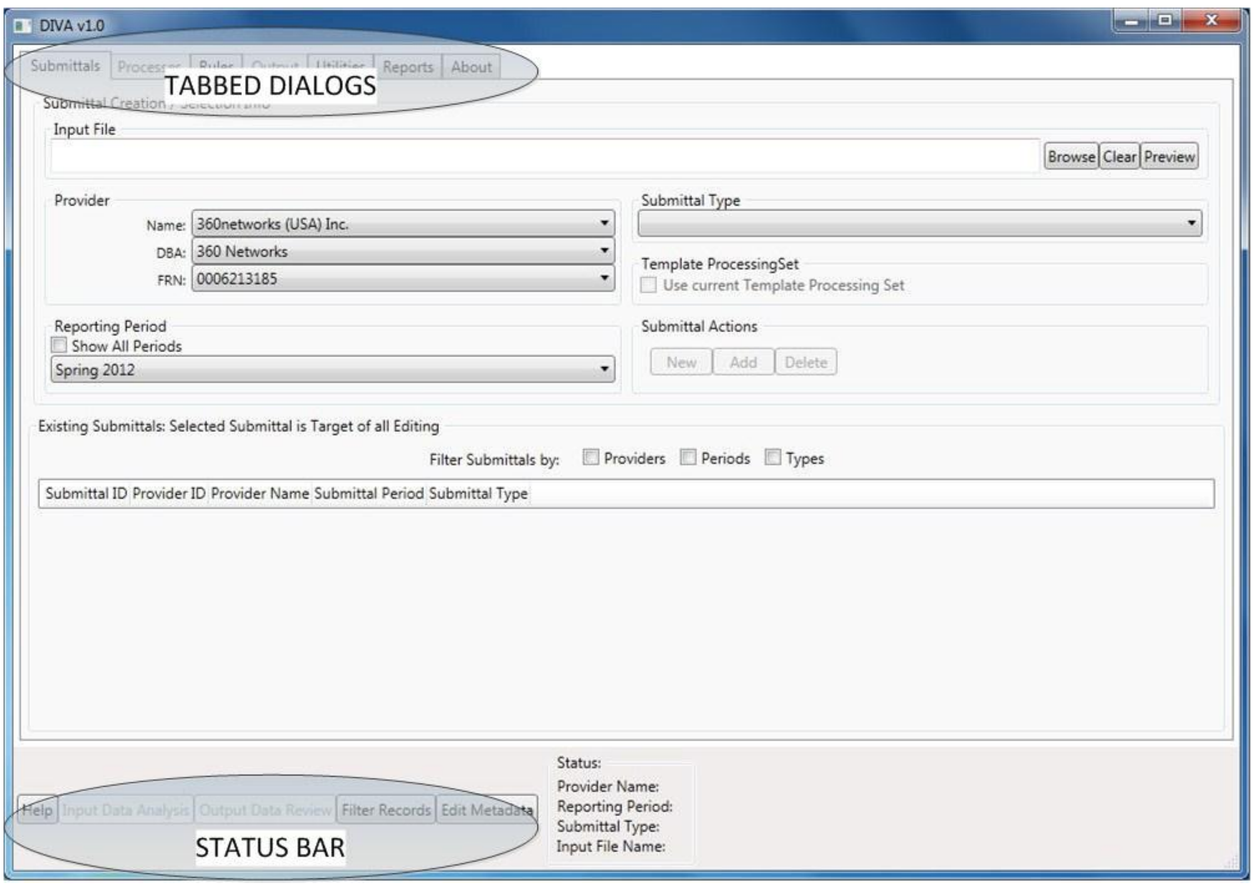
Basic installation steps are:

1. Create an install folder on your system
2. Copy the "DIVA.exe.config" file from the previous prototype folder to the new install folder.
3. In SQL Server, delete and then re-create DIVA database.
4. In SQL Server, run "DivaModel.edmx.sql"
5. In SQL Server, run, "BaseData.sql "

Provider data will now be loaded into period-specific data bases. THESE WILL HAVE TO BE DELETED IN THE FUTURE as part of the re-install. Their names look like "Diva_PData_X##" where "X" is "F" or "S" and "XX" is the two digit year. For a description of the tables that DIVA creates in SQL Server please see Appendix D.

Functionality Overview by Graphic User Interface (GUI) Elements

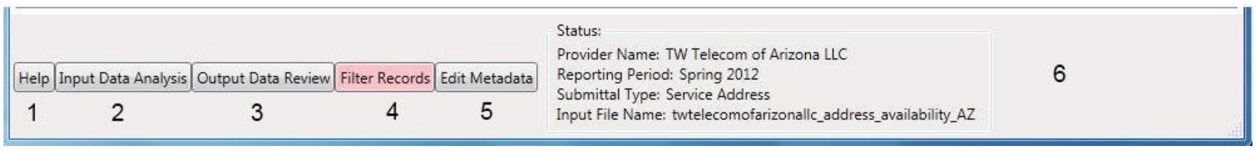
The main DIVA interface is a tabbed dialog box with the tabs organized from left to right roughly corresponding to the order in which a user would proceed while processing Provider data. The image below shows the initial DIVA view, the Submittals Tab. In addition to the left-to-right ordering of tabs, DIVA also guides users by activating tabs and various controls only when pre-requisite steps have been completed. This guidance is only approximate. DIVA was not designed as a data processing "wizard" and therefore users are allowed to choose many pathways through the DIVA application. In addition to tabs, DIVA has a "Status Bar", composed of five buttons and a status display area found at the bottom of the DIVA GUI regardless of which tab is currently active.



Following are brief explanations of the tabs and Status Bar controls on the DIVA GUI. Hyperlinks reference more detailed descriptions of how and when to apply a particular control.

Status Bar Overview

For the most part, buttons on the Status Bar can be used at any time, which is why they are visible no matter which tab is active. The “Status” area on the right side of the bar displays the currently active Provider, Period-Type (Reporting Period and Submittal Type) and Input File Name. Following is a table that briefly describes the function of each of the Status Bar elements; if an element is a button, then the description is what happens when the button is clicked Follow hyperlinks for more detailed information.



Key	Control	Description
1	Help button	Brings up an HTML version of selected portions of this documentation.
2	Input Data Analysis button	Opens the “Input Data Analysis” window which displays the data that was loaded into DIVA from the active Input File for the active Submittal.
3	Output Data Review button	Opens the “Output Data Review” window and displays the data resulting from applying the Processes (as configured on the “Processes” tab) to the Input Fields and the errors resulting from applying Rules on the Output tab. *Note: after selecting a Submittal, users must click on the “Processes Tab” to apply the Processes for the selected Submittal. This will generate the Output Field data and the “Output Data Review” window will be populated with those values.* *Note: after applying Processes, users must click on the “Refresh Violation Counts” on the Output tab. Errors will then be viewable in this window.*
4	Filter Records button	Opens the “Filter Records Window” where the user can specify a number of records or an SQL query expression (or both) to restrict the number of records that are loaded for current processing. *Note that, in the example above, the button is colored. This indicates that a filter is in effect (i.e., not all Input File records are currently being processed).*

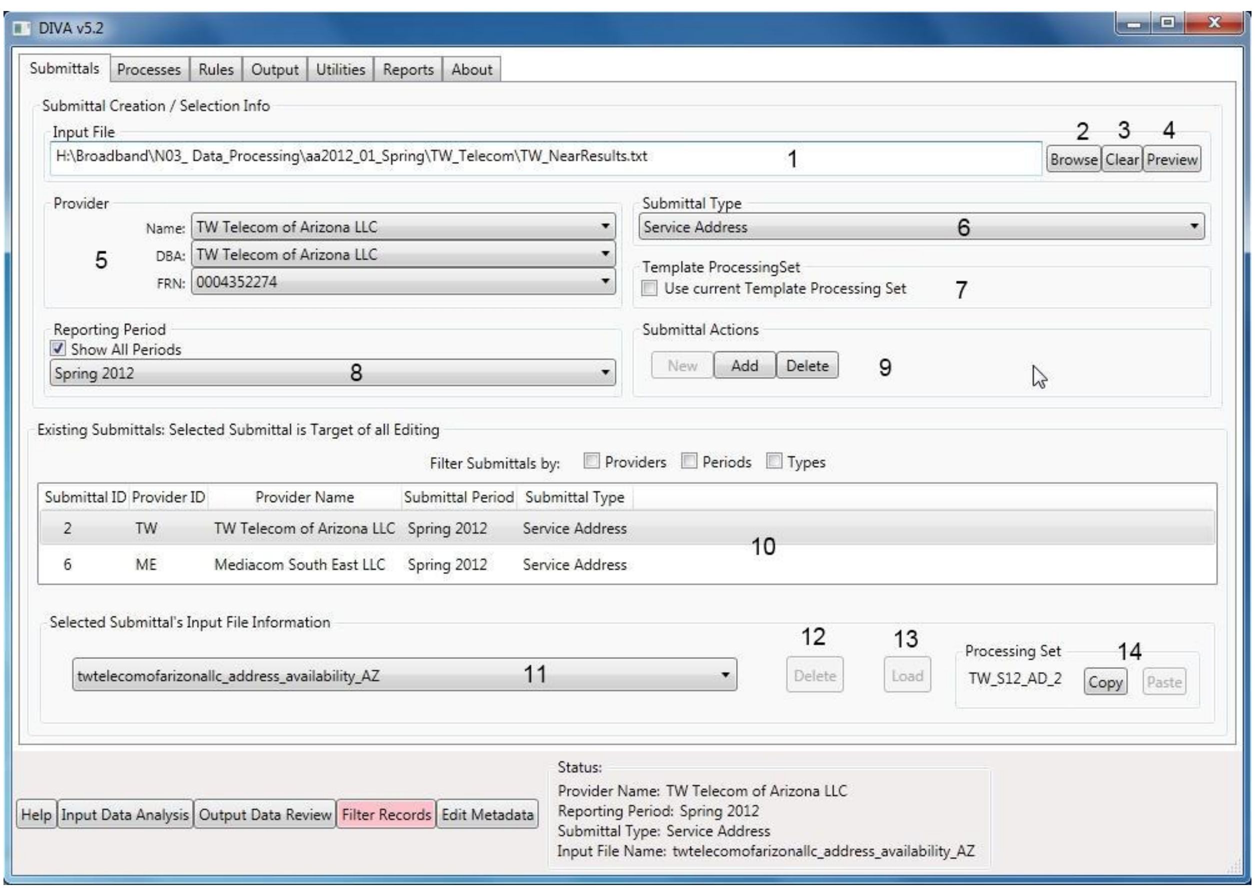
Key	Control	Description
5	Edit Metadata button	Opens the "Edit Metadata Window" where users can record notes about Providers, Reporting Periods, Submittal Types and Submittals. Metadata entries are included, as appropriate, in the various Reports.
6	Status area	The "Status" area is always visible and reports on information about the active Submittal.

Submittals Tab Overview

The Submittals tab contains all the controls a user needs to manage the intake of provider data. In the image below are numeric keys to the discussion that follows. More detailed information on how and when to use these controls can be found in the “Functional Details” and “Sample Workflow” sections of this documentation.

The upper portion of the tab, the “Submittal Creation / Selection Info” panel, is used to set the active Provider, Reporting Period and Submittal Type. If this combination has been used previously to define a Submittal, then that Submittal will automatically be selected in the lower panel and the selected data set (the Input File) can be added to the Submittal. If this combination has not been used previously, then a new Submittal (with the selected Input File data set) can be created.

The lower portion of the Tab, the “Existing Submittals” panel, displays all existing Submittals and can also be used to navigate among them. The “Filter Submittals” check boxes allow the user to restrict the display of existing Submittals to only those matching the active Provider, Reporting Period and / or Submittal Type.



Key	Control	Description
1	Input File text box	Displays the path and filename of the Provider Data Set which a user has selected using the Browse button. *Note: more than one Input File may be associated with a submittal. These files are processed separately and not combined by DIVA in any way.*
2	Browse button	This button opens a file dialog box which is used to select a Provider data set (a DIVA Input File).
3	Clear button	Clears the Input File selection from the Input File text box.
4	Preview button	Opens the selected Input File in an “Input Preview” dialog box, allowing the user to evaluate the content and format of the first 100 records of the Input File.
5	Provider area	The three drop-down lists in this area allow the user to set the active Provider using either the Provider Name, DBA Name or FRN (FCC Registration Number). Selection in one drop-down list automatically synchronizes the other two. Users may also click on an existing Submittal in the Existing Submittals list to set the active Provider (i.e., display the Provider’s identification information). The Provider drop-down lists are populated from an internal DIVA table. This table can be updated from the Utility tab (Update Provider Info).
6	Reporting Period drop-down list	This drop-down list is used to set the active Reporting Period. Only the current Reporting Period is available for selection unless the “Show All Periods” box is checked. Each Reporting Period has an internal DIVA-defined Start and End date. The Reporting Period that has a date range containing the current system date is considered current. The Reporting Period pull-down list can be modified from the Utility tab (Manage Submittal Reporting Periods).
7	Submittal Type drop-down list	This drop-down list is used to set the active Submittal Type. Each of the eight NTIA approved Submittal Types may be listed. The ones that will be shown are the ones for which a matching feature class was found during SBDD XML Importfor this Reporting Period. *Note: This is used in combination with the Reporting Period drop-down list to set the active Period-Type.*

Key	Control	Description
8	Template Processing Set checkbox	Checking this box, prior to clicking on the Processes tab for any new Submittal, will automatically generate Processes for that Submittal from the current Template Processing Set (if it exists) when the Processes tab is clicked. Template Processing Sets are created on the Processes Tab. Any existing Processes for that Submittal will be copied to the Template Processing Set overwriting any previously saved Processing Set for the current Period Type. *Note: there can be one and only one Template Processing Set for each Submittal Type for a given Reporting Period, that is, for any one Period-Type.*
9	Submittal Actions buttons	The “New”, “Add” and “Delete” buttons in this section of the Submittals tab all pertain to working with Submittals. The “New” button will only be available if no previous Submittal has the same assigned Provider, Reporting Period and Submittal Type. Clicking the button will create the Submittal with these values assigned and the currently selected data set as the Input File. This new Submittal will be added to the “Existing Submittals” list and it will be active (selected). The “Add” button will only be available if the active Provider, Reporting Period and Submittal Type have been used previously (i.e., there exists a Submittal with these values). In this case, the selected Input File will be added to that Submittal; it will be added to the Existing Input Files drop-down list and be made the active Input File. The “Delete” button will completely delete an existing Submittal, including references to its Input File(s), their Input and Output Fields, and their Processing Sets (any defined Processes and Process Fields). The internally stored data of the Input File(s) are also deleted. *Note: each new data set added to an existing Submittal is its own Input File. In other words, multiple Input Files are not appended and treated as a single Input File.*

Key	Control	Description
10	Existing Submittals list	This is a list of all Submittals that users have previously defined using DIVA. Clicking on a Submittal in this list makes it the active Submittal and synchronizes the information in the upper panel of the Submittals tab (the "Provider", "Reporting Period" and "Submittal Type") with the active Submittal. The checkboxes along the top filter the list of existing Submittals found in the Existing Submittals table area. Users may filter the list to specific Providers, Reporting Periods and / or Submittal Types. *Note: When a Submittal is created, the Input File's data is not automatically loaded into DIVA's internal storage. Users may have referenced several Input Files for a Submittal without loading data. Data loading is a separate step from Submittal creation and is required for any further processing in DIVA.*
11	Input File drop-down list	Displays the active Input File name for the selected Submittal. If there are multiple Input Files assigned to a Submittal, the active Input File may be selected using this drop-down list. *Note: When a Submittal that has multiple Input Files is selected, the first Input File will be active (selected). The user must change this as needed. DIVA does not remember (and restore) the last Input File that was used for this Submittal.*
12	Delete button	Deletes the active (selected) Input File. This deletes all associated information in the DIVA database, including Processes and Metadata, for that Input File only; the selected Submittal is not deleted. If there is only one Input File for a Submittal, then it is not possible to delete it and the button is inaccessible; use the Submittal Delete button instead. *Note: A Submittal must have at least one Input File; therefore, to remove the last Input File the user must delete the entire Submittal.*
13	Load button	Opens a "Load Data" dialog box (this is very similar to the "Input Preview" dialog box accessed with the Preview button) and allows the user to evaluate the content and format of the first 100 records of the Input File. The settings here are more critical because, when the Load button in this dialog box is clicked, these settings will determine how the data file will be loaded into DIVA's internal database. *Note: It is important to understand that you can Create a new Submittal, but nothing further can be done with it until you load the data from the Input File.*

Key	Control	Description
14	Processing Set area	This area shows the (internal) name of the Processing Set attached to the active (selected) Input File, and contains buttons for copying and pasting a Processing Set to another Submittal's Input File. The "Copy" button will be accessible only if this Input File has had its data loaded and its Processing Set contains at least one Process (the user must have created and saved at least one Process on the Processes Tab). Clicking the Copy button will "tag" this Processing Set for copying. The "Paste" button will be accessible only if this Input File has had its data loaded, another Submittal has had its Processing Set "tagged" for copying, and this Input File's Processing Set is empty (no Processes ever assigned to it). The user must remove all Processes from an Input File (by deleting them on the Processes tab and then saving the results) if another Processing Set is to be "pasted". Clicking the Paste button will automatically transfer DIVA "focus" to the Processes tab so that the Paste operation can be completed.

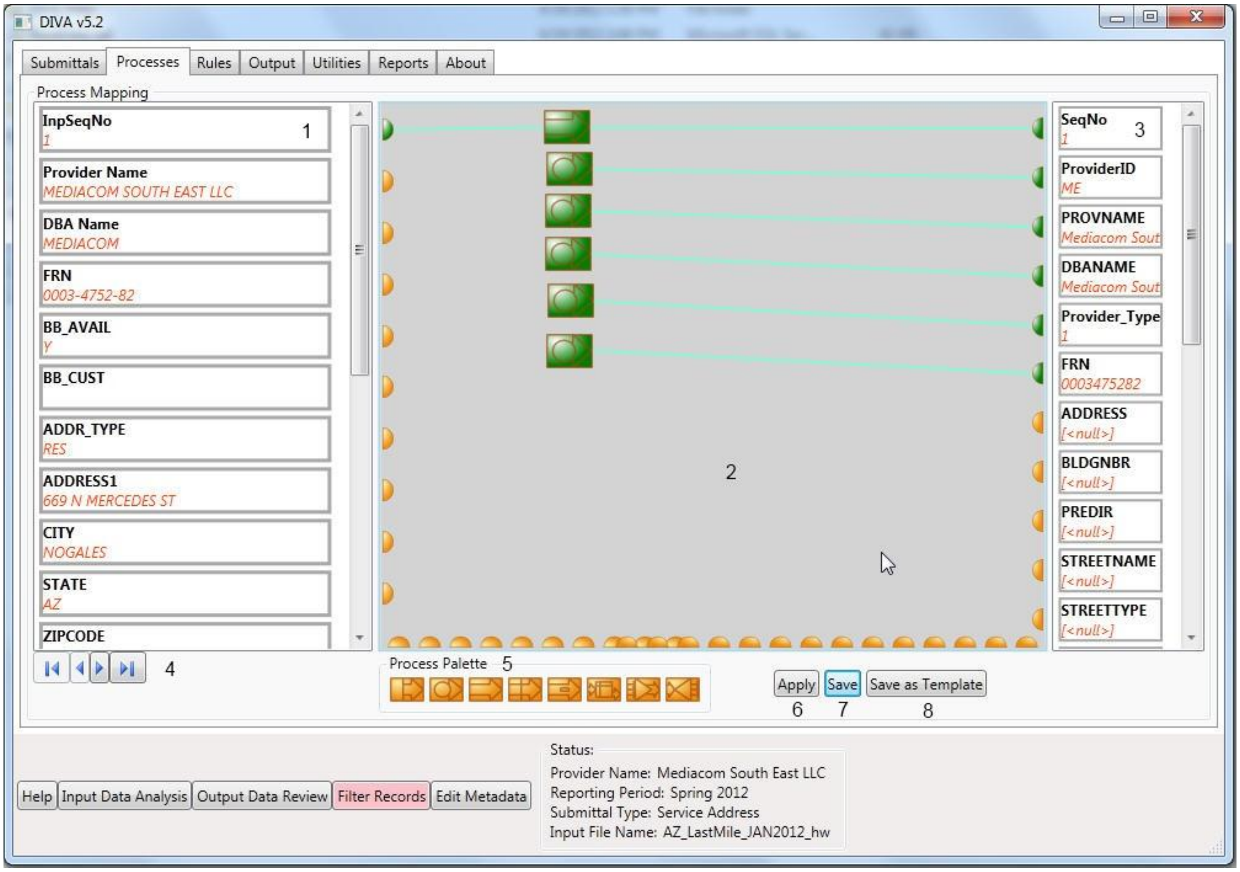
It is important to note that once a Provider's data set (computer file contents) has been loaded into internal DIVA storage (as a data table in a Reporting Period-specific database), that data set's computer file may be renamed, moved or deleted with no effect on DIVA. Prior to loading, changing the filename, the file's location or deleting the file will cause the DIVA data loading operation to fail. Doing any of these actions will force the user to browse to a new data set and add it as an Input File for that Submittal or restore the file to its original location with its original name.

Processes Tab Overview

The Processes tab is where the user assigns the data transformation Processes and uses them to link Input Fields with Output Fields. This linkage creates a data "flow" from the Input Fields (data "sources") to the Output Fields (data "sinks"). Not all Input Fields need be used and some may be used more than once (linked to more than one Process). Output Fields are typically fully linked. Most Output Fields derive from SBDD geodatabase requirements (SBDD-source), but some have been added by the DIVA design team for their utility based on past experience (DIVA-source). Some SBDD-source Output Fields will have a "MustHaveData" Rule created for them if the Output Field is required to have data (per the SBDD geodatabase).

Note that only Column Processes are placed and manipulated on the Process Mapping Canvas. There are eight DIVA-defined Column Processes, ranging from a simple copy to complex decompositions. Row Processes (of which, at this time, there is only one) will automatically appear under the Output Fields List as needed. The existence of a Row Process is determined by the existence of the corresponding Row Rule (the user cannot create or remove this Process directly); the Process is then used to resolve violations detected by the corresponding Rule.

At DIVA start-up, the Processes tab will be inaccessible. Users must select an existing Submittal that has loaded data, or define a new Submittal and load its data, before the Processes tab will be available for use. In the image below are numeric keys to the discussion that follows. More detailed information on each Process type is referenced in the hyperlinks.



Key	Control	Description
1	Input Fields list	The list of Input Fields created when the active Input File was loaded. These fields are Data Sources.
2	Process Mapping canvas	This is a drag-and-drop area where users place and connect Processes with Input Fields and Output Fields or with other Processes through Process Fields.
3	Output Fields list	The list of Output Fields as imported from the SBDD geodatabase for the user-selected Period-Type (Reporting Period and Submittal Type). These fields are Data Sinks.
4	Record Pointer controls	Moves the record pointer on the Input File to (in order) the first, previous, next or last record.

Key	Control	Description
5	Process Palette	Displays the graphics representing the eight data transformation processes defined in DIVA and serves as the "launch pad" for creating a Process. To create a Process, click one of the Process icons in the Palette, and drag-and-drop it onto the Process Mapping Canvas. The name of each Process can be found by hovering the mouse over its icon to display a tool tip. In order from left to right, these eight processes are listed below, with details on each found by following the hyperlink. • Constant Value – populate an Output Field or another Process with a user-defined value. • Provider Value – populate an Output Field or another Process using values imported into DIVA from a provider information table. See "Update Provider Information" for details on this table. • Copy – populate the Output Field or another Process by copying the value of the Input Field. • Copy with Default – populate the Output Field or another Process where values are either null or blank by copying the default value as defined in the SBDD database for the active Reporting Period. • Make Negative – populate the Output Field or another Process by copying the value from the Input Field and inversing its sign. • Translation – populate the Output Field or another Process by translating values in the Input Field to a new, user-defined value. • Composition - populate the Output Field or another Process with values appended (composed) from two or more Input Fields. • Decomposition – populate two or more Output Fields or Processes with values parsed (decomposed) from a single Input Field. DIVA currently has four types of decomposition processes: Census Block, Full Address, Simple and Zip Code. The user cannot create a Decomposition Process, per se, but only one of these four types. While each is configured and functions in its own manner, the same symbol is used on all decomposition graphics. Associated tool tip can be used to identify specifics about these Processes.
6	Apply button	Applies the Processes, transforming Input Field values to Output Field values and causing them to display in red font below each Output Field.
7	Save button	Saves the Processes to a Processing Set. If already saved, this updates that Processing Set with any changes made since the last save.
8	Save As Template button	Saves the current Processing Set as a Template Processing Set for use when creating new Submittals.
9	Row Process(es) button(s)	Below the Output Fields List, a button will be displayed for each existing Row Process. Click this button to open a dialog window to configure that Row Process. *Note: At present, DIVA has only one defined Row Process.*

Tips for creating Processes:

- Preserve the Input Field, “InpSeqNo”, in the DIVA-defined “SeqNo” Output Field. This creates a unique record identifier which is useful in subsequent processing steps. Alternatively, use some other Input Field that uniquely identifies a data record (e.g., the UNQID field suggested for shapefile processing). Failing to put a unique identifier in the “SeqNo” Output Field can make it difficult to track NTIA-submitted data back to its source.
- Apply and save Processes as you define them. This ensures work is tested and then saved. Always examine the results of applying Processes across multiple data records to ensure that you have achieved what was intended.
- Use a “Provider Value” process instead of copying a Provider’s name, DBA name, FRN, etc. information from the Input File. This keeps the Provider identification information consistent with the values maintained in the Provider Information database and consistent across multiple Reporting Periods.
- Use Template Processing Sets when loading a new Submittal, or Copy and Paste another Submittal’s Processing Set. Chances are the processing will be similar enough that it will be faster to start with some pre-defined Processes.
- Right clicking any Process on the Process Mapping Canvas brings up a context menu which allows the user to change the configuration of inputs and/or outputs to the Process. Only composition allows you to add inputs, only decomposition denies adding outputs. All Processes allow you to delete them. Deletion can also be accomplished by selecting the input or output on the Process and pressing the “Del” (delete) key.

Rules Tab Overview

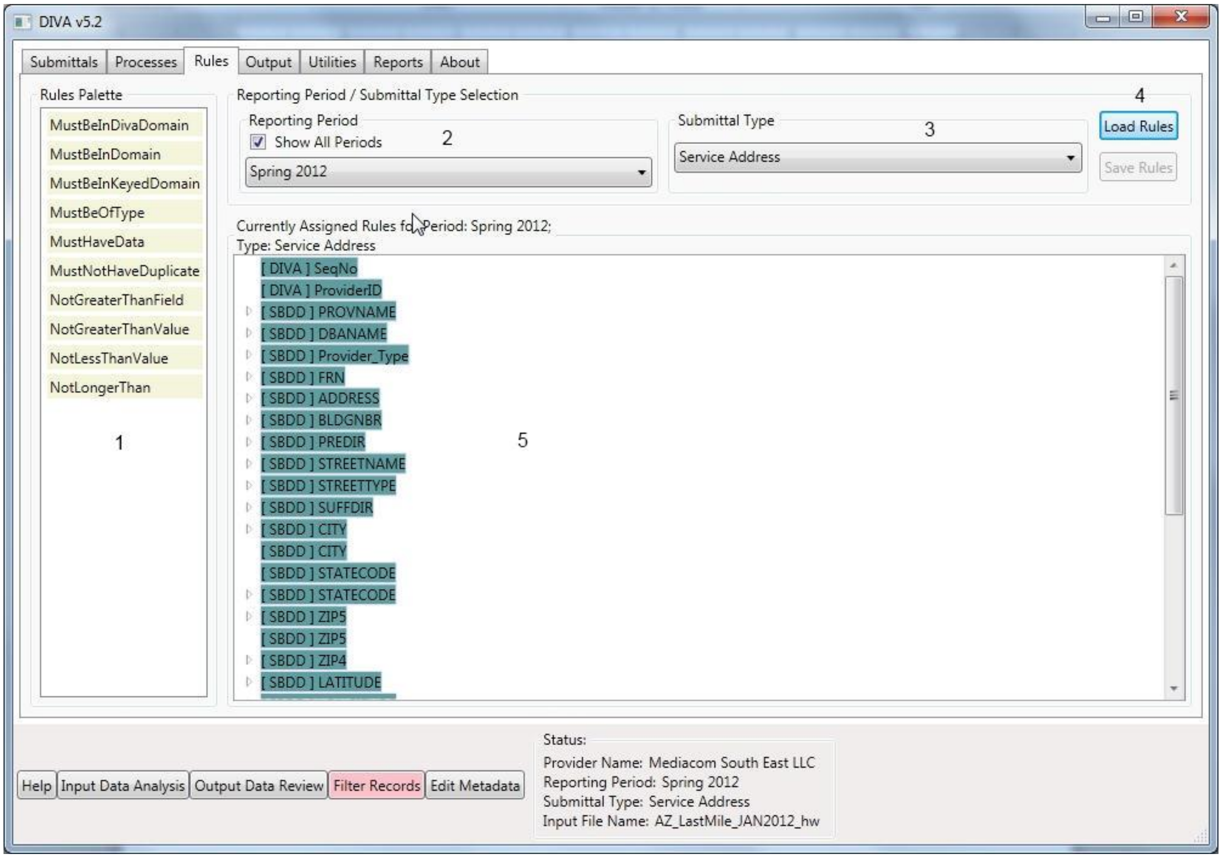
The Rules tab is where a user can review the Rules that are imported during the "SBDD XML Import" process. The user may also assign more Rules, modify (configure) existing Rules, or remove Rules. Rules are how DIVA implements Data Verification and Data Validation for Output Field values.

It is vital that the user understands that Rules are assigned to Template Output Fields. Template Output Fields are unique for each Period-Type (e.g., for Spring 2012 Census Block reporting). Each Input File that is identified with a Submittal (and there must be at least one) will have a corresponding set of Output Fields created; one Output Field for each Template Output Field. The Rules that are in effect for a Template Output Field affect every Output Field that is created from it. Because of this, all Submittals of a particular Period-Type will have the same set of Rules applied to each of them.

Obviously, this will not be true if the user processes some Submittals and then changes the Rules. Therefore, careful consideration should be given at the start of the Reporting Period, after SBDD geodatabase import, as to which Rules should be added or removed, and how they should be configured. **For consistency, when Rules are modified, previously processed Provider data should be re-processed and checked for consistency with these modified Rules**. DIVA makes it easy to rapidly review any previously processed data.

Because Rules are assigned to Template Output Fields, it is not necessary to have an active (selected) Submittal, or even any defined Submittals for a Reporting Period, in order to access and modify the Rule Set for a Period-Type. All that is required is that the SBDD geodatabase be imported for the Reporting Period. Nor is it required that a Rule Set be loaded on this tab before they are applied (the results of Rule application are seen in the Output Tab). They will automatically be applied because the Output Field is tied to the Template Output Field from which it was derived

In the image below are numeric keys to the discussion that follows. More detailed information can be found by following the hyperlinks.

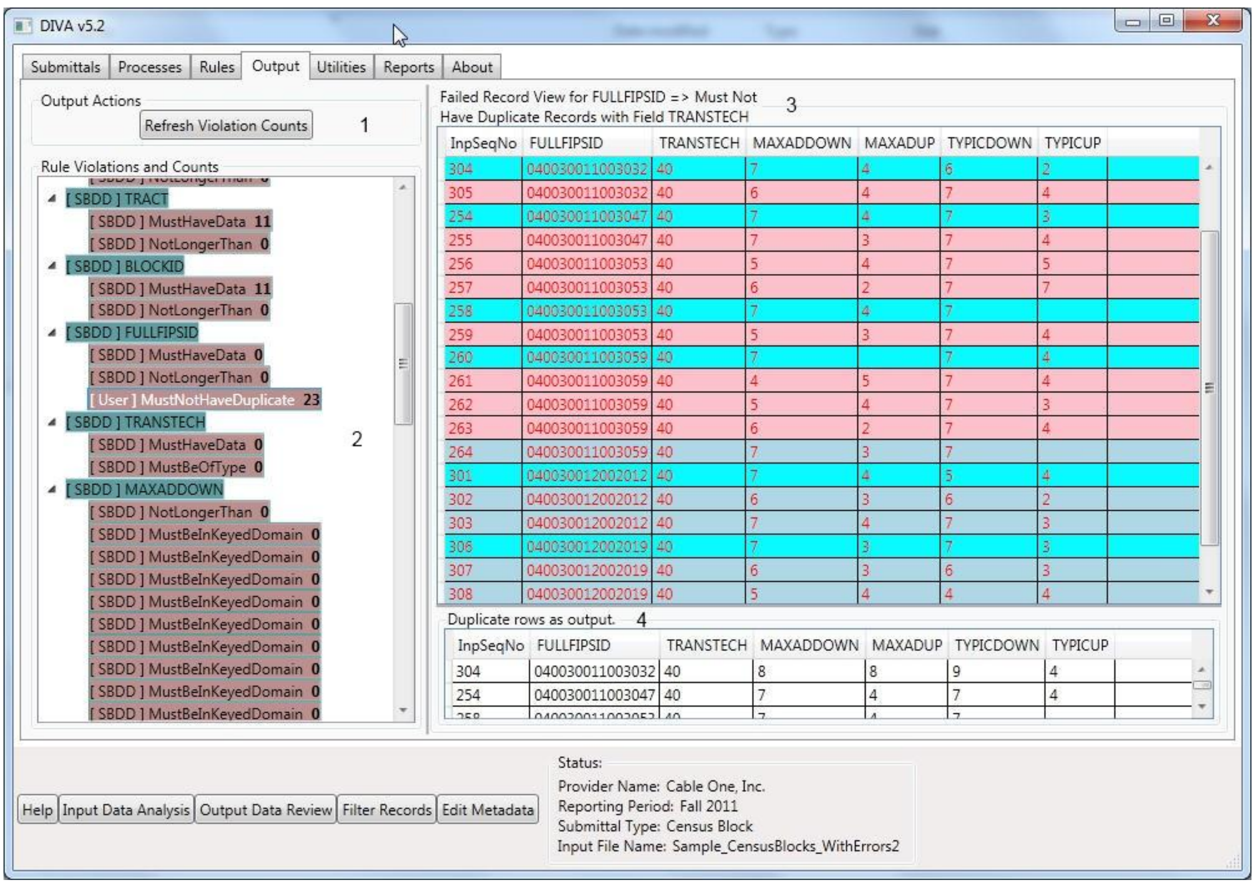


Key	Control	Description
1	Rules Palette area	A list of rule types that can be applied by dragging and dropping them onto the Output Fields shown in the "Currently Assigned Rules" area.
2	Reporting Period pull-down list	This pull-down list displays the current Reporting Period or all of the Reporting Periods defined in DIVA if the "Show All Periods" box is checked.
3	Submittal Type pull-down list	Each of the eight NTIA approved Submittal Types are listed in this menu.
4	Load Rules button	Loads the Rule set for the selected Period-Type.
5	Currently Assigned Rules area	Displays the Rules that have been assigned to each Template Output Field of a Period-Type (and, thus, each Output Field of a Submittal).

Output Tab Overview

The Output tab is where a user reviews and evaluates the results of applying Rules to values in the Output Fields. Users click the “Refresh Violation Counts” button to update the violation counts (apply the Rules). Rules and their violation counts are shown in a tree-view grouped under the Output Field to which they apply. Double-clicking on any Output Field will toggle the expansion / contraction of the tree view. Double-clicking on any given Rule that shows an error displays details on that error in the “Failed Record View”. Depending on the Rule, additional information may be displayed in the Extra Data panel below the “Error Record View” area.

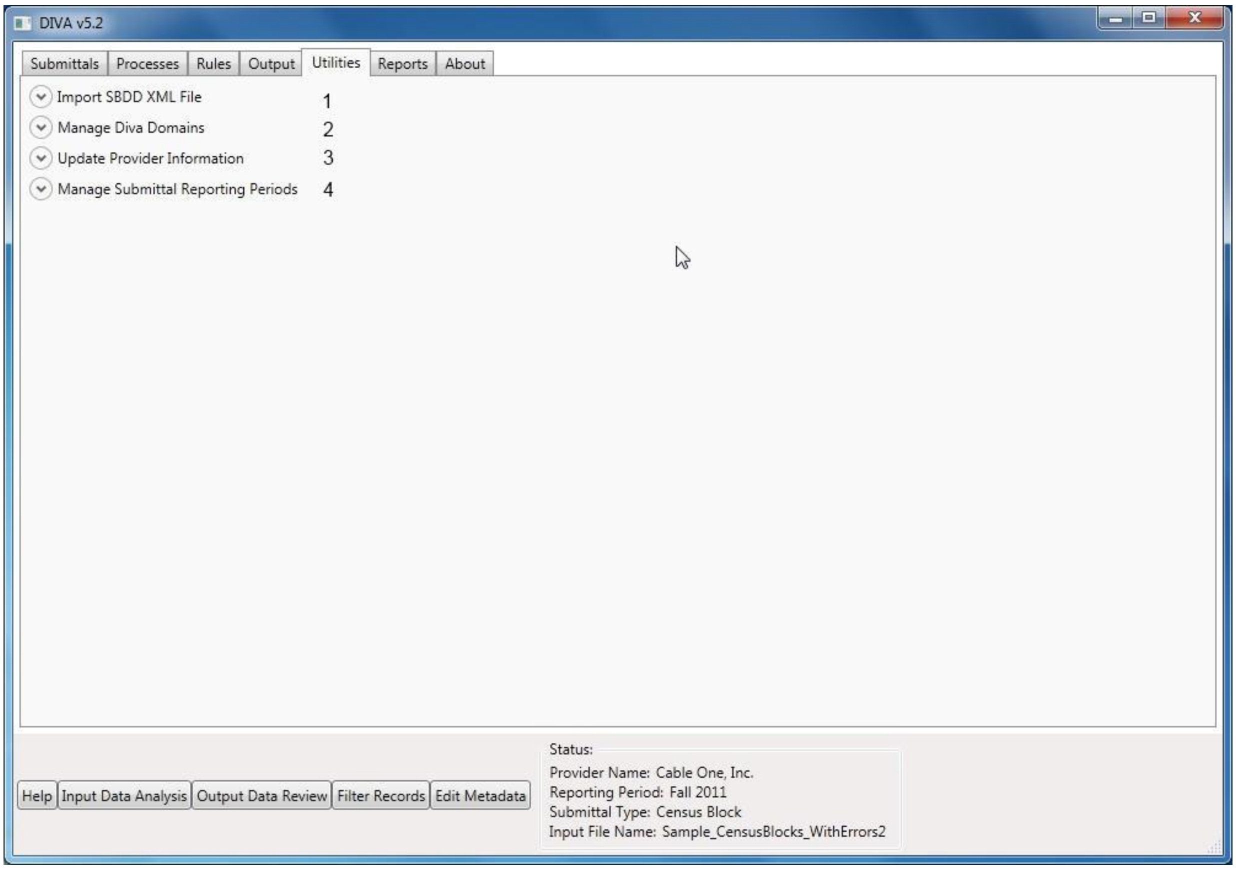
In the image below are numeric keys to the discussion that follows. More detailed information on each entry can be found by following the hyperlink in the table.



Key	Control	Description
1	Refresh Violations Count button	Click this button to update the record violation counts in the "Rules and Violation Counts" area. Be sure Processes have been applied prior to refreshing violation counts by clicking on the "Processes" tab first.
2	Rules and Violation Counts area	Displays the results of applying Rules to the Output Fields of the active Submittal. Any number greater than or equal to zero is the error count. A "-2" indicates that the Rule is not configured and therefore cannot be evaluated. A "-1" indicates that there is no data in the Output Field to be evaluated. Either the Output Field is not connected to a data source on the Processes tab or there is no data in the connected data source. *Note: There is a "splitter" line between the Output Actions / Rule Violations and Counts panels and the Failed Record View / Extra Data panels. The user may click and drag this line to change the panel area sizes in the window.*
3	Error Record View	Displays rows which have an error in the Output Field for the Rule that has been selected and double-clicked in the "Rules and Violation Counts" area.
4	Duplicate Rows as Output area	This area is used to display either details about the "MustNotHaveDuplicate" error type or the Domain values for domain rule types. For duplicate rules It displays the record(s) that will be added after compositing the duplicates into a single record based on user-defined parameters. *Note: There is a "splitter" line between the Failed Record View and the Extra Data areas. The user may click and drag this line to change the panel area sizes in the window.*
4	Domain Table Display Area	This area is used to display either details about the "MustNotHaveDuplicate" error type or the Domain values for domain rule types. For domain rule types, it will display the domain table when the user clicks on a domain Rule. *Note: There is a "splitter" line between the Failed Record View and the Extra Data areas. The user may click and drag this line to change the panel area sizes in the window.*

Utilities Tab Overview

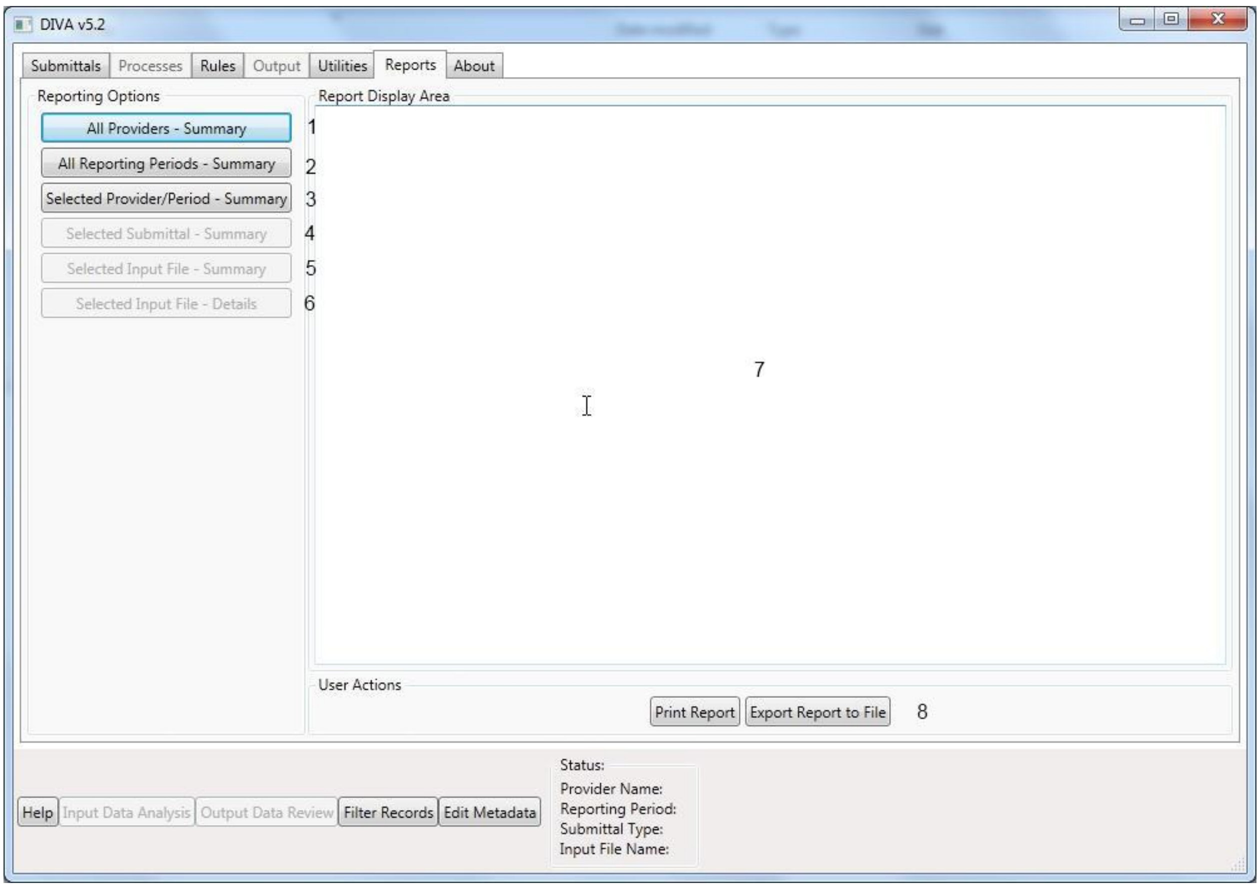
The Utilities tab is where a user configures various aspects of DIVA to keep it current with new information. In the image below are numeric keys to the discussion that follows. More detailed information on each utility can be found by following the hyperlinks.



Key	Control	Description
1	Import SBDD XML File	Import an XML workspace document that describes an SBDD geodatabase schema and domain tables. This need only be done once for each Reporting Period.
2	Manage DIVA Domains	Import a text, Excel or DBF containing DIVA Domain values.
3	Update Provider Information	Import a text, Excel or DBF containing Provider identification and status information. The field names in the source file must match exactly with those that DIVA expects.
4	Manage Submittal Reporting Periods	Add or remove Reporting Periods, or remove all data for a Reporting Period.

Reports Tab Overview

The Reports tab is where a user selects from a menu of pre-configured reports and either prints or exports them. Note that in the illustration below, some report options are greyed out. This is because no Submittal has been selected on the Submittals tab. More detailed information on each report and control can be found by following the hyperlinks in the summary table.



Key	Control	Description
1	All Providers Summary button	Displays a list of information about each Provider currently loaded into DIVA. Use the "Update Provider Information" button on the "Utilities" tab to update this information.
2	All Reporting Periods Summary button	Displays a list of information about each Reporting Period currently defined in DIVA. Use the "Manage Submittal Reporting Periods" button on the "Utilities" tab to update this information. This report will include all notes recorded by the user on the left-hand side of the "Edit Metadata" dialog.

Key	Control	Description
3	Selected Provider/Period Summary button	Displays a list of information about the active Provider and Reporting Period, including a list of the Period-Types (Submittal Types) defined for the Reporting Period and the number of existing Submittals for that Period-Type. *Note that the Submittal count can only be 0 (none defined) or 1 (a Submittal exists). For brevity, only Period-Types that have a Submittal count of 1 are displayed.*
4	Selected Submittal – Summary button	Displays a summary of the active (selected) Submittal, including summary information about each of its Input Files (inaccessible if no active Submittal).
5	Selected Input File – Summary button	Displays more detailed information about the active (selected) Input File of the active (selected) Submittal on the Submittals tab(inaccessible if no active Submittal). Information will be displayed about each Output Field of the Input File followed by a "chain of data flow" that shows the Output Field's connected Process, any Process Fields connected to that Process, any Processes connected to those Process Fields, etc., until the ultimate Data Source (which may be a Process or an Input Field) is listed. After the "chain of data flow" into the Output Field, a list of the Rules that apply to this Output Field is displayed along with the number of current Rule violations.
6	Selected Input File – Details button	Same as "Selected Input File – Summary" – except that additional details are given. Some Processes will have additional information given, e.g., for the Translation Process, all translated From and To values will be displayed. For Rule listings that have a violation count greater than 0, all violating records will be listed (for brevity, this includes just the record number ["InpSeqNo" field] and the Output Field's value). This report can be very long if there are excessive Rule violations, so the Summary version should be checked before generating this report.
7	Report Display area	The area in which the various reports are displayed. Scroll bars will automatically appear if necessary.
8	User Actions area	Allows the user to either print the file to a printer or export it to a text file.
9	Print Report button	Prints the information in the Report Display area to a printer selected by the user (invokes a standard Window's Printer dialog box).

Key	Control	Description
10	Export Report to File button	Exports the information in the Report Display area to a file, in plain text format, as selected by the user (invokes a standard Window's File Save dialog box).

About Tab Overview

The About tab gives general information about DIVA, its current version number, contact information, acknowledgements for other code uses and the licensing information for that code. There is no other functionality for this tab.

Functionality Details

This section describes in detail how to perform key operations in DIVA.

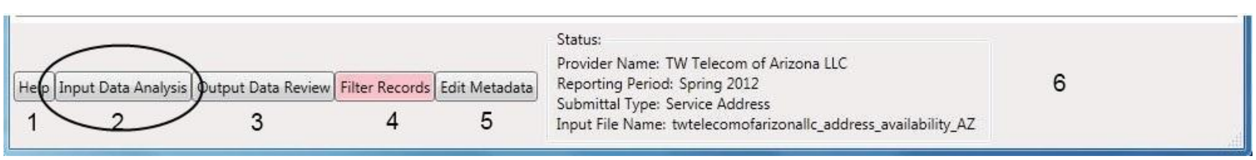
Status Bar Functions

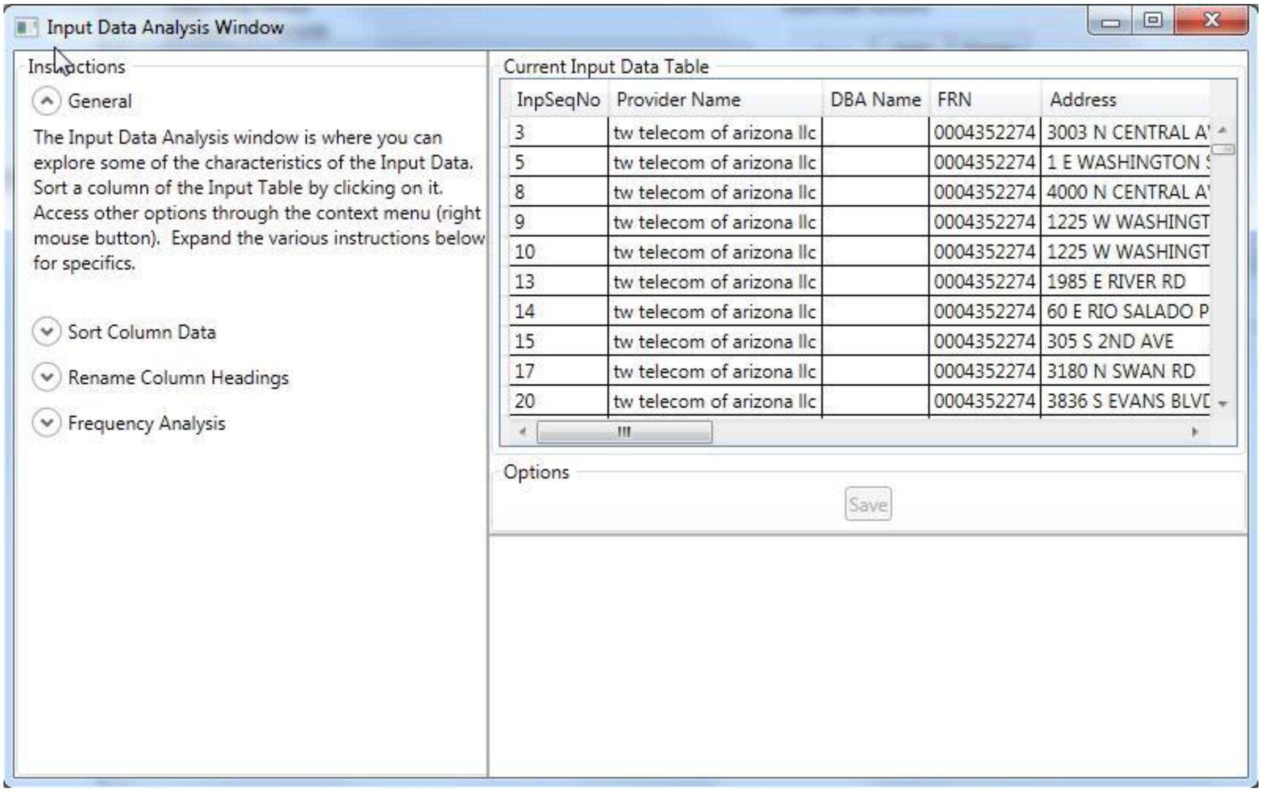
Input Data Analysis button (Status Bar, "Input Data Analysis" button) – the Input Data Analysis window shows the contents of the active Input File for the active Submittal. It offers a number of features for evaluating the data that has been loaded, including sorting and frequency analysis. It also has its own Help window which offers guidance on the use of its features.

Note: a Submittal must have its data loaded (not just created) before the Input Data Analysis Window can be accessed.

Note: This window is not a "modal" window; <u>it may be left open</u> while other operations are performed in DIVA. The user may minimize the window or may click the "Input Data Analysis" button to "toggle" this window in and out of view.

Note: The user <u>must explicitly close this window</u>, by clicking the red "X" icon in the window's upper right, before selecting another Submittal. If it is left open, it will continue to display the originally selected Submittal's data, not the currently active Submittal's data.

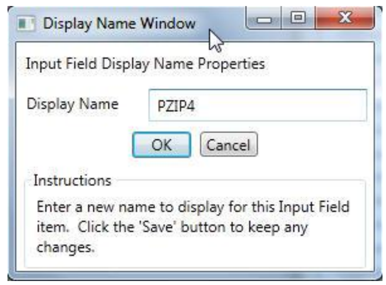




Key	Control	Description
1	Instruction Panel	Instructions to guide users on how to understand and use the Input Data Analysis Window. Note: there is a "splitter" line between the Instructions and the rest of the window which can be dragged to change the amount of the window allocated to each panel. Dragging the line all the way to the left will completely hide the instructions, but the splitter line is still there so that the instructions may be redisplayed at any time.

<table>
<tr><th>Key</th><th>Control</th><th>Description</th></tr>
<tr><td>2</td><td>Header Row Context Menu, “Rename the Header”</td><td>
Right Click on any column header and select “Rename the Header”

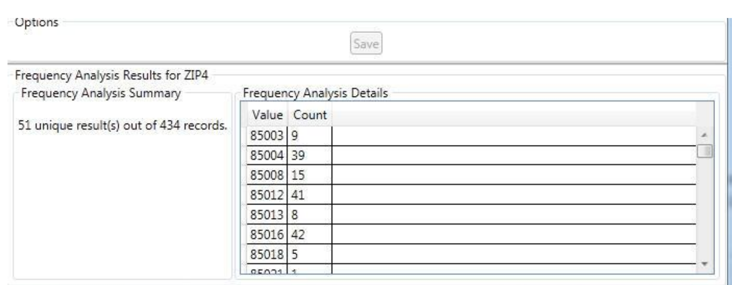
Type in a new Display Name and click “OK” to save changes and dismiss the dialog. Click “Cancel” to exit without saving.



Note: You can use spaces in the Display Name. This string is just an alias and does not become an actual database field name.

Note: Upon clicking “OK” which dismisses the dialog and returns you the Input Data Analysis Window, you must click the “Save” button immediately below the table display in order to have Display Name changes be saved permanently (i.e. so you will see them the next time you select the Submittal).
</td></tr>
<tr><td>2</td><td>Header Row Context Menu, “Do Frequency Analysis”</td><td>
Right Click on any column and select “Do Frequency Analysis” optin

The results of the Frequency Analysis are shown in its display area. On the left side, a summary of the number of unique values for the analyzed field (column) and total number of records in the Input File is displayed. On the right side, a detailed table of the analysis results is shown, with each unique value listed along with the frequency count.



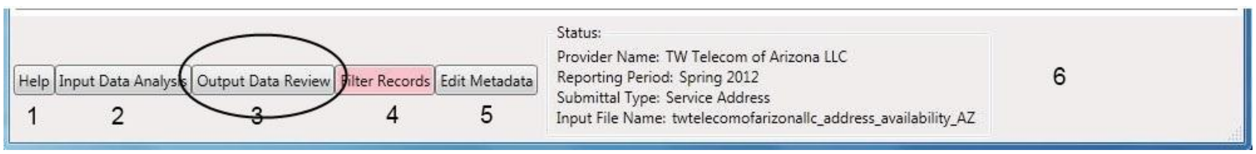
Note: There is a “splitter” line between the Data <u>Table</u> and the Frequency Analysis Results areas. The user may click and drag this line to change the viewing area sizes
</td></tr>
</table>

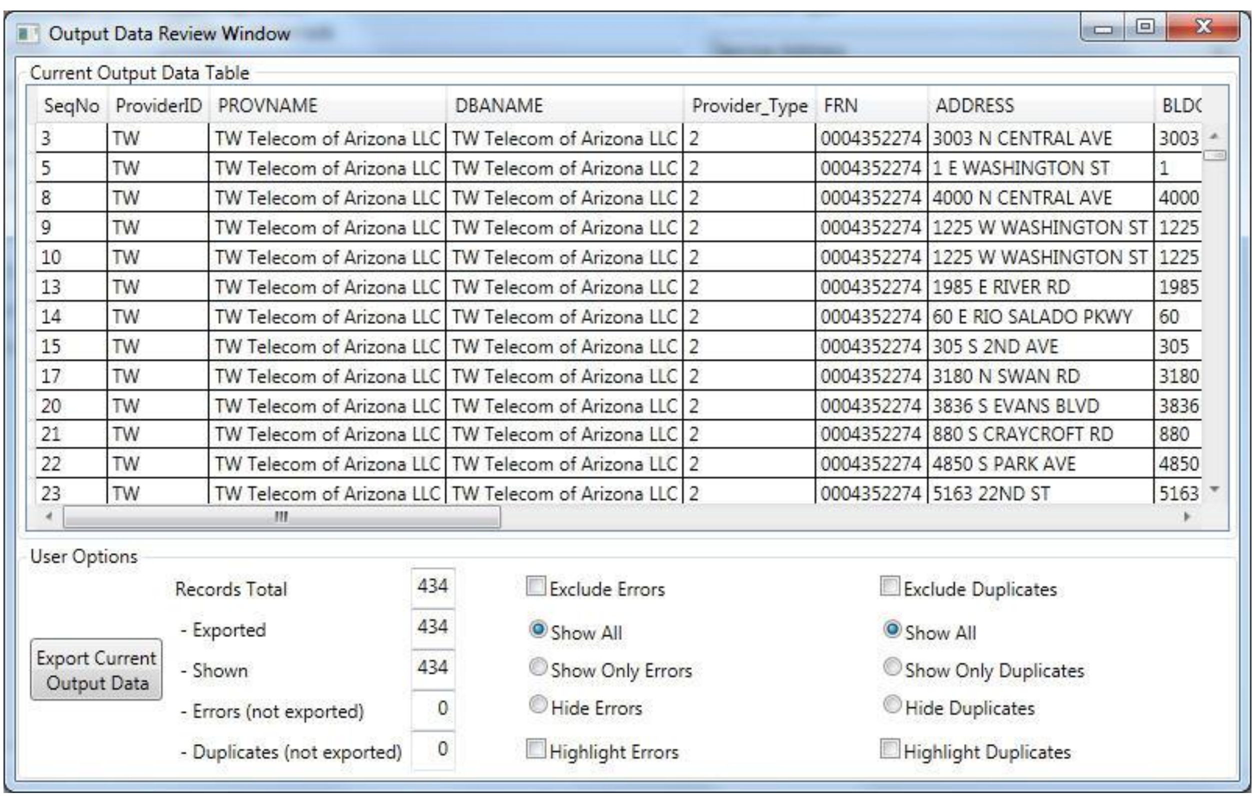
Key	Control	Description
		in the window. *Note: Clicking on the header column of the results table will sort the entries. Thus, by clicking on the Count header, you can sort the results by the Count value in ascending order. Clicking again will sort the values in descending order.*
3	Save button	Saves any changes made to the header row (column) names.
4	Display area	The area where the “Do Frequency Analysis” output (table) is shown when that menu option is selected.
5	Cancel Menu control	Click on the red x in the upper right corner of the “input Data Analysis Window” to dismiss it. *Note: no matter what you do in this window, the source Input File is not changed.*

Output Data Review button (Status Bar, "Output Data Review" button) – the "Output Data Review" button opens the "Output Data Review Window" which shows the results of applying [Processes] to the values in the Input Fields and [Rules] to the values in the Output Fields of a Submittal. This window offers information about the processed file and options to apply before exporting it to a text file.

Note: This window may be left open while other operations are performed in DIVA. The user may minimize the window or may click the "Output Data Review" button to "toggle" this window in and out of view.

Note: The user must explicitly close this window, by clicking the red "X" icon in the window's upper right, before selecting another Submittal. If it is left open, it will continue to display the originally selected Submittal's data, not the currently active Submittal's data.



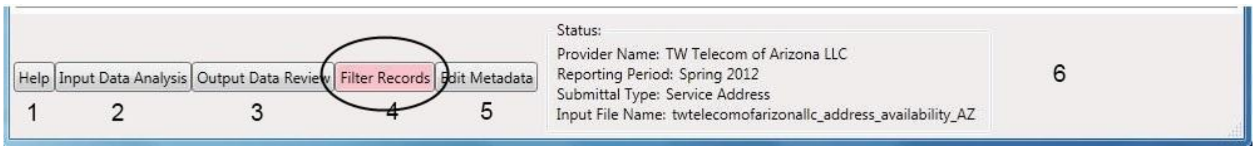


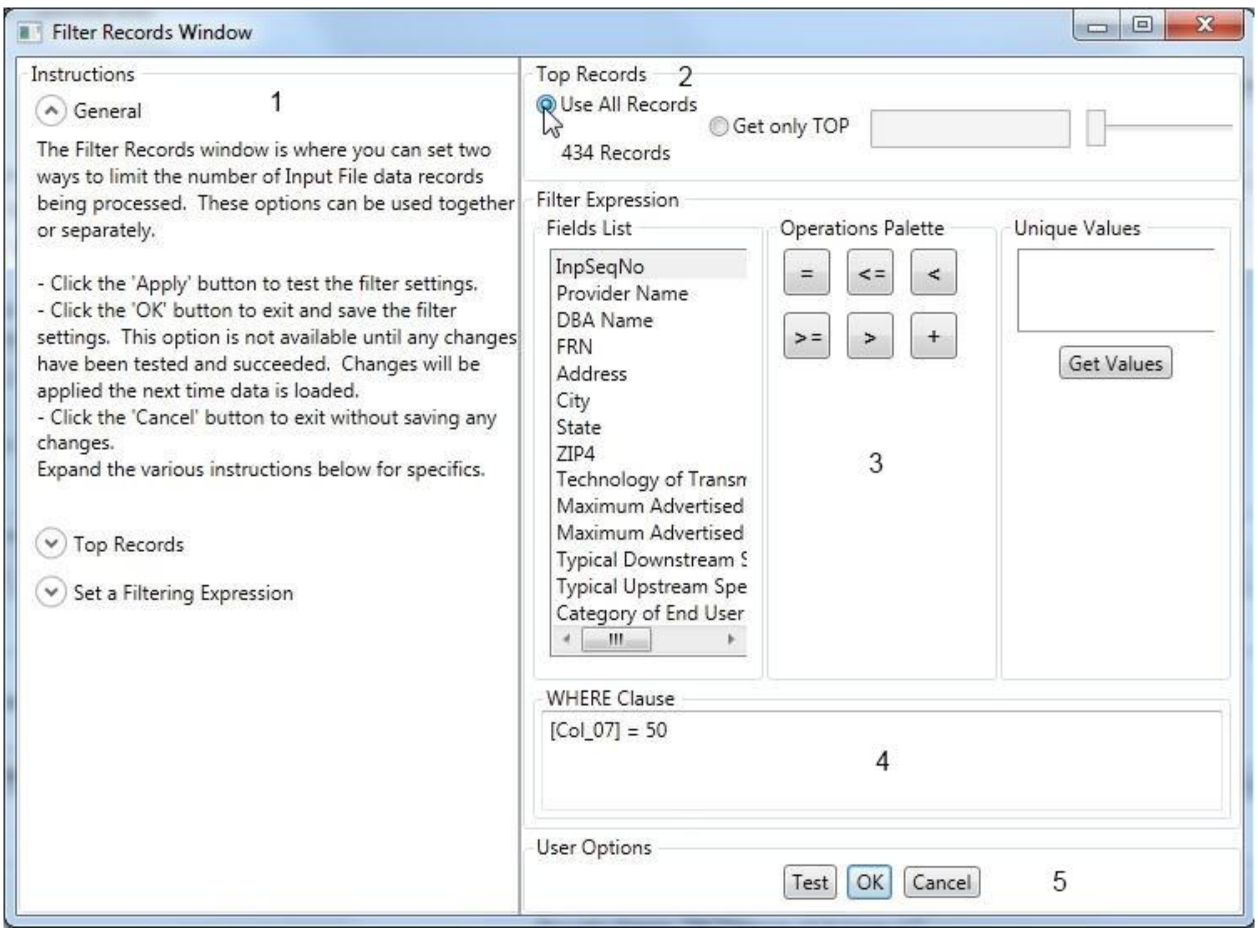
Key	Control	Description
1	Export Current Output Data button	Opens a dialog box where the user can specify the output location and file name for data that will be exported. Export only works on records visible in the “Current Output Data Table” control and only produces delimited text files.
2a	Records Total text box	Total records in the active Submittal. This number reflects any Filters the user has applied.
2b	Exported text box	The number of records that will be exported when the “Export Current Output Data” button is clicked.
2c	Shown text box	The number of records being displayed in the “Current Output Data Table” section of the window. This number reflects any errors or duplicates the user has chosen to exclude using the checkboxes in this area.
2d	Errors (not exported) text box	The number of records with an error that will not be exported. This number will differ from the Total Records, only if the user has checked the “Exclude Errors” box in the “Errors Column”.
2e	Duplicates (not exported) text box	The number of duplicate records that will not be exported. This number will differ from the Total Records, only if the user has checked the “Exclude Duplicate” box in the “Errors Column”.
3a	Exclude Errors checkbox	Check this box to exclude errors from the export file.
3b	Show All radio button	Show all records, including those with errors.
3c	Show Only Errors radio button	Show only records that have been flagged with an error.
3d	Hide Errors radio button	Show only records that have NOT been flagged with an error.
3e	Highlight Errors check box.	Check this box to highlight error rows so they can more easily be seen.
4a	Exclude	Check this box to exclude duplicate records from the export file.

Key	Control	Description
	Duplicates checkbox	
4b	Show All radio button	Show all records, including those with duplicates.
4c	Show Only Duplicates radio button	Show only records that have been flagged as duplicates.
4d	Hide Duplicates radio button	Show only records that have NOT been flagged as duplicates.
4e	Highlight Duplicates checkbox	Check this box to highlight duplicate rows so they can more easily be seen.

Note: Errors and duplicates are two separate concepts and mutually exclusive when displaying in this window. If a record is both a duplicate and an error, it will be flagged as an error first and will remain that way until the other rule violation(s) is/are fixed. Only then will its duplicate status be considered.

Filter Records Window (Status Bar, "Filter Records" button) – the "Filter Records" window allows users to define a subset of data contained in a Provider Input File for further processing. Filters affect how many records are loaded from a Provider's Input File as well as any data that has been loaded into DIVA using the Load button on the Submittals Tab. Filters do not change the input data in any way.





Key	Control	Description

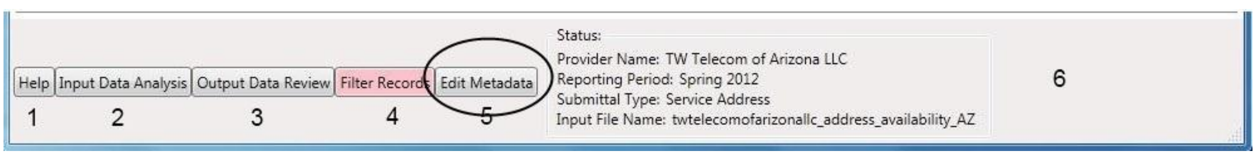
Key	Control	Description
1	Instruction panel	Instructions to guide users on how to understand and use Filters. Note: there is a “splitter” line between the Instructions and the rest of the window which can be dragged to change the amount of the window allocated to each panel. Dragging the line all the way to the left will completely hide the instructions, but the splitter line is still there so that the instructions may be redisplayed at any time.
2	Top Records Selection area	Filter by selecting the top N rows per user specification. Click the “Use All Records” radio button to use the entire data set. Click the “Get only TOP” radio button to set the number of records to be retrieved. Type the number of records to be retrieved into the text entry box next to this radio button OR use the slider bar control to adjust the record number. Note that this Filter can be applied before data is initially loaded. If that is the case, then the number of rows that may be user-specified is between 4,000 and 40,000 (DIVA has no way of knowing how many records are in the Provider’s data set at this time, so this is completely arbitrary). Setting this filter before data loading does not affect loading all of the Provider’s data; it merely affects how many of those records will be initially available for processing. After data loading, the number of records is limited to 10% to 60% of the total number of records. Note: setting a filter (clicking “OK”) has no immediate effect on the Submittal data currently loaded into DIVA for processing. The user must switch to another Submittal (or Input File of the current Submittal, if there is one) and then back to this Submittal (or Input File) for the filtering to take effect. Note: close the Input Data Analysis and / or Output Data Review Windows before re-loading the data to have them properly reflect the change.

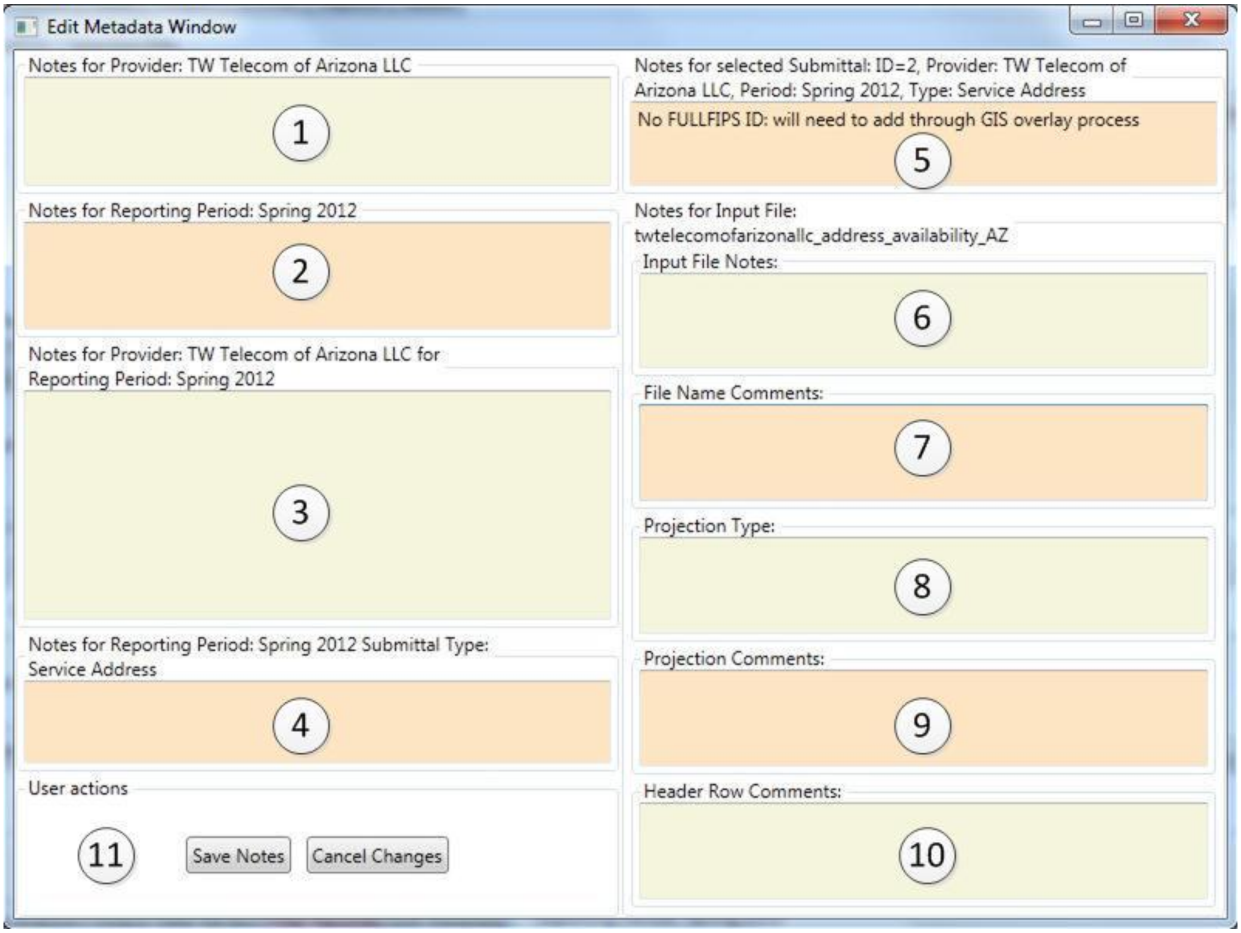
Key	Control	Description
3	Filter Expression area	Use the controls in this area to build an SQL “Where” Expression to filter records: a. A list of fields from the active Input File is presented on the left side in the “Fields List”. Double-clicking a displayed field name will add it to the “WHERE Clause” expression building panel. b. An “Operations Palette” is presented in the middle from which a user can select operators for the expression (e.g. less than). Clicking one of the buttons will add that operation to the “WHERE Clause” expression at the current insertion point. c. A “Unique Values” box is shown on the far right. A user may wish to see the unique values present in the field chosen from the “Fields List” to help build an expression. Clicking the “Get Values” button will retrieve a (sorted) list of unique values for the currently selected Field in the Fields List. d. The “WHERE Clause” area (see #4 below) shows the query expression as it is being built.
4	Where Clause area	This is the “Where Clause expression building panel. It is where the user can see the query expression being built. It is an area in which the user can also directly edit the query expression.
5	User Options	The “User Options” area is where the “WHERE Clause” filter expression is tested (“Test” button) and then accepted/applied (“OK” button) or canceled (“Cancel” button). **Expressions must be tested before they can be applied** (the “OK” button will not be activated until the expression is successfully tested).

Edit Metadata button (Status Bar, "Edit Metadata" button) – the Edit Metadata window provides a place for users to record notes about the active Provider (general comment), the active Reporting Period (general comment), the active Provider for the active Reporting Period (general comment), the active Period-Type (determined by the active Reporting Period / active Submittal Type combination; general comment), the active Submittal (specific comment) and / or the active Input File for the currently active Submittal (numerous specific comments).

To enter a comment about a Provider, for example, that Provider must be the active (selected) Provider. Thus the metadata targets in this window are dependent on the context of what is currently selected in the Submittals Tab. If there is no active Submittal, then the Submittal and Input File entry panels will be inaccessible.

Users can choose to save their work or cancel without saving any changes. The information entered into this form is available for viewing by re-opening this window or through one or more reports on the "Reports" tabbed dialog.





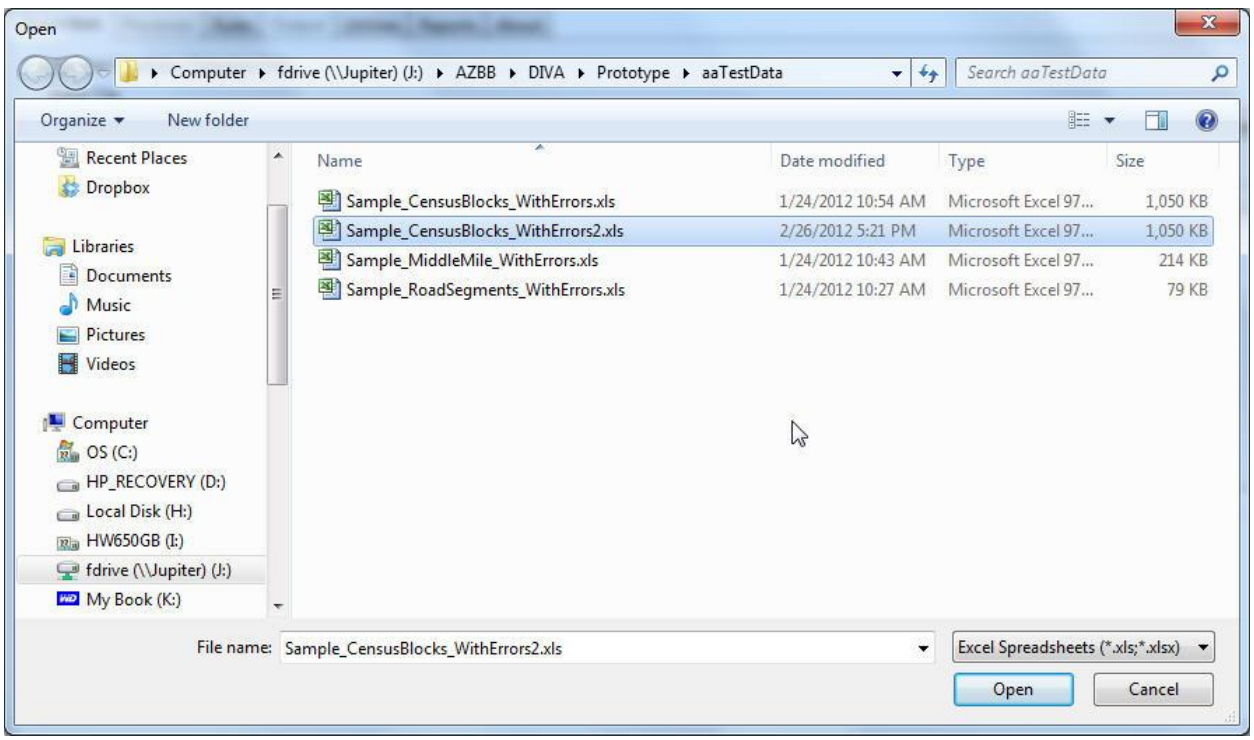
Key	Control	Description
1	Notes for Provider text box	Enter notes pertaining to the Provider (not specific to any Reporting Period or Submittal Type). For example, “Provider X generally submits data in CAD format and we need to contact them ahead of time to ask for shapefiles.” A comment in the Provider metadata panel will show up in all reports for that Provider, no matter what the Reporting Period is or what Submittal is selected for that Provider.
2	Notes for Reporting Period text box	Enter notes pertaining to the Reporting Period (not specific to any Provider or Submittal Type). For example, “In the Spring 2012 Reporting Period we began to send Verification Packages to all Providers even if they did not submit for that Period. We re-sent them a package from a previous Reporting Period.”

Key	Control	Description
3	Notes for Provider for Reporting Period text box	Enter notes for the selected Provider for the selected Reporting Period (not specific to any Submittal Type). Use this panel to record metadata that applies to a Provider for all data submitted during the Reporting Period. This is a good place to record general questions to follow-up with the Provider, as well as overall processing notes. A comment in this panel will show up in all Submittal and / or Input File related reports for that Provider / Reporting Period combination.
4	Notes for Reporting Period and Submittal Type text box	Use the Period-Type panel to record SBDD geodatabase-related metadata as this information will show up for every Submittal of that Period-Type for every Provider. This is a good place to record additional Rules that have been added for that Period-Type and why they were added.
5	Notes for selected Submittal text box	Enter notes specific to the active Submittal. For example, “No FULLFIPSID; we will have to obtain through overlay process.”
6	Notes for Input File text box	Enter notes specific to the Input File associated with the selected Submittal. For example, “The source file was not in column-row format and had to be transformed by TSSW using Excel.”
7	File Name Comments text box	Enter notes specific to the Input File’s data source file name. For example, “File Name indicates a Census Block delivery, but it really is an address submittal as well.”
8	Projection Type text box	Enter the projection. This only applies to shapefile submittals.
9	Projection Comments text box	Enter any comments about the projection. For example, “The Census Block shapefile was delivered in WGS 84 while the Roads were in UTM Zone 12.”
10	Header Row Comments text box	Enter any comments about the header row in the Provider delivery. For example, “No header row; TSSW had to guess as to which column mapped to the proper SBDD field.”
11	User Actions buttons	Click “Save Notes” to exit and save your changes. Click “Cancel Changes” to exit without saving edits.

Submittals Tab Functions

Select an Input File (Submittals Tab, "Input File" control, "Browse" button) – the "Browse" button opens a file-browser dialog which lets the user navigate to any area on their network to select an Input File for further processing.

Click on the Browse button located on the Input File control of the Submittals Tab and the Open file dialog appears



Key	Control	Description
1	Folder pane	Use the folder pane to browse to the folder on your system or network where the Provider source file is located.
2	File pane	Use the file pane to select the the Provider source file.

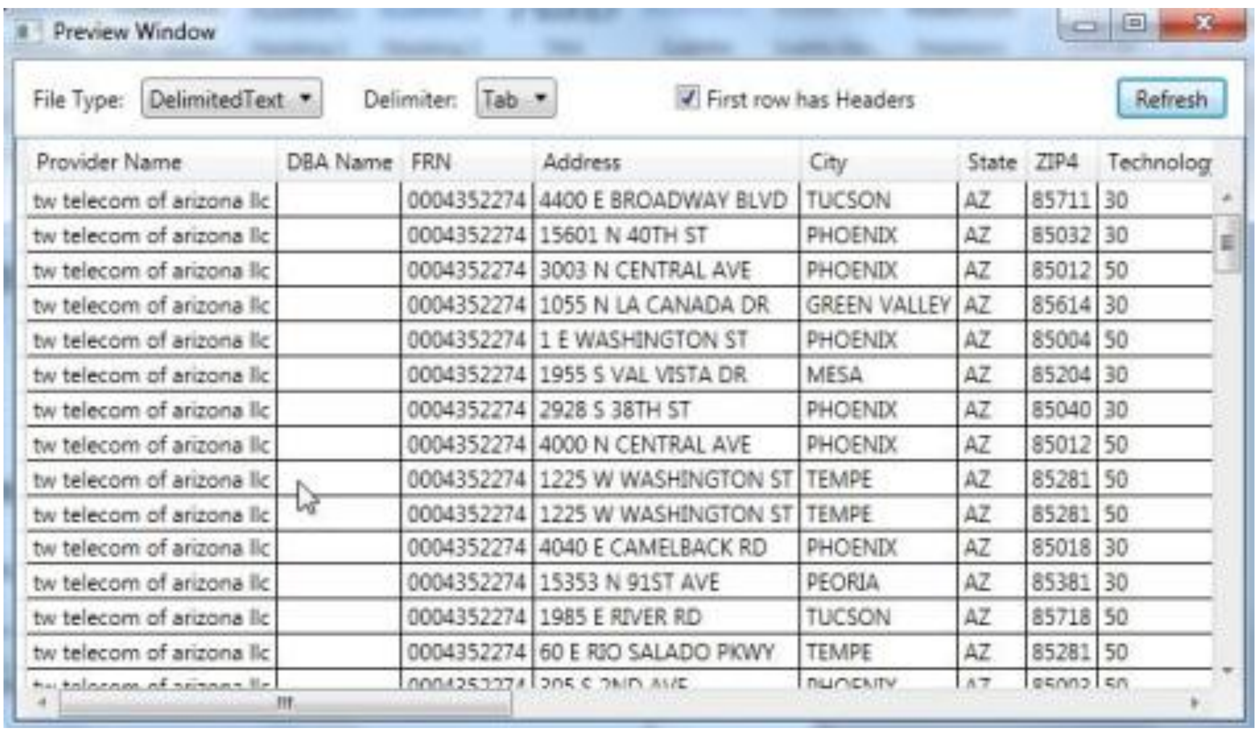
3	Filename text box	Displays the name of the selected file.
4	File Type Pull-down	Set the File Type pull-down to match the type of Input File for which you are browsing. Only delimited text, DBF and Excel file types are supported by DIVA.
5	User Option buttons	Click the "Open" button after selecting the desired file or double-click on the desired file to select it. The file-browse dialog is dismissed and the user is returned to the DIVA submittals tab, with the path and file name now showing in the Input File text box. Click the "Cancel" button to dismiss dialog without selecting a file.

Special Note on Processing Shapefiles

DIVA is not designed to process shapefiles. However, users can load the DBF portion of a shapefile, transform its data, and then join the output text file back to the original shapefile. Users cannot change record count from the source or the join operation will not be valid. See "Processing Shapefiles" for further details.

Preview an Input File (Submittals Tab, "Input File" control. "Preview" button) – the Preview Window is a common control called from a number of different places in DIVA. This is simply a preview function and neither affects the source file being previewed, nor loads the source data into DIVA. Its purpose is to let the user preview a source file prior to loading it into a DIVA table. If major problems are encountered, the user can then take appropriate steps to modify the source file, filter the number of in-coming records or to perform other tasks to ensure the Input File will be loaded into DIVA cleanly.

Click on the Preview button located on the Input File control of the Submittals Tab and the "Preview Window" opens. (Note: for performance reasons, this window only displays the first 100 records of the Provider's data set. This setting is not user-controllable).

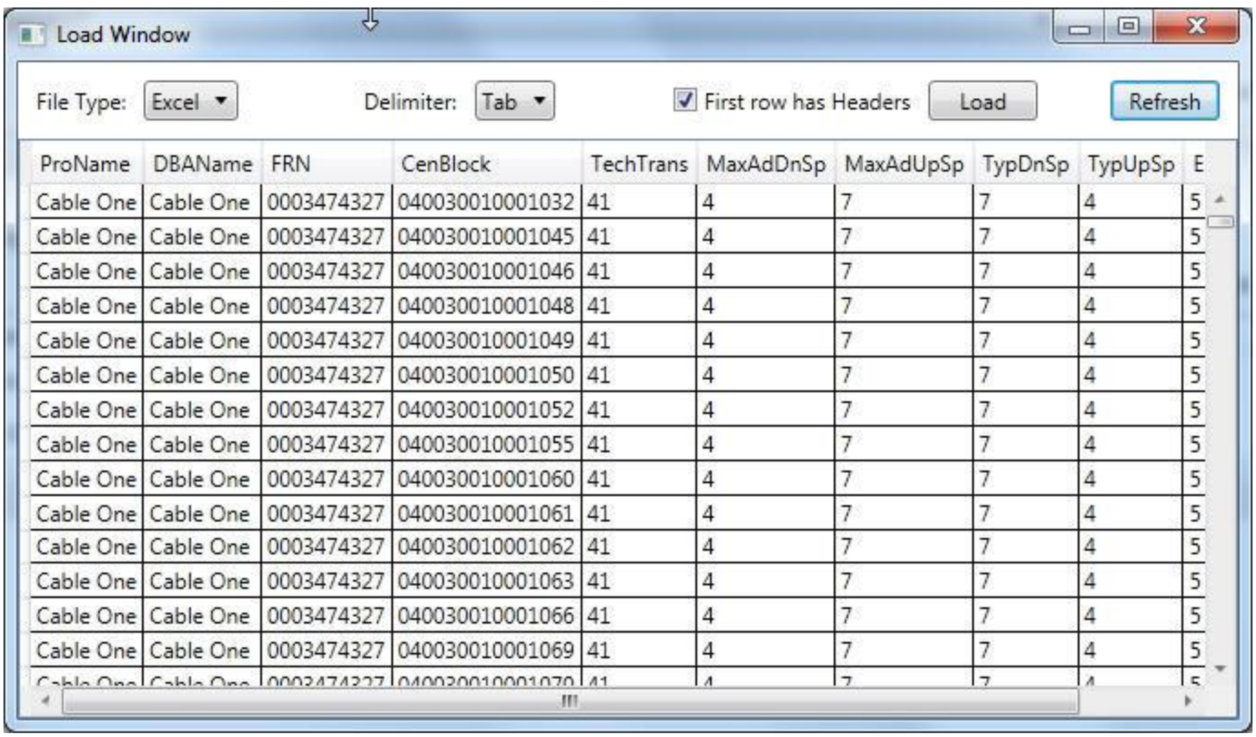


Key	Control	Description
1	File Type pull-down	Set the File Type pull-down to match the type of Input File for which you are browsing. Only delimited text, DBF and Excel file types are supported by DIVA.
2	Delimiter pull-down	If you are opening a delimited text file, then you must select the appropriate delimiter from this pull-down menu. When opening DBF or Excel files this option has no effect.

Key	Control	Description
3	First Row has Header checkbox	Click the “First Row Has Headers”, toggling the checkbox to match the structure of your Input File regarding the presence of a header row. If your file does not have a header row (column names), and this box is left unchecked, DIVA will name the columns in sequency (e.g., “Col01”, “Col02”, etc.)
4	Refresh button	Click this button to load the file or refresh that file display after making changes.
5	Column Headings	Double-click any column header to toggle the table sorting in ascending or descending order of values in that column.
6	Table Display area	This area displays the first 100 records of the source file. This display is a preview of how the file will look when you actually load the data.
7	Dismiss Window	The red “X” in the upper right corner is used to dismiss the “Preview Window”

Load an Input File (Submittals Tab, "Load Button") – the Load button copies in records from the current Input File into an internal DIVA table. This step is required before any further processing can be accomplished.

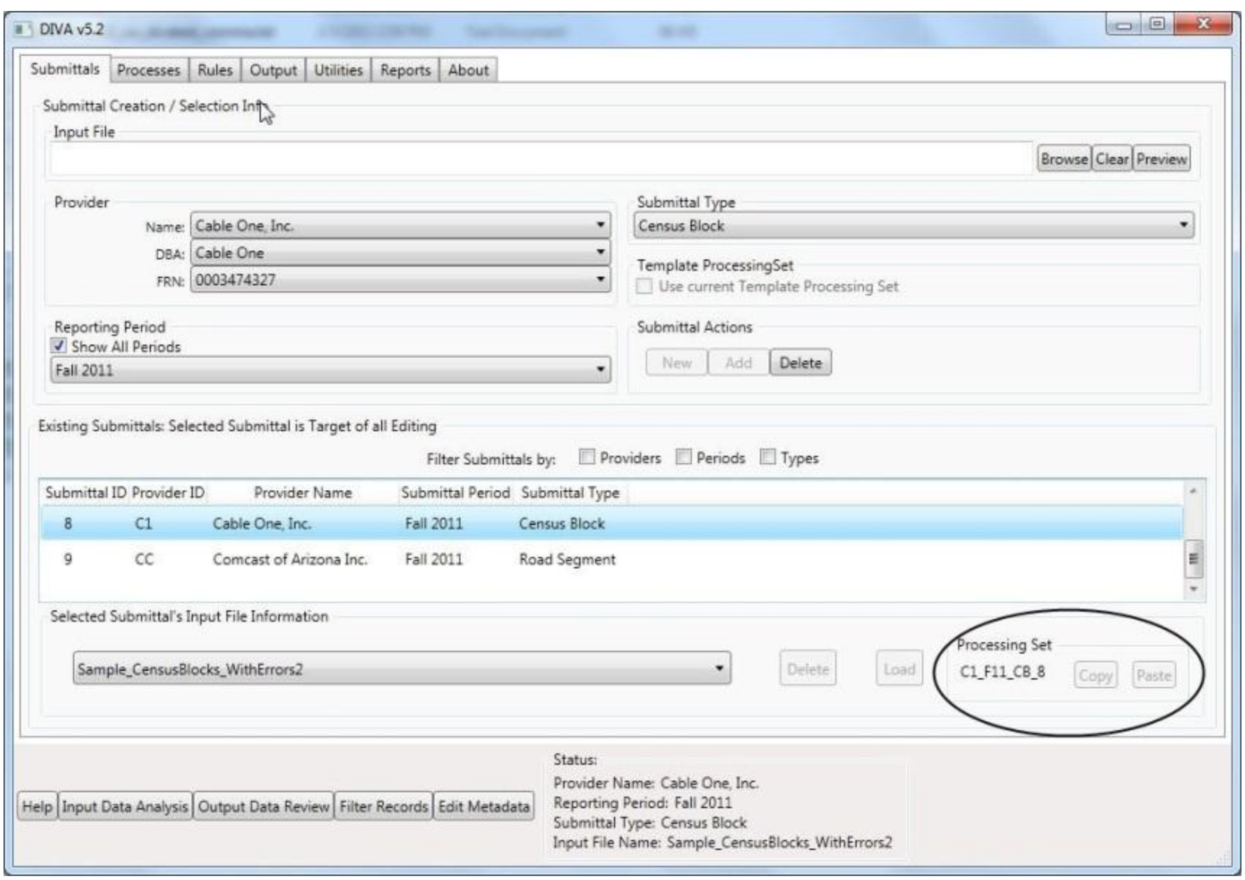
Click on the Load button on the Submittals tab and the Load Window opens. This dialog is very similar to the "Preview Window" previously discussed, but with the option to load the data into DIVA.



Key	Control	Description
1	File Type pull-down	Set the File Type pull-down to match the type of Input File for which you are browsing. Only delimited text, DBF and Excel file types are supported by DIVA.
2	Delimiter pull-down	If you are opening a delimited text file, then you must select the appropriate delimiter from this pull-down menu. When opening DBF or Excel files this option has no effect.

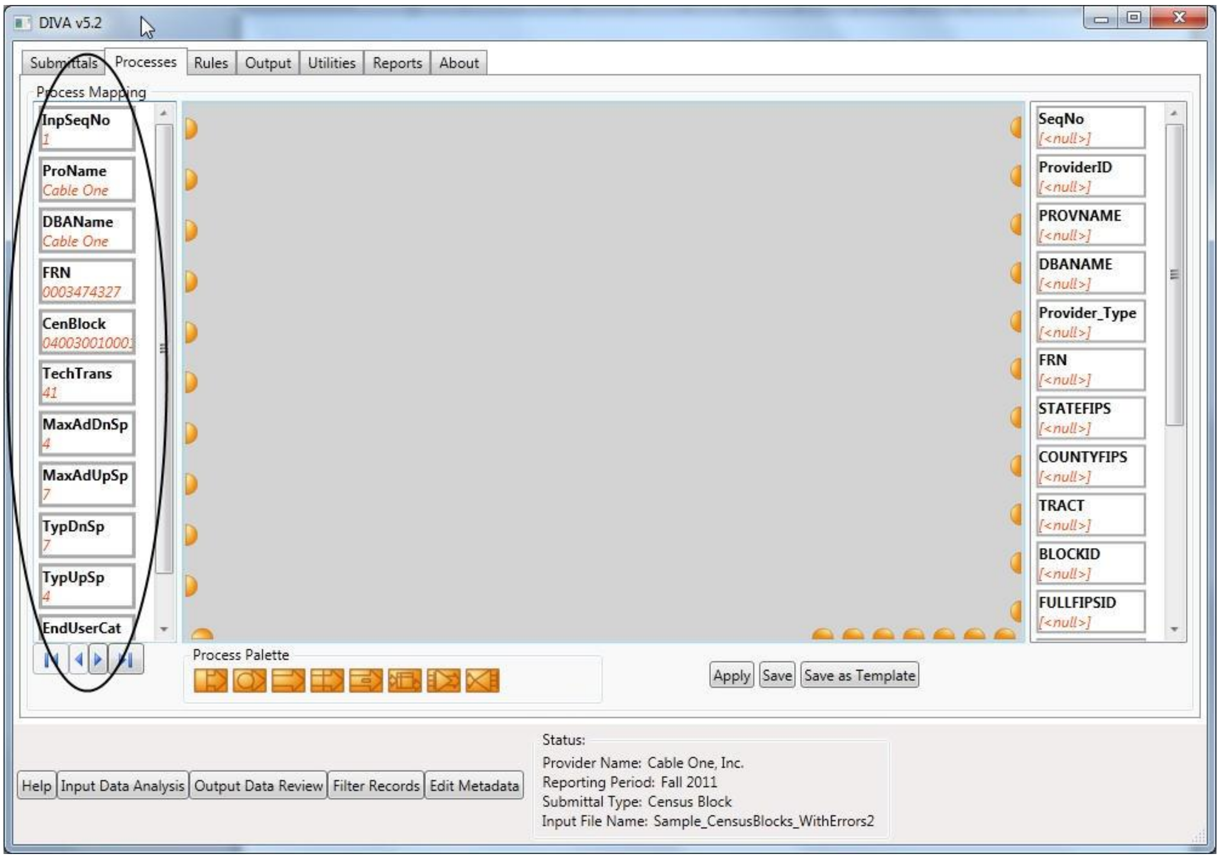
Key	Control	Description
3	First Row has Header checkbox	Click the “First Row Has Headers”, toggling the checkbox to match the structure of your Input File regarding the presence of a header row. If your file does not have a header row (column names), and this box is left unchecked, DIVA will name the columns in sequency (e.g., “Col01”, “Col02”, etc.)
4	Load button	Click this button to load the data into DIVA.
5	Refresh button	Click this button to load the file or refresh that file display after making changes.
6	Column Headings	Double-click any column header to toggle the table sorting in ascending or descending order of values in that column.
7	Table Display area	This area displays the first 100 records of the source file. This display is a preview of how the file will look when you actually load the data.
8	Dismiss Window	The red “X” in the upper right corner is used to dismiss the “Preview Window”

After the data is loaded you will see the name assigned to the Input File’s Processing Set in the “Processing Set” area of the Submittals tab.



Processes Tab Functions

Input Fields List (Processes Tab, list) – The list of Input Fields as read from the Provider Input File.



- Each “box” in the list represents one Input Field. The name assigned to that Field is shown in bold typeface and the value it has for the current Input File record is shown in red below it.

- If there was not a header row in the Input File, the Fields will be named “Col_00”, “Col_01”, etc.; if there was a header row, then the Field names will have the values obtained from that header row. In any case, the first Field will always be named “InpSeqNo”; it is the sequential “record number” that DIVA automatically creates and assigns during data loading so that the user can reliable cross-reference DIVA data with the original Provider’s data set information.

- The Input Field names in the list will reflect any changes a user may have made using the "Input Data Analysis" window. The user may also change the Input Field names here. Double clicking on the Input Field "box" will produce a dialog box where the existing name may be edited or replaced.

- If the Input Field list is longer than can be displayed on the screen, a scroll bar is shown and the half-connectors will arrange themselves along the bottom or top of the Process Canvas, depending on the position of the scroll bar. The User may use the scroll bar to the right of the Input Field List to see these hidden Input Fields, or make the DIVA window large enough to display all of them (which may not be possible if there are a large number of Input Fields).

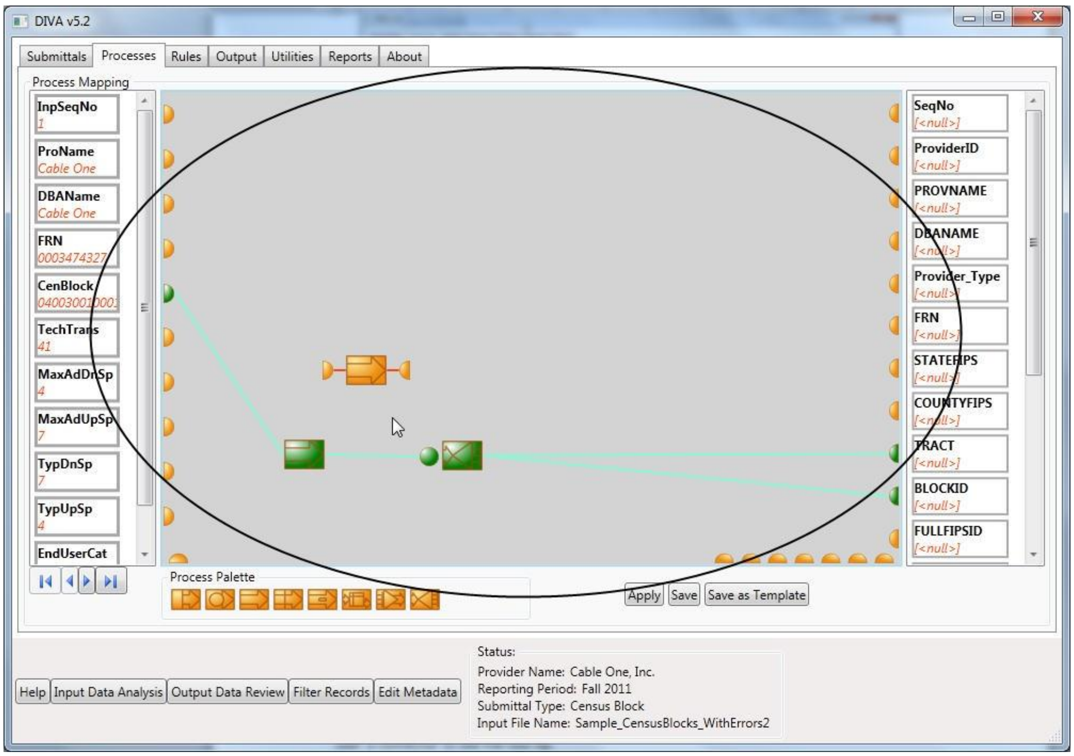
- The orange half-connectors along the left side of the Process Mapping Canvas correspond to the Input Field with which they are adjacent; they represent data "sources" and are used to connect (link) a Process with the Input Field. A data source (or input) is a half-circle with its arc to the right.

- The color of the connector will change depending on its status with regard to the "flow" of data. If data is "flowing" out of the (associated) Input Field, due to its connection to a Process, then the connector will turn green.

- The color of the connector will also change depending on its status as an "eligible" target when the user is dragging an Input Process Field. If it is "eligible" to have the Input Process Field dropped on it, then it will turn dark blue. If dropping the Input Process Field would result in a connection, then it will turn a light blue (as will the dragged Input Process Field).

- There is a "splitter" line separating the Input Fields List from the Process Mapping Canvas. Click and drag this line left, or right, to decrease, or increase, the displayed width of this list.

Process Mapping Canvas (Processes Tab, "Process Mapping Canvas") – The Process Mapping Canvas is where a user manipulates Processes and creates linkages (connections) between Input Fields and Output Fields. A Process is created by "dragging" a Process from the "Process Palette" and dropping it onto the "Process Mapping Canvas". Each Process will have Input Process Field(s) and / or Output Process Field(s) attached to it when created (the type and number depend on the particular Process). These Input / Output Process Field(s) are used to connect Processes with Input Fields and Output Fields or with other Processes through Process Fields.



In the example above, a Copy Process has been dragged and dropped onto the Process Mapping Canvas. The orange rectangle represents the Process, its Input Process Field is to its left (the half-circle with arc facing right) and its Output Process Field is to its right (the half-circle with the arc facing left); each of these is connected to the Process with a red connection line. The symbol shown in the Process' rectangle is a clue to what type of process it represents. The green colored Input Field (half-circle on the left side), Processes (rectangles), Process Field (circle) and Output Fields (half-circles on the right side) show data "flowing" from one data source to two data sinks. Note that the Process Field (the circle) is required to link two Processes together.

General Rules for using the Process Mapping Canvas

- A Process is created by "dragging" a Process from the "Process Palette" and dropping it onto the "Process Mapping Canvas".
    - In the case of Decomposition Processes, a dialog box will be displayed for the user to specify which type of Decomposition Process is to be created. Note that all Decomposition Processes have the same symbology; the user can identify the Decomposition Process from its "tool tip" (see below).

- A Process can be connected by dragging an Input or Output Process Field (shown as orange half-circles with a connecting red line) to an eligible target and dropping it there. Eligible targets are shown in dark blue when the user starts the dragging operation. Both the target and the dragged Field will turn light blue when they are eligible to be connected; dropping only has an effect when both are light blue (otherwise, the user is simply dropping the Field back on the canvas). The results of dropping on an "eligible target" depends on the nature of the target:

    - If an Input Process Field is dropped on a data source (an Input Field's connector), then the Input Process Field disappears and the connecting line attaches directly to the Input Field's connector. In addition, the Input Field's connector will turn dark green, the connecting line will turn light green, and the Process will turn dark green to indicate that data is now "flowing" from the data source.

    - If an Output Process Field is dropped on a data sink (an Output Field's connector), then the Output Process Field disappears and the connecting line attaches directly to the Output Field's connector. In addition, if the connecting line is light green (has data "flowing" into it), then the Output Field's connector will turn dark green.

    - If an Input Process Field is dropped on an Output Process Field (or vice versa), then both will disappear and be replaced by a Process Field represented by a small circle. The respective connecting lines will now connect to this Process Field. If the incoming connecting line is light green, then the Process Field will turn dark green and the outgoing connecting line will turn light green (these color changes will "flow" down the connectors, Processes, etc., until an end is reached).

    - An Input Process Field can be dropped on eligible Process Fields (circles). If a Process Field is eligible for a drop, then it will turn dark blue when the Input Process Field is being dragged (and light blue when a drop would result in a connection). Output Process Fields can never be dropped on a Process Field (it can have only one source of input data).

    - Only Input and Output Process Fields can be "dragged and dropped" to create data connections.

- Connected items turn from orange to dark green to give the user visual feedback that a proper connection has been made and data will flow between the green elements.

- Connectors (Input / Output Process Fields; half-circles), Process Fields (circles) and Processes (rectangles) can be selected and moved individually, or as a group by pointing and clicking for individual elements or dragging a box around multiple elements. The use of the control and shift keys as part of the selection process has the expected behavior of adding / removing items from the selection set. Elements in the selection set will have a "dotted line" shown around them.

- Processes can be connected in any allowed order to get the desired transformation of data (e.g., a string of simple decomposition processes may be required to decompose a complex string). DIVA will not permit creation of "circular" relationships; this is enforced by limiting eligible targets for dragged items.

- Processes cannot be connected directly to each other. Connections are always made to Fields (Input, Output or Process). You cannot drop a Process on anything (there are no eligible targets). You cannot drop a connector on a Process; it is never an eligible target.

- Data sources (when the half-circle arc is on the right) may have multiple connection lines running from them; that is, you may attach many connectors to a data source. Data sources can feed many Processes.

- Data sinks (when the half-circle is on the left) can have only one connection line running into it; it can receive data from only one source.

- Process Fields (circles) are the only way to connect two Processes. The Process Field is always a data sink (half-circle on the left) because it is receiving data from some Process. It is always a data source (half-circle on the right) because it is providing data to some Process. **A Process Field can only exist between two Processes;** they are only needed when Processes need to be connected to each other. They are automatically created when an Input Process Field is dropped on an Output Process Field (or vice versa).

- Processes can be disconnected by right-clicking on a Field (an Input, Process, or Output) and choosing "Detach" from the context menu. If there are multiple connections (i.e., multiple connection lines) on the Field, then <u>all</u> are disconnected (detached).

- Process can be deleted by selecting and then pressing the "Del" (delete) key or selecting "Delete" from the right-click context menu. Only Processes can be deleted. Multiple Processes can be deleted at one time by selecting several at once. Deleting a Process has no effect on Input Fields or Output Fields (you cannot delete these), although it may disconnect them from data "flow".

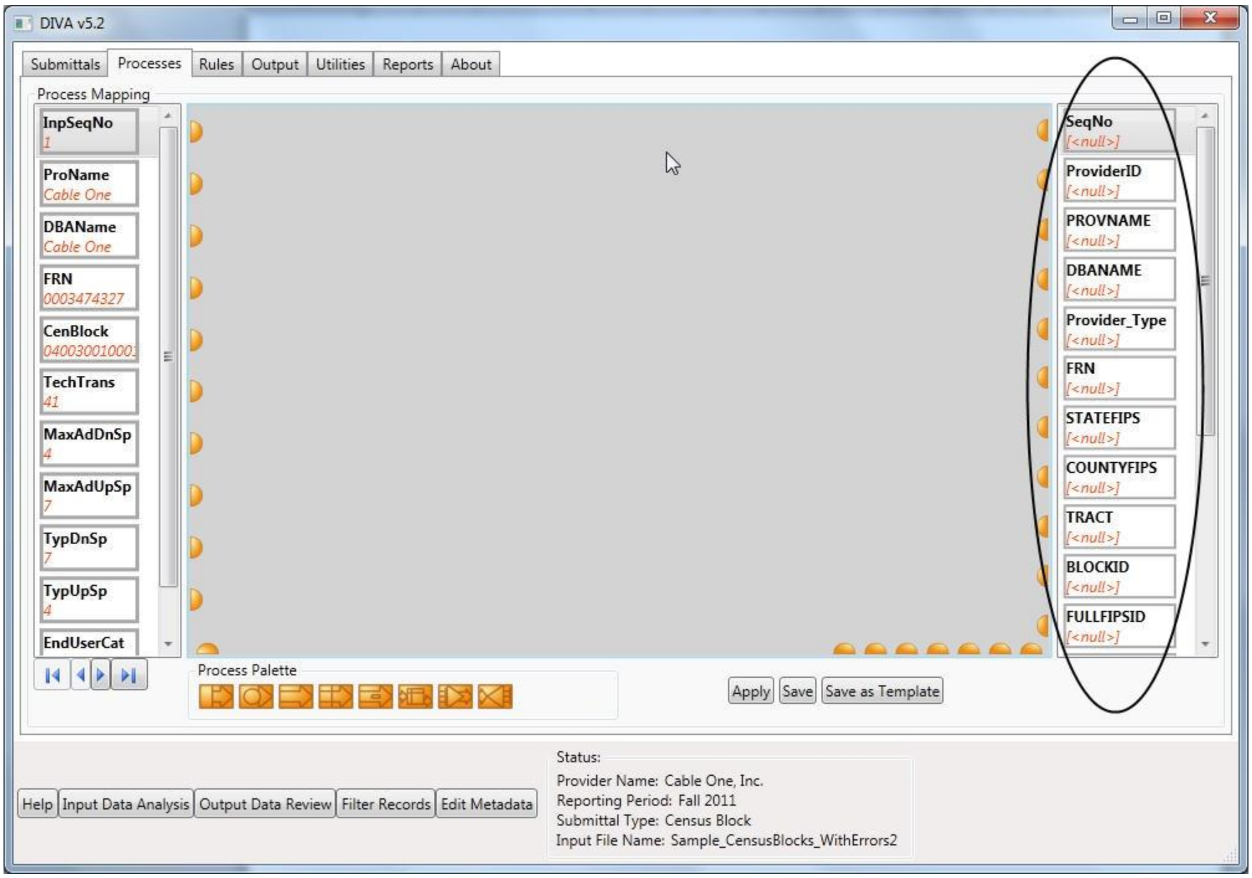
- Processes have a varying number of Input Process Fields (half-circle on the right) and Output Process Fields (half-circle on the left). Some Processes (Constant Value and Provider Value) have no Input Process Fields in which case they serve as a data source themselves. The Composition Process allows for the addition (and removal) of Input Process Fields, but the user can never reduce this below the minimum number of two.

- All Processes have at least one Output Process Field; Decomposition Processes have several (one for each decomposition “part”). All Processes, except Decomposition Processes, allow for the addition (and removal) of Output Process Fields, but the user can never reduce their number below one.

- Some Processes require the user to do some configuration before they have any effect. Configuration is done by double-clicking on the Process. A dialog box specific to that Process will then be displayed. Some Processes (Copy, Copy With Default) have no configuration options; double-clicking on these has no effect.

- “Tool tips” (pop-up text) are available to help users understand how to connect Processes. Just place the mouse (“hover”) over a connector or a Process to see the tool tip.

Output Fields List (Processes Tab, list) – The list of Output Fields as read from the SBDD geodatabase schema for the current Reporting Period and Submittal Type (Period-Type).



- Each “box” in the list represents one Output Field. The name assigned to that Field is shown in bold typeface and the value it has for the current Input File record, as transformed by the Processes, is shown in red below it. In the illustration above, no Processes have been defined; therefore all values in the Output Fields are null.

- The user can see the effect of the assigned Processes on data transformation by examining these values. The values can be changed by adjusting the Processes as needed.

- The name assigned to each Output Field in this list is not editable; they come from the SBDD geodatabase and are the NTIA-approved field names (or, in the case of DIVA-related Output Fields, from the standard field names assigned by the DIVA design team).

- The orange half-connectors along the side of the Process Mapping Canvas correspond to the Output Field with which they are adjacent; they represent data "sinks" and are used to connect (link) a Process with the Output Field. A data sink (or output) is a half-circle with its arc to the left. Unlike Input Fields, Output Fields cannot have more than one connection to Processes. It is likely that one to several Output Fields will have no connections as the data is not present in the Input File and cannot be filled in using one of the Processes that generates values (i.e., Provider Value Process).

- If the Output Field list is longer than can be displayed on the screen (i.e., a scroll bar is shown), then these orange half-connectors will arrange themselves along the bottom (or top, depending on the position of the scroll bar). The User may use the scroll bar to the right of the Output Field List to see these hidden Output Fields, or make the DIVA window large enough to display them all of them (which may not be possible if there are enough Output Fields).

- The color of the connector will change depending on its status with regard to the "flow" of data. If data is "flowing" into the (associated) Output Field, due to its connection to a Process, then the connector will turn green.

- The color of the connector will also change depending on its status as an "eligible" target when the user is dragging an Output Process Field. If it is "eligible" to have the Output Process Field dropped on it, then it will turn dark blue. If dropping the Output Process Field would result in a connection, then it will turn a light blue (as will the dragged Output Process Field).

- The area below the Output Fields List is used to display any "Row" Processes that may exist.

- There is a "splitter" line separating the Output Fields List from the Process Mapping Canvas. Click and drag this line left, or right, to increase, or decrease, the displayed width of this list.

Constant Value Process (Processes Tab, Process Palette) – Used to create a user-defined constant value. This Process is useful when there is no Input Field to provide data for a required Output Field. A good example of this is the numeric code for End User required in recent versions of the SBDD geodatabase. It is rare that a Provider submits this value and the Constant Value Process can be used to put in the appropriate value (e.g. a "5" representing "Other"), when a user does not have any other information.

Action	Result
Drag and drop the Constant Value Process onto the Process Canvas from the Process Palette	The control appears on the canvas and is ready to be configured. By default, it will have one Output Process Field; others may be added. It will never have an Input Process Field as it serves as its own data source.
Double-click the Constant Value Process	A configuration dialog box is opened. The user types in a value and specifies the value's type (e.g. string). Right-click the Constant Value Process on the Process Mapping Canvas	May add or remove outputs. The constant value can be sent to one or more Output Fields or Processes. 
Provider Value Process (Processes Tab, Process Palette) – Used to create a constant value based on a specific Provider attribute. This Process is useful to ensure that values for Provider ID, Provider Name, DBA Name, FRN and Provider Type (Output Fields required by most Period-Types) are standardized from a table imported into DIVA

Action	Result
Drag and drop the Provider Value Process onto the Process Mapping Canvas from the Process Palette	The control appears on the canvas and is ready to be configured. By default, it will have one Output Process Field; others may be added. The Process box will be orange, until the user configures its properties.
Double-click the Provider Value Process	A configuration dialog box opens which allows the user to select the field in the Provider Information Table for the active Provider that will populate the Output Field. Right-click the Provider Value Process on the Process Mapping Canvas	May add or remove outputs. The constant value can be sent to one or more Output Fields or Processes. The number can never be reduced below one. This means that a single Provider value can be directed to one or more Output Fields and/or Processes. 
Copy Process (Processes Tab, Process Palette) – this Process populates an Output Field or Process by copying the value of the Input Field or Process.

Action	Result
Drag the Copy Process onto the Process Mapping Canvas	The control appears on the canvas and is ready to be configured. It will be orange, until the user connects its input side to an Input Field or another Process and its output side to an Output Field or another Process.
Double-click the Copy Process	Note that there is no configuration dialog for this Process. Just drag, drop and connect. No transformative process is applied other than to cast the Provider value into the field type of the Output Field
Right-click the Copy Process on the Process Mapping Canvas	May add or delete outputs. 
Copy with Default Process (Processes Tab, Process Palette) – this Process populates an Output Field or Process with a default value as defined in the active SBDD database, where the input values are either null or blank.

Action	Result
Drag the Copy with Default Process onto the Process Mapping Canvas	The control appears on the canvas and is ready to be configured
Double-click the Copy with Default Process	Note that there is no configuration dialog for this Process. The value is determined by the default value contained in the SBDD geodatabase.
Right-click the Copy with Default Process on the Process Mapping Canvas	Note that no configuration options are available for this Process. The User cannot specify multiple input or output fields.

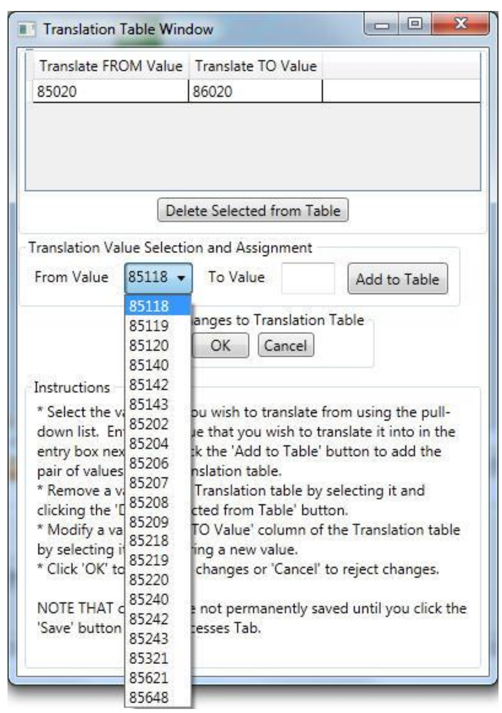
Make Negative Process (Processes Tab, Process Palette) – this Process inverses the sign of the value coming from a Input Field or Process.

Action	Result
Drag the Make Negative Process onto the Process Mapping Canvas	The control appears on the canvas and is ready to be configured.
Double-click the Make Negative Process	Note that there is no configuration dialog for this Process.
Right-click the Make Negative Process on the Process Mapping Canvas	Add or remove an output connection. 
Translation Process (Processes Tab, Process Palette) – this Process is used to translate one or more values from an Input Field or Process into another value in the Output Field.

<table>
<tr><th>Action</th><th>Result</th></tr>
<tr><td>Drag the Translation Process onto the Process Mapping Canvas</td><td>The control appears on the canvas and is ready to be configured.</td></tr>
<tr><td>Double-click the Translation Process</td><td>

A configuration dialog window opens which allows the user to map values from the data source (either an Input Field or a Process Field) to new values in the data sink (either an Output Field or a Process Field).

In the illustration below the value of “85020” is mapped to “86020” and is shown in the top part of the “Translate Table Window”.



The unique list of values shown in the “From Value” pull-down list comes from the data source (the Input Field or Process Field) to which the Translate Process is attached.

Input values are mapped by typing a new value into the “To Value” text box and then clicking the “Add to Table” button. The user must click the “OK” button in the “Save

</td></tr>
</table>

	Changes to Translation Table" area or click "Cancel" to exit without saving changes since the last Save. Values which are <u>not</u> translated are simply copied from the data source to data sink.
Right-click the Translation Process on the Process Mapping Canvas	Add or remove an output connection. 
Composition Process (Processes Tab, Process Palette) – this Process is used to combine values from two or more Input Fields or Processes into a single Output Field.

Action	Result
Drag the Composition Process onto the Process Mapping Canvas	The control appears on the canvas and is ready to be configured. By default, two input connectors are provided, but more can be added (see below) Double-click the Composition Process	A configuration dialog opens which allows the user to specify a separator value to be placed between the appended Input Field values. Right-click the Composition Process	Add or remove both input and output connections. 
Decomposition Process (Processes Tab, Process Palette) – this Process is used to parse values from a single Input Field or Process into two or more Output Fields or Processes.

Action	Result
Drag the Decomposition Process onto the Process Mapping Canvas and choose the decomposition type.	A dialog appears on the canvas and asks the user to specify the type of Decomposition Process to use:  **Census Block** – Decomposes a full census block ID into its four component parts (State, County, Tract and Block). There are one input and four output connectors provided. This is fixed and cannot be changed from the context menu. Tool Tips on the output connectors guide user as to which of the four parts of a full Census ID it should be connected. **Full Address** –The full address decomposition process is not active at the current release. **Simple** – Parses a string into two parts based on a user-defined symbol (e.g. a space). There are one input and two output connectors provided. This is fixed and cannot be changed from the context menu. Multiple parsing can be accomplished by chaining multiple simple decomposition Processes together. **Zip Code** – Parses a nine-digit zip code string into a five-part and four-part string. There are one input and two output connectors provided. This is fixed and cannot be changed from the context menu.

Double-click the Decomposition Process	**Simple** – Only the Simple decomposition type has a configurable dialog. Type the character on which the string will be parsed into the "Symbol Value" text box. The current value is displayed immediately below. Right-click the Decomposition Process	None of the decomposition process types are configurable from the context menu

Saving a Template Processing Set (Processes Tab) – the "Save as Template" button saves the active Processing Set to a Template Processing set, overwriting any pre-existing set for the current Period-Type. No GUI is involved, but there are some things to be aware of regarding these templates.

Doesn't make sense to copy between Reporting Periods due to potential changes in Output Fields. That is why this option only works within a single Reporting Period

Users can choose which set of Processes to apply within the same Reporting Period. This can be done in one of two ways. A Template Processing Set can be applied when a new Input File is created or it can be copied and pasted from an existing Processing Set to another Processing Set at any time. The workflow for each is listed below:

Applying to a New Submittal

[HW: write this up and include screen dump(s)]

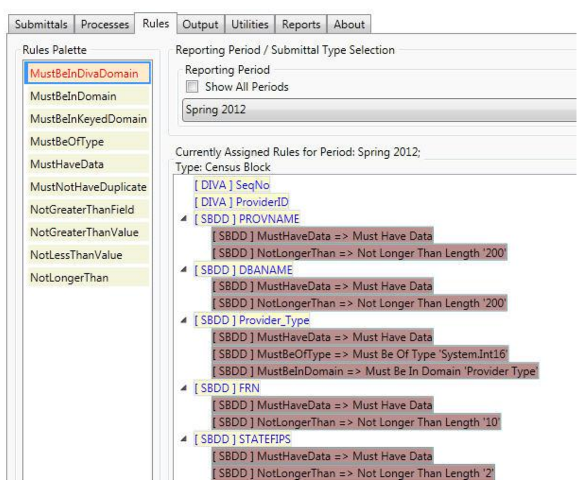
Copying and Pasting a Template Processing Set

[HW: write this up and include screen dump(s)]

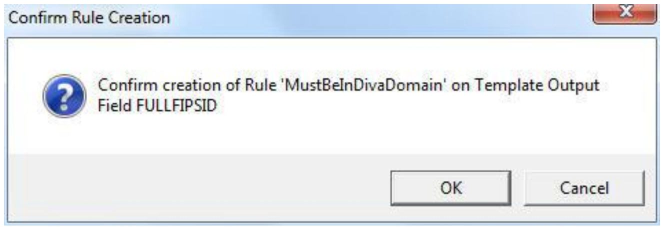
Rules Tab Functions

Using the Rules Palette Area (Rules Tab, "Rules Palette" control) – A list of Rule types that can be applied to the Template Output Fields by dragging and dropping them onto the Template Output Fields shown in the "Rule Summary Area".

- As the user clicks on each rule type in the Rules Palette, the Output Fields that can accept that rule type are highlighted in blue.



- When the Rule is dropped on a valid Output Field, the user is prompted whether this is what should be done. Click "OK" or "Cancel".



- Rules can be removed from an output field by right-clicking and selecting “Delete”. This includes Rules imported from the SBBD database. Be careful, there is no “Undo”.

- Following is a summary of each rule type. More detailed information on how to configure each rule can be found by clicking on the hyperlinks.

  - Must Be In Diva Domain – The value in the Output Field must be in a DIVA domain.

  - Must Be In Domain – The value in the Output Field must be in an SBDD-defined domain.

  - Must Be In Keyed Domain – The value in the Output Field must be in an SBDD-defined keyed domain.

  - Must Be Of Type – The value in the Output Field must be of a certain type. This rule type applies only to numeric fields.

  - Must Have Data – The value in the Output Field must not be empty strings or null values. There must be a value present.

  - Must Not Have Duplicate – The value in the Output Field must not result in a duplicate row.

  - Not Greater Than Field – The value in the Output Field must not be greater than the value of those in another user-specified Output Field.

  - Not Greater Than Value – The value in the Output Field must not be greater than a user-specified value.

  - Not Longer Than – The value in the Output Field must not exceed a user-defined number of characters. This rule type applies only to character fields, not numeric fields.

Using the Currently Assigned Rules Area (Rules Tab, "Rules Palette" control) – A display of the Rules assigned to each Template Output Field of a Submittal, as well as a place to drag and drop new Rules onto Template Output Fields, configure existing Rules, or remove Rules. As discussed in the introduction to the Rules tab, this area is used to assign or remove rules from the Template Output Fields and therefore any change you make here now apply to any Submittal that uses the same Template Output Field. Therefore, if a user makes changes here, they should re-run previous Submittals again to see how the new rule applies to them.

- At a minimum, the Rules for the Output Fields of a Submittal's Input File will be those imported from the SBDD geodatabase. Remember that these will be stored on the Template Output Fields, so they will automatically apply to all Output Fields for that Period-Type. Additional Rules may be assigned by dragging a rule type from the "Rules Palette" and dropping it on a Template Output Field.

- There are some restrictions on which Rule types may be placed on which Template Output Fields. For example, a Rule type that only works with character (string) field cannot be dropped on a numeric field. If a Rule from the palette is valid for a given Template Output Field, the cursor will change to a small box with an arrow as the user drags it over the Output Field Name. Otherwise, the cursor will display as a circle with a bar through it. In addition, at the start of the "drag" operation, all eligible target Template Output Fields will change color to indicate that they will accept the Rule "drop".

- There are also some restrictions, depending on the Rule, as to the number of the Rules that can be assigned to a Template Output Field. For example, the "Must Have Data" Rule can only be assigned to each Template Output Field one time. If a Rule has been dragged from the palette and there are no eligible targets, a dialog box will inform the user of that fact and the Rule will be made inaccessible.

- By default the rules are collapsed and all that shows in the "Currently Assigned Rules" area are the Template Output Fields for the Submittal. Rules can be viewed for a given Template Output Field by double-clicking the field name. All the fields can be expanded to show their rules by double clicking the top-most Template Output Field in the list. Double-clicking again will collapse the expanded nodes and open the collapsed nodes.

- Rules may be deleted from a Template Output Field by right-clicking on the rule and selecting the "Delete" option, or by clicking on the Rule (selecting it) and then pressing the "Del" (delete) key.

- The MustNotHaveDuplicate Rule can only be applied once. After it is applied, that Rule choice will be greyed out in the palette.

- If any Rule no longer has eligible targets, that Rule will be de-activated (greyed out) in the palette. To re-activate it, you must delete at least one occurrence of that Rule.

MustBeInDIVADomain Rule (Rules Tab, "Rules Palette" control) – allows users to apply their own domains to Output Field values. These domains are called "DIVA Domains" to distinguish them from the domains imported from the SBDD geodatabase.

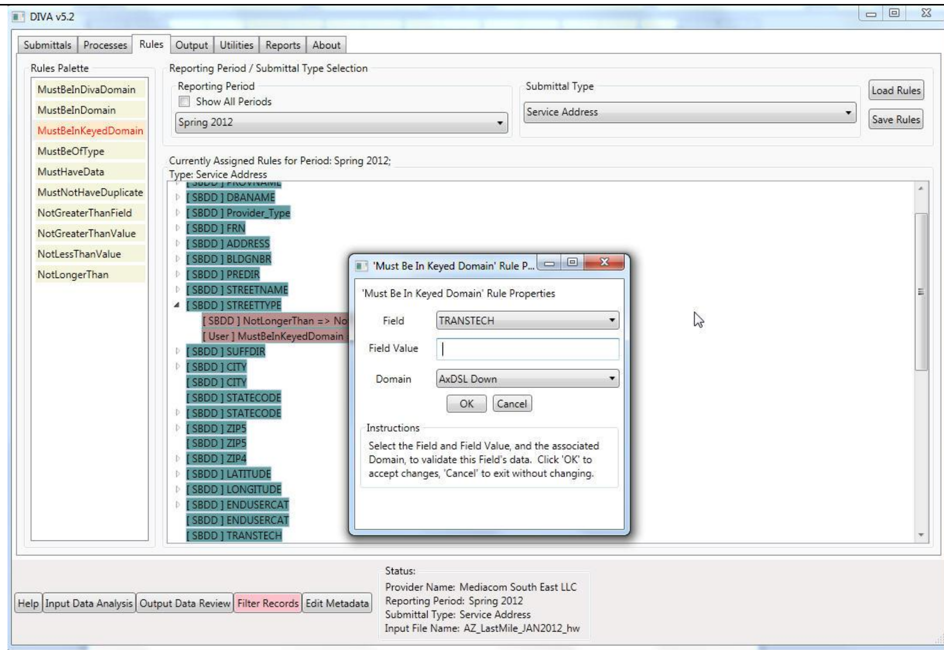
Action	Result
Import one or more domains from the "Utilities" tab.	A domain table must be imported into DIVA before it will be available to be used in a Diva Domain rule. This procedure is documented in the "Manage DIVA Domains" section of this User Manual.
Drag and drop the Rule onto the target field	When the "drag" of a Rule is initiated from the Rules Palette, the acceptable Template Output Field targets will change color. As noted, DIVA has certain restrictions on the number and types of Rules that can be assigned to various Template Output Fields.
Double-click the Rule under the Output Field to Configure	 • When the Rule is first placed under an Output Field, the text "UNDEFINED" will appear next to it. This means the user must configure the rule before it can be applied. • Select the imported domain from the "DIVA Domain Table" pull-down. • Select the field in the imported domain table that has the domain value from the "Validating Column" pull-down. • Optionally select an additional Template Output Field and a validating column from this DIVA Domain table; this allows the user to check the validity of two Template Output Fields against the same table (e.g. check both Census Block ID and Census Block area values simultaneously). • Click "OK" to apply the domain, or "Cancel" to exit without applying the domain.

MustBeInDomain Rule (Rules Tab, “Rules Palette” control) – allows users to apply an SBDD-generated domain to Output Field values. These domains are called “Domains” to distinguish them from the “DIVA Domains” imported by users from local source tables. This rule type allows users to apply any existing SBDD Domain to any compatible Output Field, whether it makes sense or not. It is likely this rule type will not be applied very often, if at all, but it is another tool DIVA users have to help validate Provider data.

<table>
<tr><th>Action</th><th>Result</th></tr>
<tr><td>Drag and drop the Rule onto the target field</td><td>When the “drag” of a Rule is initiated from the Rules Palette, the acceptable Template Output Field targets will change color. As noted, DIVA has certain restrictions on the number and types of Rules that can be assigned to various Template Output Fields.</td></tr>
<tr><td>Double-click the Rule under the Output Field to Configure</td><td>
- When the Rule is first placed under an Output Field, the text “UNDEFINED” will appear next to it. This means the user must configure the rule before it can be applied.
- Select the SBDD domain from the “Domain” pull-down.
- Click “OK” to apply the domain, or “Cancel” to exit without applying the domain.</td></tr>
</table>

MustBeInKeyedDomain Rule (Rules Tab, "Rules Palette" control) – allows users to apply an SBDD-generated Keyed Domain to Output Field values. These domains are called "Domains" to distinguish them from the "DIVA Domains" imported by users from local source tables. This rule type allows users to apply any existing SBDD Keyed Domain to any compatible Output Field, whether it makes sense or not. It is likely this rule type will not be applied very often, if at all, but it is another tool DIVA users have to help validate Provider data.

<table>
<tr><th>Action</th><th>Result</th></tr>
<tr><td>Drag and drop the Rule onto the target field</td><td>When the "drag" of a Rule is initiated from the Rules Palette, the acceptable Template Output Field targets will change color. As noted, DIVA has certain restrictions on the number and types of Rules that can be assigned to various Template Output Fields.</td></tr>
<tr><td>Double-click the Rule under the Output Field to Configure</td><td>



- When the Rule is first placed under an Output Field, the text "UNDEFINED" will appear next to it. This means the user must configure the rule before it can be applied.
- Double-click the Rule to open the configuration dialog
- Select the Output Field containing the key value which will be used to look up the appropriate values in the Domain
- Type in a key value found in the Output Field which will be used to look up the appropriate values in the Doman
- Select the appropriate SBDD Domain from the "Domain" pull-down.
- Click "OK" to apply the domain, or "Cancel" to exit without applying the domain.

</td></tr>
</table>

MustBeOfType Rule (Rules Tab, "Rules Palette" control) – allows users to check the Output Field value type. This rule is only valid for numeric Output Fields.

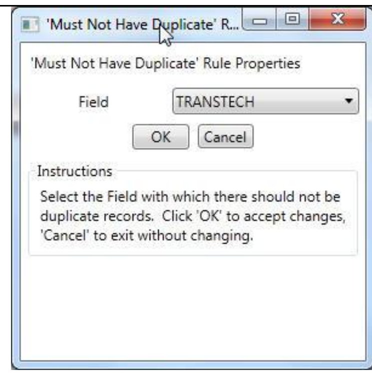
Action	Result
Drag and drop the Rule onto the target field	When the "drag" of a Rule is initiated from the Rules Palette, the acceptable Template Output Field targets will change color. As noted, DIVA has certain restrictions on the number and types of Rules that can be assigned to various Template Output Fields.
Double-click the Rule under the Output Field to Configure	There are no configuration options for this rule.

MustHaveData Rule (Rules Tab, "Rules Palette" control) – allows users to check the Output Field for empty or null value. If found, the Rule throws an error.

Action	Result
Drag and drop the Rule onto the target field	When the "drag" of a Rule is initiated from the Rules Palette, the acceptable Template Output Field targets will change color. As noted, DIVA has certain restrictions on the number and types of Rules that can be assigned to various Template Output Fields.
Double-click the Rule under the Output Field to Configure	There are no configuration options for this rule.

MustNotHaveDuplicate Rule (Rules Tab, “Rules Palette” control) – allows users to check Output Fields for values that would result in a duplicate row. This is a very different type of Rule than all the others. It operates across rows and not on a column or column(s), exclusively.

<table>
<tr><th>Action</th><th>Result</th></tr>
<tr><td>Drag and drop the Rule onto the target field</td><td>When the “drag” of a Rule is initiated from the Rules Palette, the acceptable Template Output Field targets will change color. As noted, DIVA has certain restrictions on the number and types of Rules that can be assigned to various Template Output Fields.</td></tr>
<tr><td>Double-click the Rule under the Output Field to Configure</td><td>



The target field on which the “MustNotHaveDuplicates” Rule was dropped was the census block ID (FULLFIPSID), so that part of the configuration is done.
This dialog is asking for a second field, the one that contains the value that should not repeat. In this case the user specified the technology type (TRANSTECH) from the pull down meaning that for any unique FULLFIPSID, there cannot be two identical TRANSTECH values.

</td></tr>
</table>

Action	Result
Go to the “Processes” tab and click on “Configure Duplicate Resolution” button.	 • Clicking on the “Configure Duplicate Resolution” button opens the dialog below.  • Using the pull-down lists at the bottom of the dialog, specify how each of the field values for duplicate records should be handled. • In the example above, each of the four speed fields is told to take the maximum value found in any of the duplicate records and to use that for the final value in the single combined record that will be created.

NotGreaterThanField Rule (Rules Tab, "Rules Palette" control) – the value in the Output Field must not be greater than the value in another user-specified Output Field.

Action	Result
Drag and drop the Rule onto the target field	When the "drag" of a Rule is initiated from the Rules Palette, the acceptable Template Output Field targets will change color. As noted, DIVA has certain restrictions on the number and types of Rules that can be assigned to various Template Output Fields.
Double-click the Rule under the Output Field to Configure	 • Select the "not greater than field" from the pull-down list. The values in this field must be less than the values in the rule field or the record is flagged as an error.

NotGreaterThanValue Rule ***(Rules Tab, "Rules Palette" control)*** -- the value in the Output Field must not be greater than a user-specified value.

Action	Result
Drag and drop the Rule onto the target field	When the "drag" of a Rule is initiated from the Rules Palette, the acceptable Template Output Field targets will change color. As noted, DIVA has certain restrictions on the number and types of Rules that can be assigned to various Template Output Fields.

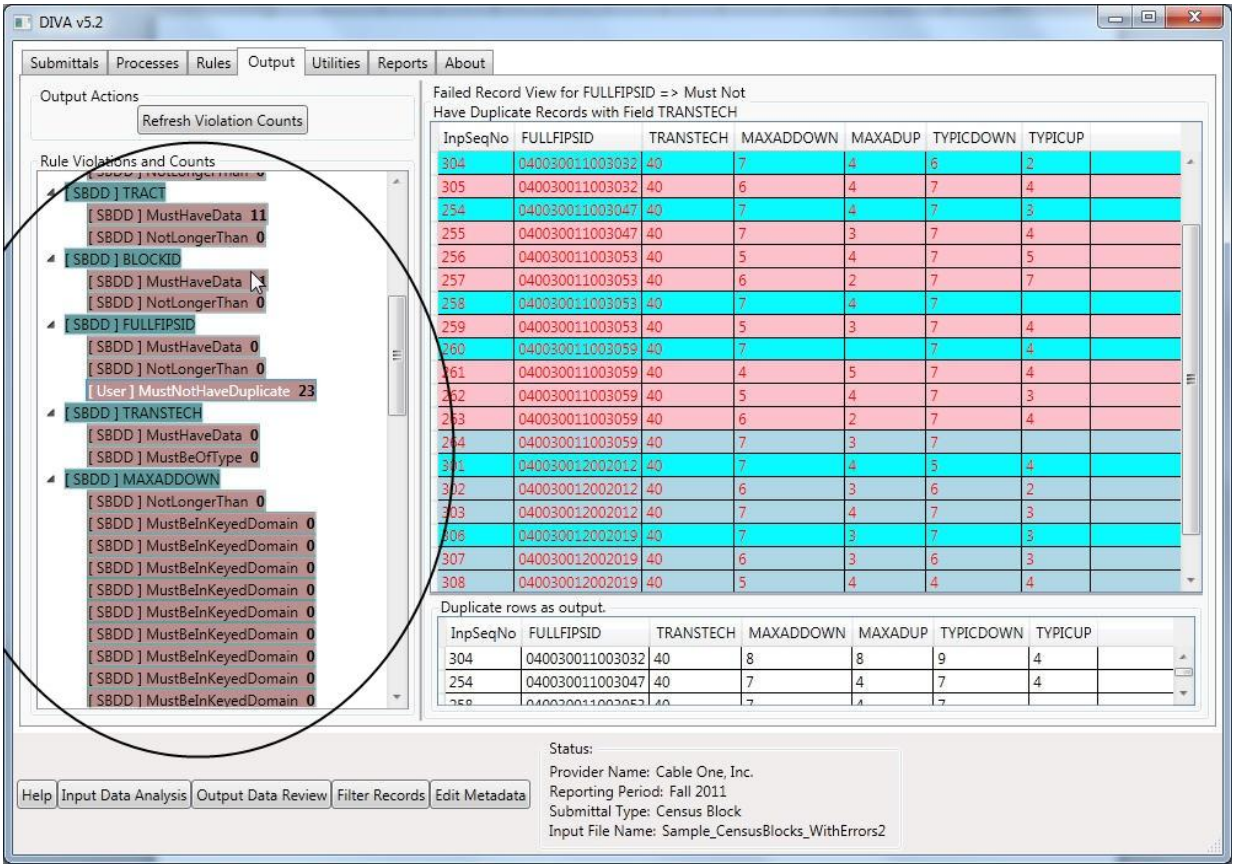
Action	Result
Double-click the Rule under the Output Field to Configure	 • Type in the "Not Greater Than Value" and press tab key to validate. Select "OK" to accept or "Cancel" to exit without setting/changing the value.

NotLongerThan Rule ***(Rules Tab, "Rules Palette" control)*** – the value in the Output Field must not exceed a user-defined number of characters. This rule can only be applied to character (string) fields.

Action	Result
Drag and drop the Rule onto the target field	When the "drag" of a Rule is initiated from the Rules Palette, the acceptable Template Output Field targets will change color. As noted, DIVA has certain restrictions on the number and types of Rules that can be assigned to various Template Output Fields.
Double-click the Rule under the Output Field to Configure	 • Type in the "Not Longer Than" value and click "OK" to accept or "Cancel" to exit without setting/changing the value.

Output Tab Functions

Rule Violations and Counts area (Output Tab) - Displays the results of applying Rules to the Output Fields of a Submittal.



- This is a list of Output Fields with each Rule that has been assigned to the associated Template Output Field shown underneath it. The number of Rule violations (errors) is shown to the immediate right of each Rule.

- By default, the Rules under each Output Field are not visible, having been collapsed under each Output Field. The user can toggle the visibility of rules by double-clicking on the Output Field. The visibility of all rules can be toggled by double-clicking on the top-most Output Field in the list.

- Each Rule has either "[SBDD]" or "[User]" listed before the Rule name. This reflects whether the Rule was added as part of the SBDD XML Importoperation or subsequently by the user.

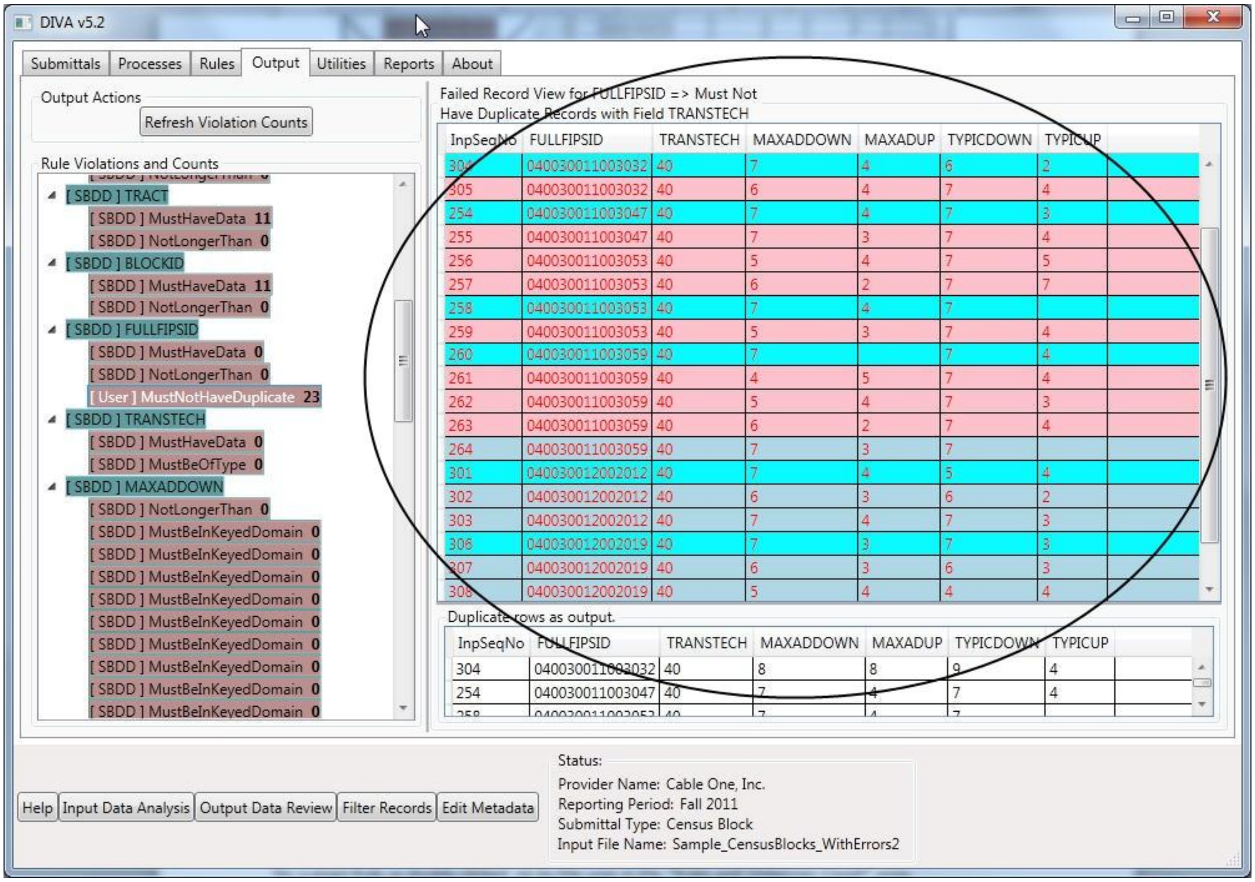
- Placing and holding (“hovering”) the mouse over any Rule will display the more informative Rule description as a tool-tip.

- A Rule violation count of “-2” indicates that the Rule is not configured and therefore cannot be evaluated. Rules are configured on the Rules Tab.
- A Rule violation count of “-1” indicates that there is no data in the Output Field to be evaluated. Either the Output Field is not connected to a data source on the Processes tab or there is no data in the connected data source.

- More information about errors can be displayed by double-clicking on a Rule that is showing one or more errors. The “Failed Record View” will be populated with the rows that were flagged with errors in the Output Field.

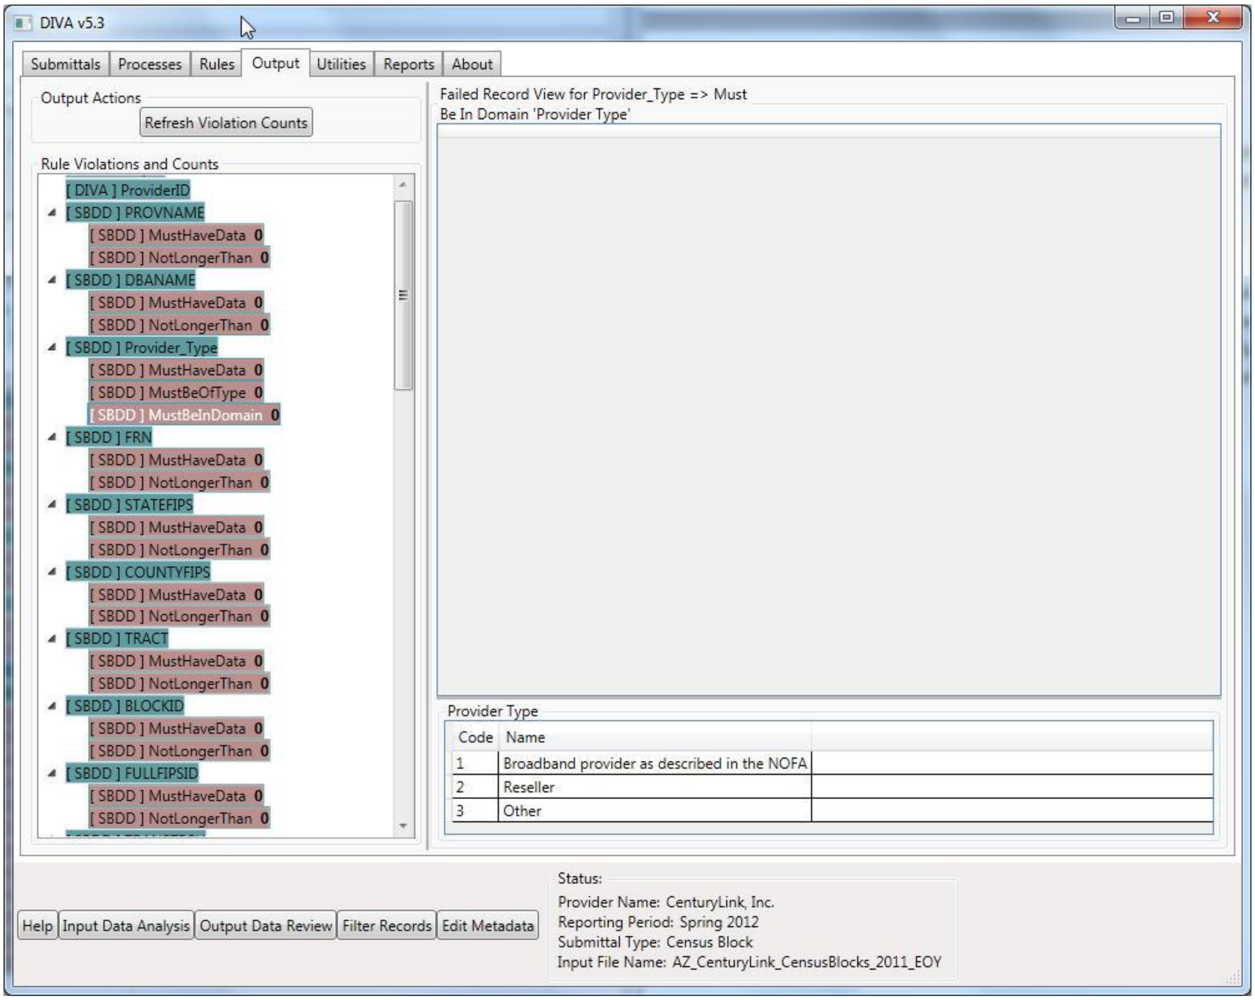
- Users work iteratively, adding/deleting/editing Processes, Rules and Filters until zero errors are achieved or the errors that remain are acceptable. For example, there may be no address information and no way to get it, so those Output Fields will always show errors in the MustHaveData rule.

Failed Record View area (Output Tab) – Displays the rows which have an error in the Output Field for a Rule which has been double-clicked on by the user in the "Rules and Violations Count" area.



- This display will change somewhat depending on the error type being displayed.
  - In the illustration above, "MustNotHaveDuplicates" errors are being displayed with records that have errors being shown in red. The first non-error record of each duplicate set (if there is one) will be shown in cyan (light blue); this record will be exported (however, not necessarily with the values shown in this panel). Subsequent non-error records of each duplicate set of records will be shown in darker blue; these will not be exported.
  - The rows that will be exported from DIVA are shown in the Extra Data panel (labeled, in this case, with "Duplicate Rows as output"). There will be one record here for every record in the above panel that is in cyan. However, their values have been adjusted in accordance with the settings of the "Resolve Duplicate" Process (on the Processes Tab, below the Output Fields List). In this example, the "Resolve Duplicate" Process is set to resolve values by selecting the maximum value of each of the four speed fields.

Domain Table Display area (Output Tab) – Displays the values in the domain table for a Rule which has been double-clicked on by the user in the “Rules and Violations Count” area.



In the illustration above, “MustBeInDomain” rule has been clicked with the result that (a) the rule changes to white font and (b) the domain table for that rule is being displayed below the “Failed Record View” area. The “Failed Record View” is blank in this case, because no records violated the domain Rule

Utilities Tab Functions

Import SBDD XML File (Utilities tab, "Import SBDD XML File" control)

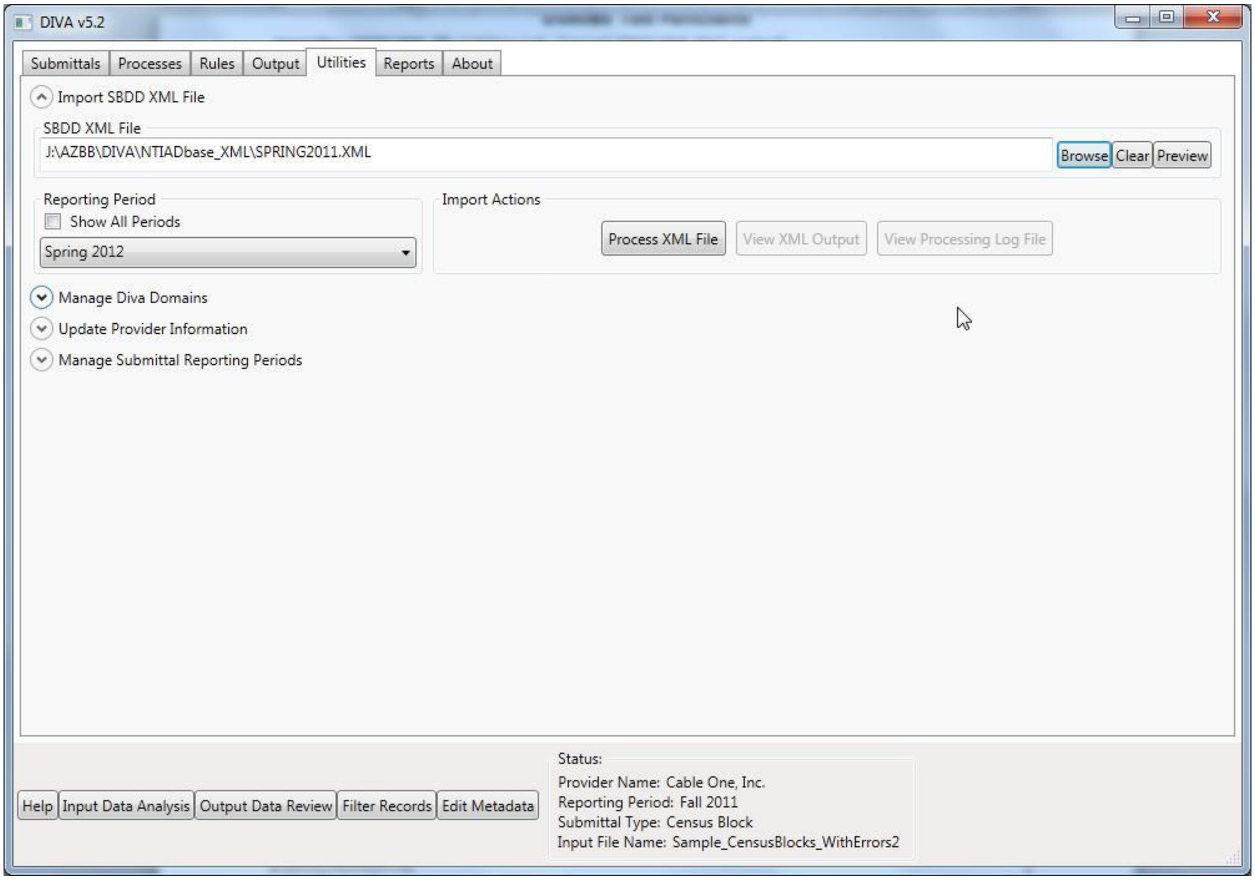
The "Import SBDD XML File" control allows the user to import a file (text, dbf or Excel) containing SBDD database schema and domain values into a DIVA table.

THIS STEP MUST BE PERFORMED FOR A GIVEN REPORTING PERIOD BEFORE ANY OTHER PROCESSING CAN TAKE PLACE.

This step creates the definitions for most Template Output Fields (DIVA has some extended fields for various SBDD feature classes which are added by DIVA automatically) and imports the Rules for them by processing the SBDD domains.

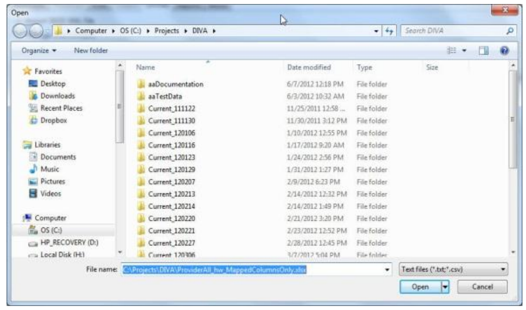
A pre-cursor step for this function is to use ArcCatalog to export a workspace XML document from an SBDD geodatabase.

Click on "Import SBDD XML File" section of Utilities Tab and the "Import SBDD XML File" area expands:



Key	Control	Description
1	"SBDD XML File" text box	Displays the path and file name to the SBDD XML file.

<table>
<tr><th>Key</th><th>Control</th><th>Description</th></tr>
<tr><td>2</td><td>Browse
button</td><td>Click on the “Browse” button and the browse dialog box opens:

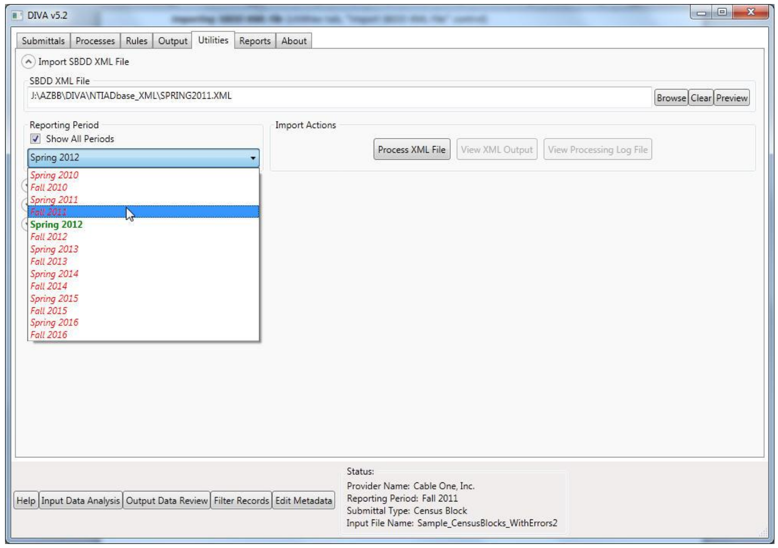


Choose the file type filter at the bottom of the Browse dialog to match the file type (extension) of your Provider information file.

Select the source file and click “Open” on the file dialog box. The browse dialog goes away and you will be back to the Utilities tab with the pathname and file to your source file now showing in the “SBDD XML File” text box.</td></tr>
<tr><td>3</td><td>Clear
button</td><td>Clears the value in the “SBDD XML File” text box. Does not delete the XML file or unload a previously loaded XML file. It just clears the text box.</td></tr>
<tr><td>4</td><td>Preview
Button</td><td>Opens the DIVA “Preview Window” which has been previously discussed.</td></tr>
</table>

<table>
<tr><th>Key</th><th>Control</th><th>Description</th></tr>
<tr><td>5</td><td>Reporting Period

area</td><td>
Click on the “Reporting Period” pull-down menu and the list of Reporting Periods is displayed. The currently active Reporting Period is shown in green while the rest of them are in red font.



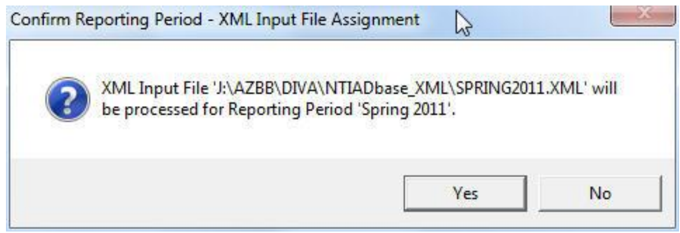
Select the appropriate Reporting Period from the pull down list for the selected XML Import File. The active Reporting Period is shown in green font.

If an XML file for a given Reporting Period has already been imported, the “Process XML File” button will be inactive.

The selection of the Reporting Period and the source XML file can be done in any order.

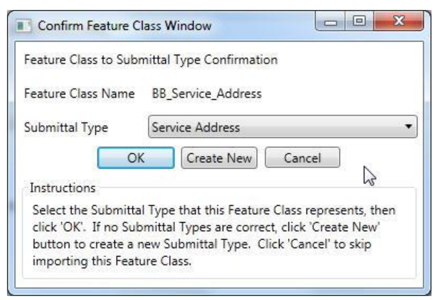
Note: the pull down list can be managed (to a certain extent) from the “Manage Submittal Reporting Periods” area on the “Utilities” tab.
</td></tr>
</table>

<table>
<tr><th>Key</th><th>Control</th><th>Description</th></tr>
<tr><td>6</td><td>Process XML button</td><td>
Click the “Process XML” button” and the “Confirm Reporting Period – XML Input File Assignment” dialog appears.



If the file matches the Reporting Period, click “Yes”; otherwise click “No” and repeat the previous step.

Follow the dialogs to confirm that the SBDD feature class is being properly associated with the Submittal Type.



Use the Submittal Type pull-down to select the matching Submittal Type for the current Feature Class Name. DIVA will attempt to find the best match for you by matching the feature class and Submittal Type names.

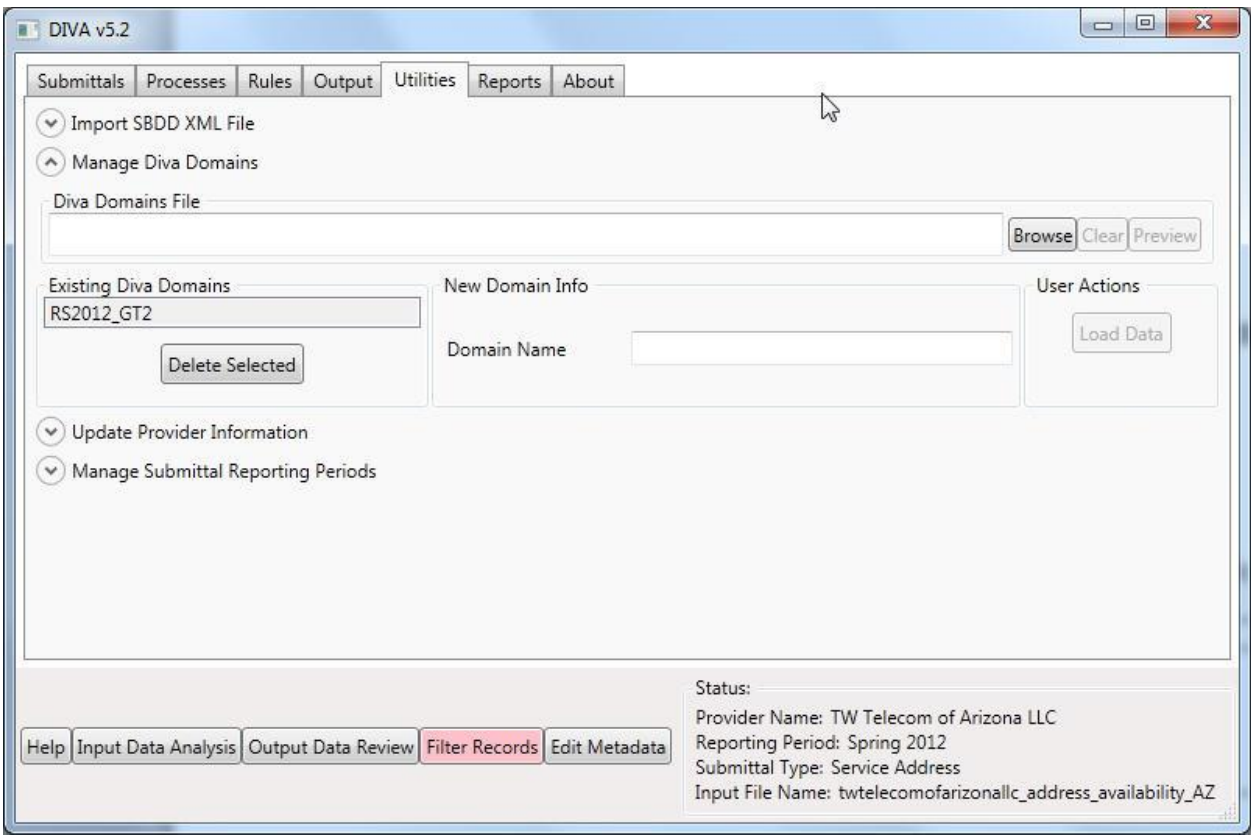
Note: there will be one “Confirm Feature Class” dialog for each SBDD-defined feature class. The user will be asked to click “OK” twice, once to confirm the mapping as in the second illustration above and then again on a simple confirm dialog. It is faster to use the return key on the keyboard instead of clicking OK with the mouse.
</td></tr>
</table>

Key	Control	Description
7	View the XML Output button	Click on the View the XML Output Button and the “XML Viewer” window opens:  Click to expand one node of the tree view; double click on a branch to expand all nodes nested below it. This is only used if you need to confirm something about the XML import.
	“View Processing Log File” button	Click on the “View Processing Log File” button and the “Log Viewer” window opens:  This is only used if you need to confirm something about the XML import process.

Manage DIVA Domains (Utilities tab, "Manage DIVA Domains" control)

The "Manage DIVA Domains" control allows the user to import into a DIVA table a file (text, dbf or Excel) containing domain values. The imported domain table can then be referenced in a "Must Be in DIVA Domain" Rule from the "Rules" tab.

Click on "Manage DIVA Domains" section of Utilities Tab and the area expands



Key	Control	Description
1	"Diva Domain File" text box	Displays the path and file name to the SBDD XML file.

Key	Control	Description
2	Browse button	Click on the “Browse” button and the browse dialog box opens:  Choose the file type filter at the bottom of the Browse dialog to match the file type (extension) of your domain file type. Select the source file and click “Open” on the file dialog box. The browse dialog goes away and you will be back to the Utilities tab with the pathname and file to your source file now showing in the “Diva Domain File” text box.
3	Clear button	Clears the value in the “Diva Domain File” text box. Does not delete the source file or unload a previously loaded domain file. It just clears the text box.
4	Preview button	Opens the DIVA “Preview Window” which has been previously discussed.
5	Existing DIVA Domain area	If the domain import was successful (Step 7), you will see the new domain name you provided in a previous step in the will appear under the “Existing DIVA Domains” area.  From here, you can select and delete and existing domain, as well

Key	Control	Description
6	New Domain Info area	Assign the domain a name in the “Domain Name” text box and then load the data (see next step)
7	Load Data button	The “Load Data” button becomes active after the user has selected a “Diva Domain File” in the previous steps and assigned a “Domain Name”. Click the “Load Data” button” and the “Load” window opens:  Like all DIVA Preview Windows, only the first 100 records of the source file will be shown. If the source is a text file, be sure to set the proper file delimiter in the “Delimiter” pull down menu at the top of the window. The “First row has headers” checkbox must be checked if the first row is column names. To populate the window with records from the source file or to se changes you made in this window, click the “Refresh” button in the upper right corner. To load the data, click the “Load” button at the top of the dialog.

Tips for Managing DIVA Domains:

- Do not load large tables if avoidable. This will significantly slow performance when applying these domains through rules. So, for example, if you need to check for valid Census block ID values, you can create and load a table based only on Census Blocks less-than-or-equal-to 2 square miles. There is no need to include all the larger Census Blocks in the domain table.

Update Provider Information (Utilities tab, "Update Provider" control)

The "Update Provider Information" control allows the user to import a file (text, dbf or Excel) containing Provider identification and status information into a DIVA table. In the Arizona Broadband Project, this file is a spreadsheet maintained by the telecommunication consultants and uploaded to a wiki page. The information in the spreadsheet includes a two-character ProviderID value which is used internally to track Providers, as well as SBDD fields for Provider Name, DBA Name and FRN.

Users may need to pre-Process the file containing the new Provider Information. The source file must have a header row and the field names must match the following DIVA file names exactly (case and spaces, included).

ProviderID	PROVNAME	DBAName
FRN	ProviderType	DSC_Active
Notes		

There can be additional fields or even missing fields (e.g. Notes), but DIVA must find an exact match on the header row for each column it imports.

Click on "Update Provider Information" section of Utilities Tab and the "Update Provider Information" area expands.

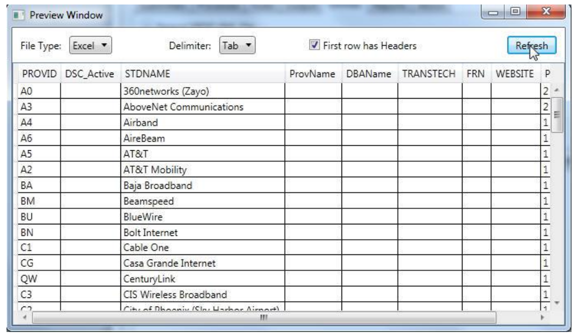
</table>

<table>
<tr><th>Key</th><th>Control</th><th>Description</th></tr>
<tr><td>4</td><td>Preview Button</td><td>
Click on “Preview” button and the “Preview Window” opens:



Like all DIVA Preview Windows, only the first 100 records of the source file will be shown.

Be sure the “File Type” pull down reflects the extension of the source file.

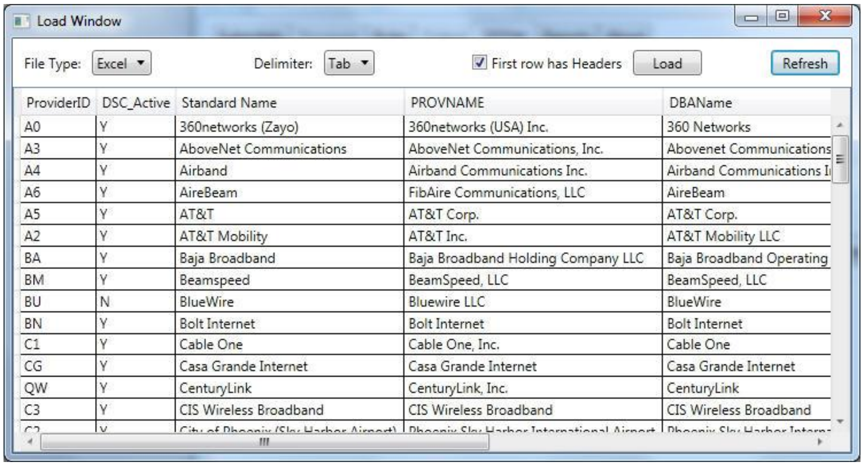
If the source is a text file, be sure to set the proper file delimiter in the “Delimiter” pull down menu at the top of the window.

The “First row has headers” checkbox must be checked and the header row must have column names that exactly match what DIVA expects, or the import will not work. See the first step in this process for the list of valid header row names

To populate the window with records from the source file, click the “Refresh” button in the upper right corner.

Dismiss the “Preview” window by clicking the red “x” in the upper right corner of the dialog.
</td></tr>
</table>

<table>
<tr><th>Key</th><th>Control</th><th>Description</th></tr>
<tr><td>5</td><td>Load and Process Provider Data button</td><td>
Click on the “Load and Process Provider Data” and the “Load Window” opens:



Like all DIVA Preview Windows, only the first 100 records of the source file will be shown.

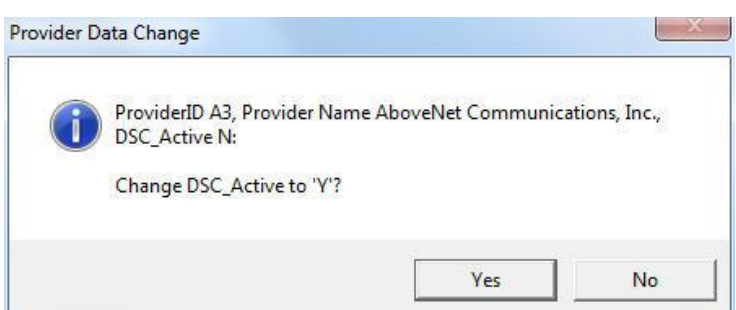
If the source is a text file, be sure to set the proper file delimiter in the “Delimiter” pull down menu at the top of the window.

The “First row has headers” checkbox must be checked and the header row must have column names that exactly match what DIVA expects, or the import will not work. See the first step in this process for the list of valid header row names

To populate the window with records from the source file, click the “Refresh” button in the upper right corner.

To load the data, click the “Load” button at the top of the dialog.

Assuming there are changes since the last version, a dialog will appear that asks you to confirm or reject each change since the last version.

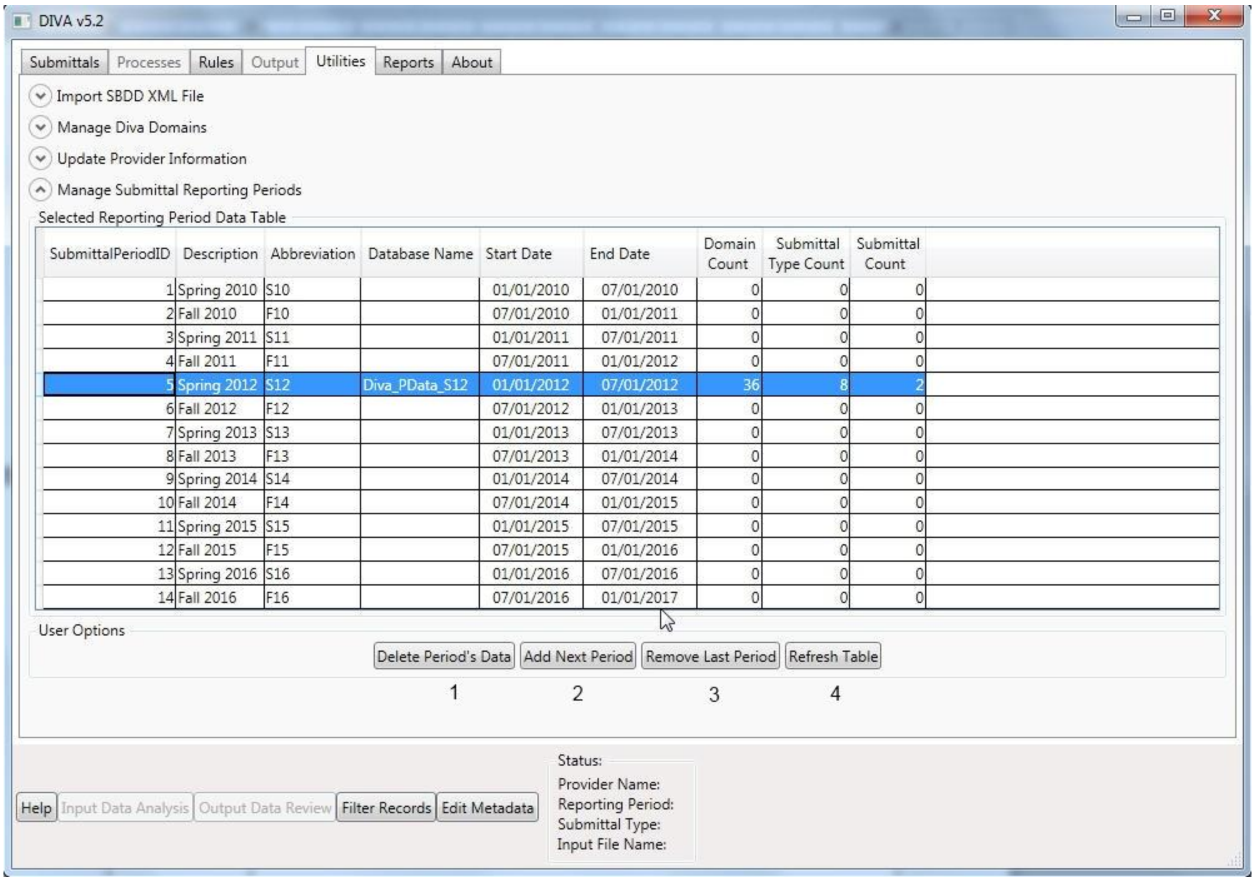


</td></tr>
</table>

Manage Submittal Reporting Periods (Utilities tab, "Manage Submittal Reporting Periods" control)

The "Manage Submittal Reporting Periods" control allows the user to add or delete Reporting Periods but not change any of the descriptive or date attributes.

Click on "Manage Submittal Reporting Periods" section of Utilities Tab and the "Manage Submittal Reporting Periods" area expands. Below are explanations of the "Manage Submittal Reporting Periods" control. Explanations of the buttons are keyed by number.



Key	Control	Description
1	Delete Period's Data button	Users can delete a Submittal Period's data which removes all database entries related to the Reporting Period.
2	Add Next Period button	Adds the next Submittal Reporting Period to the bottom of the table.

Key	Control	Description
3	Remove Last Period button	Removes the last Submittal Reporting Period from the bottom of the table.
4	Refresh Table button	Shows changes made to the table.

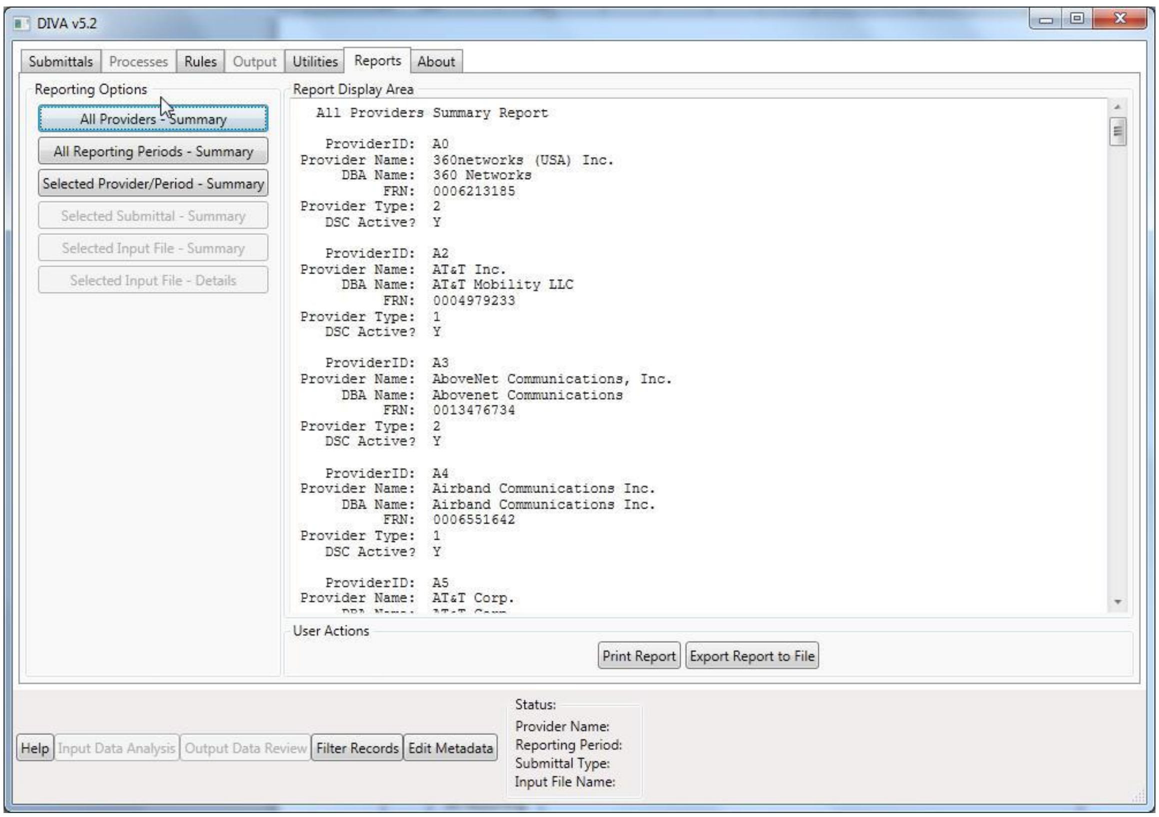
This control also shows some information about SBDD XML files that have been imported by the user. In the example above, only Spring 2012 SBDD information has been imported which entailed 36 domains covering 8 Submittal Types. In addition, the numbers of Submittals that have been created are displayed in the "Submittal Count" column.

Each Submittal Period has a 6-month window of time, though the Submittal Date is in the middle of that window. This allows changes to the Submittal Period data before the system clock closes access to a Submittal Period.

Reports Tab Functions

Reporting Option "All Providers - Summary" (Reports tab, button)

Creates a summary listing of current Provider information as imported into DIVA from the "Update Provider Information" utility.



Provider information consists of:

- ProviderID value – internal user-defined two-character identifier to uniquely identify Providers; it is not part of the SBDD database schema. This value, along with other Provider information, derives from imported Provider information. This value is used to create Provider-specific Input File data table names and Processing Set names.

- Provider Name value – the NTIA-required Provider Name attribute. This value is used in the first drop-down list in the Provider area on the Submittals tab.

- DBA Name value – the NTIA-required DBA Name attribute. This value is used in the second drop-down list in the Provider area on the Submittals tab.

- FRN – the NTIA-required FCC Registration Number attribute. This value is used in the third drop-down list in the Provider area on the Submittals tab.

- Provider Type value – the NTIA-required Provider Type attribute; this uses an SBBD-defined standard code.

- DSC_Active value – a Y / N entry that indicates whether this Provider is active in terms of providing data sets. This is a code developed by the AZBB team (not part of the SBDD database schema).

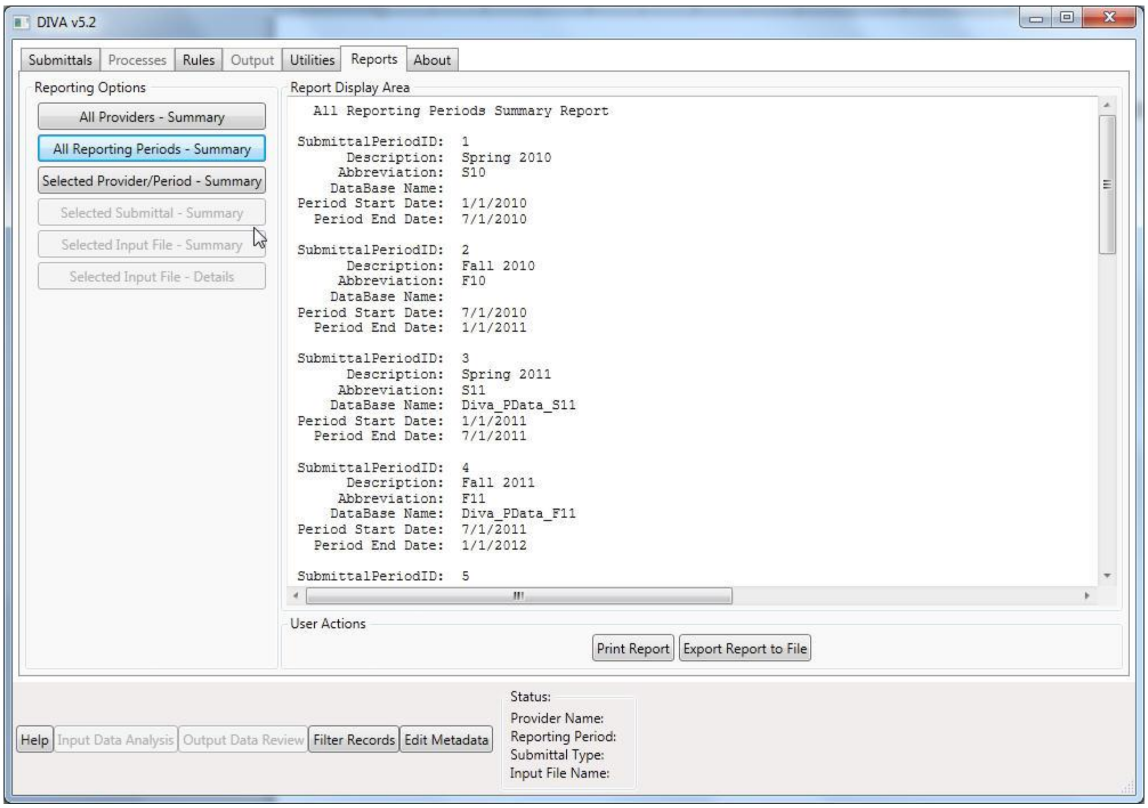
- Notes – user-added Provider-specific metadata (from Edit Metadata Window"); only appears if there is a note (not part of the SBDD schema)..

- Reporting Period Notes – user-added Reporting Period-specific metadata attached to this Provider (from Edit Metadata Window"); only appears if there is a note (not part of the SBDD schema)..

This set of data, except "Reporting Period Notes", is repeated in other reports. When it is, rather than describing each reported field again, we will simply note "Provider information".

Reporting Option "All Reporting Periods – Summary" (Reports tab, button)

Creates a summary listing of current Reporting Period information as currently stored in DIVA. The user may modify this using the "Manage Submittal Reporting Periods" utility. If a Reporting Period shows values for "Database Name", it means that the SBDD geodatabase for that Period has been imported into DIVA using the "Import SBDD XML File" utility.



Reporting Period information consists of:

- Submittal Period ID – an internal identifier created by DIVA (not part of the SBDD schema).
- Description – a short description of the Submittal Period (not part of SBDD schema). This value is used in the Reporting Period drop-down list on the Submittals tab.
- Abbreviation – an abbreviated description of the Submittal Period (not part of the SBDD schema). This value is used to create Provider-specific Input File data table names and Processing Set names.
- Database Name – the DIVA name for the SQL Server database created for each Reporting Period using the "Importing SBDD XML File" button on the "Utilities" tab (not part of SBDD schema).
- Period Start Date – the starting date of the Reporting Period. These are defined based on the date of the data to be reported in the original NTIA reporting instructions (i.e. December 31 and June 30 of each year). The Reporting Period start date is the day after that date.

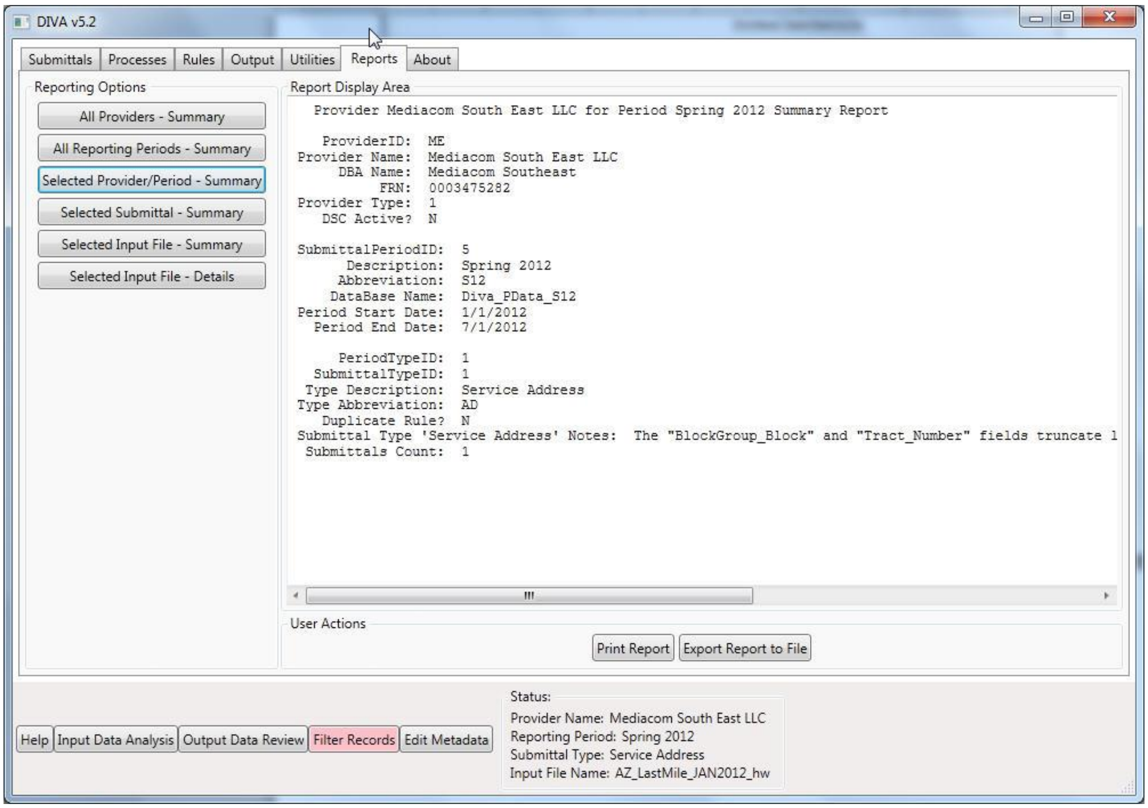
- Period End Date – the ending date of the Reporting Period. These are defined based on the date of the data to be reported in the original NTIA reporting instructions (i.e. December 31 and June 30 of each year). The Reporting Period end date is the day before the next Reporting Period's Start Date.
- Notes – user-added Reporting Period-specific metadata (from Edit Metadata Window"); only appears if there is a note (not part of the SBDD schema).
- Provider Notes – user-added Provider-specific metadata attached to this Reporting Period (from Edit Metadata Window"); only appears if there is a note (not part of the SBDD schema).

Note that the Period End Date has nothing to do with the date that the NTIA requires information be submitted. The start and end dates are chosen so that there is no "gap" or "overlap" in the Reporting Periods.

This set of data is repeated in other reports. When it is, rather than describing each reported field again, we will simply note "Reporting Period information". Note that the "Provider Notes" entry will be labeled differently so as to indicate both the Provider and Reporting Period.

Reporting Option "Selected Provider/Period – Summary" (Reports tab, button)

Creates a summary listing of information about the active Provider and the active Reporting Period.



Provider / Period information consists of:

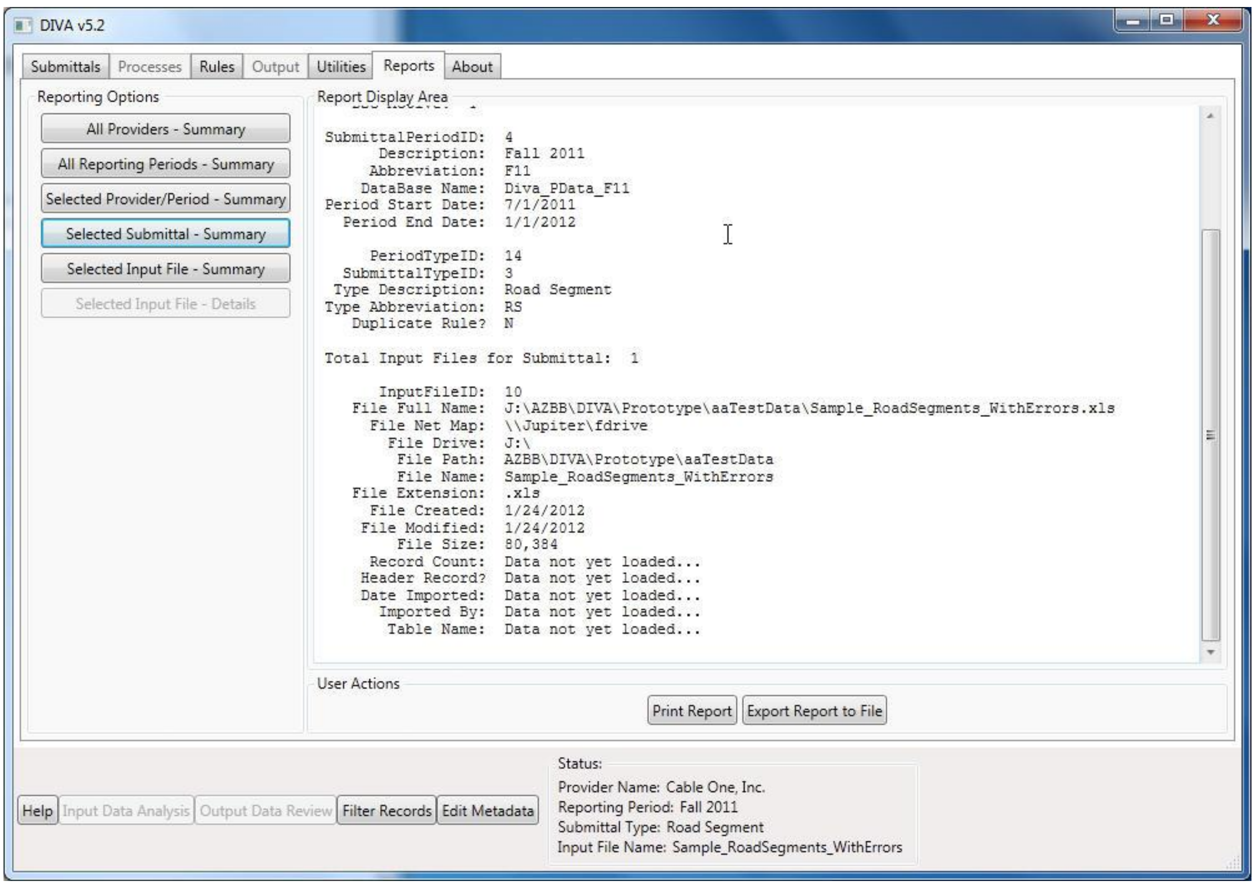
- Provider information.
- Reporting Period information.
- For each Period-Type in this Reporting Period (i.e. for each Submittal Type defined):
  - Period Type ID – an internal Period-Type identifier created by DIVA (not part of the SBDD schema).
  - Submittal Type ID – an internal Submittal Type identifier created by DIVA (not part of the SBDD schema).
  - Type Description – a short description of the Submittal Type (not part of SBDD schema). This value is used in the Submittal Type drop-down list on the Submittals tab.
  - Type Abbreviation – an abbreviated description of the Submittal Type (not part of the SBDD schema). This value is used to create Provider-specific Input File data table names and Processing Set names.
  - Duplicate Rule? – a Yes/No field indicating whether a "Must Not Have Duplicate" Rule has been assigned to any Template Output Field associated with this Period-Type. Used for DIVA internal processing (not part of the SBDD schema).

- Notes – user-added Period-Type-specific metadata (from Edit Metadata Window”); only appears if there is a note (not part of the SBDD schema).
- Submittals Count –the number of Submittals defined for the current Provider / Period-Type. Since there can only be one such Submittal (which may have several Input Files) for each Period-Type, this number will always be one. If there are none, then that Period-Type will not be reported (for brevity).

The set of data listed under Period-Type, except “Submittals Count”, is repeated in other reports. When it is, rather than describing each reported field again, we will simply note “Period-Type information”.

Reporting Option "Selected Submittal – Summary" (Reports tab, button)

Displays a summary of the active Submittal (button is inaccessible if no active Submittal). This report includes information about a single Submittal including a summary of the information about each of its Input Files, which includes record counts, the date imported, imported by etc. If the data for a Submittal has not yet been loaded, some of the Input File information will not be available ("Data not yet loaded…" is displayed as shown in the image below).



Submittal information consists of:

- Provider information.
- Reporting Period information.
- Period-Type information.
- Total Input Files for Submittal – the number of Input Files that are associated with this Submittal; the count must be at least one.
- For each Input File of this Submittal:
    - Input File ID – an internal Input File identifier created by DIVA (not part of the SBDD schema).

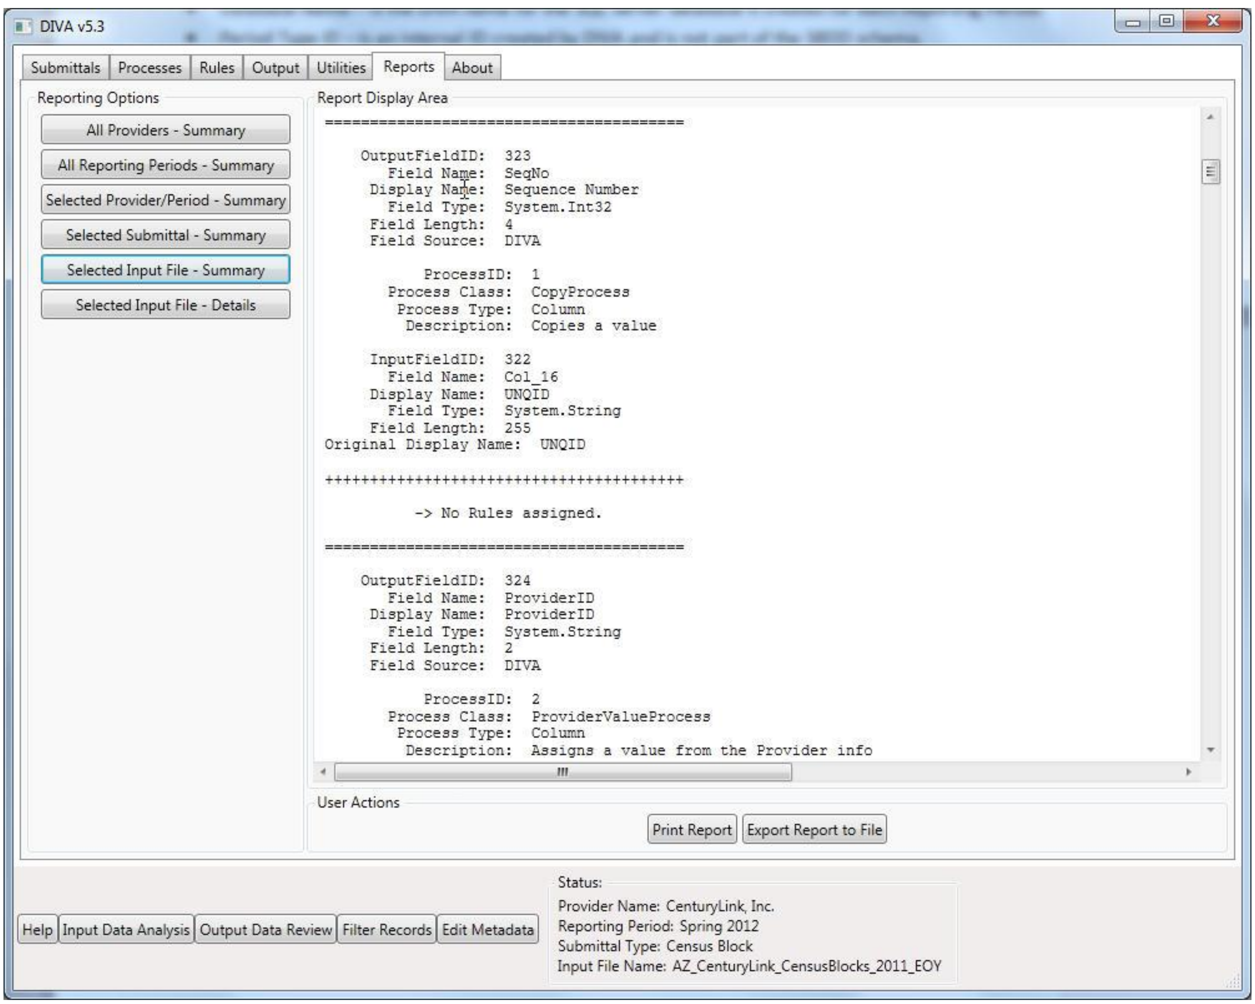
- File Full Name – the original complete file name, including path, of the Provider's data set that was loaded into DIVA for processing (not part of the SBDD schema); this is the "source file".
- File Net Map – if the drive letter portion of the File Full Name was a network mapping (share), then the value of that mapping is shown here (not part of the SBDD database schema).
- File Drive – the drive portion of the File Full Name (not part of the SBDD schema).
- File Path – the path portion of the File Full Name (not part of the SBDD schema).
- File Name – the file name portion of the File Full Name (not part of the SBDD schema).
- File Extension – the file name extension portion of the File Full Name (not part of the SBDD schema).
- File Name Comment – user-added File Name metadata (from Edit Metadata Window"); only appears if there is a comment (not part of the SBDD schema).
- File Created – the date that the source file was created (not part of the SBDD schema).
- File Modified – the date that the source file was last modified (not part of the SBDD schema).
- File Size – the size of the source file in bytes (not part of the SBDD schema).
- Record Count – the number of data records in the source file (not part of the SBDD schema). This is the number of records that are available for processing in DIVA; it excludes the count of the header record, if there was one.
- Header Record – a Y / N entry indicating if the data was loaded into DIVA with the "First row has Headers" checkbox checked. As explained in data loading, checking this box tells DIVA to use the values in the first record of the source file as the names of the Input Fields (data columns) and not to load it as data records for processing (not part of the SBDD schema).
- Header Record Comment – user-added Header Record metadata (from Edit Metadata Window"); only appears if there is a comment (not part of the SBDD schema).
- Date Imported – date that the source file's data was loaded into DIVA (not part of the SBDD schema).
- Imported By – the Window's user name of the person who loaded the data into DIVA (not part of the SBDD schema).
- Table Name - the name of the SQL data table and database that the data was loaded into (not part of the SBDD schema). This name is a combination of the Provider ID, Reporting Period's Abbreviation, Submittal Type's abbreviation and the Input File ID. See Appendix D for further details.
- Notes – user-added Input File-specific metadata (from Edit Metadata Window"); only appears if there is a note (not part of the SBDD schema).
- Projection Type – user-added Projection Type metadata (from Edit Metadata Window"); only appears if there is an entry (not part of the SBDD schema).
- Projection Note – user-added note regarding the projection type metadata (from Edit Metadata Window"); only appears if there is a note (not part of the SBDD schema).

The set of data listed under Input File is repeated in other reports. When it is, rather than describing each reported field again, we will simply note "Input File information".

Reporting Option "Selected Input File – Summary" (Reports tab, button)

Creates a summary listing of the active Input File for the active Submittal (button is inaccessible if no active Input File). It adds Input File-specific information regarding the Output Fields of the Input File and the Process that is the source of data to each Output Field. It traces the "flow" of data "upstream", through possible Process Fields and additional Processes until it reaches a data source, which is either an Input Field or a Process. It also lists all of the Rules that are attached to this Output Field along with a count of Rule violations. Accuracy in this report depends on the user having first visited the Processes tab and then the Output tab, clicking the "Refresh Violation Counts" button on that tab. Failure to do so will result in inaccurate reporting of error counts.

Since a Row Process (i.e., Resolve Duplicate Process) cannot be attached to any Output Field, the information regarding this Process is added at the end of the report.



Input File (summary) information consists of:

- Provider information.
- Reporting Period information.
- Period-Type information.
- Input File information.
- For each Output Field of the Input File (a double-dashed line separates each entry):
  - Output Field ID – an internal Output Field identifier created by DIVA (not part of the SBDD schema).
  - Field Name – the name of the field as specified in the SBDD schema. The Field Name is what is shown in the "tool tip" when you hover the mouse over the Output Field in the Processes tab.
  - Display Name – the alias of the field as specified in the SBDD schema.
  - Field Type– the field's data type as specified in the SBDD schema but translated into a .NET data type.
  - Field Length– the field's length as specified in the SBDD schema if the Field Type is a string; otherwise, the field's length depends on the .NET data type.
  - Field Source – "SBDD" indicates that the field was specified in the SBDD schema; "DIVA" indicates that the field was added by the DIVA development team. Remember that all Output Fields derive from Template Output Fields and these are defined during the SBDD XML Import operation.

- For the Process connected to the Output Field (only one is possible):
  - Process ID – an internal Process identifier created by DIVA (not part of the SBDD schema).
  - Process Class – the type of the Process, e.g. "TranslationProcess" (not part of the SBDD schema).
  - Process Type – the type of the Process (not part of the SBDD schema). Only "Column" type Processes can be listed here.
  - Description– a short description of the Process (not part of the SBDD schema). The Description is what is shown in the "tool tip" when you hover the mouse over the Process in the Processes tab.
  - If the Process is a Constant Value Process:
    - Constant value set – the value that will be assigned to this Output Field for <u>every</u> record (not part of the SBDD schema).
    - Constant value type – the data type assigned to the value during user-configuration of the Process (not part of the SBDD schema).
    - Because this Process serves as a data source, no further "tracing" to find additional Processes is done.
  - If the Process is a Provider Value Process:
    - Provider attribute – the property (attribute) of the Provider (e.g., "ProviderType") whose value will be assigned to this Output Field (not part of the SBDD schema). This is set during user-configuration of the Process.
    - Provider value set – the value of the Provider's attribute that will be assigned to this Output Field for <u>every</u> record (not part of the SBDD schema).
    - Provider value type – the data type of the specified Provider attribute (not part of the SBDD schema).
    - Because this Process serves as a data source, no further "tracing" to find additional Processes is done.

- The data source(s) for each Process may be either a Process Field or an Input Field. If there are multiple sources, they will be listed consecutively (although they may be interspersed with Processes, etc., as the data flow is "traced" from Output Field back to Input Field)
- For each connected Process Field:
  - Process Field ID – an internal Process Field identifier created by DIVA (not part of the SBDD schema).
  - Field Name – the name of the field as assigned by DIVA (not part of the SBDD schema).
  - Display Name – the display name of the field as assigned by DIVA (not part of the SBDD schema). The Display Name is what is shown in the "tool tip" when you hover the mouse over the Process Field in the Processes tab.
  - Field Type– the field's data type (not part of the SBDD schema). Typically this is left blank.
  - Field Length– the field's length (not part of the SBDD schema). Typically this is left blank.
  - The Process connected to the Process Field (only one is possible) and any further elements as data flow are "traced" back to source(s).

- For each connected Input Field:
  - Input Field ID – an internal Input Field identifier created by DIVA (not part of the SBDD schema).
  - Field Name – the name of the field as assigned by DIVA (not part of the SBDD schema). This will be either "InpSeqNo" for the field that holds the sequential record number or a name of the form "Col_##" where"##" is a two digit integer starting at 0 (e.g., "00", "01", etc.). Field names are automatically assigned by DIVA during data loading depending on the position of columns in the user's data source file.
  - Display Name – the display name of the field as assigned by DIVA (not part of the SBDD schema). The Display Name is what is shown in all of the displays of Input Fields. It will be the same as the Field Name if no header record was specified during data loading <u>or</u> the value found in the header record for that field <u>or</u> a user-specified value (set in Input Data Analysis window or in the Input Fields list on the Processes tab).
  - Field Type– the field's data type (not part of the SBDD schema). This will always be string except for the "InpSeqNo" field, in which case it is Int32.
  - Field Length– the field's length (not part of the SBDD schema). This will always be 255 except for the "InpSeqNo" field, in which case it is 4.
  - Original Display Name – the display name of the field as originally assigned by DIVA (not part of the SBDD schema). The It will be the same as the Field Name if no header record was specified during data loading <u>or</u> the value found in the header record for that field in the header record.
  - An Input Field is a data source so tracing stops at this point (although there may be additional Input Fields to list, or previous "tracings" to complete).

- For each Rule attached to an Output Field (Rule listings are separated from the first part of the Output Field listing by a row of plus signs):
  - Rule ID – an internal Rule identifier created by DIVA (not part of the SBDD schema).
  - Rule Type – the type of Rule (not part of the SBDD schema). This will always be "Column" for all rules listed with an Output Field.

- Rule Description – the description shown in the Rules tab along with the Rule name (not part of the SBDD schema). The Description is what is shown in the "tool tip" when you hover the mouse over a Rule violation count in the Output tab.
- Rule Source– the source for the Rule. It will be "SBDD" if it was created as part of the SBDD XML Importoperation or "User" if it was assigned by the user on the Rules tab.
- Violation Count – the number of errors for (violations of) this Rule since the last "Refresh Violations Count" button click. A value of "-2" indicates that the Rule has not been configured (for user-assigned Rules); a value of "-1" indicates that there is no data to check (no data source attached to the Output Field).

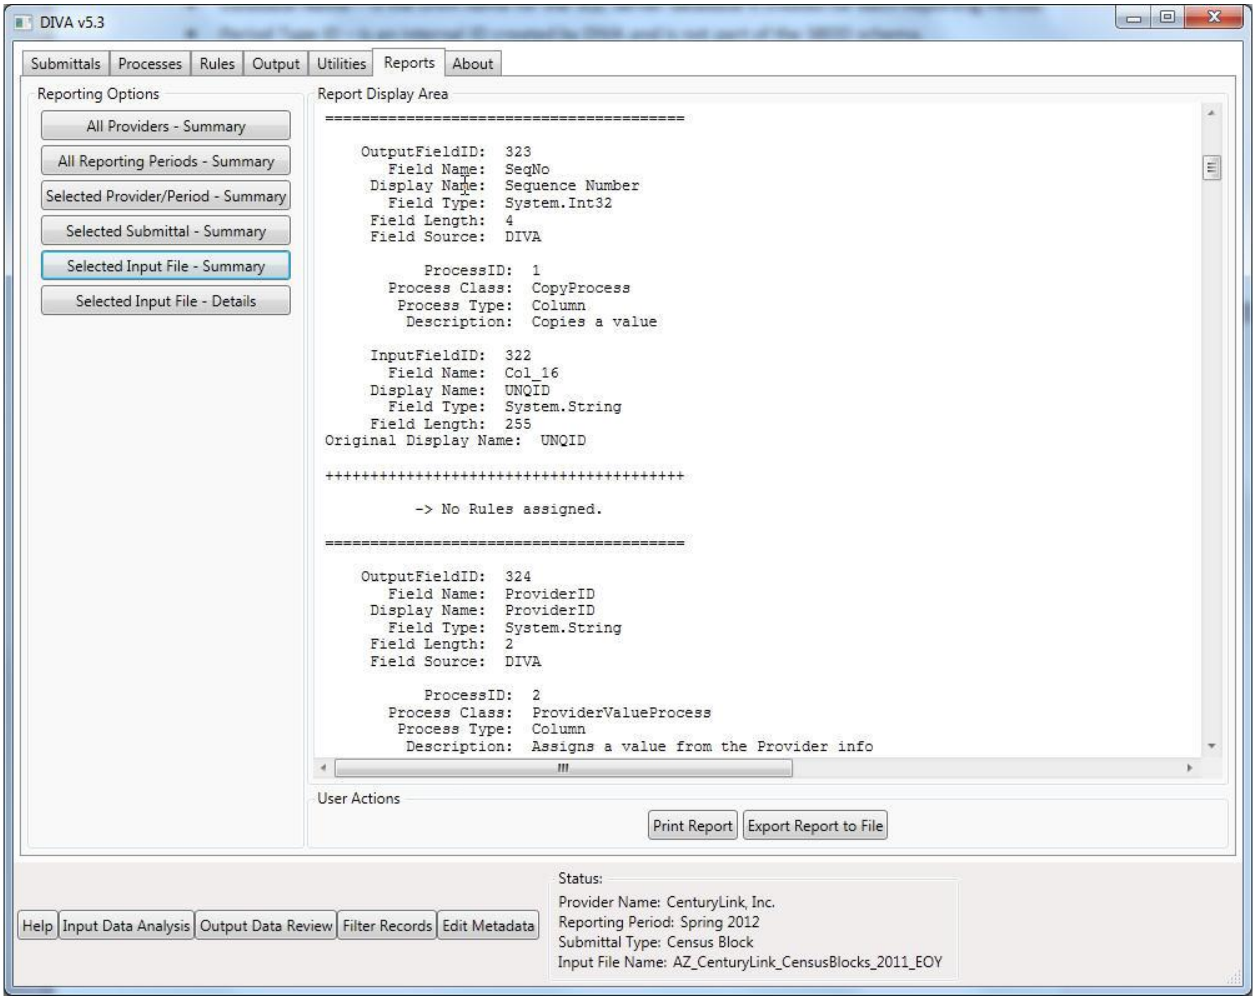
- The set of data listed after Output Field is repeated in the "details" version of this report. It will be referenced there as "Output Field information".

- The final entries after all Output Fields have been listed are the Row Processes associated with Row Rules. There is currently only one Row Rule ("MustNotHaveDuplicate"), so there is only one Row Process ("ResolveDuplicate") to list. This will only be present if this Rule has been assigned on the Rules tab to this Period-Type.
  - Process ID – an internal Process identifier created by DIVA (not part of the SBDD schema).
  - Process Class – the type of the Process, e.g. "ResolveDuplicateProcess" (not part of the SBDD schema).
  - Process Type – the type of the Process (not part of the SBDD schema). Only "Row" type Processes can be listed here.
  - Description– a short description of the Process (not part of the SBDD schema).
  - Decider Field #1 – the first Output Field used to determine if a duplicate exists.
  - Decider Field #1 – the second Output Field used to determine if a duplicate exists.
  - Repeated for each Output Field that is having its value resolved in the case of duplicates existing is a statement giving the name of the Output Field and how the resolution is to be made (currently either "Max value" or "Min value").

The set of data listed above is repeated in the "details" version of this report. It will be referenced there as "Resolve Duplicate information".

Reporting Option "Selected Input File – Details" (Reports tab, button)

Creates a summary listing of the active Input File for the active Submittal (button is inaccessible if no active Input File). It adds some additional detailed information to the "Input File – Summary" report discussed previously.



Input File (details) information consists of:

- Provider information.
- Reporting Period information.
- Period-Type information.
- Input File information.
- Output Field information augmented with (additional information is bracketed with single-dashed lines):
  - Translation values – under the Translation Process, if present, the detailed "From" and "To" values (user-assigned in the configuration dialog box) are listed.
  - Rule violations – under each Rule that has a violation count greater than 0 will be listed each violating record. This essentially is a listing of what appears in the "Error Record View" panel on the Output tab.
- Resolve Duplicate information.

Sample Workflow

DIVA is an event driven application meaning that the user can control in large part what action is performed and when; therefore, the workflow below is only one of many possible paths for processing a file. This workflow is grouped into actions that are non-Reporting-Period specific, and Period specific. Within the Period specific workflow are General Operations (generally performed once) and Provider Operations (performed one-to-many times for each Provider). This workflow assumes you have opened DIVA and are ready to begin processing for a new Reporting Period.

<u>Non-Reporting-Period Specific</u>

1. Import Provider Information – only if there have been changes since the last Reporting Period. It is important that the ProviderID never change from version to version of the Provider Information table.

2. Import DIVA Domains – only if you have a need to validate values in a field that is not already covered in one of the imported SBDD or DIVA domains. For example, you may want to check each Provider's County FIPS codes against a table of valid codes in your State.

<u>Reporting Period Specific – General Operations</u>

3. Maintain Reporting Periods – the only time this will be necessary is when the standard list of Reporting Periods is exhausted and you need to add another one to the end of the list.

4. Import the SBDD XML Files - this is how DIVA enforces the SBDD rules built into the domains in the SBDD database for each Reporting Period. THIS STEP MUST BE PERFORMED FOR EACH REPORTING PERIOD FOR WHICH DATA WILL BE PROCESSED. If you are not sure which Reporting Periods have been imported, you can use the "Manage Submittal Reporting Periods" function on the Utilities tab to see which ones have a value in the "Database" column. Note that DIVA will not let you import a given Reporting Period twice.

5. Assign/Modify/Delete Rules – the SBDD import function will automatically assign Rules to the Template Output Fields for a Period-Type which means there will already be SBDD-defined rules that will attach to every Output Field for every Submittal type you will process. You can assign your own Rules or even delete the imported SBDD rules. Be careful though. Once you delete a rule for a Period-Type it is deleted for every subsequent Provider for that the Period-Type. It also means any Provider you have processed prior to the delete was checked against that rule but any going forward will not be. This goes for adding new rules after one or more Providers have already been processed. You may want to avoid this inconsistency.

Reporting Period Specific – Provider Operations

6. Pre-process Provider Input Files – DIVA is designed to handle Input Files in a row –column structure and the user must verify and modify them to meet this criteria.

7. Import a Provider Input File –
    a. Select an Input File – browse to and select an Input File for loading.
    b. Preview the selected Input File. – you do this as the very first step to see what you have.
    c. Filter Records - as needed based on evaluation from the Input File preview.
    d. Load the selected Input File – loads data from Input File into an internal DIVA table.

8. Analyze the Loaded Data – use DIVA tools to better understand the data in the Input File and help you make choices for subsequent processing.

9. Define and Save Processes – apply transformation Processes to values from the Input Fields to values in the Output Fields. On the "Processes" tab
    a. Be sure to use a "Copy" Process to save the value of DIVA input field, "InpSeqNo" to DIVA Output field, "SeqNo". This will give you a way to tie Input and Output records together. In the case of shapefile processing, use "SeqNo" to capture a unique identifier from the Input file for later use in joining the clean DIVA text file back to the shape.
    b. Use "Provider Value" processes to populate the provider identification Output Fields. This will help ensure that the final NTIA deliverable is consistent with the official project view of provider identification. Do note in the metadata (later to be copied to the QA spreadsheet) if there is a discrepancy between the Provider-submitted values and the ones that result from the "Provider Value" process. You can quickly spot errors by comparing the values in the Input Field list with those that show up in the Output Field list after Processes are connected and applied.
    c. Be sure to "Apply" and "Save" your Processes regularly so you do not lose your work.
    d. Do not hesitate to use the "Input Data Analysis" button from the Status Bar any time you need to better understand values in Input Fields and therefore the correct process to apply to transform these values to Output Fields. For example:
        i. The Input Field "TransTech" may be displaying a valid NTIA code, "10" but you are not sure if every record in the Input File is a "10." Open the "Input Data Analysis" window and run a "Do Frequency" to see every unique value for "TransTech" in the Input File.
        ii. You are not sure if the Census Block identifier is unique or whether there are multiple records for some Census blocks. A "Do Frequency" will give you a "Count" field on which you can sort to see if there are any values greater than 1.
    e. If this set of processes seems generic enough to be applied to the same Submittal Type from subsequent Providers in this Reporting Period, then click the "Save as a Template" button.

10. Load, Evaluate and Modify the Rules – use the "Rules" tab to "Load", inspect and edit as needed the rules that will be applied to the current Submittal. In this sample workflow, we suggest you do this step early on; however, after working with the data through the establishment of Processes, you may gain insight into new Rules that should be applied.
    a. On the Rules tab, choose the "Reporting Period" and "Submittal Type" from the pull down menus that correspond to the active Submittal and click the "Load Rules" button.
    b. Evaluate the Currently Assigned Rules - double click on the topmost Output Field to expand each Output Field to reveal the Rules nested under each one. Double click on any Rule you wish to evaluate and/or edit; right-click and select "Delete" from the context menu to delete a Rule.
    c. Add a new Rule by dragging and dropping a Rule Type onto a field in the "Currently Assigned Rules" area and then configuring it appropriately.

11. Apply the Rules and Look for Errors – use the "Output" tab to see where Output Field values are not congruent with the Rules.
    a. Click the "Refresh Violation Counts" button – depending on the number of and type of Rules, and the number of records in the Input File, this may take 20 to 30 seconds or more to complete.
    b. Use the "Rules Violations and Counts" area to evaluate the result of applying Processes on the Output Fields - double-click the topmost Output Field in the "Rules Violations and Counts" area to reveal each Rule and the error count immediately to the right of each Rule.
    c. Evaluate the errors - click on each Rule that has an error count greater than zero. Details on the error will appear in the "Failed Record View" area.
    d. Based on your evaluation of errors, adjust the Filters, Export Options, or Processes and add, delete or modify Rules to eliminate or reduce the number of errors.

12. Use the Output Data Review Window – use the controls on this window to sort and filter errors and gain insight into why errors are occurring.
    a. Adjust the Filters, Export Options, or Processes and add, delete or modify Rules to eliminate or reduce the number of errors.
    b. Export the Data – to a delimited text file format. From here you can process the data onto the GIS layers for creation of the NITA submittals.

13. Create/Edit Metadata – click on the "Edit Metadata" button in the "Status Bar" area at any time to make notes about Reporting Periods, Providers, Provider Types, and more. This data can be output to reports and used to help fill in the QA Sheets used for each Provider

14. Generate Reports – click on a report type button to display various levels of detail for the current Reporting Period, Provider, Submittal Type, etc. Information from these reports, including metadata the user has captured using the "Edit Metadata" button, can be cut and pasted into the Provider QA worksheet.

Notes on Desired Functionality and Bugs

As with any software project, not all design targets were fully achieved or met in the way we anticipated. In addition, the process of developing DIVA gave us some good ideas for functionality that was not in the original project scope or budget. Fortunately, DIVA provides a framework on which additional functionality can be added. The source code is available to the BB community and is well-documented.

Things that don't and won't work:

- Compatibility with 32-bit OS: The specification in the original User Needs was that DIVA run in a 32-bit Windows operating system (Win 7 or XP). However, very large source files (1 million records or so) cannot be processed as DIVA does all data processing in memory (for speed) and 32-bit versions of the OS run out of addressable memory space.

Some ideas for additional functionality:

- Add a "drill-down" capability to the Output Data Review Window so that a user can see all of the errors affecting a record. The Output tab shows the errors one Rule at a time, making it difficult to see that one record may be violating multiple rules.
- Add some "intelligence" to the Process Mapping canvas so that graphics gracefully respond to re-sizing the DIVA GUI, adjusting their layout in a "proportional" manner.
- Right-click, copy and paste a process in the Process Mapping Canvas, rather than having to drag a new process from the Process Palette each time.
- More fully develop the "Full address decomposition" Process. This was not included in the current version due to budget priorities. And Arizona does not submit address data to NTIA per the original NDA's signed with each Provider.
- Modify the Object Data Model (ODM) so that Providers are treated like Submittal Types. By that we mean create a Period-Provider entity so that the "state" of each Provider for each Reporting Period could be retained. This would prevent some problems with users changing Provider ID values between Reporting Periods and allow us to track the history of Provider information changes.
- Sort columns as numbers, rather than text. You will notice that when you sort columns in any of the Preview or Analysis windows, the values sort as text. This is because DIVA treats <u>all data</u> as strings. Rules that check if data is an integer type, for example, do this <u>without</u> changing the data from a string.

No non-trivial programs are ever error free. We have done extensive testing of DIVA, but no doubt bugs remain. Please inform us of any that you might encounter.

Please share code enhancements with us and the DIVA community.

Glossary

active – the currently selected attributes: Provider, Reporting Period, Submittal Type, Submittal and / or Input File. An existing Submittal is made active by clicking on it in the “Existing Submittals” list in the Submittals tab (this list is the table on the bottom panel of the Submittals tab); this Submittal will then be highlighted in that list. Activating a Submittal will synchronize the drop-down lists in the upper panel of the Submittals tab with this selection; thus the active Provider, Reporting Period and Submittal Type will be shown. The first Input File of the Submittal will become active; the Input File drop-down list will be synchronized to show that Input File. Making any choice in the upper panel active (selecting a Provider, Reporting Period and / or Submittal Type) will activate the matching Submittal if it exists. If it does not exist, then a new Submittal may be created for it once an Input File is selected. Creating the Submittal (with the “New” button), will create it and make that Submittal active. If a Submittal has more than one Input File associated with it, a different Input File may be made active (using the Input File drop-down list) without changing the active status of any of the other attributes. Thus “active” is synonymous with “selected”.

Column (or Data Column) – a particular reported, or added, attribute of a data set when viewed as a data Table. The definition of the data values in this column remains constant throughout the Table, although the actual values vary by the Record or Row.

Column Process – a Process that is applied to all values in a particular data column (data source Field). All Processes that are manipulated on the Process Mapping Canvas are Column Processes.

Column Rule – a Rule that applies to all values in a particular data table column, that is, to an Output Field in all rows of the data table. Column Rule violations are corrected by adjusting Processes (creating, linking, configuration, removing) on the Process Tab.

Data Set – a file containing Provider-specific information, submitted to the State during a Reporting Period. Typically, this data set will be a text file, a spreadsheet file, or an ESRI Shapefile. DIVA requires that data sets be in a table-oriented format and handles only specific types of delimited text formats, Excel spreadsheets (in either .xls or .xlsx formats), or DBF formatted data tables. Provider submittals that do not meet formatting requirements require some pre-processing; see Appendix B for details.

Data Sink – a Field that serves as a target for the output of a Process. All Output Fields serve as data sinks. Process Fields that connect Processes may not serve as a data sink since, by definition, they are allowed only one connecting line (one connection leading in) and that line is already assigned by the creation of a Process Field from an Input Process Field and an Output Process Field.

Data Source – a Field that serves as the source of data (input) for a Process. All Input Fields serve as data sources. Process Fields that connect Processes also serve as data sources for the Processes they feed into.

Data Validation – the process of checking a data value against another data value. Validation implies that knowledge outside of that data value is needed, that is, that another data source is involved. For example, checking a data value against a Domain of allowed values is a form of data validation.

Data Verification – the process of checking a data value without using another data value. Verification implies that knowledge outside of the checked data value is not needed, that is, that what needs checking is intrinsic to the data value itself. For example, checking that a data value is of a particular type (e.g., an integer value) does not require checking another data value and is thus a form of data verification.

Default Value – a value for an Output Field that will be entered if a Provider fails to report (specify) a value. Default values are specified in the SBDD Geodatabase.

DIVA Domain – a domain imported by the DIVA user which is not part of the SBDD database domains. An example of a DIVA Domain might be a list of valid Census Block ID's. This is not specified in the SBDD data model, but is useful for validating a Provider's list of Census Blocks. Users import DIVA Domains from the "Utilities" tab.

Keyed Domain – a domain whose scope is determined by the value in a key field. In the latest SBDD model, the speed fields are in a domain keyed off of the value contained in the Technology of Transmission field. This means that each Technology Type will have its own range of permissible speed values.

Domain – a set of values that are used to validate data.

Field – an entity that can contain provider reported data. A Field is always of some particular type: Input Field, Template Output Field, Output Field, Process Field, Input Process Field or Output Process Field.

Input Field – a data source for DIVA processing. The Input Fields for a particular Input File are created, and their values populated, based on the data fields (or "columns") in a Provider's submitted data set (the Input File).

Input File – the internal DIVA equivalent of a Provider-submitted Data Set. An Input File, once associated with a Submittal, still needs to be "loaded", that is, have the data set's data values transferred into the internal storage database table that will be used for all processing. The actual Provider's data set is never altered by DIVA.

Input Process Field – an "unconnected" Data Source Field for a Process. These will show up as one or more orange half circles with the arc facing left on the left side of a Process when it is dragged onto the Process Canvas. Not all Processes will have an Input Process Field(s).

Output Field – a target field (Data Sink) for DIVA processing. The Output Fields are either specified by the SBDD geodatabase for a given Reporting Period or added by DIVA designers to hold information that may not be part of a final SBDD feature class. This additional, non-SBDD information was deemed critical by the DIVA designers to post-DIVA GIS processing. Output Fields have their data values populated by transforming Input Field values using the Processes that a DIVA users specifies.

Output Process Field – an "unconnected" data sink Field for a Process. These will show up as one or more orange half circles with the arc facing right on the right side of a Process when it is dragged onto the Process Canvas. All Processes will have an Output Process Field(s).

Period-Type – a composite of the Reporting Period and Submittal Type. Because the reporting requirements for a particular Submittal Type may change each Reporting Period, this composite allows us to attach those specific requirements (attributes) to this particular Reporting Period / Submittal Type combination.

Process – an operation in DIVA that transforms data from an Input Field to an Output Field. DIVA has eight Processes that a user can apply to data. These are "Constant Value", "Provider Value", "Copy", "Copy with Default", "Make Negative", "Translation", "Composition", and "Decomposition". Each of these Processes is explained in detail in the "Functional Detail" section of this documentation.

Process Field – an intermediate data "storage" that DIVA uses to link (couple) Processes together when the connection is not directly to an Input or Output Field.

Processing Set – a collection of Processes defined for a particular Submittal. Processes are defined on the Processes tab of the DIVA GUI. A Processing Set is specific to a Provider, Reporting Period, Submittal Type and an Input File

Provider – a Broadband services Provider as defined by the NTIA. These may be primary providers or resellers.

Record (or Data Record) – see Row.

Reporting Period – an NTIA established reporting period for submittal of State broadband data. There are two reporting periods per year, Fall (October 1st) and Spring (April 1st). In DIVA, there is a 6-month window assigned to each of these periods. The Fall reporting period spans July 1 to December 31 while the Spring period runs from January 1 to June 31. Only the Reporting Period that has a date range matching the current system date will be considered The "Reporting Period" pull down list can be modified using the "Manage Submittal Reporting Periods" function found on the "Utilities" tab.

Row (or Data Row) – a particular instance of all reported, or added, attribute values of a data set when viewed as a data Table. The definition of the data values in this Row is set by the definition of the Columns of the Table. Each Row corresponds with a single observation of the values for the defined Columns and the order that the values have in the Row corresponds with the order of the defined Columns. A (Data) Record is synonymous with a (Data) Row.

Row Process – a Process that is applied to certain user-assigned Output Field values on particular data rows. The nature of the Row Process defines how particular data row groups are obtained, and the user-assigned Output Fields have their values determined from that particular data row group. There is, at present, only one Row Rule in DIVA ("Must Not Have Duplicate").

Row Rule – a Rule that applies to values in more than one column (Output Fields) across two or more rows of the table. Row Rule violations are corrected by configuring a specific Process (which is not user-creatable; it is created automatically by the existence of the Row Rule) on the Process Tab.

Rule – a Rule expresses a criterion that an Output Field's values must meet in order not to be flagged as an error (a Rule violation). DIVA has 10 pre-defined Rules that are classified according to their data Verification or Validation type, and their Column or Row type. These rules, in alphabetical order, are:

- MustBeInDivaDomain: Validation, Column.
- MustBeInDomain: Validation, Column.
- MustBeInKeyedDomain: Validation, Column.
- MustBeOfType: Verification, Column.
- MustHaveData: Verification, Column.
- MustNotHaveDuplicate: Validation, Row.
- NotGreaterThanField: Validation, Column.
- NotGreaterThanValue: Validation, Column.
- NotLessThanValue: Validation, Column.
- NotLongerThan: Verification, Column.

Rules are automatically created during the SBDD XML Importoperation for a given Reporting Period (for all Submittal Types of that Period). These Rules can be reviewed and modified (or removed), and additional Rules assigned by users (from the “Rules Palette”) on the “Rules Tab”.

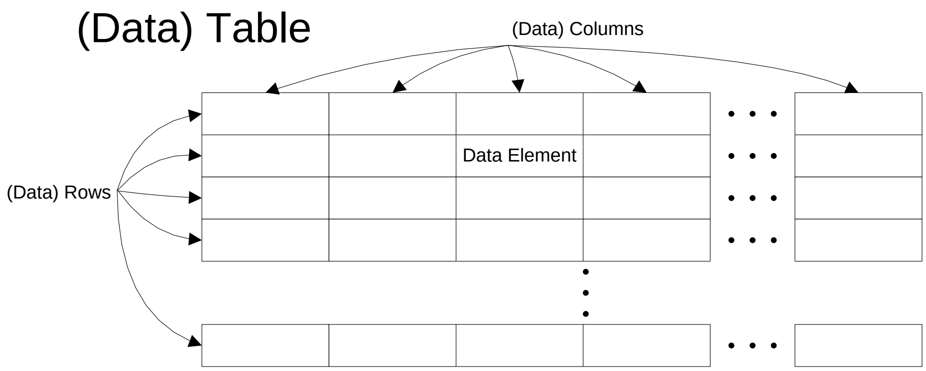
Rule Set – the collection of Rules that has currently exists for the Template Output Fields of a particular Period-Type, and thus for all Output Fields for all Input Files for Submittals of that Period-Type.

SBDD ArcGIS File Geodatabase – referred to, for short, as the SBDD Geodatabase, this is the format in which NTIA reporting requirements for a Reporting Period are defined.

Submittal – the Input File(s), Processes, Rules and other data and metadata that pertains to a specific Submittal Type for a specific Provider for a given Reporting Period.

Submittal Type – an NTIA defined database schema for submitting Provider broadband data to the federal government. As of Spring 2012, there are eight defined ESRI feature classes (“Service Address”, “Census Blocks”, “Road Segment”, “Last Mile”, “Middle Mile”, “Wireless Services”, “Service Overview” and “Community Anchor Institutions”.

Table (or Data Table) – a way of regularly arranging a collection of data elements, where each type of data (attribute), irrespective of instance, is a Column and each instance of all Columns is a Row. Spreadsheets provide a familiar way of creating a Table (but only if all cells in a column are of the same type). Databases are composed of groups of Tables. The number of Columns in the Table is fixed by the specification of the attributes that are included. The number of Rows in the Table varies depending on the number of instances (Records or observations) of data that the Table contains. An Input File must always be equivalent to a Data Table no matter what its file format may be.



Template Output Field – a specific attribute, either reported or added, for a Period-Type, which is the basis for creation of an Output Field for an Input File of a Submittal. Since all Submittals for a particular Period-Type have identical reporting requirements, it makes sense to specify these requirements once for each Period-Type. Then, when a particular Submittal is created (or, more specifically, the Input File for a Submittal is created), then the specific Output Fields for this Input File are created from the Template Output Fields. This allows for efficiency in data storage and processing, particularly with regard to Rules.

Template Processing Set – a Processing Set that is saved to act as a Template for a given Period-Type (Reporting Period / Submittal Type). A Template Processing Set is applied (if the check box on the Submittal's tab is checked) when the Processes tab is first visited after loading an Input File's data. If any Processes have been created for an Input File, then the Template Processing Set will be ignored. There can only be one Template Processing Set for each Period-Type. It is created from the Processes tab by saving the current (displayed) Processes and Process Fields (the Processing Set) as a Template; if a Template already existed, it will be replaced. Application of a Template Processing Set will result in a Processing Set that is exactly like the one that was saved (as the basis for the Template) except all Input Fields will be uncoupled (disconnected) and appropriate Input Process Fields will be substituted in their place. All Output Fields, however, will still be coupled. Any Provider Value Processes will be automatically updated to use the attribute values for the active Provider. Thus, the user simply needs to connect the Input Process Fields to this Input File's Input Fields, click "Apply" and "Save", and they're ready to proceed.

Appendix A: User Needs Analysis

DIVA development began with a list of user needs from which the functionality of DIVA was designed and implemented. It should be noted that this project was scoped in July 2010 based on the type and amount of Provider data the development team had seen to that point. As with any software development project, needs have changed somewhat over time. We have done our best to add features to DIVA that respond to insights we gained in subsequent submittals. Following is the original list of requirements.

Functional Area	Req. Number	Requirement
01 - General	1.10	The application should be designed and developed to **install** and run in Windows XP or Windows 7 (32 or 64 bit).
01 - General	1.20	The application should minimize or eliminate the need for third-party proprietary software that needs to be present on client workstations.
01 - General	1.30	The application should be updateable and configurable by non-programmers.
01 - General	1.40	The application should provide a means to store and recall configuration options for re-use with future input files.
01-General	1.50	The application should provide a means to configure field-specific rules, transformations or other processes that must be performed on each field in the Provider submittal to standardize the output to NTIA specifications.
01 - General	1.60	The application should record and report the results of major data translation and verification/validation operations in a metadata file that would be rendered as a report to the user.
01 - General	1.70	The application should allow the user to select from a set of pre-defined report templates and output formats that define the output of reports.
02 - Data Intake	2.10	The application should be capable of processing all NTIA-acceptable Provider submittal types, including address, road segments, census blocks, service areas and middle/last mile point datasets.
02 - Data Intake	2.20	The application should be able to read and process Excel, delimited text, shapefiles and KML format submittal files from Providers.

Functional Area	Req. Number	Requirement
02 - Data Intake	2.30	The application will be written to assume that input files contain data in a flat-file table schema regardless of the submittal's file type.
02 - Data Intake	2.40	The application should allow users to assign field names to the columns present in Provider submittals that do not contain header rows.
02 - Data Intake	2.50	The application should allow users to "map" the columns found in the Provider files to equivalent SBDD target fields in the SBDD geodatabase schema.
02 - Data Intake	2.60	The application should allow users to identify and document any non-SBDD standard fields for retention in the application's internal database.
02 - Data Intake	2.70	The application should [allow user to capture and] report metadata information which summarizes major items discovered during the initial intake of Provider files.
03- Data Validation	3.10	The application should be capable of "decomposing" a data column value into other data column values (e.g., parse an address into address elements) or "composing" a data column value from other data columns (e.g., assemble a geocodable address).
03- Data Validation	3.20	The application should check for consistency of the Provider Name, DBA Name and FRN in each record.
03- Data Validation	3.30	The application should check the validity and consistency of address information
03- Data Validation	3.40	The application should check the validity and consistency of City and Zipcode information
03- Data Validation	3.50	The application should check the validity and consistency of Census Block identifiers for both Census 2000 and Census 2010. blocks, including the proper area (<= 2 square miles; > 2 square miles)
03- Data Validation	3.60	The application should determine the format that the Min and Max address information has been submitted and standardize the informaiton to report out as AddMin and AddMax fields.

Functional Area	Req. Number	Requirement
03- Data Validation	3.70	The application should check for consistency in how the Speed, Technology and Spectrum Values are coded in a Provider submission.
03- Data Validation	3.80	The application should check for unique records across LocationID, EndUserCat, Spectrum and/or TechID fields
04 - Data Output	4.10	The application should be configurable to adjust to changes in the target NTIA geodatabase.
04 - Data Output	4.20	If the application encounters multiple records for the same technology type and user ID, the application should flag the records that represent the highest maximum download speed.
04 - Data Output	4.30	After processing the Provider input file, the application should output the processed data in a format that can be readily geocoded or joined to the latest NSGIC geodatabase.

Appendix B: Guidelines for Pre-processing Provider Data

Data submitted from Providers will occasionally be in a form or format that DIVA cannot process. For example, information may be broken up into multiple tabs by zip code. Or attribute information, such as Technology Type may be contained in the title of a table and not in the body of the data; or rows of data may be broken by labels indicating an attribute that applies only to the subsequent records. This type of data submittal must be placed into a consistent row-column format in order for DIVA to process it.

Processing Text Files

Open the text file in a text editor or other software that can read and write and ASCII delimited text file. Examine its structure and content. Ensure a clean row, column format and consistent delimiters on each row. Edit the file, as needed, to put the text in a regular format. Using a text editor that can show "hidden" characters, such as tabs and line feeds, is helpful. Notepad++ is one such editor; it is open source and freely downloadable from the Internet.

A user may also import the text file into Excel, Access or another database tool and clean the data there. The file must be saved (exported) in a format that DIVA can process (text, dbf or Excel)

Processing Excel Files

Open the Excel file and examine its structure and content. All data must be on a single tab, in a clean row and column format. At times, this may mean adding a column(s) and moving data from a table title (e.g. Technology Type Asymmetric DSL) into each record of the table (e.g. add a "TechID" column and calculate it to the SBDD value of 10). Save the Excel file in XLS or XLSX formats. Note: DVIA will do translation of values and you may want to wait to convert a textual description of an attribute (e.g. "Asymmetric DSL") to a value ("10") until you process in DIVA, as that conversion step will be preserved as part of the processing record.

Processing DBF Files

Open the DBF file in software that can read a DBF. Newer versions of Excel no longer read and write DBF files, but Access does. Examine its structure and content. All data must be on a single tab, in a clean row and column format.

Processing Shapefiles

DIVA does not read shapefiles, per se, but only the attributes stored in the DBF file. It is very easy to corrupt a shapefile by editing its DBF file separately. Therefore, we recommend that (1) you work on a copy of the DBF file and (2) add and unique identifier to the DBF file for later use in joining back to the original shapefile DBF.

To process the DBF's from shapefiles, do the following:

- First make a copy of the shapefile, then add and calculate a UNQID field = ObjectID field of the shapefile.
- Use the copied shapefile's DBF file as the DIVA Input File for the Submittal.
- On the Processes tab in DIVA, copy the UNQID Input Field to the InpSeqNo Output Field (using the Copy Process).
- After processing and exporting to a text file, use the InpSeqNo as a join field back to the UNQID field.

Processing MapInfo Files

Convert the MapInfo files into shapefiles using a freeware convertor. See the above "Processing Shapefiles" for further processing guidelines.

Processing Access Files

Open the Access file and export to a DBF, text or Excel format. Since Access files have to be structured as a database, there should be no other action required.

Appendix C: Object Data Model

A key architectural decision early in the DIVA development process was to use object-relational mapping (ORM) to persist DIVA programming objects. Microsoft's Entity Framework v4.1 (EF) was chosen based primarily on earlier decisions to do code-development using the .NET C# language and the Windows Presentation Foundation (WPF) for the GUI creation. Our "prototype-driven" development cycle made it easy to settle on the "Model-First" approach to using EF. The DIVA Object Data Model (ODM) is simply our class diagram done in EF format.

The version of the ODM for DIVA v1.0 is shown in Figure C-1 below. The following is offered as a short description in how to "read" the diagram. Refer also to the simpler version of this diagram, Figure 1, as you read this explanation.

DIVA entities (objects) are shown as "boxes". The name of the entity (e.g., Provider) is shown at the top of the box. Each entity (e.g., Provider) implies a collection of all such entities (e.g., Providers); the collection name is the same as the data table storing ("persisting") the attribute values with one row in the data table corresponding to one entity. The attributes, or properties, of each object are listed below the name. Note that there will always be at least one attribute, the ID attribute, for each entity. Below the properties are listed "navigational properties"; these are essentially the names of the other entities that are directly related to this object.

Relationships between entities are shown as dashed lines connecting the entities. The "multiplicity" of a relationship is shown by the number next to each end of the relationship "lines"; it is also implied by name assigned to the navigational property (e.g., InputFile has a navigational property named Submittal implying that it can only be related to one Submittal, while the Submittal has a navigational property named InputFiles implying that it can be related to more than one InputFile). Note that a "*" means "many" which means any number (including zero).

The Provider, Reporting Period and Submittal Type entities are "primary" in the sense that they do not depend on other entities (they are the "independent" dimensions of the Submittal "space"). Start with these primary entities when examining the ODM.

The ProviderPeriod entity is an association object linking Provider and Reporting Period. It exists to "host" the Notes attribute. The "multiplicity" shows that there can only be one ProviderPeriod entity at most for every Provider / Reporting Period combination (however, we do not have to have one if not needed to store the

Notes attribute). The "*" on the line next to the Provider means, for example, that a Provider might have many ProviderPeriods associated with it, but there can be only one for each Period (as shown by the other relationship line).

Similarly, the PeriodType entity is an association object linking ReportingPeriod and SubmittalType. It is needed to allow the definition of a SubmittalType (in terms of TemplateOutputFields, etc.) from one Reporting Period to another. The "multiplicity" shows that there can only be one PeriodType entity for every Reporting Period / Submittal Type combination (again, we do not have to have one if that Period / Type combination is not allowed).

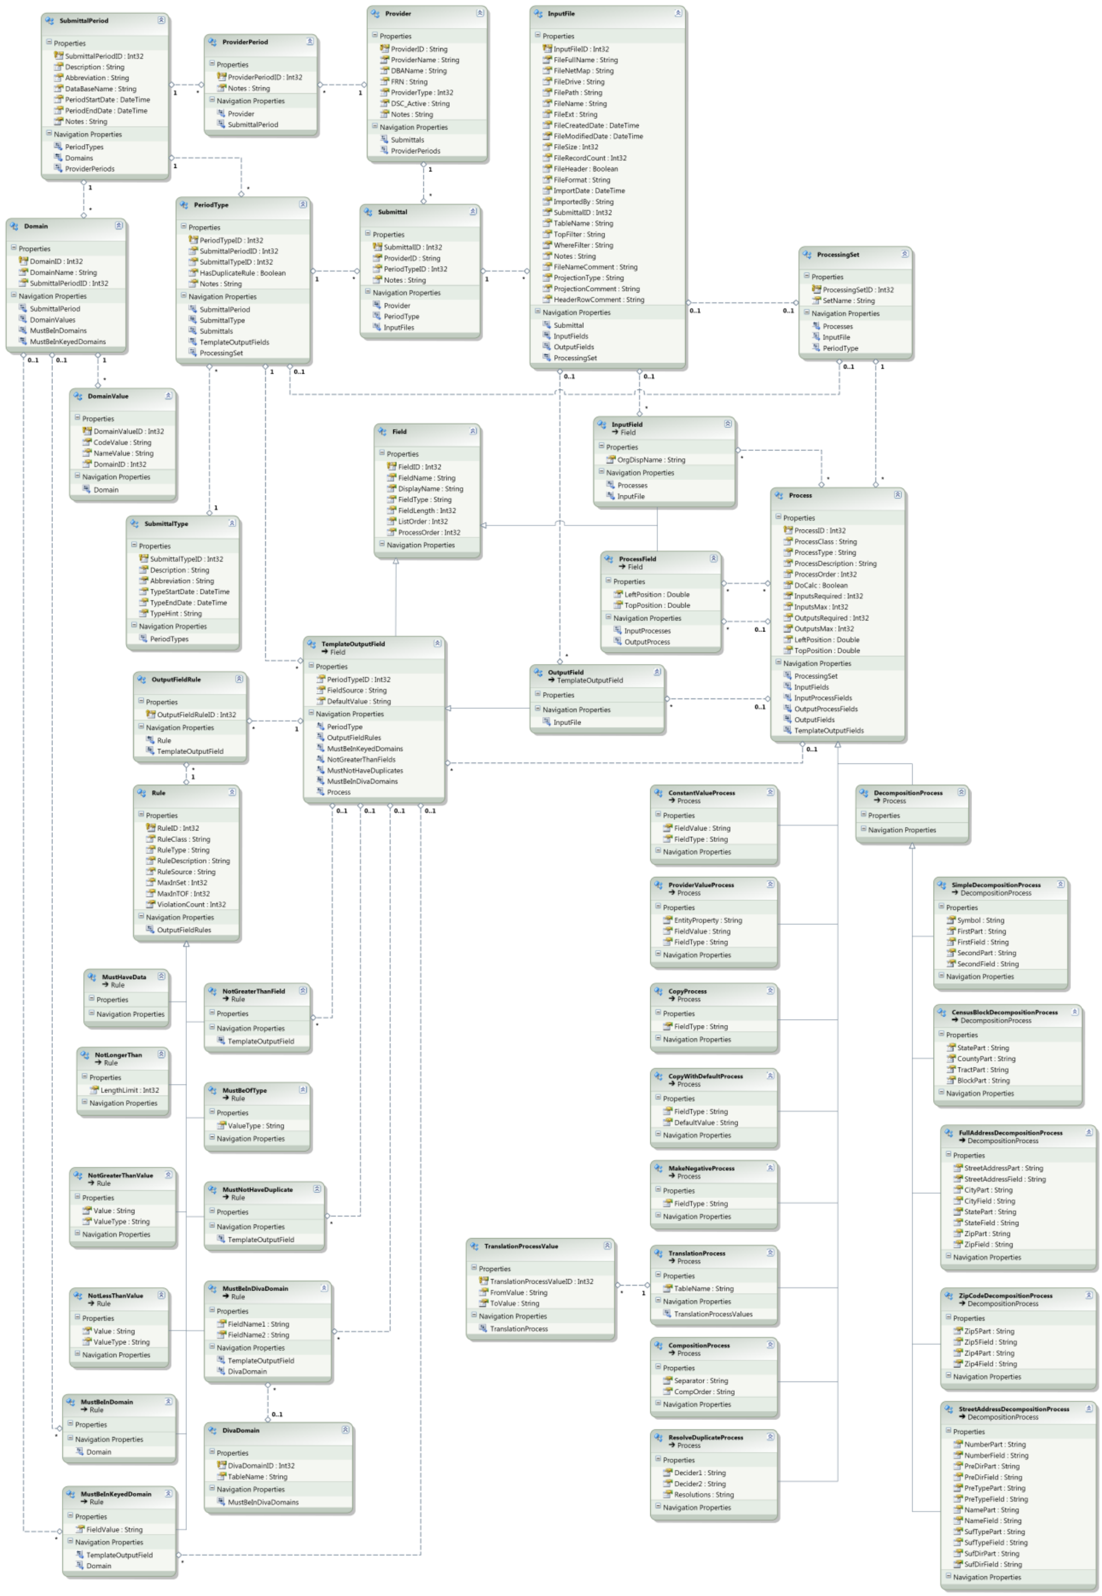


Figure C-1. DIVA v1.0 Object Data Model (ODM)

The TemplateOutputFields are related to the Period-Types; each may belong to only one Period-Type. As explained in the User Manual, these are created, along with the associated Period-Type, during the SBDD XML Importoperation.

There is a many-to-many relationship between Rule and TemplateOutputField entities. This is handled explicitly by creating an association entity called OutputFieldRule between them. There can only be one such OutputFieldRule for every Rule TemplateOutputField combination. This does not, however, prevent us from assigning more than one Rule of a particular type to a TemplateOutputField! We simply have to create a new OutputFieldRule to carry that association. Rules and OutputFieldRules are created, again, by the SBDD XML Importoperation; the user may add additional Rules to TemplateOutputFields on the DIVA Rules tab (an OutputFieldRule entity is automatically created by DIVA each time this is done).

The Submittal entity may only have one Provider and one PeriodType associated with it. The Submittal properties show another possibility. While we have the Provider as a navigational property, we also have the related ProviderID as an attribute of the Submittal. This is done merely for convenience in how we write code to “grab” related entities; we could simply use the navigational property if we wished.

The InputFile entity may only belong to one Submittal (the one on the relationship line next to the Submittal), but each Submittal may have many InputFiles (the “*” on the relationship line next to the InputFile). The ODM makes clear the large number of attributes that DIVA tracks regarding a Provider’s data set.

An InputFile has a ProcessingSet and a collection of InputFields and OutputFields associated with it. These are all created during data loading. Initially the ProcessingSet will be empty, but we will add to it Processes and their associated ProcessFields (if any) as they are created. The InputFields are DIVA’s way of getting a hold of the Provider’s actual data (which sits in another data table, not shown in the ODM). The OutputFields derive from the TemplateOutputFields. Because the Submittal is related to only one Period-Type, it has only those TemplateOutputFields to use in creating its OutputFields, and one OutputField is created for each TemplateOutputField.

In examining the ODM, you will see that there are no “multiplicity” numbers next to some of the lines coming into the TemplateOutputField, InputField and OutputField entities. Instead, there is a line that has a “triangle” on one end of it. These all lead, ultimately, to a Field entity. This is how EF handles “subtyping” objects. The Field entity is actually an “abstract” object; that is, we cannot create a Field object per se. An InputField is a *type-of* Field. A TemplateOutputField is a *type-of* Field. An OutputField, however, is a *type-of* TemplateOutputField. What this means is that an InputField, for example, not only has the properties and navigational properties shown in its box<u>, it also has the properties and navigational properties shown in the box of which it is a type</u> (the Field entity’s box). This allows for efficient storage of commonly shared attributes in the data tables that are used to save (“persist”) these entity attribute values.

A Process is related to a ProcessingSet. It is also, possibly, related to an InputField and / or an OutputField. The multiplicity values make clear that a Process may be related (connected to) more than one InputField, but only one OutputField. A Process may also be related to a ProcessField and this is shown with two relationship lines. One of these lines represents the InputProcessFields navigational property, the other the OutputProcessFields navigational property. It is this set of relationships that allows us to model the connections shown on the Processes tab that are created as we “link” Processes with InputFields and OutputFields, or other Processes through ProcessFields.

A Process is also an “abstract” object; we do not create a Process per se, but a particular *type-of* Process. The various Process entities are shown on the lines that descend from the Process entity. Note that the DecompositionProcess itself is an abstract Process and that we can only make the particular *type-of* DecompositionProcesses that are shown.

Similarly, a Rule is an “abstract” object; we can only make the *type-of* Rules that are shown. So the line leading out of Rules has a triangle on its end.

This takes us through the bulk of the diagram. A few items remain.

Note that the ProcessingSet has two lines leading out of it, each with “0..1” on both ends. This means zero or one related entities. One line leads to the InputFile entity; if this relation is “1” then the ProcessingSet belongs to the InputFile (it is a regular ProcessingSet) and the other relation line will be a “0”. The other line leads to the PeriodType entity; if this relation is “1” then the ProcessingSet belongs to the Period-Type (it is a TemplateProcessingSet) and the other relation line will be a “0”. That is, it has to be one or the other; it cannot be both. And there is no fundamental difference between these two. Note that the Process entity has similar lines leading to OutputField and TemplateOutputField, respectively. Again, a regular ProcessingSet will only have relations going to OutputFields, while a TemplateProcessingSet will only have relations going to TemplateOutputFields.

The Domain entity is attached to the ReportingPeriod entity. Thus, these are specific to a Reporting Period and the same Domains will be used for all Period-Types that are related to that Period (and, thus, all Submittals, Rules through TemplateOutputFields, etc.). The DomainValue entity is related to the Domain that it belongs to; each Domain may have any number of values but a DomainValue may only belong to one Domain.

The TranslationProcessValue is attached to the TranslationProcess. Each TranslationProcess may have many TranslationProcessValues, but each TranslationProcessValue may only belong to one TranslationProcess. This is where the From / To value pairs are stored for this Process.

Finally, the DivaDomain entity is attached to the MustBeInDivaDomain *type-of* Rule entity. The DivaDomain entity does not store its values in another entity (like the Domain does). Instead, it points to a data table that is stored in the DIVA database. The DivaDomain is not specific to a particular Reporting Period and can be used for all Periods if desirable.

Appendix D: Changes DIVA Makes in SQL Server

When DIVA is initially installed, a database named "DIVA" will be created. This database is used to "persist" (save) the state of all DIVA entities (objects). It is managed by Entity Frameworks v4.1 and not by explicit DIVA code. Because of this, you should think carefully before attempting to make any manual changes to DIVA's data tables and <u>never</u> do so without making a backup beforehand.

When an SBDD geodatabase XML file is imported, a new database will be created specific to that Reporting Period. These Period-specific names follow the pattern "Diva_PData_X##" where "X" is either "F" or "S" (Fall or Spring, respectively) and "##" is the two digit year.

When data is loaded into DIVA's internal storage, it will be placed in the database appropriate to the Reporting Period and will be given a name that matches the Processing Set's name. This name has the format "PP_RRR_SS_#" where "PP" is the two character ProviderID attribute value, "RRR" is the Reporting Period's Abbreviation attribute value, "SS" is the Submittal Type's Abbreviation attribute value and "#" is the integer value of the Input File's internal identifier. This name is guaranteed to always be unique.

The DIVA database can be backed up at any time. Usually, this would be done at the end of a Reporting Period before the start of the next Period's data processing. Restoring the database would thus return DIVA to the state it was in "between" these periods. Because the DIVA database is "uncoupled" from the Period-specific databases, no adjustment would be needed if restoration is done from such backups. Just delete the Period-specific database and re-import the SBDD geodatabase XML file.

Backing up and restoring DIVA during a Period is more complicated in that you need to ensure that only those data tables that should be in the Period-specific database are actually in it. This can be done by backing up the current Period's database at the same time that DIVA is backed up, and then restore it in synchronization with DIVA restorations.

The Period-specific databases themselves can be backed-up and then removed from SQL Server after a Period is closed and you have no further need of them (e.g., for reporting). They can be restored, if needed, for access to previous Periods.

The DIVA database grows in a fairly "linear" fashion (for each Reporting Period and Submittal added) and should remain relatively small over time. However, the Period-specific databases could be quite large depending on the size and volume of Provider-submitted data sets. In our experience, they tend to be quite a bit larger than the amount of data added to DIVA during the Reporting Period. The fact that they are "uncoupled" from DIVA greatly eases the "data management" problem.

Note that data tables loaded as DivaDomains are stored in the DIVA database, not a Reporting Period-specific database.
